I have spent my life of 56 years stewarding America's landscapes and productive farms. I teach natural history environmental science and land conservation. The connection we humans share with the one great life force of nature is essential to the wellbeing of this generation and future generations. I have spent many weeks and months experiencing our great wilderness areas forests and parks. The solutions for our future as a civilization depend on preserving intact healthy ecosystems and our planet's biodiversity. Without these resources we will lose the basis for our greatest commodities and economies. Please be bold in creating new wilderness areas expanding our national parks and forests adding watershed management protection and conserving our precious natural heritage so that my children and grandchildren and all future generations. While camping in one of the beautiful New York State campgrounds in the Adirondacks this August I was struck by how these facilities benefit the poorer families. For many the summer vacation consists of packing up the camper truck tents and moving to a campground by a lake. The respite from daily life and work is palpable in the woods and on our waterways. Spending time outdoors around a campfire fishing hiking or paddling renews our souls and restores our health. Being in nature is a necessity for us all. I was on a nearby island in Maine when you visited Mt. Desert Island with your family this July. I was so thrilled to know you were taking time for yourselves surrounded by the immense beauty of Acadia National Park. It made me extra happy.

Please pay attention: This is a much bigger issue than recreation. This issue is about our human soul and our relationship to Life. We have no soul or life without respect and reverence for nature. This protection of the natural world is the most pivotal critical aspect of human life today all other crises are rooted here.

Less than 3% of the United States original forest remains. Where we are fortunate to have old growth it is often in fragmentary plots broken up in a way not conducive to protecting animal populations especially migratory ones. Please make preservation of native forest and restoration of multispecies and multistage forest ecosystems an urgent priority. In many cases the Forest Service is selling timber permits for less than it costs to manage the sales build and maintain the roads and it is putting timber on the market when demand is low due to slow housing starts. Who benefits? A few extraction companies who do not have an investment in the future of the environment and seek only shortterm gain. We can do better. If we are to ever cut the majestic oldgrowth it should be for timeless projects such as those of the CCC and WPA building the great lodges and parks of the depression years.

We also need to be more proactive in preparing to counter global warming as much as possible. Most scientists consider this not an issue any more in that unfortunately global warming is clearly happening right now. The issue is getting our political leaders to communicate this as a national priority.

Please ignore those ranters and ravers from the Tea Party who would have you believe all Americans agree with them and their big oil big business partnerships. The majority of us want our shared outdoor spaces protected from drilling and mining.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I ask you to create expand and better protect America's shared outdoor spaces including wilderness monuments wildlife refuges parks forests trails wild To ensure future generations will always benefit and enjoy our public lands please consider these priorities for America's Great Remove cattle from grazing on land within 50 miles of bison Close sensitive areas with endangered plants and animals to any offroad use Stop drilling along our coastline. With two explosions and oil spills in ONE year it's time we went green as a nation. That alone will save thousands of species from extinction and put America's labor force back to work . Once we ruin them they're gone forever. especially inner city children. They are our hope and future.

It is insane to drill out the few reserves we have anyway for security reasons. I used to vote Repub figured it was pick your poison. But they have gone off the deep in over the past few decades into the land of total stupidity. They think we can get back the resources that we have used up over the past 200 years or the capital we accumulated at the end of WWII like magically when in fact this country really needs to change quite a bit to survive in any viable form in the future. BTW not everyone in Kansas is a total idiot. Majority idiocy takes root west of Lawrence. ::::: boilerplate

I want America to be the leader in hte heavens energy wind sun and water bio fuels .Time for America to be a leader agin move on from hells energy (bellow ground) oil and coal

For too long we have sacrificed these lands to drill for the fossil fuels which are destroying us and all we cherish. We must break free from our dependence on oil create new jobs in renewable energy and protect our wild lands for the future.

I have particular enjoyed our Texas state park through out my life time. I grew up on summer trips in to the wilderness it is there where I learned about the world and our great nation! The wilderness is where I hope to teach the next generation! GSA

I think drilling in the Chukchi sea is much to risky. Any oil spill in ice and water is almost impossible to fight.

We have had both the benefits and responsibilities of vast wilderness that sustain innumerable species of plants and animals that fit the intricate pattern of our world and survival. Interfere at any level (from microbes to humans or elephants) will upset the balance and potentially create problems to the rest. Destroy the wilderness areas and add to global warming new diseases insufficient potable water polluted air etc etc. We cannot continue to let those with the most money and the least ethical commitment to protecting our global "inheritance" to destroy everything we value.

American's are tired of big business calling the shots! Exploiting wildlife at will!

if we don't pay attention to the natural world humans will be preserved in formaldehyde !

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

If I were to be selfish I wouldn't be writing to you. I wouldn't be taking your time or mine. I've seen the beauty of this great land. I am still enjoying it. Why should I care what happens to it after I die? Well I do care. You should care as well. I think you do. I also think you have a lot of tough choices to make. But I think that this is one tough decision that you have to make in favor of your children and grandchildren. And you have to make it now.

The National parks are the visions of another forward thinking President. He would be very upset and not what he envisioned of how a treasures are being whittled down by leases and permits. The Parks are being nickle and dimed to be a Disneyland atmosphere and for profit for a few.. Stronger protection for all life within parks. boundaries . Public or BLM lands need to be added to Nat'l Parks to make" Green corridors" for migrating wild life. Summer and winter ranges. Decrease the number of leases for mining and grazing. They are being given first priority by Government Agencies to the detriment of wild lands and wild life.. Have an environmental group be in charge not a government agency. No building. create a buffer zone near all rivers and no clear cutting. Ban mountaintop removal. poisoning the future.

ALL OF THESE OUTDOOR SPACES ARE NECESSARY FOR THE PEOPLE OF OUR COUNTRY TO HAVE A PLACE TO REST RELAX AND TO JUST TO BE IN A PLACE WHERE THEY CAN THINK ABOUT THE THINGS THAT ARE IMPORTANT IN THEIR LIVES ... HAVING PLACES WE CAN GO TO THAT ARE STILL PRISTINE AND UNDEVELOPED WILD PLACES WHERE WE CAN OBSERVE THE NATURAL WORLD HELPS US TO KEEP THE PROPER PERSPECTIVE IN REGARD TO OUR OWN SURVIVAL IN THIS HARSH WORLD ENVIRONMENT THAT WE NOW LIVE IN .... AND GIVES US HOPE THAT WE CAN MAKE IT A BETTER WORLD. PLEASE PROTECT OUR COUNTRY'S WILD PLACES ... SEND THOSE WHO WANT TO MINE AND DRILL AND BUILD TO OTHER PLACES THAT ARE ALREADY DEVELOPED OR THAT WILL NOT BE DESTROYED BY SUCH ENDEAVORS BECAUSE THAT IS WHAT WILL HAPPEN IF THEY ARE ALLOWED EVEN LIMITED ACCESS TO OUR WILD PLACES.

Please we need to make a change before habitat and wildlife is ruined and species extinct. Before it's too late make a difference

My generation and my children's generation have enjoyed the great outdoors for years. We really need to keep it going for future generations. This is so important to me. We already are in dire straits with Global Warming we need to help even more.

I have a number of concerns about environmental issues including the destruction of habitats our consumption of fossil fuels and the numbers of children growing up without experiencing nature.

We need for the next generation to enjoy America's great outdoors too.

As an avid outdoorsman I have noticed many changes in the quality of our air and water since my childhood. Even though I live in the great state of Wisconsin with it's limited population and and copious open spaces the impact of our species on the environment is noticeable.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dr. Mr. President Unlike many Americans I grew up with access to hundreds of acres of woodlands streams and clean quiet country air. Today that land like hundreds of millions of acres across this country is being threatened by pollution and rampant development. Please before more wilderness is lost to corporate greed or unchecked development take this time to protect America's shared outdoor spaces including wilderness monuments wildlife refuges parks forests trails wild

I live in Southern Appalachian Ohio. It is a beautiful area to grow up and live in or even just to visit. However I worry that this will not always be the case.

Teddy Roosevelt kicked off the preservation of America's great wild places so that future generations would always be able to experience the grandeur of our natural resources. The past administration as has been typical for Republican presidential administrations made only token efforts in this area while instituting policies and legislation which encouraged business interests to exploit and damage our lands and environment. This must be rectified and in a more permanent manner. Please make this a major initiative of your administration. In particular I would like to see less corporate subsidies and more permanent conservation of wilderness to ensure largescale biodiversity and habitat.

As we all should know we are watching our world fall apart all around us. Areas that are normally moist are drying out. Areas that are normally dry are flooding. The icebergs are melting at a distressing rate. Our water supplies are becoming polluted.

This is so important because there are those out there who are greedy and only think of where they see the already protected environment as a source.

We need your help.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

My husband and I just returned from a vacation where we visited several national parks and scenic areas including Mesa Verde in Colorado Canyonlands and the Arches in Utah the Snake River in Hell's Canyon Idaho and Crater Lake Oregon. We drove along the Columbia River Gorge from east to west and down the Oregon coastline. Finally we drove through Rocky Mountain National Park from west to east on our way home to Arkansas. What beautiful and irreplaceable sights we saw. When I was 12 my dad took me up to the timberline of Mt. Hood outside of Portland where I had my picture taken standing in my shorts on a snow glacier right outside the hotel. That was some 60 years ago. We went back of the mountain this year hoping to recreate that photo. Unfortunately the snow fields have withdrawn so far up the mountain that they are now unreachable by foot. Protecting conserving and understanding how to best protect our natural resources is vitally important to our country and to our national psyche. These special places must be preserved no matter what the cost. We have been to Yellowstone the Grand Canyon Yosemite and many other natural wonders in the U.S. There is no vacation we would rather take than to visit one of these wondrous places and we want our children and grandchildren to be able to have the same experiences as we have had.

Frankly it is disgusting that we have to continue to fight to protect our outdoor spaces! But we will continue to do so until future generations are assured that they will have these benefits. We've GOT to preserve and conserve this great country's greatest assets our outdoor spaces. We have already lost too much as it is; just consider the original sizes of our national parks as compared to their sizes now for only one example. ENOUGH ALREADY!!

Sir ... you enjoyed your New England coastal vacation with your family this summer ... imagine what that time would have been if Corporate illogic had been allowed to have its way in the areas you visited ...for profit at the expense of our wildlands ...

In a related issue I DO NOT and CANNOT understand your worsethanPresidentBush policies re: wolves. I am shocked and amazed by it. It is one of your worst environmental debacles.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I have worked within several wilderness areas on projects that provide for increased environmental protection and recreation. The original wilderness areas plan included areas that fit the intent of the designation and protected pristine and unique lands accomplishing tremendous good for those fortunate enough to have the time and physical ability to enjoy such wonderful country. I continue to work on volunteer projects within and outside of Wilderness areas of Sequoia National Forest. As additional areas were sought to add to the original wilderness areas that meant the intent of the wilderness law. Some of these were private in holding, lands that needed to transfer from other agencies others were areas that took time to survey and to process. The Wilderness system grew for good reasons. As the years went by the term Wilderness began to be misused and politicians learned they could stir up emotion by claiming to ? protect at risk Wilderness areas? with new legislation. So the original definition and purpose for wilderness areas, a quite noble one? became skewed and often were based on emotion, politics and not on any science. Wilderness designations in many of these areas can do harm by restricting the abilities to conduct land management activities that are needed to protect the lands, public and adjacent communities . There have been areas closed to 4x4 over the last 20 years based on no logic just emotion. Such as areas proposed in this bill. In these areas prior to wilderness designation vehicle use had been restricted to designated routes that due to soil and rock and infrequent use no environmental damage was occurring. This was all based on scientific studies. Many of the areas that were closed under the desert wilderness act have no other ways to access them due to distance traveled to and from water and the severe environmental conditions. Without 4X Jeep type access there is no other way to recreate, protect or study these areas. The USFS and BLM have spent many years studying and improving the roads that can be maintained to allow for recreation, and environmental protection, while closing those that do not provide for all those issues. Protection of public safety and protection of the area from invasive species, disease and from the effects of catastrophic wild fire is greatly impacted by the designation of wilderness area to areas that do not meet the intent or definition of Wilderness area. Non Wilderness lands can be managed for any type of recreation opportunity that is eco friendly for that area and in a much more cost effective manner. Designating more Wildernesses will discourage the public from enjoying the outdoors because many unintended and cumbersome regulations that automatically apply. The President said he is interested in local involvement in his plan, yet none of the local user in these areas that I am involved with have been contacted. Only national interest groups who do not use the area at all have been promoting the changes in our area. The Initiative seeks to address Climate Change and should use the best science, which has been determined to be the need for fuel load reduction, (logging, chipping, masticating and control burning) to promote forest watershed health and reduce greenhouse gas emissions. These activities are restricted by wilderness areas. Reduction of hazard fuels from our forests to provide for public safety and to reduce emissions by the reduction of plumes that transmit huge quantities of material into the atmosphere daily from catastrophic wildfires requires renewable resource harvesting in America, also known as logging. In the US we have now evolved logging practices to mimic natural fire in the forests. Our logging is done under the strictest environmental regulations in the world. Wilderness designation generally eliminates logging and all other fuels management practices. There are many scientific reports how logging can reduce the wildfire threat and the emissions of green house gasses. An

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Increaseing wilderness acre has already increase the occurrence of large fires and the emission of green house and toxic gasses by wildfires. The Klamath County seat in Ca. the city of Yreka, 2 years ago had un healthy CO2 levels for weeks above the Federal Permissible Exposures limits due to fires burning in wilderness areas. .

It pains me to see what this country is becoming. The taking of "public" lands from the public is not what this country was built on.

It's such a nice area for a family to go ATViing in; it would be such a shame to have this area closed. Having ATV'd in the area; closing it would have an impact on the small towns nearby who rely on our business, while enjoying this area.

Most american families came from contries that a few controlled most of the land. We consider our right to public land part or our freedom. Most of the land is only accessable by off road rides. Why keep us out.

My area allready has huge areas closed to vehicle usage. As I am partially disabled I will never see these areas. Even though there are roads into and all over these areas. Made by logging operations many years ago.

My family has enjoyed Off Highway vehicle recreation for over 30 years. We treat the environment with respect and help keep it clean. I sure do wish the Federal Government would quit spending money they do not have.

My family, three generations, are utilizing these off road areas on a routine basis. Closing these areas will drastically diminish our use of these lands. It will not only be bad for us but also for the economies of the small towns which depend on the revenue going to these areas provides.

My fiance and I both are tired of seeing the American Owned Public Lands being taken away from us and from all future generations to enjoy. These lands are all of ours to enjoy and use.

My name is and I live in Midvale, Utah. I am 53 years old and passionately enjoy riding my dirt bike with friends, family and fellow members of the Utah Desert Foxes Motorcycle Club. Up until 1999 when I was 43 years old, I had never had the opportunity to ride a dirt bike. Once I started riding, I was hooked and look forward to every opportunity that I have to get out and experience riding in Utah. One of my biggest disappointments is the fact that I discovered this fulfilling activity so late in life and that I probably won?t be able to explore all of the beautiful Utah riding areas that I would like to before I?m too old to ride them.

Not only do Wilderness and Monument areas close access to Multiple Use recreation but harms the economy of the small communities that depend on Off Rosd Vechicle and Mountain Biking to servive.

Off Highway motorcycling has enabled me and my family to experience, enjoy, and respect the California deserts and mountains. Access has been greatly restricted over the years and further closures will all but eliminate this great escape from city life.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

OHV, four wheeling, and mountain biking are activities that my entire family enjoy. It gives me a chance to teach the kids to both enjoy and respect the outdoors. My kids are in 6th and 8th grades and due to the family time we spend together we have not had to deal with the challenges that face families that do not spend time together. By closing more areas to motorized or bicycle traffic you are reducing the chance of my family and other families like mine from doing the same.

OHV's are also used in hunting which would also, be effected by these proposed changes.

Public land is intended for Public use, not use by a few who despise motor vehicle use, I would also question the constitutionality of setting any rules for Public land use that would not be voted on by the Public, Not just corrupt Politicians that have ulterior motives.

The closure of any more lands for our recreation, namely offroad riding would make this form of recreation practically impossible. We already have given up much of the areas that we were allowed to ride. The State of CA has made two classes of vehicle, restricting when we can ride. When will you people listen to the real Americans that pay the bulk of the taxes that you see willing to use against us? For the most part the Offroad community are families that care about the environment. We take care of the trail, clean up after hikers that litter the backwoods and spend our capital and labor maintaining the areas we ride.

The creation of Wildlife corridors will have a disproportional and severe negative impact on rural communities. It appears that organizations such as The Nature Conservancy stand to make huge illicit profits by swapping lands to the government for Wildlife Corridors.

The current state of this Nation's economy, and the best interests of the Citizens across the Country, will not be best served by creating a land grab, which will all but eliminate a multi million dollar industry in the recreational vehicle and mountain bike industry. Drive across this great land and you will see that our natural wildlife areas are plentiful, and healthy under the existing stewardship already in place. This entire plan of Wildlife corridors is yet another sham put out by the Nature groups to close all public access, against the wishes of the vast majority, and in spite of very essence of what outdoor recreation truly is in this Nation. Shame on them, and those who support this type of closed minded and self serving Initiative.

At this time of economic uncertainty we should not be creating additional tax burdens for the American people and we should promote the use of the public lands by as broad a segment of the population as possible

The President is interested in local involvement in his plan, yet no multiple use groups have been included or invited. The initial plan has clearly been created by a small segment of special interest groups who seek to limit access to our public lands. If Off Highway Vehicle Recreation groups were involved, the President would understand why this is a mistake.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Public lands are for the PUBLIC i.e taxpayers.

I will allow the representatives I vote for to take care of the big issues. But THIS issue affects what I enjoy doing most in my free time, Riding dirt bikes and mountain bikes. It's what I look forward to doing at the end of my work week. And I am not one of those stereotypical drunk riders with a lifted financed truck littering my food and beer in the parking lot!

. The current access that I have enjoyed throughout my lifetime and my familys have tought me the values that I practice everyday. I have ridden off highway motorcycle my hole life and enjoyed growing up with my mother and father and have passed onto my family and now thay are grown up and productive citizens. This access is very important and we need more access not less. Sincerly

. I object to spending over \$2 billion of my tax dollars locking the majority of the public out of more of their public lands through inappropriate Wilderness and Monument designations!

. Our rural community (Orofino, Idaho) has had severe negative impact due to the locking up of public lands.

Access to public land is very important to me and my family. You say this is youth access, but it adds more limits and reduces access. Thank you for reading my letter. Please keep public lands open to the public!

Additionally, I live here and enjoy our public lands - more designation takes land away from the folks who fall under the AMERICAN DISABILITIES ACT! Many of my friends are not as lucky as I am and need motorized assistance to enjoy their public lands. They are already restricted to places that allow such types of activities. Please think about ALL the citizens in our country, not just those that are able to walk without help. Thank you for your time!

Also, it is just another step in which we loose a little bit of freedom everyday. This is suppose to be the land of the free, but instead it is becoming the land of the regulated. I strongly disagree that we should lock up our wilderness and observe it like it is a museum. We belong in the forests recreating responsibly. I grew up riding dirt bikes in our awesome national forests, and I want my sons to enjoy the great outdoors like I have and do. However, there are bodies of people who believe we should live in high density cities and never venture out doors to enjoy this wonderful God given earth. We as a species were not meant to be locked up in our cubicles and condos and live our lives hooked to the T.V. to be entertained until we die. We are suppose enjoy what little time on this earth we have enjoying the true beauty of it all. By denying the people from public land that belongs to the people is downright criminal. Shame on you all who want to take our God given right to be human beings enjoying the gifts the forest. Shame on you all.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Although I understand the intention in designating the land as such, restricting access to most of the public will be a disservice to the intention of what public lands were intended for. The general public generally uses this land for recreation. It also appears that many recreation groups have been shut out of the decision process of how the lands are allocated. Please include more lands in this designation, and include more outdoor recreation groups in the decision process. Thank you for taking the time to consider my views.

And frankly, aren't there better ways to spend over \$2 billion in tax dollars than locking the majority of the public out of public lands through inappropriate Wilderness and Monument designations? Thanks for listening...

Any normal person would believe this also. We want to have fun in life and I want to be able to show my daughter what fun I had. Its an experience that everyone should be able to encounter. Plus it brings in money not only in the area but hundreds of miles away it creates revenue by the motosports shops that sell dirk bike gear and merchadise of the sort. Jobs obviously come with retail sales and manufacturing of where this items are made throughout the country and the world. So it will make a huge negative impact if we cannot spend our money and have fun at the same time. Beilieve me its not a free type of fun. It takes money to go have fun and that is how the world turns!

As a kid growing up, I have enjoyed recreating in the outdoors using ohv's and mountain bikes. I belong to clubs that build trails and maintain existing trails. Now that I have kids, and grandkids, I take them along to enjoy our great outdoors. How dare you disguise this initiative as away to get kids outdoors. Strange this was trying to be passed without public knowledge or comment.

As a tax paying voter I am tired of seeing land closed to multipurpose use. Time and again I hear people who never leave the city on the weekend talk about how we must preserve our land by closing it to multiple use. Yet they never even leave town to enjoy the outdoors. As an Avid offroader I leave for the mountains about every other weekend, waking up at 5:00 am to do so. I buy gas and meals in the small communities near these areas, and often stay in hotels there. The more areas that are closed to my choice of recreation, the less money I will be spending in these small communities. I volunteer my own time and money to maintain trails as well. Obviously as more land access is shut down, I will not do this.

As an avid ATV enthusiast, I am concerned with any legislation which could prevent me from riding ATV's in woodlands.

Please do not close any more land to the people of the great and vast country, in California alone we have lost several areas in the past 30 years and now the drive to get to one from where I live is many hours longer than it used to be. Open more land to the public don't close it!

As an off road user, I do not want to see land abused or "trashed". We stay on designated trails and enjoy responsible use of puplic lands. This new plan is not going to improve and encourage responsible land use, rather it will sit empty or be abused by someone willing to break the law.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

As an offroad enthusiast myself, I have been experiencing our available land shrink more and more, crowding more people into smaller areas. This creates dangerous conditions.

As much as disapproved of the Bush administration the president was a mountain biker and recognized what the sport and activity offered besides physical fitness.

As past president of a large ATV Club and current secretary, my interests are along the lines of recreation, although from other standpoints as well. Many of the areas we enjoy and take careful care of are so vast, no one will ever see them close-up the way we have been able to. I think, in particular, of the San Rafael Swell. An all day long ride on an ATV takes through on a small portion of it, which is so rugged to hike very quickly so it could never be seen if it were closed to motorized travel. I would like my grandchildren and beyond to enjoy these areas, as well. I do not think those in Washington who are so willing to close and "preserve" an area are even aware of what they are doing.

At what point does the Government stop being dictators and begin to be the Government that our fathers designed it to be. You know "FOR THE PEOPLE BY THE PEOPLE". This is just another Bullshit attempt of Socialism to take Control from the people. We have the right to use public land as we see fit and not to be governed by CLUELESS BURECRATS! Period.

By closing these lands i will not be able to continue take my family off roading please do not deny my children the ability to access these lands the way i have growing up.

California is becoming a look but don't touch state. It needs to stop, the lands are useable!

Careful consideration needs to be addressed for the continuation of outdoor off road recreational use as well as mountain bicycle riding on designated hiking trails etc here in california we are restricted already to minimal & excessively small confined off road desert and forest managed areas This has gone too far..... Please include off road recreation groups in the discussions and decisions of any future plans for expansion of any closure of public lands that may be used for recreation for youth & family to enjoy the god's creation for all of us to share and enjoy ..... nick dally hiker, mtn biker, & offroad motorcycle enthusiast

Closing of these lands.. Can and WILL cause hardship to MY FAMILY.. as our business rely's on people enjoying these area's. My family has been in the business of selling products for OFF ROAD vehicles for many years.. and we are all ready struggling to make it now with the poor economy. DON'T waste my TAX DOLLARS to put me and MY FAMILY out of business.

Closing off more public land makes no sense. Living in California, which already has more land closures by the day, is getting ridiculous.

Closing public lands is absolutely wrong. Taking away what little freedoms we have left in this country is the going down the wrong track. OHV use is more popular than ever, yet land to conduct this form of recreation is shrinking, closing public land is the WRONG thing to do.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Closing public lands will take away needed economic input to the communities that survive on the money spent by citizens that utilize these lands for recreation. This would most certainly lead to more economic hardships for these communities that are already struggling due to the harsh impact of the downturn in the economy.

Currently, the majority of us - the public - recreate on Non Wilderness lands. Designating more Wilderness will discourage the public from enjoying the outdoors. The President says he is interested in local involvement in his plan, yet no multiple use groups have been included or invited. The initial plan has clearly been created by a small segment of special interest groups who seek to limit access to our public lands. We rely on YOU to make sure our lands are managed in the best interest of US ALL, not just some selected few. Please consider this:

Dear "Leaders," This is in effect thievery. People who think their personal recreational preferences are the only option are attempting to prevent other from enjoying their recreational activities. In effect, they are stealing my ability to to enjoy -- without damaging -- the wilderness. The thing that bothers me most is the blanket assumption that using a piece of land for something like dirt biking or mountain biking destroys it, while hiking does not. This is complete bunk. First, we're talking about dirt and rocks. Needless to say, the dirt and rocks will still be there are we are long gone. Second, hiking is just as detrimental to trails as any other activity, and believe me, hikers can be messy pigs. They are not saints. God gave us the wonder of nature to enjoy. Not to be put on a shelf. Keep the lands in this great country accessible to all! Thanks,

Dear Legislator, Please represent me and do not take away our recreational access! I am an older American that can no longer hike or backpack. Responsible 4x4 is the only way I can access and enjoy our PUBLIC lands. I practice "Tread Lightly" and am a responsible recreationist and belong to several organized groups that share the same ideals. Stop the closure of PUBLIC Lands and the "Wildlands Project!"

Dear Mr. President, I am greatly disturbed to read of the ideas being put forth concerning the use of outdoor lands. In addition, I greatly object to the closed nature of this action- the fact that only one viewpoint was represented during the planning of this.

Please vote to end this Federal land grab. Thanks for your attention to this matter and for your earliest response to my concerns.

Dear Sir, I feel enough land has been locked away from the public. Please keep our public lands open and available to all,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Sir, I and many friends and family are against any new closure of any public lands to Off Road Recreational Vehicle use. As an American citizen having lived in Oregon, California and now Arizona, I have seen the closure of many areas previously open to Off Road Vehicle use and am deeply concerned that these places are becoming fewer farther to reach. Closing public lands to Off Road Vehicle use not only impacts the end user but also the community and local businesses small and large who support our sport. I entreat you to reject any Initiative to close any public lands to Off Road Vehicle use, for these are the sanctuary of tax paying American citizens who use these lands to recreate and live free. Talor Kelman

Dear sirs, I have been an avid recreational user, not abuser for my entire life, dirt-biking, hunting/hiking, and pay an enormous amount of fees for licensing, tags and taxes to use this great land we have here in Ca, and would find it disgraceful to see our forest lands which I am part owner; taken away for a couple billion dollars. Keeping it hush hush by not inviting the main people that actually use and upkeep the land is politically as well as morally wrong to be sure.

Designating Wilderness will degrade our public lands which will be overtaken by invasive plants and fire. Non-management is not the way to preserve our Great Outdoors. No more wilderness!

During my life have have witnessed an ever shrinking area in which to enjoy Mtn biking and motorized recreation. Enough is enough already, the ever shrinking lands open to these sports is an affront to these freedoms and has a polarizing effect amongst the American populace. There is plenty enough land that is already off limits to all but hikers, a group to which I also belong. In other words, the balance of land use has already been met. Just not in the eyes of totalitarian extremist, whom are not interested in anything short of a total ban on anything they deem unacceptable. Please keep America free, for everyone! Proud citizen and voter,

Enough is enough. We need more areas open to the public at large, not limited to the few.

Every year I pay over \$200 in off highway vehicle registrations. If the areas where I ride are severely limited, I will find a different activity and not pay these fees any longer.

. I have to ask if those creating this legislation - have ever even visited these areas; let alone recreated in them. I challenge you Mr. Secretary, along with the President and his cabinet and constituents to come camping and OHV exploring with me and the organizations I work with - only then can you begin to appreciate why Americans should continue to have our constitutionally and God-given access.

Following is my feedback on the presidents America Great Outdoor Initiative. As a concerned voter I want my views to be known. I cherish my right to use the outdoors recreation areas but think the designation of further wilderness land will not benefit my use rights in any way and strongly oppose it!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

For myself and my family, the most enjoyment we have is going to the out doors and enjoying it together and with friends. This legislation assumes that all Americans will have the same sort of experience and will attain that experience in the same manner. I do not agree or support legislation that does not address the concerns of all groups that use an area. I may not agree with OHV use in all manners but the groups that are dedicated to an area that have established use should not be shut out of the process or out of the use of that area. For many of us, it is why we live where we live. I appreciate your concern in this matter. GIVE US A SAY!

For the past 20 years of my 30 years alive, I have ridden and enjoyed off road motorcycles at least 40 times a year. I don't think I can count on one hand, the times I have not seen some form of wildlife, in the areas I ride in. To me that shows that ohv use is not removing or hindering any wildlife within their natural habitat. There is absolutely no need to prohibit, Us as Americans from the very lands that Us as Americans are entiteled to, with much thanks to our fore fathers. Your thoughts and considerations on this matter are greatly appreciated. Thank you,

Greetings, I am a resident of California and am 49 years old. I am writing this to express my objection to the Presidents Wildland Project. I believe this is a thinly veiled attempt by special interest groups to lock out a large portion of Americans from their public lands by designating vast areas as "Wilderness". Alot of these areas being discussed do not even qualify as true Wilderness, due to roads and utility corridors, etc. These designations sound nice and people like the idea of Wilderness when asked, but in reality, most folks are not capable or desire to hike into these areas (Wilderness means foot traffic only). I believe Managed Recreation is a much more balanced approach and all local stakeholders should be heard when making such important decisons. Thank you,

Having given 20+ years of my life to my Country and the Marine Corps if feel that I have secured the right of my family, myself, and millions of Americans to enjoy and recreate in the great outdoors. More and more land in my state (California) and many of the surrounding states of the great southwest are being closed and restricted thus creating overcrowding and increasingly dangerous environments for the outdoor activities that I and many Americans enjoy. Whether it be hiking, boating, off-roading, shooting sports, camping, fishing, etc, everyone who enjoys these activities are running into less and less areas and opportunities to do so. Please end this madness.

Hello, This upsets me and many families. Do not use my tax dollars to take away land that belongs to the people.

Help promote a healthy America by keeping our lands open for use. By closing so much of our lands you are promoting a fat, unhealthy youth that is forced to stay indoors instead of hiking, mountain biking, camping, fishing, and enjoying the great lands that the USA has to offer. I am saddened by the amount of our freedoms that are slowly being taken away.

Here me well, I'm a tax paying American and I demand that our elected government officials stop spending Millions & Billions of our hard earned dollars against the will of the people to close public lands, only to serve a special interest group, and lock out the the masses who enjoy them.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

How can the government justify closing these areas for urban youth? Since when are the rest of us excluded from land that our tax dollars go to maintain? Why do citizens have to pay for closures and the result is we get shut out? After the work week is over and we have paid into the gov money pool, a huge portion of the populous heads outside to enjoy our country side. I can't believe what the "audicity of hope" has delivered. What a utter shame and disappointment this governement has become.

How much more damage do you plan to do to our country? You want to save the land for future generations by closing it to this generaation. At what point do we get access agin? This is not a good idea as we have lost almost all of our access to public lands to ORV in and I'm against any more closures.Let the people that use the land decide it's future, not the Searra Club. Seirra Club should be renamed to the anti access closer club.

Hunting also takes a blow with the President's new direction. Wilderness areas allow no vehicular access and an inability for older hunters to transport their game out of the field. Hunters are the world's greatest conservationists. Locking them out of their hunting stopping grounds could result in fewer and fewer hunters - this results in less revenue for state game agencies to manage our precious wildlife.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am a 61 year old-tax paying , native born American citizen who has accessed the wilderness areas of this country since I was old enough to walk. The last two or three decades I have witnessed the closure of more and more areas to four wheel drives, motorcycles, Atvs, bicycles and horses. In my experience, the individuals who access and enjoy the wild areas of our country by these means outnumber those advocating denying such access by 100 to 1. Extremely seldom do I ever see anyone from the Sierra Club, even in the areas that I have accessed where no trails exist, and I have to backpack in. There are already TENS OF MILLIONS of acres of land in this country that are protected as national forest, wilderness, national or state park areas. In a large percentage of these cases, the state or federal government appoints itself as the financial custodian of granting access. Personally, I am fed up with poor management of these areas by the Federal and State personnel. The public ends up paying for entrance fees, wilderness permits, unreasonably high salaries and benefits to support an area where the land and trail maintenance was done much better and less expensively by private user associations/organizations. The last time I took a 2 day wilderness backpacking trip in the Desolation Wilderness area of the Sierra Nevada Mountains in California, the trails and areas I traveled were the worst maintained that I had seen while frequenting them in the past 40 years, yet I had to travel to the nearest Federal Ranger Station, pay 20dollars for a permit, be ignored by a staff of 5 or 6 federal employees who obviously, judging from their physical condition, have NO experience in the wilderness let alone any business providing "guidance" or oversight to people like myself and others. They should have been outside, removing the trees that hindered access along the trails, restoring areas of erosion etc.. This is the type of work and public service (done at no expense to the taxpaying public) is provided by countless local and national interest groups of 4 wheelers, mountain bikers, equestrian clubs etc.. ACCESS, NOT CLOSURE is the means by which far more people can enjoy the outdoor wonders of this nation. Hunters, Fishermen, Hiking/mountainbiking/four wheel/atv/equestrian clubs given the charge of stewardship is FAR superior to federal or state closure and oversight! If you REALLY want to enhance the wilderness experience for the public, give financial support to organizations of these users, and charge them with the custody and maintenance of the land.

I am a citizen, a taxpayer and a voter. I do not want more public lands closed. Now more than ever, Americans need the opportunities for recreation and relaxation afforded by public lands. Like millions of other Americans, I do not want the Wildlands Project to be pushed through by President Barack Obama and special interest groups such as the Sierra Club. Keep these lands open for all Americans to enjoy. Limit recreational land use only through limiting immigration.

I am a land user in many ways. I like to 4 wheel, but that is not the only activity for which I use our national forests and public lands. I hike, bike, camp, fish, snow mobile, and I really love to just site there and relax. This is a big land grab and it is being done in secret and without the input of the people who know and frequent these individual parcels.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am a member of a Dirt bike club that puts on 3 events a year. Each one of these events brings in thousands of dollars to local communities, this stimulates the communities. We see 200-500 parents and children per weekend spending quality time together ( not on a computer ). The kids are physically active, getting in shape. The riding areas are getting closed down due to a earlier Wilderness bill so this would just compound the closure problem. Thanks for your consideration to this letter.

I am a mountain biker, hiker, fisherman, backpacker, and off road motorcycle rider. We have plenty of wilderness areas, in my opinion. The multiple use areas have become smaller and smaller, and need to be expanded. Typically the multiple use areas are not true wilderness areas, and plenty of Americans will suffer if locked out of them. I object to this proposal and the use of my Tax Dollars to lock me out of public lands

I am a senior and am physically unable to hike local trails but I do like to go out on my ATV to enjoy nature and to fish in the high mountain lakes. Locking up more land will certainly not be beneficial for myself and many of my friends. Sincerel

I am against any further wilderness designation. This is essentially closing the door to many seniors, disabled people and older people who do not want the "experience" of hiking down a mountain trail or up a mountain trail, or any other trail for that matter! It also closes the natural resources to any type of development at a time when we need our natural resources to reduce our dependency on foreign energy. Windmills and solar power will not run our industries and everyone knows it. Taking out the dams in rivers to "preserve" the sucker fish and delta smelt will further increase our dependency on foreign energy. To lock up our reserves is pure stupidity! You cannot have it both ways, wake up! Wilderness closures are devious and politically motivated. This has nothing to do with "saving the wilderness!"

I am an avid off-road vehicle participant. In recent years we have been limited more and more in the places we are allowed to ride/recreate. In an era when it is important to provide our children a constructive outlet, they are being denied the right to use these outdoor areas. In addition, I object to spending over \$2 billion of my hard-earned tax dollars locking the majority of the public out of more of their public lands through inappropriate Wilderness and Monument designations. We do not need more government involvement in "protecting" our open spaces. Thank you,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am an enthusiastic mountain biker and motorcycle rider. I was raised in the outdoors of Idaho and having these tools allowed me to ride the trails and see public lands that most people will never see. Sometimes riding a mountain bike or a motorcycle is not the end result. Quite often we use this mode of transportation as a means to an end. For example we use them to get into the backcountry for mountain lake fishing, huckleberry picking, and just plain spending time in some beautiful country. Idaho already has nearly 5 million acres of wilderness (including the recent Owyhee Wilderness). Enough is enough in the State of Idaho. We will no longer be able to tap into our natural resources if this continues. Do you expect wilderness to carry our economy in Idaho? It will do just the opposite, because most folks are not backpackers and horsemen, and that is all you can use the land for. The President needs to include the two largest forms of recreation as a priority in his plan to reconnect Americans with the Outdoors. That would be Off Highway Vehicle recreation and Mountain Biking. More areas need to be opened to people who enjoy these most popular ways to enjoy the outdoors. You wonder why our economy is in the tank. The radical environmental groups such as the Wilderness Society, Sierra Club etc., are slowly choking our country of using our natural resources to make a living in this country. Now they want to further lock up our natural resources where nobody can physically visit these places, but only by backpack and horse. Mountain bikes are not allowed in wilderness areas. The radical environmental groups only have one agenda and that is to make everything wilderness if they can get away with it, especially with the current administration, and it may very well happen. This type of radical thinking of our public lands could very well sink this country. Do you expect "Craigslist" and "E bay" to keep this country afloat? Another problem with the radical environmental groups is they will lie and show the worst possible scenes, as far as OHV use etc..., when in most cases it is a small area of concern and managed accordingly. If policy is driven by this, then we are doomed. The President is interested in local involvement in his plan, yet no multiple use groups have been included or invited. The initial plan has clearly been created by a small segment of special interest groups who seek to limit access to our public lands. Maybe President Obama should come out to the west and see what is really going on, and decide for himself rather than second hand information from environmental special interest groups. Not everyone is gifted like Carol King as a singer and make millions and then use her riches to shut down this country for the common person. The same goes for John Marvel - Western Water Sheds Project (Haily, Idaho) who is trying to destroy cattle grazing on public lands for folks who make a living ranching in Idaho. There has to be some sort of sacrifice when making a living from our public lands, and we have learned to do both responsibly because of the environmental movement, which has worked out great. However the environmental movement is going too far and destroying huge amounts of recreating freedom and ways of making a living from our natural resources on public lands. Our public lands will no longer be public lands but managed for the environmental groups' mindset. For example the President wants to place windmills on public lands for a cleaner energy source. Areas of public lands will have to be used in order to accomplish this. Sacrifices have to be made in order to use our public lands, and we just have to be smart about it. Creating more wilderness or national monuments will shut down any possibilities of progress in this country as far as energy growth, natural resource extraction, and multiple use recreation. The initial Wilderness Act envisioned about 20 million acres as suitable. Today we have over 120 million acres of

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Wilderness where public access is restricted. The majority of the public have been forced onto smaller and smaller areas outside of Wilderness. In order to encourage Americans to enjoy the outdoors we do not need any more wilderness areas.

I am both an avid backpacker and OHV rider and this initiative threatens both of these recreational opportunities! OHV and wilderness CAN go hand-in-hand. Restricting OHV access to wilderness is the easy solution, but not the right solution if government is truly representing its constituents. Don't take the easy way out, do the right thing.

I am completely against any new designations of monuments of any kind.

I am disappointed that the President is supporting closing down public land to the public. As a disabled American I cannot hike into the forest like I did in my youth. Motorized transportation is the only way I can get into the back country now that my knee is shot. This land grab is discriminatory against disabled Americans, many of which received their disabilities fighting for freedom of the land you want to close to them.

I am not in favor of land being closed off to motorized vehicles anywhere. In the past I may have supported some, but it is now becoming just a political scam by the environmental groups who don't care what or how the majority of the public thinks. The motorized rec. groups have not been heard and no level of professional review of impacts seems to help. Thus, I don't care what they say anymore because frankly, I DON'T BELIEVE IT MATTERS! If it's money they want, open access to forests promotes and OUR land provides tourism to real places. Driving through a paved road looking at signs is not a substitute for actually driving on a dirt road into the woods and being prepared to get yourself back out. So I say, get yourself informed and stop being sheep following the herd. VOTE NO THIS and ANY OTHER BILLS LOOKING TO REDUCE ACCESS TO OUR LAND!

I am outraged over this latest attempt to seal off public lands from the public.

I am tired of having our country taken away from us and Obama has been a great disappointment. Please help.

I am tired of the back door deals. Let the people decide the future of our public lands.

I am very concerned by the potential loss of available lands for OHV recreation. Specifically,

I am very disappointed that Wilderness and Monument designations are being used. This is the most restrictive classification and essentially limits access. If the President's goal is indeed to promote urban youth access and for all Americans then this designation is not the way to reach his goal. This makes me think his goals are other than stated.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am writing to express my concern regarding the recently announced, "America Great Outdoor Initiative". As I understand it, the goals of the America Great Outdoors Initiative are laudable, to encourage local involvement, increase access to public lands and encourage the Public to get out in the Backcountry. However, the land designations being considered will restrict access, not encourage it and the purported goal of engaging local involvement has been betrayed by that fact that the only groups thus far consulted have been national environmental organizations such as the Sierra club whose avowed goals are to outlaw any form of recreation that fail to meet their narrow definition of what is acceptable forms of outdoor recreation - i.e. hiking and backpacking.

I do not believe that the president is interested in input from anyone other than special interest groups desiring the most extreme restrictions preventing the people who own the land from enjoying it.

The use of monument status has gone way overboard and has gone way beyond what it was originally intended to do.

There is enough wilderness already, the interest in making more wilderness does not effect the people who want it wilderness, it affects us who ACTUALLY use it. You can find me in the mountains all year, from riding snowmobiles to glassing for trophy mule deer to pursuing these magnificent animals. I am outdoors and I speak loudly against wilderness, I can hike in during the summer months and not need it wilderness to this. Then when the snow gets deep I can take my sled in the same country where I pursue trophy mule deer and enjoy it in a whole different way!!

These proposed wilderness and monument areas amount to more government land and power grabs.

This goes against the belief that this is our land to enjoy and TAKE CARE OF so our children can have the opportunity to experience it first hand (NOT from books)!!!

This has gone on long enough, closing up all this land and no one will ever see it.

This plan will destroy local businesses throughout the U.S.

Closing our public lands is not what America is about. How is our youth going to know how to conserve if they aren't allowed to take part in using the public lands. As a concerned mother of 3 beautiful American children,

The closure of millions of acres in California has had a very negative effect on the off roading sport forcing more and more people into smaller more crowded and dangerous areas. Off roading is a quality family sport, supporting thousands of businesses.

I am an active outdoor enthusiast. This plans seems to limit my ability to enjoy public lands.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

we do not need anymore wilderness areas.

We need to balance the federal budget and add to the deficit! Why do we need another federal program?

What good is closing off huge areas that are inaccessible by any means other than offroad vehicles? Who are these lands being preserved for if people are not allowed to use "public lands"?

What good is nature & the outdoors, if we cannot access it? The majority of outdoors enthusiasts are respectful and make certain the environment we explore is left in the same condition as it was encountered. But again....closing land is too extreme of a solution.

what is happening to our country. Everyone wants to make new law and stop people from enjoying life. they think they can just make up any law and get away with it. I would like to keep my freedom if we have any freedom left. I do care about our animals and forest but this is taking it too far. please do not let this happen.

Wilderness designations severely limit the ability of parents with young children and the elderly from enjoying outdoor activities such as fishing, camping, photography and other pursuits in remote areas. Instead they are forced into campgrounds that are noisy and crowded at best. I have even been forced to abort a vacation and return home because all camping spaces were full. All this is just another form of discrimination.

You have seemed to OVERLOOKED Access for the HANDICAP PEOPLE [ROADS] not Horses or Hiking!

As an avid OHV rider, hunter, fisherman, hiker, outdoorsman I fear for preservation of these activities due to special interests groups, who DO NOT represent even close to the majority's opinions, mindless campaign to close off land to American citizens. Let's keep this country great by allowing its citizens to enjoy what it has to offer as well as preserve the land for future generations use. Land use and land preservation complement each other. They are not mutually exclusive.

As an avid snowmobile rider and supporter of equal access I find it very discouraging that OHV groups are not included in these discussions. I encourage our government to solicit involvement of all interested groups and not just a select group of anti outdoor recreationalists.

Dear Sirs: My family and I recreate on public (and some private) lands on almost a weekly basis. We enjoy hiking, camping, hunting, and OHV riding, and have done so for many years. The time we spend together as a family enjoying our public lands is priceless and irreplaceable. We encourage you to consider the following comments while drafting public lands planning and management agendas. The President is interested in local involvement in his plan, yet no multiple use groups have been included or invited. The initial plan has clearly been created by a small segment of special interest groups who seek to limit access to our public lands.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am a Father, American, and a DirtBiker... It sickens me when I hear about plans to close the already diminished available lands for riding and camping and enjoying this beautiful country. Near and dear to my heart is the CCMA or Clear Creek, which has already shut down 35,000 acres of the best MC riding land in the western U.S.

I have lived in Colorado all my life. I am a multiple use advocate. I am very frustrated having to fight for use of our public lands. Every week there is another proposal to shut down our forests or BLM lands to wilderness. I agree wilderness has it's place but limiting our access to millions more acers of wilderness recently proposed is a crime. Every time we go out to ride in an area there is another trail closed. Leave the trails we have been riding for years alone. The President needs to listen to the public who uses our public lands not the small group of special interest who want to limit access of our public lands to everyone. Over Labor Day we went to Taylor Park ATV riding with many of our friends. I was shocked to see how many people were out enjoying our public lands. It was great seeing fishing, bicycle riding, jeeping, hiking, motorcycle riding, OHV's, and boating all in one place. The people were having fun on our public lands. We need to encourage not discourage this kind of activity.

I love to ride motorcycles on single track trails. I've done it for 45 years and have seen many of my favorite riding areas closed or restricted. Some of it is unavoidable due to development. To many gov mandated closures will cause overuse in areas remaining open. Closing everything will result in a lot of disobedience. Thanks for this forum.

My family has enjoyed camping and OHV recreation for 3 generations and now our favorite form of recreation is going to be shut down by you?! The majority of Americans enjoy recreating on multiple use trails, how could you close these lands to us?! Billions of dollars annually is spent recreating in areas that provide multiple use trails, our country BADLY needs this monetary velocity and spending, and you want to put the brakes on our economic recovery?! I voted for Democrats across the ticket in 2008, because I did not like many of the policies of the Republican party. Our country (and our planet) has huge problems with economics, nuclear weapons in countries with aggressive foreign policies (Iran, Korea, and Isreal just to name a few), overpopulation, the poor and hungry in the USA, etc. And, you choose to spend your valuable time closing our public lands? I will NOT vote Democratic again, because obviously you would rather placate a few constituents than work on some serious problems.

These Lands are public and no one has the right to say one group can or can not use them.

This letter is my effort to express my concerns about our government secretly taking control of things that powerful groups seem to want to change. Probably for reasons relating to the almighty dollar. I came from Arizona, where we raised a family and traveled many of the western states enjoying the sand dunes because my son, daughter, wife, and I enjoyed sharing these dune camping trips. Due to California Government , and Federal Government. rules, this recreation has become too expensive to enjoy. This letter is my attempt to keep the Government from ruining many families enjoyment of Multiple Use Land.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To whom this concerns, As a land owner and a recreational vehicle owner Multiple Use lands are where the majority of people recreate, as well as where much of our timber and beef products come from, but these lands have been closed at an alarming rate. The President must keep the Federal government from over stepping it's Constutional bounds and mandating anything. They need to turn over the lands to the states and do what they are suppose to.

Maine's forests provide countless benefits for human and natural communities. Over 70 million people live within a day's drive of Maine and rely on them for clean water and air, as well as for their outstanding recreational opportunities. These diverse forests also contain a dizzying array of flora and fauna, including many endangered or threatened species, as well as rare tree and plant communities. Increasingly, we are confronting the reality that our forests face more urgent threats than ever envisioned. These threats include sprawling growth and development that are diminishing forests in Maine at an alarming rate, and climate change will have tremendous impacts on forests and on plant and animal species in Maine, New England, and globally. As the climate warms, species will generally shift their ranges up to higher elevations and to the north. The more our forests are fragmented by development, roads, and shopping malls, the harder it will be for species to successfully shift their locations, adapt, and survive.

The Western Mountain and Lakes landscape totals over one million acres, encompasses both the Mahoosuc and Rangeley Lakes/High Peaks Regions, links the Northern Appalachians as they pass from New Hampshire to Maine, and serves as a bridge between the White Mountain National Forest to the south and the Maine Woods. This region comprises the southwestern boundary of the Maine Woods closest to population and tourism centers making it the demonstration landscape that is most vulnerable to development pressures that could fragment the forest. Loss of lands from the timber base and severing recreation corridors, such as snowmobile trails, would undermine the area's local economy which relies primarily upon forest products and tourism. This provides us with an unprecedented opportunity for addressing loss of species and open space, preserving water quality and climate change adaptation while preserving the wildlife and lands we enjoy today.

. Natural and cultural sites and landscapes areas whose constituent resources are closely related to one another are inextricably linked because environment shapes human societies, and people, in turn, affect their environments.

These historic and natural sites reflect a wealth of locations, resources, histories and voices whose interpretations help all Americans celebrate our shared earth and heritage. There has been a lack of parity for over a decade between funding for our historic and cultural resources in our National Parks and other public lands. Please bring funding for cultural resources back into balance with our natural resources.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

When declaring September as National Wilderness Month, you stated that ""we must ensure that future generations can experience the tranquility and grandeur of America's natural places."" However, policies from the Bush administration remain in place which threaten the pristine natural beauty, quiet and solitude of worthy wilderness-quality lands throughout the West, especially in Utah's redrock country. The Bush administration's ""No More Wilderness"" policy and resulting land use management plans for 11 million acres of BLM land in Utah have left 80% of these lands open to oil and gas drilling and designated an astounding 20,000 miles of ORV routes. In some of the plans, every single riparian area has an ORV trail, leading to pollution, erosion, shrinking water availability and lost wildlife habitat. Climate change, the overriding influence on the health of BLM lands, got just three paragraphs of the same boilerplate language in each of the 1,000-page Environmental Impact Statements instead of any real analysis.

Throughout my life of hiking and exploring wild places whenever possible, I have seen the disappearance of ever more rural and wild land beneath encroaching unnecessary development. Much that has not disappeared has changed for the worse ecologically and spiritually through prolific invasion of ATVs and the beer cans, guns, and littering trash and paraphernalia carried into remote areas and left there by their riders. I feel great sorrow from this.

Where I live, the green spaces are being eaten up by businesses and housing additions. I want my children to enjoy the out-of-doors without having to drive an hour to get there!!!!

Many of our National Parks need projects to maintain facilities, study wildlife, and to do education for visitors. Many State Park Systems are cash strapped and need federal assistance to stay open and to maintain their facilities and programs. America's Natural Heritage needs a greater commitment than ever.

Most urgently is the loss of bird habitat which is the primary reason why birds are disappearing. Forest, parks, grassland need to be restored, with less commercialism and development to provide safe refuges for breeding and migratory birds, the latter needing these wild locations including urban open spaces for survival.

Seriously! oh, and let's try not to cut down all the trees every time we need to build houses, high rises, parking lots/garages...there are many ways of incorporating what is already there versus bulldozing it all down and replanting new just to say, "Well, we planted new trees!" Yeah, trees that will take 20+ years to mature again as if the ones that were already there in the first place weren't good enough! Take some actual design time to plan around nature as it should be versus nature around us, because we will just lose in the end! Thank you!

I want to continue to enjoy camping in the great outdoors but I have a problem in Illinois with Reserve America. We don't need this reservation system. It's horrible! Go to the website "reserve america sucks" to see campers' comments.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I have been mountain Biking for a couple of years now and have found that there are fewer and fewer places to go biking or hiking around here. I believe that we need to preserve our great outdoors so that families everywhere will have the same opportunities that we and the generation before us had. Thank you for your time Mr. President.

We must start now if we are to synchronize our efforts to save this planet, this will be one of many stepping stones on the way to a greener, better future. What is our Dollar going to be worth when oxygen, clean water, and food are scarce, are you going to explain to your grand children why our once great country has turned into wasteland of parking lots and overdeveloped land for an ever lazier society who cant even walk to their mail box anymore. How in a matter of a couple hundred years we have burned enough fossil fuels to choke ourselves out, and although there are greener more efficient alternatives all around us we wont put forth the effort or money to invest in our own lives. There will be a price to pay for what we have done to our environment and that price will be grand in scale. i love to pedal and hike through the great outdoors and the walls of highways and over sized houses are closing in quickly, There are so many ways we can help our friends and family by giving them a head start to saving our world.

In Illinois, the proposed Prairie Parkway will cause urban sprawl and destroy one of the most unique landscapes, water tributaries, pristine waterways and thousands of acres of prime farmland nearest to Chicago through the heart of Kane and Kendall Counties. Progress and growth in the form of a highway system in the middle of nowhere is not the answer to solving traffic problems, To support your jobs act, spend the earmarks improving existing roadways with turnarounds (without traffic lights) to keep traffic moving (I-47, I-71, and I-126).

If we don't do something soon, we risk losing our national treasures. In a time of climate change, environmental degradation over searching for oil, and stressing ecosystems, we need your leadership to address motorized recreation which has been recognized as one of the number one threats to our public lands and ecosystems. It is important for people to find their connection to nature. Preserve this opportunity for future generations to enjoy these places like so many before us have, before they are gone forever. We need more Wilderness Designation NOW!!

We just came back from visiting the Santa Barbara area and were sad to see the oil spill 26 miles north of Santa Barbara where the rigs on. This was my 7 year old's first visit to the pacific shores and how disappointing for him to have a picture next to the water with the oil spill right behind him. How would I explain to him that because of some people's green he shouldn't even set foot in the water? Thank you and I am proud to have you as president.

If we don't protect it, what will happen to it? Will it be turned into another oil field? Or clear cut for the lumber? For once, listen to those that put you in office.

Please, Mr President. All the kids these days are turning to drugs and sex, when we the people should be educating on the natural beauty & spice in life as the great outdoors. thank you for your time.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

If we give the land away for commercialization, we will never get it back - not in many lifetimes could the environment recover. It is most important to have lands close to the city because people need the proximity to where they live. The outdoors should be in reasonable reach for everyone, not just those who live in rural areas. It is also crucial for wilderness areas to allow mountain bikes - they are non-motorized transport that do no more harm to trails than hikers, and do LESS harm to trails than horses. This inequality has to stop.

I am a natural sciences major and I don't want to have spent all this money, time and effort toward a field I am so greatly involved in to have it all taken away for some set of condos no one can afford to live in.

Snowmobiles don't damage the land or wildlife.

We do not need any more land closures. This is a family sport and we need to keep public land open for our future generations!!!

PORT fervently believes that the conservation of America's working lands is equal in importance and as deserving of funding as enhancing urban parks and acquiring additional federal lands. In the states in which we live and work, the majority of residents strongly support land conservation. However, many also oppose the acquisition of additional federal acreage. The current inventory of federally-owned lands in some western states already requires substantial private and state dollars to address invasive species, habitat management and recreation expectations. However, we recognize that this is not the case in other parts of the country.

Fully fund the Land and Water Conservation Fund (LWCF) and expand the program to allow LWCF dollars to be utilized by qualified conservation organizations. Presently, the Land and Water Conservation Fund provides money to federal and state agencies to acquire land and recreation facilities. The criteria should be expanded to include competitive grants awarded to land trusts for conservation easements. These awards could be in the form of matching grants that would enable land trusts to leverage private and non-federal funds to protect critical wetland, riparian, agricultural, forest and recreational resources.

Eliminate the requirement for the cash match for Farm and Ranchland Protection (FRPP) and Grassland Reserve Program (GRP) dollars. The current requirement of the 25% cash match is an unnecessary limiting factor. Many landowners are willing to donate a greater percentage of the conservation easement value. In many western states, there are simply not enough state or municipal dollars to meet demand.

Allow funds from LWCF, FRPP and GRP to be utilized by land trusts to cover transaction costs for donated easements. Transaction costs are also an unnecessary limiting factor. Landowners considering a full donation or partial donation via a bargain sale of a conservation easement often do not have the cash to pay for the cost of an attorney, certified appraisal, geologist and/or other professional assessments. Similarly, land trusts struggle to meet the cost of their own counsel and operational costs.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Make the now-expired, federal conservation easement donation tax incentive permanent. This landmark legislation has resulted in more than 525,000 new acres placed under conservation easement, especially on working family farms and ranches throughout the west and across the country. By providing cost-effective tax benefits for modest-income landowners, including family ranchers and farmers, to donate a conservation easement, family lands can stay intact, in the family and in agricultural production and continue to provide priceless ecosystem services.

Most development before 1950 focused around centers, surrounded by expansive rural and natural landscapes. Forming a combined ecosystem, cities and smaller centers concentrated diversity and innovation in commerce and culture, while large areas of farms, woods, and wetlands generated a wide diversity of natural species. This interconnected pattern of central places and surrounding greenspaces, evolved over centuries and embedded in nature, has now segmented into suburban forms that mandate driving for every major movement. Commercial strips line most highways and residential sprawl spreads far into the countryside, fragmenting both communities and nature. Auto-dependency also fuels a basic contradiction: low-density sprawl creates high levels of traffic congestion.. Limited land, unlimited traffic aggravation, and escalating local taxes to service all those scattered subdivisions make the continued strip-and-sprawl conversion of outlying areas unsustainable. Global energy and climate concerns make policy changes even more urgent. A Greenway-inspired Centers and Greenspaces approach that re-centers most new development into walkable, mixed-use forms can protect our natural and agricultural heritage, end wasteful land, energy, and pollution practices, and provide a wider range of transportation choices, from walking, biking, and cars to transit alternatives

Small acreage farms have always been deeply woven into the fabric of America. While rural communities have retained much of this classic culture, urban communities, having largely fallen victim to the pressures of urban and suburban sprawl and the resulting spike in land values, have generally lost significant ground-both literally, in numbers of actual working farms, and figuratively, in waning community and municipal support for agricultural enterprise. Rockland County is a prime example of this. As recently as 1920, Rockland County was home to over 900 working farms. Today, there are 10. In fact, The American Farmland Trust reports that the Hudson River Valley ranks within the top ten regions of the country in danger of losing all of its agriculture. There is no retreating from the economic realities that drove our farms from the community. For agricultural enterprise to survive and thrive it must embrace a new paradigm, based on a reciprocal relationship whereby the farm supports community and the community, in turn, supports the farm.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In recent years, the concept of growing food for local consumption has become iconic to a healthy lifestyle, especially in light of the endemic obesity, diabetes and other chronic disease rates that have swept the nation as a result of poor dietary options and a lack of consumer education. It is against this background that the Rockland Farm Alliance (RFA) was formed in 2007. What began as a modest group of concerned citizens in Rockland County, with the help of the local Soil & Water Conservation District (SWCD) and USDA's Resource Conservation & Development (RC&D) office, has grown into an impressive coalition, poised to create much needed change. The goal of the organization is to create local food production into our suburban community in a portable model that can be adapted to and successfully deployed anywhere.

According to US government sources, 81 % of the US population now lives in either cities or suburbs. There are many programs available to support rural agricultural development and under HUD, there are a few that are designed to address struggling urban populations, but there are no programs available to support agricultural development and food production in America's suburbs. For communities to truly reconnect to a local food source, it is critical that that food source be accessible. This means we must bring the farms to the suburbs and the small urban centers. The overall goal of the Rockland Farm Alliance is to develop replicable models for increasing local food production for these communities that house the majority of the population, through the creation of community agricultural models. We have already begun this process in suburban New York City, in Rockland County, New York, where we have created a nonpartisan community lead and government supported effort to reverse the exodus of local food production from our county.

Like any agricultural enterprise, launching the Cropsey Community Farm will entail significant initial capital investment. The Board of Directors have calculated that the start up costs for this project will be under \$100,000. We have instituted a membership drive, which we anticipate will raise \$25,000. We have also aggressively pursued grant funds for both the agricultural and educational initiatives planned for the Cropsey Farm. We anticipate that this two pronged fundraising campaign will cover the capital costs of creating the working farm. Future revenues to support the farm's long term overhead and maintenance will be generated by the CSA program and educational programs, which are targeted to both the local schools and general community.

Funding for planning, development and management is the major challenge to implementation of this plan. Many programs exist to assist with and support infrastructure development, but of course, reaching this stage successfully depends in large part on the unifying guidance, support and management of a skilled project manager. It is essential that funding be sourced to support this critical position early in the process, unfortunately, there is a dearth of programs available to assist with such costs, particularly at the local level.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Yet as the 21st century takes shape, there have been dramatic changes in forest land ownership that had been relatively stable for decades. Millions of acres of forest land once owned by paper companies as the resource base to feed their Maine mills have been sold to a new generation of forest land investors. This has been a wake-up call that there are no assurances that the valued resources, traditions, and economic enterprises that define Maine's forests will be there in the future.

In today's world, with landowners under increasing pressure to realize returns from their investments, one cannot necessarily expect forest owners to sustain these practices.

For much of the state's history, the forest landscape of the Maine Woods was predominantly owned by vertically integrated paper companies; they owned vast acreage of woodlands and used these lands to supply their mills. However, over the past two decades land ownership patterns in the Maine Woods have undergone dramatic changes. Many point to the sudden liquidation of the holdings of the Diamond International Corporation in 1988 as the beginning of a profound transformation. Following his hostile takeover of Diamond International, billionaire financier Sir James Goldsmith, seeing unrealized value in forest lands, elected to sell off the company's lands separate from its production facilities. This action initiated a new trend in forest ownership that, driven by global economic pressures and rising land prices, has continued to this day. By the 1990s the shift had begun in earnest. Familiar names such as Great Northern, S.D. Warren, Champion, and later International Paper, Boise Cascade and Georgia-Pacific sold their land and then their mills, ending historic connections that had endured for nearly a century.

When these companies elected to sell their lands, a new generation of non-industrial owners took their place. Many of these lands were acquired by timber investment management organizations (TIMOs) and real estate investment trusts (REITs) that brought investment capital from pension funds, wealthy individuals, endowments and other sources to invest in timberlands, often as a strategy to diversify the portfolio of these investors. Large timber contractors, looking for lands to harvest also have been a significant buyer of industrial timberlands as have some conservation groups such as The Nature Conservancy and The Appalachian Mountain Club

In 1988, industrial owners owned 7.7 million acres of timberland in Maine, while large non-industrial owners held 3.1 million acres. By 2004, however, these proportions were nearly reversed, with 3.2 million acres held by industrial interests and 6.5 million by non-industrial owners. More than half the industrial acreage was held by a single company, Canadian-based Irving, one of the few major timber producers still holding to the integrated model.

In addition to managing for returns from timber production, which relies upon vibrant timber markets, the new timber owners must consider other means of generating returns from the timberland where they exist.

Today, there is no clear consensus among forest interests as to what this shift in ownership will mean for the future of Maine's forest resources and traditional uses such as timber production, wildlife habitat and public recreation.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Some conservation interests will point to second home developments that subdivide productive forest land and develop pristine lakeshores and maintain that the integrity of the Maine Woods will be lost if action is not taken soon.

Some timber interests and motorized recreation groups have voiced concerns that some large tracts of land are being acquired by preservation-oriented owners who are less interested in timber harvesting than previous owners and more restrictive regarding motorized recreational access

The fundamental challenge is to find ways to provide these assurances in a manner that is both acceptable and attractive to today's forest landowners and the public.

Today, a forest landowner interested in pursuing the sale of land or a conservation easement funded by the Forest Legacy Program faces the reality that there is a queue of worthy projects in Maine already awaiting funding and that they may have to wait several years or more to have their project funded.

Landowner interest in selling land for conservation or working forest conservation easements is outstripping available funding creating situations where conservation opportunities will be lost due to a lack of resources.

The time to act is now. It would be imprudent to wait-once landscape integrity is lost it is prohibitively expensive to restore. We need to heed lessons learned the hard way elsewhere where massive amounts of money are being spent attempting to restore a broken ecosystem.

The Keeping Maine's Forests Steering Committee is composed of very diverse forest interests. Included in these ranks are environmental, conservation, hunting and fishing, recreational, and tribal governments, major forest landowners and representatives from Maine's forest products industry. A number of these interests had clashed repeatedly over forest issues in years past. Similarly, Northern and Eastern Maine communities have often been skeptical of land conservation proposals hatched from afar, fearing that such initiatives could threaten the local economy and traditional way of life.

Secretary Salazar and DOI have offered an ambitious and far-sighted agenda for protecting the country's most treasured landscapes stating that "The great outdoors that fuels the American spirit and the American economy is fast disappearing under the pressures of population growth, habitat fragmentation and climate change. Over the last 60 years, as our nation's population has doubled, millions of acres of open land have disappeared to development. We are losing - and losing touch with - the places where we fish and swim, woods where we hunt and hike, and wild lands where we find solitude. This new conservation legacy will protect the places that fuel our nation's spirit and contribute to the health of its people and local economies."

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The past dozen years have seen unprecedented levels of conservation investment in the Maine Woods increasing conservation ownership (both fee and conservation easement) from less than 8% of the Maine Woods in 1998 to around 23% today. The purpose of this proposal is to maintain this momentum by embarking upon a new initiative that offers a comprehensive array of conservation options and stewardship tools for forest landowners who wish to take advantage of them.

Overview: The Western Mountain and Lakes landscape totals over one million acres, encompasses both the Mahoosuc and Rangeley Lakes/High Peaks Regions, links the Northern Appalachians as they pass from New Hampshire to Maine, and serves as a bridge between the White Mountain National Forest to the south and the Maine Woods. This region comprises the southwestern boundary of the Maine Woods closest to population and tourism centers making it the demonstration landscape that is most vulnerable to development pressures that could fragment the forest. Loss of lands from the timber base and severing recreation corridors, such as snowmobile trails, would undermine the area's local economy which relies primarily upon forest products and tourism.

It is important to note that not all landowners in the demonstration landscapes have expressed interest in taking advantage of potential conservation or stewardship options. Some would prefer to not participate in any government programs and others have indicated that they need additional details before determining their level of interest.

Healthy Forest Reserve HFRP, a relatively new program, has been used in Maine for Canada lynx management but not easements.

The requirement that HFRP easements be held by federal government and an easement template that includes holder approval of all harvests and strictly limits motorized recreation makes the easement option, as currently proposed, unattractive to many Maine timberland owners. However, the management side of HFRP (listed in the stewardship table) has been successful in Maine.

Land & Water Conservation Fund Keeping Maine's Forests would benefit if federal-side LWCF could be used to acquire conservation easements to buffer national wildlife refuges and other federal lands. Increasing LWCF funding for stateside programs would also benefit Maine's ability to utilize funds for other projects.

Working with willing landowners, Keeping Maine's Forests seeks to create new opportunities for forest landowners to benefit from enhanced stewardship of their lands that provide an important suite of public benefits including maintenance or improvement of wildlife habitat that benefits a broad array of forest species, storage of carbon, protection of water quality, and assurance of public recreational access (generally referred to today as ecosystem services). Today, landowner stewardship programs are fragmented and in many cases unavailable or of limited value to large landowners in the Maine Woods.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The federal agency that currently has the greatest responsibility for forest stewardship, the Natural Resources Conservation Service (NRCS), has eligibility requirements for many of their programs that exclude large forest landowners or income limits that limit their appeal, even though their lands encompass important habitat, valued waterways, and popular recreation areas that would greatly benefit from stewardship incentives. Programs that have substantial potential to benefit the Maine Woods (e.g. Healthy Forest Reserve Program) have received minimal funding at the national level.

Environmental Quality Improvement Program Landowner participation in EQIP in the Maine Woods has been limited, with the exception of tribal and land trust ownerships, because most large forest landowners do not meet the adjusted gross income eligibility requirement and landowner payment limits are too low to be attractive to large ownerships.

Conservation Stewardship Program Landowner participation in CSP in the Maine Woods has been limited, because most large forest landowners do not meet the adjusted gross income eligibility requirement and landowner payment limits are too low to be attractive to large ownerships.

Wildlife Habitat Incentive Program WHIP has been an important contributor to Atlantic salmon restoration efforts through the involvement of non-profit organizations and also greatly benefits wildlife management on tribal lands. However, the annual \$50,000 cap on payments greatly limits the ability of organizations to initiate major habitat conservation efforts. Landowner involvement is limited by the adjusted gross income requirements.

Partners for Fish & Wildlife To date, Maine projects, due to limited funding, have focused primarily on restoration of degraded environments and projects on tribal lands.

Traditionally, stewardship incentive programs have been focused on specific activities that provide a particular benefit or are limited to small areas. Increasingly, applied scientific research has been looking at stewardship benefits in a more holistic and integrated manner. For example, wildlife biologists are finding that in certain forest ecosystems, management for certain "umbrella species", such as Canada lynx and pine marten benefits a tremendously broad spectrum of wildlife species from neotropical warblers to moose and provides an array of other ecosystem services as well. Likewise, managing cold water habitats for species like brook trout may offer the same benefit to a broad range of aquatic species. As we wrestle with new challenges such as adaptation of forests and wildlife to climate change, it is time to rethink the design and administration of forest stewardship programs in the Maine Woods.

Along with compensating landowners for the expense of providing important ecological benefits from their forest lands, Keeping Maine's Forests also seeks to address the costs incurred by landowners who allow the public to recreate on their lands. In most other states, large forest landowners profit from the recreational use of their lands. In Maine, landowners typically bear the cost of recreational use. This issue needs to be addressed.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

If the important tradition of public recreational access to Maine's forest lands is to continue, new mechanisms will be needed to reward landowners who make their lands available for public recreation. Ideally, Maine could develop the inaugural effort of the Voluntary Public Access & Habitat Incentive Program authorized in the most recent Farm Bill or utilize funding from an already established NRCS program.

Ensuring a secure and productive future for the Maine Woods is a daunting challenge. In asking USDA and DOI to make a major commitment of resources to Keeping Maine's Forest, Maine realizes that it must make a commensurate pledge to the effort, both monetarily (discussed in a separate section below) and in other equally important ways including the following:

Keeping Maine's Forests began two years ago with the idea that diverse forest interests, many of whom have been on the opposite side of issues in the past, could find common ground on the goal of keeping forests as forest. That idea was put to a test when Secretary Salazar visited Maine in June 2009 and sat down with a delegation to learn about the Maine Woods. He challenged those present to bring forward a proposal to DOI that had buy-in from conservation interests, recreation groups, forest landowners and the forest products industry. That challenge helped to transform Keeping Maine's Forests from an exercise without a clear path to implementation to a hard-nosed discussion about specific forest initiatives.

Every year, Maine's Forest Legacy Committee needs to make difficult choices among high quality forest conservation proposals put forward by Maine landowners and their conservation partners. Landowner interest in selling conservation easements (and in some cases fee interest in high value ecological and recreational lands) has consistently outstripped available funding for such projects.

Maintaining the environmental and economic integrity of the Maine Woods (of which approximately 2.8 million acres have already been protected along with approximately 200,000 acres of tribal Trust lands) represents a major funding challenge in the best of times to say nothing of today's current environment of scarce resources.

Consider that: The cost of restoring the Everglades, an ecosystem of comparable size to the Maine Woods, is now estimated at \$10.9 billion (approximately \$1000/acre);

In 2008, Congress spent \$250 million (50% of total cost) to protect 310,000 acres of forest land in Montana (at a cost of over \$1,600/acre for fee purchase of lands);

The Steering Committee has identified a variety of challenges and issues that require its future attention that can help to refine and improve Keeping Maine's Forests and strengthen the partnership and resolve of its participants.

These include: Evaluating how the different elements of the Keeping Maine's Forests initiative (fee acquisition, conservation easement acquisition, and stewardship programs) may impact wood supply over the long-term (positive or negative) as compared to anticipated wood supply in the absence of such programs and strategies that can be used to increase wood supply;

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Evaluating how the different elements of the Keeping Maine's Forests initiative achieve: Biodiversity, protection of significant wildlife habitat, and preservation of unique ecological areas including exemplary natural communities and late successional forests; and

Availability of diverse high quality outdoor recreation opportunities (including motorized and backcountry recreation); and

Sustainability of forest management practices.

Reviewing existing working forest conservation easement standards and assessing: How to provide the best "bang for the buck" for conservation easement investments (e.g. where to target conservation easement acquisitions and what rights to purchase, including simple no-development easements);

How to ensure that working forest conservation easement requirements do not impede the flow of timber off well managed, conserved properties;

Identify those easement standards that have been most problematic for landowners and determine whether the public's interests can be adequately protected through alternative approaches that better align with landowners' needs; and

How to provide conservation easement standards that are not cost prohibitive for the easement holder to administer or for compliance by the landowner.

Encouraging local and regional planning efforts that identify appropriate and strategic areas necessary for future economic development or that are the highest priority for conservation so that conservation acquisitions can be sited and designed to protect valued resources without precluding important future economic development opportunities;

Exploring how the objectives and strategies of Keeping Maine's Forests can be applied to the forest landscape in southern Maine;

Determining how best to establish an economic and legal framework for stewardship programs that pay for habitat management and other ecological services that benefit society; and

Monitoring development pressures and trends to help ensure that Keeping Maine's Forests efforts are designed and focused in a cost-effective manner.

The challenges facing the Maine Woods are greater than ever before, ranging from global competition in the woods industry to climate change to the ever-increasing pressure to develop our country's last remaining open spaces. Without concerted actions to maintain the Maine Woods and ensure the wise stewardship of all its resources, these and other forces will inevitably diminish the integrity and viability of this forest landscape over time.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There is a multi-year backlog of quality Legacy projects in Maine awaiting funding. Maine has nationally significant project opportunities due to its high proportion of private forest ownership. Current caps on Legacy funding (\$10 million/state and \$7 million/project) limit the use of Legacy in Maine. An exemption from these caps for high priority conservation areas such as the Maine Woods would allow additional high quality projects to be funded.

I am one of the few Democrats remaining in Georgia. I have two adult children and have been working as a Professional School Counselor at the Middle School level for more than 20 years. Additionally I am the Environmental Committee Advisor. I promote environmental consciousness. In fact under my leadership our school has recycled [the first in Georgia] over 1 000 000 (yes ONE MILLION) pounds of paper. I hope that my students my family my friends my neighbors will live in a country where the environment is cherished and preserved. No matter what wars we find ourselves fighting no matter what turns our economy takes our lives cannot continue if we do not preserve the Earth. It seems that the American public only reacts to the mighty dollar. When gas prices were very high in recent years and lines at the stations were long people began to use less fuel to economize. It is sad that our the people of our nation only responds to what is good for our Earth if it benefits them without additional expense or inconvenience. I am happy that you put a moratorium on Gulf drilling- that oil should stay put- it is there for a reason and that reason is not for us to mess with. I hope you continue to support preserving and protecting our habitats our land and all of the Earth's inhabitants. If I may perhaps one day you would go on National television and say something like this: "Being President of the United States is a great honor and a great privilege. One that I take with pride and humility and with responsibility. There are only four living citizens who know what responsibility this position holds. I want to assure you that when a decision is made from the Oval Office much advice has been listened to and research has been done. I would not serve me my family or my country well if I were to make a decision that I did not think was the best choice to make. As I have said in the past I always welcome your input. But please realize that in taking that input I must also consider the input of others and what is best for the United States not only at this time but in decades to come. Thank you for listening Mr. President.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I grew up playing outside in the yard and the woods behind our house. What I thought at the time was a normal experience I've realized now was actually somewhat of novelty. Now as an adult I've come to realize how much an oddity playing outdoors and having access to the wilderness is for today's children. The disconnect between the two is distinct. That really concerns me as our nation moves forwards. The creativity developed the wonderful experiences had by being in the outdoors is something I relish and hope future generations of children can relish as well. As I think about this a linked question that's been asked many times before arises "How do we protect instead of relinquish the lands that we as a nation cherish in the face of potential capitalistic gains?" It is a very difficult question to answer but a question that I ask of you as our nation always should to answer it with a long-term mindset. What will we lose with the decision made and how will affect it our nation long-term and the heritage that defines us? Our country is blessed with incredible treasures in our national parks but just the same in our state and city parks right down the street. In the constant rush that all of us experience these places allow us to slow down and truly enjoy the land around us if for a moment. Not only is it our duty as a country to protect these special places from our short-term immediate wants but it's just as important to develop the programs that allow all of us - from the inner-city child to the suburban one - to truly have the opportunities to reconnect with the lands that surround them in a way they've never experienced. If it opens their eyes even close to the ways it's opened mine the blessings on so many of their futures will be abundant.

Dear Sir As an American citizen born in the UK I have observed many differences and similarities between the two nations. When I was young I became a member of Friends of the Earth and was enabled to travel to other countries to work on archaeological digs etc. Having lived most of my life in Florida near the university town of Gainesville it impressed me to see many students play volleyball football and other games outdoors. Now that I'm back in the UK looking after my elderly parents my mother passed away last year I see less people motivated to go outside. It seems they throw garbage everywhere as did many people in the U.S. and there is little thought for the wildlife. I personally took care of a baby wren whose leg was caught in a piece of plastic garden string because he was unable to fly out of the nest like its siblings. How cruel we are to make do with things that are harmful to future generations such as over use of oil and nuclear power instead of alternative technology plastic bags instead recycling our own over production of new gadgets and more and more noise producing machines such as boom boxes and turbo engines in public automobiles food that has been sprayed with long term life threatening chemicals etc etc. Since my arrival in the Alachua area in 1990 I've seen the Itchetutnee springs for example turn from a pristine spring fed river to one that is dying from over fertilization of farmlands. The nitrogen input is at dangerous levels increasing the algae and suffocating the fish and snails in the Florida University breeding area. Is there a way to provide a system of permanent mandatory funding for the Land and Water Conservation Fund? Surely there could be more education in schools to promote knowledge about our back yards and beyond.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Whenever I tour our great country the places which I choose to visit first are the units of the national park system. These parks provide me with substantial open spaces unmarred by damaging land uses such as grazing mining or logging activities. In order to improve the park system I urge the following improvements: The parks system should be protected and preserved according to the findings produced by the National Parks Second Century Commission respected individuals who developed a vision for how to protect the parks and connect Americans to them in the next century. The Land and Water Conservation Fund has been in existence for over 40 years yet funding is always well below the 900 million authorized. The fund must be fully funded. This program should be fully funded in order to support and protect our parks seashores forests and waterways across the country. As our population continues to increase we need more parks for people to enjoy. There are still segments of our country and history which are not yet represented within the park system. Please evaluate and consider new sites to bring into the system that better represent our changing country and protect remaining natural areas before they are lost to development. National parks often protect only portions of critical watersheds and wildlife corridors. We must provide for complete corridors in order to ensure that the wildlife in our parks can find the food it needs and breed successfully outside as well as within park boundaries. Therefore there must be cooperation between other federal and state agencies as well as private landowners since wildlife does not understand the concept of ownership boundaries or property lines. From an economic perspective national parks are generators of local jobs. According to the recent study by the National Parks Conservation Association for every dollar of federal money invested in national parks there is a four dollar return in economic value to the public. This means that jobs are created where there are national park units. Even in 2009 a recession year visitation to the national parks increased by nearly 4 percent. Parks generate local revenue even in tough economic times. The national parks are very popular. Americans and foreign visitors travel great distances to visit them and spend substantial dollars to do so. They must be protected with adequate funding and proper protections so they are not "loved to death"

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

My family and I are cosigners of this petition to improve and support the National Park system because we believe strongly in the protection and also "enjoyment" of our national parks. As a child my first exposure to them in the 60's made lasting impressions on me as to nature the beauty of this country and protection of our precious unspoiled regions. The majesty of our National Park system is a true shining bright spot in our country and an advantage that Americans created for themselves that led the way to a worldwide movement to imitate us. Our national forests protected lands and especially the uniquely American concept of vast protect "public" land set aside just because it exists and was worthy of protection and able to add a joy to our lives that nothing else could do should not be allowed to wither. We have deplored that under the previous administration the National Park funding has been ripped apart. Parks suffer from closed facilities lack of maintenance rising fees etc. all to fund wars overseas that you were unfortunate enough to inherit and are literally starving our country's economy to the breaking point. My wife and I made decisions years ago when we married to make certain things in our own lives sacred and non-negotiable. To us the National Parks are one of those aspects of being "American" that should be funded "first" above majority of what we do otherwise which of course changes as time goes on. The parks though stay the same as they are timeless and will surely outlast our own species. We truly appreciate all you are doing to turn the tide in our country toward the future and more enlightened lives. We also appreciate how you have managed to handle the wars that you inherited from your predecessors. However there are some things that should be truly transcend other politics and even foreign policy and that is quality of life here at home. I'd be hard pressed to think of a more deserving recipient of our taxpayer dollars than our public parks forest and lands. The light in a person's eyes viewing the Grand Canyon Lower Falls on the Yellowstone River Zion National Park and any of our other great parks cannot be easily duplicated. Please as you go about the business of leading this country back to the task of fulfilling it's long held promise consider the huge role our National Parks play in what it means to be an American and to be human above all.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am writing to give my support to the National Park System one of the few federal bureaucracies that provides an efficient and necessary service to the American public. Although my wife and I are senior citizens and haven't attended a National Park in a few years I can remember many vacations of camping picnicing sight seeing and day use excursions with our children in the National as well as the state parks. The park system is a wholesome relatively inexpensive way for everyone to enjoy the wonders and beauty of the United States. While I want to see the National Park System kept up to date for all Americans I do not want our taxpayers to have to incur further debt to do so. Instead I would recommend that either existing stimulus funds (already earmarked for federal departments) or cuts in other areas be utilized. As a taxpayer (one of the only 50% of our citizens who pay taxes) I believe that our tax burden is already too high and will become unreasonably high when we undergo a huge income tax increase on Jan 1 2011 and the taxes you said didn't exist in the healthcare bill that hardly anyone read before passing it and the proposed cap & trade tax you want to push onto unwilling taxpayers and the myriad of other taxes that will go into effect during the next two years of your reign. President Obama the majority of Americans are not with you on the tax borrow spend and print money program you are on. If your goal is as is most progressives to enlarge government and to control as much of our lives as you can supposedly to our benefit then we are not behind you. We want a president not a dictator and we want a president who will stand up for America and who

Due to the fiscal crisis being felt nationwide funding for our national parks and park staffing has suffered. Though not an outdoorsman myself I appreciate nature and its right to co-exist with man. I believe that priority should be given to preserve open spaces not merely national parks.

Disconnection from the natural world is a prime reason there is such despair in our environment. Funding Organizations such as the National Parks and promoting environmental awareness in school from K-12 is a goal worth attaining. Children need to be introduced to the great outdoors at very young age to create a connection and respect for the world that sustains them. I believe the national parks are one of many great ways to do this.

When I think of America's Great Outdoors I think of the great expanses of open land upon which native americans lived which pioneer families settled which riverboats navigated; all now reduced to token national and historic parks. This is an unfortunate thing but nothing we can do anything about except to preserve what little of this heritage remains. Forget connecting Americans to these places. They are Amerca. Keep corporate enterprise out especially the British (once and for all) except as necessary to maintain the integrity of the locations. Give the casino mongers fast food dealers and trash entrepreneurs a one way ticket to China. Thank you for your attention to the real America.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am very fortunate to live near the Point Reyes National Park and it is my church. I have always found the outdoors to be a soothing magical place where whatever is weighing on me comes back in a more manageable perspective after I've been hiking or out somewhere in nature- open spaces open us up. Our national parks remind us all of what is truly important and beautiful and it keeps us small and wondering and in awe. Many of our parks exist solely because someone loved a tree or a stream and wanted it protected from private enterprise and development. Ken Burns' documentary on our national parks said it all so perfectly and clearly portrayed them as our greatest treasure and as a creation that makes us a truly great country. And yet our parks are still threatened daily- our only designated wilderness area here within the Point Reyes National Park is currently facing serious threats from private enterprise which could begin the slow encroachment of our parks throughout the country. I am turning sixty this year and so was fortunate to grow up when kids could bump around in the outdoors and explore the wonders of their local creek and forest. These are critical components of a child's education and our current generation has been denied these experiences unless they are lucky to have parents who have the time and money to make it happen. I believe we need to make these experiences available to all kids. I am also old enough to remember when the schools had money to include outdoor education weeks in their curriculum and as a teacher I see the yearning and excitement the kids have for any experience out in nature. Somehow as a country we have learned to value a sole quest for money and have lost the spiritual balance that an experience out in nature can provide. You can't love the environment unless you've been given the opportunity to be out in it. The parks feed our soul and also protect habitat for wildlife while many species are slowly disappearing from our planet. I support your initiative- and perhaps more government jobs within our parks could be created thereby helping the parks and helping with unemployment. Your initiative will support national parks and bring them the national attention they deserve and the continued protection they need. Thank you for all you have been attempting to do and for considering my comments.

I think Obama should take our Youth through A slaughter house and explain to them why our wild horses Are being took from their land where they was born free and now are being Instilled with fear and pain and butchered and their meat is being sold and where the money is going that is made off them going Now that's A field trip and A truth our Youth needs to know about horse slaughter is America"s Disgrace.

In recent years a reduction of trails, trail heads and the closure of federal lands to horses and pack animals has been a growing concern for recreational riders around the country. There is a clear feeling among recreational riders that access to trails historically open to equestrians is being lost and a bias against equestrians by land managers is more prevalent. However, there is a lack of specific information regarding access issues on federal land including detailed examples, data on the scope of the problem, causes for this trend, etc.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It should be noted that this is not a scientific survey. Individuals are self reporting based on their experiences and on their personal assessments. Reports have not been confirmed by the AHC. As previously noted, the primary objective of the effort is to collect examples of access issues on federal land. The AHC to date has received 36 such reports. What follows is a basic overview of these reports.

- Loss of access due to a maintenance issue (maintenance related)
- Trails or areas where equestrian access has been restricted or a trail closed (restricted access)
- A trail or area has become unusable due to user conflict (user conflict)
- Several reports fall into an “other” category where the issue is not entirely clear or the respondent would like some improvement even if access has not been restricted or a trail closed.

There are several reports concerning maintenance issues on federal land that have effectively close areas to equestrians or limited the number of trails open to equestrians. This issue affects the recreational riding community as well as all recreational user groups. This issue seems to be particularly prevalent on lands managed by the National Forest Service.

Respondents also reported significant numbers of trails that they had previously had access to closed to equestrians in recent years. Many did not know the reasoning behind these closures. Some reported new management plans that resulted in the loss of trails, and some reported rumors of bias against horses by local land managers or complaints by other user groups for the closures. It is difficult to make absolute assertions at this time.

It is clear that some equestrians are losing access to trails, and that this loss of access is not attributable to any one cause. It will be the continuing goal of the AHC to determine the extent equestrians have lost access to trails, the reasons behind these losses and develop strategies to combat the loss of access.

In 1994, one in five visitors to Fredericksburg Battlefield also visited the battlefield at Chancellorsville (both battlefields are part of Fredericksburg and Spotsylvania National Military Park, VA). In 2009, only one in fifty made the drive. Increasing traffic and commercial development along the connecting highway have made the eight-mile trip less attractive to visitors.

Lowell is home to the second-largest Southeast Asian population in the U.S., many of them Cambodians who sought refuge here from the Pol Pot regime in the 1980s. Although the park protects historic buildings and runs museums scattered throughout the old part of the city, many Cambodian families are not aware of it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Yet, as the National Parks Second Century Commission found, our country is barely scratching the surface of our national parks' tremendous potential. Using the substantial contributions that parks already make as a springboard to achieving its aims, the America's Great Outdoors initiative (AGO) can foster a legacy that connects all Americans with the rich heritage that national parks represent.

At San Antonio Missions National Historic Park, budget shortfalls have the park running with about a third of needed staff. The park covers 835 acres in five separate sites—one of which has never been open to regular operations because of lack of funds.

- Eleven interpreters staff four full-time contact stations serving nearly 1.8 million visitors in 2009;
- Three law enforcement officers patrol the park, which is located in a downtown urban area. Forced to focus on high-visitation areas, in a recent two week period, the patrols were unable to stop an armed robbery, break-ins, vandalism, and the theft of \$20,000 in government property; and
- The park's historian position remains vacant. There is no staff historic preservation expert, and no museum or curatorial staff to care for nearly a million Spanish colonial artifacts.

The National Park Service depends on operational funding in order to serve the public and surrounding communities, while also protecting our parks for future generations. Unlike other federal agencies, funding for the parks goes almost entirely to fundamental personnel needs, including rangers, interpreters, educators, and scientists. These are the people on whom achieving many goals of the America's Great Outdoors initiative depends.

Parks are hamstrung by funding shortfalls that have hit interpretive and educational programs particularly hard. In fact, the portion of park operations funding devoted to visitor services actually declined by \$40 million from 2001 to 2010, despite recent steps toward eliminating the large, ongoing shortfall in the National Park Service operating budget.

National parks are able to meet only a fraction of the demand for youth and adult programming, often with severely outdated materials, exhibits, and technologies. Staff is stretched thin, unable to commit as much time to the community engagement, innovations, and partnerships as will be needed to widely realize AGO's goals.

Inadequate funding of key programs such as the Land and Water Conservation Fund and Historic Preservation Fund makes it difficult to protect core areas and resources. The National Park Service has been unable to acquire key private lands within or adjacent to parks from willing sellers—an undertaking the LWCF is designed to support. This creates challenges for protecting park resources and limits public access to areas that should be part of our National Park System. Shortfalls in the Historic Preservation Fund pose similar challenges to preserving America's historic resources and the cultural education and tourism that they underpin.

The Park Service has a long-standing commitment to partnerships that benefit communities, historic sites, and recreational opportunities outside park boundaries. But inadequate funding impairs the ability of the Park Service to support community initiatives.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Rivers, Trails and Conservation Assistance program has enormous leveraging potential in helping communities expand access to healthy recreation by preserving open space and building more trails, yet it receives barebones funding. The National Underground Railroad Network to Freedom helps protect and connect local historical sites, museums, and interpretive programs associated with the Underground Railroad. It, too, is underfunded.

Another successful partnership program, the Centennial Challenge was begun in 2007 to foster projects and programs that protect parks, enhance visitor services, and foster hands-on learning. In 2008 and 2009, \$24.6 million dollars in federal funds were matched by \$32 million from partner organizations in 35 states and the District of Columbia. While the Centennial Challenge was successful in aligning resources to advance some local and park priorities, it suffered from a few key problems, including short fundraising timelines that made it difficult for smaller partners to participate.

During youth listening sessions across the country, Administration officials heard from young people eager for outdoor learning to be part of their school experience. Participants also underscored the need to provide experiential education opportunities relevant to students' daily lives, empower kids to translate what they learn into actions they can take in their homes and neighborhoods, and use new technologies to connect to the younger generation. The National Parks Second Century Commission identified this need as well. It pointed out that parks need to embrace technology to facilitate park-based learning anywhere, at any time, and to take advantage of social media and new media initiatives to augment park-based programming. Barriers include security policies for government-supported websites, legal concerns with service agreements, and challenges integrating the Park Service's traditional strength in place based education with tools such as the Internet and social media.

Many national parks are leaders in learning to speak the language of youth and different cultures and connecting them with outdoor opportunities. But national parks are able to meet only a fraction of the demand for youth and adult programming, often with severely outdated materials, exhibits, and technologies.

In 2009, the NPS Intermountain Region received 320 applications for the TRT program, but was able to hire only 74 teachers. Additional funding and more onsite housing would enable this program to expand.

America is changing, and our National Park System needs help keeping up. Today's racial and ethnic "minority" groups will collectively become the nation's majority before 2050. Native, Asian-American, and African-American populations are expected to grow in both number and percentage of the total population. Leading the way will be the Hispanic population, projected to triple in size and jump from 15% to 30% of the nation's population by 2050. And many of today's immigrant groups wish to maintain their cultural values and identity even as they become loyal U.S. citizens.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

At the same time, shifting age demographics put new demands on parks. An aging Baby Boom is expanding the ranks of the “over 65” crowd—still active but perhaps more inclined to safer, more convenient recreation. And America’s youth are already presenting a more ethnically diverse, technologically savvy face, challenging parks and the National Park System to connect to them in relevant ways.

At the same time as a diversifying population presents new opportunities for expanding both the park system and the cultural stories it represents, the footprint of development continues to march across the landscape, presenting its own imperatives to the park system. The National Parks Second Century Commission noted that the development of over a million acres of farms, forests, and wild spaces each year places a premium on quick action to protect nationally significant places.

The 21st Century Conservation Corps engages young people from all backgrounds as resources to provide service ranging from urban tree planting to wildland firefighting while gaining valuable job skills on public lands. Engaging young people in paid service on public lands is a pivotal strategy to address pressing national issues including:

- disengagement of young people from the great American outdoors;
- lack of diversity in both public lands employees and users;
- youth obesity;
- record high unemployment among youth and young adults;
- millions of dollars of backlogged maintenance on public lands; and
- need for future federal public lands employees.

The impacts of climate change on our planet and our lands are happening right now. Even if we cut global warming emissions 80 percent by 2050, the natural world is threatened today and the impacts are projected to become more severe in the decades ahead.

In an era of climate change, not only must we be thinking about managing our lands differently, we must think about protecting lands differently. The old model of drawing lines on a map and protecting an area is not sufficient for a warming world. Certain species of plants and wildlife have begun migrating further north and higher in elevation, numbers of caribou, moose, and bighorn sheep are dwindling in some areas, and fish kills resulting from rising water temperatures are becoming more common. It is the job of land, water and wildlife management agencies to anticipate and react to these changes and determine which areas will become vital habitat in the future. The agencies must then actively work to secure protections for these habitats to give fish and wildlife all the help they can adapting to a changing world.

We need to aggressively implement climate smart management solutions on our public lands.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Climate change is and will continue to impact the natural resources of the United States. Sea level rise threatens to swamp the Everglades. Scientists predict that there will soon be no more glaciers in Glacier National Park. The coastal plain of the Arctic Refuge, one of the most remote places in the country, is eroding into the sea.

To safeguard America's Great Outdoors resource planning processes and resource management plans themselves should include the conduct of resource vulnerability assessments and identify specific management actions that conserve the best remaining fish, wildlife and native plant populations, increase population size and habitat in isolated populations, reduce outside habitat stressors, conserve and reconnect core and other crucial habitats and restore migratory life histories.

Highly disruptive activities such as logging, mining and drilling multiply the stresses on wild lands and wildlife already struggling for survival due to climate change. An integral part of climate-smart management is to limit or eliminate non-climate stressors. A good example to build on is the decision earlier this year to ban off shore oil and gas drilling in Alaska's Bristol Bay, a pristine ecosystem and fishing ground. We hope that the America's Great Outdoors initiative will prompt action to deal with these stressors with climate change in mind.

Between them, the U.S. Forest Service and Bureau of Land Management oversee close to 195 million acres of forested lands. Around 49 million acres of these lands are carbon rich forests that are more than 100 years old but lack permanent legislative or executive branch protection (many of these forests enjoy administrative protection under the Roadless Rule which governs the national forests. But this rule is under legal challenge and has been undermined by the previous Administration, demonstrating its lack of permanence).

Recent years have seen numerous large tracts of formerly industrial forestland purchased by investment organizations and real estate developers with economic objectives inconsistent with managing these lands for wildlife benefits and outdoor recreation. More than 5 million acres of forest have already been converted to development<sup>9</sup>. While the loss of these valuable habitats has slowed, we continue to lose over 80,000 acres each year. Some areas have seen extensive losses, such as the Prairie Pothole Region, the nation's "duck factory," where 66 per cent of the original wetlands have been drained or filled.

Despite the expanse of these working lands and potential utility for conservation, only slightly more than 36 million acres are enrolled in federal conservation programs such as the Wetlands Reserve Program, Wildlife Habitat Incentives Program or Conservation Reserve Program. The level of funding for and engagement in working land conservation programs is not commensurate with the value of these lands for fish and wildlife habitat, flood control, carbon sequestration and outdoor recreation. Adding to the challenge is the presence of disincentives to conservation on working lands within otherwise well meaning and effective federal conservation programs.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Over the last few decades, childhood has moved indoors. This phenomenon has had consequences for the health and wellbeing of our children and the future of the conservation movement. On average, children and teenagers are spending more than seven hours each day "plugged in" to electronic media and just minutes engaged in outdoor activities.<sup>11</sup> One in three American kids is overweight or obese, with a higher prevalence in African American, Latino and Native American communities.<sup>12</sup> More than half of all children in the United States have insufficient levels of Vitamin D (the Sunshine Drug).<sup>13</sup> Rates of ADHD are on the rise and stress, anxiety and depression rates among youth are increasing.<sup>14</sup> Studies suggest that spending time outdoors in green spaces can improve the mental and physical health of children and youth.

At the same time, today's children and youth are inheriting a warming world. The responsibility to ensure that the next generation is given the tools it needs to address climate change and other environmental challenges lies in our hands. Emerging research suggests that children who spend time in natural settings grow up to develop positive attitudes towards the environment.<sup>16</sup> The 21st Century Conservation Agenda must grow and sustain a constituency for conservation for the long haul. The America's Great Outdoors initiative should set children and youth on a course that is both good for their own health and for the future of conservation in America by reconnecting them with meaningful experiences in the great outdoors.

Through the America's Great Outdoors listening sessions, young people across the country have had an incredible opportunity to inform the dialogue about reconnecting youth to the natural world. Sierra Club programs have helped engage young people in the public listening sessions where they have shared some of the reasons children, youth and families are not spending much time exploring and enjoying the great outdoors.<sup>17</sup> Barriers include inadequate infrastructure, including insufficient access to safe and nearby parks and open spaces, lack of interest, fear among parents and youth alike, and alternatives luring kids indoors.

Solutions lie at all levels of government, across agencies and in the private and non-profit sectors. Coordination at the federal level is critical to address the societal trend that has moved an entire generation indoors. The America's Great Outdoors initiative is an important step towards developing a greater understanding of the problem and identifying cross-agency solutions to tackle the widespread cultural shift taking place today which has been best described in best-selling author Richard Louv's "Last Child in the Woods" as Nature Deficit Disorder (NDD).

More than 85 per cent of the region's forest lands are privately owned, with a rapidly increasing threat of fragmentation and development. The sheer size of the current forested landscape provides a unique opportunity to practice conservation in way that enhances the resiliency of key habitats across the region to lessen the impacts of climate change. In order for a comprehensive forest conservation program to succeed, it must encompass the broad mosaic of private, state, federal and tribal lands and waters. It will also require partnerships between federal, state and tribal agencies and private interests to acquire key habitat areas, obtain conservation easements and promote land stewardship incentives.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Alaskan Arctic's rolling tundra and wild rivers, wetlands, ponds, deep lakes and sparkling coastal waters are home to a stunning array of wildlife. Every year nearly 200 species of birds migrate to the region's tundra and wetlands to breed. Caribou, muskoxen, wolverines, grizzly, and polar bears roam the vast expanse of land while walrus, bowhead and beluga whales ply the Arctic waters. Now, throughout their Arctic home, rapid climate change is altering their fragile habitat and the push to drill for oil is mounting. While global warming is causing average temperatures to rise around the world, the effects are being felt most dramatically in the Arctic, where temperatures are climbing at roughly twice the global pace.

With so much of Alaska's wilderness already feeling the heat of global warming impacts it is irresponsible to create additional sources of global warming pollution from oil development in the Arctic Ocean to coal mining in the foothills of the Brooks Range Mountains in these wild places. To understand what's at stake, one need only look as far as the Prudhoe Bay oil fieldstone of the world's largest industrial complexes. Hundreds of spills involving tens of thousands of gallons of crude oil and other petroleum products occur annually. Decades-old diesel spill sites still show little vegetation regrowth. Gravel fill, excavation, and waste disposal alone have destroyed 17,000 acres of wildlife and marine habitat.

The Greater Yellowstone Ecosystem is an iconic set of two national parks and six national forests that anchor roughly 20 million acres in the Rocky Mountains. Unfortunately, this area is under attack from the effects of global warming. Snowpack in these areas is being reduced dramatically, white bark pine beetle infestation is running rampant and threatening a prime food source for grizzly bears, and , increased threats of expanding oil, gas and coal mining developments are just a few examples of the pressures on this prized destination area. The effect of climate change on the greater Yellowstone region is widely recognized by both agencies and NGOs as a driving factor for future lands management. There is a great opportunity for DOI to help shape the direction of new policies both from a land protection and resource extraction/energy development perspective. The National Park Service has already directed both National Parks to develop Climate Change plans. Now through AGO Initiative, this visionary work can be enhanced through public awareness.

The Olympic Peninsula, Puget Sound, and North Cascades iconic ecosystems in the Pacific Northwest that are critical to the survival of wildlife, local economies, and communities are under attack from the effects of global warming.<sup>19</sup> Billions of gallons of fresh water are melting into the sea as glaciers in the North Cascades, Olympics, and Mt. Rainier continue to retreat. Meanwhile, snowpack in these areas is being reduced dramatically. As glaciers disappear, important salmon and trout streams warm dangerously and sea levels rise. Tourism and sport, tribal and commercial fisheries, and the health of threatened species like orca, which uses Puget Sound as an important part of its life-cycle, depend on healthy ecosystems. Local communities on the east slope of the Cascade Mountains are experiencing more frequent and intense fires, trees of all types are dying at double the normal rate in Pacific Northwest forests, and disease and pest infestations are getting worse as droughts intensify.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Current threats are not gloom-and-doom prescriptions they are signs that the traditional protections we have in place are not sufficient in the face of climate change. Some continued climate change is inevitable, but we have a small window of opportunity<sup>21</sup> to avoid the worst projected scenarios by doing two things: 1) reduce global warming emissions (80 percent by 2050) to slow and stop global warming and 2) reduce the vulnerability of species, lands, and communities to climate change already in motion. The following vision is our view of how to increase habitat resilience on the Olympics Peninsula, Puget Sound, and the North Cascades.

**SITUATION:** Outdoor recreation is proven to be good for America and the American people. Regrettably, across America, access to our public lands and waters, and ultimately opportunities to explore and enjoy these special places is disappearing with startling speed. Needed most are sustainable revenue streams and a mechanism to distribute funding properly<sup>1</sup>. If revenue streams to help support conservation and sustainable outdoor recreation in balance with healthy flora and fauna are not established, outdoor recreation is in jeopardy of being lost or greatly diluted as an American way of life.

**SOLUTION:** A united consortium of industry and non-profit partners establish a national, apolitical mechanism, Great Outdoors America™, to collect funding from the private sector –through voluntary surcharges, per unit fees or annual endowments – and distribute in the form of grants based on needs.

**PURPOSE:** To establish a nonprofit foundation to pool and distribute private sector funding to assist America's public agencies in providing a full-range of year-round recreational opportunities, both economically and environmentally sustainable, with minimum risk of conflict through legislation and litigation and maximum probability for collaboration among diverse stakeholders.

It seems to me that The Great American Outdoor Initiative has a lot of people that are trying to put forth their own agenda and it really has nothing to do with getting people in to the great outdoors. It seems its more about keeping groups out and closing areas that the environmentalists deem to be endangered without having any input from the public.

A cattle rancher that has leased property from the BLM will be in danger of loosing his lease if he stands in the way of some environmentalist whim to create a monument or some Indian Tribe that says all this area is Holy Ground.

A lot of the people that I know make weekend trips into family camping trips with fishing, hunting, riding horses etc. These types of family trips will not be possible if the Government continues to close off our Public Lands in the interest of special interest groups.

The OHV industry supplies many, many jobs and contributes billions of dollars to the economy of these United States as shown by studies done in Utah, Arizona, and West Virginia back East. The state of New Mexico has proposed a study to be done here , however I don't know the current status of that study.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I feel that this initiative is little more than a ploy, perpetrated by the environmentalists and certain government officials with deep and long relationships. To close off lands that are recreational and just by coincidence contain large deposits of , gas, oil, coal and uranium. To me this is unthinkable, to do this, at this time in the history of our country. When we are struggling to put people back to work, to meet the demands of our economy and now to deal with cap and trade legislation, a health care bill that adds millions to our national debt. That, in and of itself, is another tax on the people, without their permission and against their will.

America has a long and successful conservation tradition and Americans still believe strongly in conservation of our natural and recreational resources. Today, however, our country's remarkable conservation legacy hangs in the balance. A new wave of threats could well undo what has been accomplished.

The cumulative impact of these trends, if we do not respond to them, will be an accelerated fragmentation of the American landscape—the separation of plants and animals from their essential habitats, of watersheds from downstream estuaries, of people from experiences in the outdoors, and of Americans from our common historic and natural heritage.

It is difficult to imagine our children, the extended family of this great nation, ever being anything but eternally grateful for our acting now to create a durable America's Great Outdoors Initiative to provide the means for the American people to work together to save the land, the rivers and streams, the ocean coasts, and great marshes that they will need for their health and happiness in the years long after we are all gone

Because of all of our years working in the American countryside, the Conservancy believes in the wisdom of the American people to guide the conservation and management of this country's natural resources.

North America and the United States are blessed with a diversity and abundance of natural resources, natural systems and habitats that have been central to our growth and prosperity as a nation and a foundation for our way of life. Despite urbanization and the increasing use of technology, our health, welfare, economy, culture and identity still depend heavily on the quality and productivity of our land, water, oceans and coasts. While we rely on nature for our well being, no place in our country is immune from at least some human impacts. We depend on nature, and it now depends upon us for its survival.

A still growing population and sprawling residential and commercial development are consuming more than 3.5 million acres of rural land each year, including ranches, farms and timberlands.

Farmers, ranchers and forest land owners are finding it increasingly difficult to retain their lands in natural resource use in the face of increasing taxes, development pressures, competing land uses and changing markets.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Climate change is affecting the productivity of rural lands and the viability of wildlife habitat; it is altering traditional wildfire regimes, hastening the spread of forest pests and diseases, producing more erratic weather patterns—more floods, droughts, and major storms, and will affect our coastlines with rising sea levels.

Demands on water resources are exceeding the supply placing particular pressure on rural water users; we have drastically altered the flows of rivers and streams through dam operation and water withdrawal.

Conventional and alternative energy development and power transmission lines are expected to affect vast areas of land.

Excessive nutrients particularly from agricultural runoff and other non-point sources of pollution are damaging rivers, lakes and coastal waters.

Intensive use and development is stressing coastal areas, near-shore waters and estuaries.

Invasive aquatic species and other pests and pathogens are becoming particularly damaging to our freshwater and forest resources.

People, particularly young urban and suburban residents, are losing their connection to the land and to experiences in nature.

The Conservancy's science confirms the value of an ecosystem-based approach to meeting the many challenges America's great outdoors face over the next 50 years.

It is our view that the only effective response to the combination of threats facing America's land and water today is to use multiple tools and techniques to conserve whole watersheds and natural areas that can then provide habitat for the range of native species, productive areas for the use of natural resources and the full range of benefits to human communities.

Providing the American people, working as individuals and through their governments, associations and institutions with the means to achieve these goals and attain this vision is a great challenge especially given the very real financial problems now faced by governments at every level. But we cannot turn away from the threats to the health of our land and water.

Landscape Partnership Projects: Large landscapes that have become focal points for conservation through strong private-public partnerships. Projects could launch within the first year, with substantial and measurable progress made toward achieving sustainable conservation goals in 25 such projects within 5-10 years.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Large Watershed Projects: Expansive aquatic systems that are already a national focus and in some phase of restoration Including: the Great Lakes, Mississippi River, Chesapeake Bay, Puget Sound, Gulf of Mexico/Louisiana Wetlands, the Greater Everglades, California Bay Delta, and the Colorado River Basin. Projects could launch within the first year, with substantial and measurable progress made in achieving sustainable conservation goals in all of the named projects within 5-10 years.

Metropolitan Greenspace Projects: Metropolitan/urban greenspace corridors that may also include cultural and historical features. Projects could launch within the first year, with substantial and measurable progress made in achieving sustainable conservation goals in 10 such projects within 5-10 years.

Build on the successes of the past and the use of existing government authorities wherever possible

Minimize new cycles of planning where plans already exist

Increase flexibility of funding and program delivery by removing bureaucratic obstacles to on-the-ground action

Great Lakes, Chesapeake Bay, Puget Sound, Mississippi River, Gulf of Mexico/Louisiana Wetlands, California Bay Delta, Greater Everglades, Colorado River. These specific places are often talked about in the context of the America's Great Outdoors Initiative. All of them, however, already have some level of multi-agency Federal and state involvement. Some, like the Chesapeake Bay and the Everglades, have been underway for many years, but they have proceeded slowly with considerable difficulty and with varying levels of funding. Others, like the Gulf of Mexico, have never been funded comprehensively and require accelerated investment and cooperative action. Large amounts of money, invested in targeted and strategic ways, over a long time period are required to accomplish restoration of these areas and in most cases there is also a significant regulatory component required to reduce water pollution and prevent further habitat degradation.

The challenge of climate change only underscores that imperative. Landscape Conservation Cooperatives (LCCs), focused in part on climate change, can facilitate this cross-jurisdictional engagement, operate within a broader climate context, can be utilized to evaluate AGO project selection and design, and can inform the ongoing management of project areas.

Our country faces many challenges and a good deal of uncertainty as we prepare to enter the second decade of the 21st Century. Americans are struggling, as well, to find the common ground required to solve those problems. For more than 100 years, however, most American's have agreed on the importance of conserving our country's legacy of rich and productive land, water, and coastlines. While we have made substantial progress in protecting America's environment and conserving our natural and agricultural lands, there are, today, many threats to that progress.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In a time of soaring federal deficits, this renewed commitment to conservation will require increased funding. But much can be done by more effectively targeting existing resources and by making conservation and restoration spending more reliable, predictable and responsive to on-the-ground needs.

“It is time for us now as a nation to exercise the same reasonable foresight in dealing with our great national resources that would be shown by any prudent man in conserving and wisely using the property which contains the assurance of well-being for himself and his children.”

In the Middle Tennessee area, our trails are quite limited. The trails that we have are heavily used. Metro Nashville Parks Department has one mountain bike trail. We also have one short beginner trail at a state park east of Nashville. 24 miles of trail was built by club volunteers at Montgomery Bell State Park, 30 miles west of Nashville. As a demonstration of the popularity of the sport, that mountain bike trail has routinely recorded more than 10,000 visits per year. Most of those users are driving more than 30 miles from Nashville to use this trail.

A major issue has just come to a head in the Cherokee National Forest in the vicinity of the proposed Corridor K highway route in southeast Tennessee. Both the northern and the southern routes of this proposed highway will destroy existing important and heavily used mountain biking trails. While it initially appears (to me) that the northern route will do less damage to our trails, we request that agencies involved agree to replace these lost trails with new mountain bike trails in the same vicinity, and to provide new connectors to trails that are cut off by the construction. This situation is made more complex by the recently proposed Tennessee Wilderness Act of 2010, in that this Act seeks to expand the Big Frog Wilderness. If a southern route is chosen and trails are eliminated from the Tanasi Trail System the Act may make it difficult or impossible to construct replacement and connector trails in the same area.

Other important points regarding the mountain bike trails in this area:

The Tanasi Trail System is an important recreational trail, having received Epic status by IMBA in 2004.

The Tanasi trail is responsible for a positive economic impact in the region, as it plays host to a number of outdoor events. Specifically, the Black Bear Rampage mountain bike race, the SERC Race #6 mountain bike race, and the Cohutta 100 race, routinely attract 200+ attendees and their families annually to each event.

The economic impact to the region would be adversely affected if the above events would lose a venue where they could continue to host these events. The economic benefit to the region not only positively affects the event promoters, but restaurants, campgrounds, hotels, gas stations, and other retail establishments.

SORBA Chattanooga has completed untold hours of trail maintenance on both the Tanasi Trails and the Chilhowee Trails. For of these efforts SORBA Chattanooga received a Certificate of Appreciation from the U.S. Department of Agriculture. Prior to that time SORBA received a letter of appreciation from the Ranger noting that chapter's and IMBA's efforts in rehabilitating the Thunder Rock Express trail in 2004.

***(cont.)***

I have been reading about the renewed push for Wilderness Designation for more and more wild areas in our country. I have enjoyed the wild areas of especially Tennessee and North Carolina most of my life. What troubles me greatly is that, under present rules, wilderness designation does not allow mountain bike usage or mountain bike trails in these areas. Designation of wilderness in Montana last year eliminated mountain bike use on hundreds of miles of trails. I think this is a major policy mistake. Because of this policy, there are hundreds of thousands of mountain bikers who find themselves at cross purposes to proposed designation of wilderness. As a lover of nature and wilderness, I hate being put in this position. Mountain bikers are a user group that should be allowed in areas protected by Wilderness status. Mountain biking is a quiet sport, in keeping with wilderness experiences. Many studies have shown that mountain biking on properly constructed trails has less impact on these trails than even foot traffic. I would ask that the federal agencies involved please reconsider this flawed policy.

I read an article in the newspaper recently that reported that Tennessee ranked last of all states for adults that are considered physically active. That report noted that the number of Tennesseans who met the definition of "physically active" ranked 13 percent less than the national average. The promotion of mountain biking and trails can help change that statistic. I find that mountain biking gives me an engaging sport that I always look forward to, and as a secondary benefit, provides my much needed exercise. The fact that I am enjoying this exercise in America's Great Outdoors, makes the sport that much more attractive.

As most people are aware, New England has experienced massive forest change over the past three centuries. To look at this landscape today, it is almost impossible to imagine that clearing for agriculture once reduced forest cover to a fraction of its current extent. The remarkable return of the region's forests through the mid-1900s and the tremendous opportunity that provided is a story many know well. What is less apparent is the quiet but equally significant second wave of forest change we are experiencing today. In the Wildlands and Woodlands report, we highlight the fact that forest cover is now declining in all six New England States (Foster et al. 2010). Parcelization associated with shifting ownership patterns<sup>1</sup> and sprawling development throughout the region is driving this hard deforestation, which will be much more difficult to reverse than the historic soft deforestation that preceded it. Moreover, with just 10% of the New England landscape held as public land, opportunities for public use are limited and forest management activities are subject to variable market forces.

The Central Virginia Battlefields Trust (CVBT) applauds the Obama Administration's initiative to promote land conservation. As a successful Civil War battlefield preservation land trust operating in the Fredericksburg area of Virginia, we can not emphasize enough how important battlefield preservation is to this initiative. Statistics show that an average of thirty acres of Civil War battlefields are lost daily to development. Now is the time for the Federal government to aggressively support the preservation of these endangered sites.

All Americans own our federal, public lands equally. But federal land agencies, and Congress make decisions about use, trade and disposal of American land, without considering the views of most Americans. In fact, agencies use procedures designed to prevent public input!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Americans who happen to live near public land, and who want to enrich themselves from that land, are given extra influence in agency decisions. They believe that these American lands belong only to them, not to all Americans. Federal land agencies encourage this wrong thinking.

Occasionally, Administration officials have openly colluded with local interests to repeal wilderness studies, and instead open that land to extractive industry.

Agencies, influenced by local extractive industry and elected officials, arrange and stack hearings to get the opinions they want. The voices of other Americans are not heard.

Western Senators push through Congress laws that order that public land be handed over to local government and exploiters in their state.

Most Americans are excluded from planning. The USFS and BLM cooperate with local "Collaborative Groups" or "Resource Advisory Committees," who are asked to give expert advice on land use planning. These groups are stacked with members of the exploitive industries and local politicians, who support them. For example: The famous "Quincy Library Group" in California was formed to advise and change plans of the local USFS managers. It had 38 members: logging company owners and staff 16 members; local county commissioners and staff 10; other groups 8; and.....environmentalists; The federally mandated (USDA Reg 1042-142, 2007) Resource Advisory Committees (RAC) for Montana are required to have these members: from local businesses, labor and officials 8; miscellaneous groups (e.g., tribes, historians, wild horse devotees, etc.) 5; ... environmentalists 2 members. What do we expect the RAC to recommend?; In 2008, Utah BLM officials met secretly with local county commissioners to get their "wants" prior to release of the DEIS's for five BLM land Resource Management Plans. Environmental groups were not allowed to participate, nor learn what the BLM and commissioners had discussed; Even within one state there is unfair representation. The Monticello, Utah BLM RAC has 12 members, six from the Salt Lake City counties (total population 1,710,000), and six from local SE Utah counties (total population 58,000). The people in the local counties have 25 times the per capita representation as do citizens in northern Utah!

Less often there are ethically-challenged, collusive lawsuits aimed at exploiting oil/mining in American land. • In 1996 the lawsuit, Utah vs. Babbitt, was filed to stop the Utah BLM from evaluating federal lands for possible wilderness designation. After years of contention, in 2003, Interior Secretary Gale Norton representing the United States, suddenly conceded defeat, even though her case was strong, and an appeal was underway! This collusive settlement was shortly followed by opening of these land parcels to drilling. I note that President Obama's Interior Department has discussed issuing orders to protect these lands as Wilderness Study Areas, but there has been no action.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

“Hearings” by federal agencies don’t hear most Americans. Almost all hearings are set in local towns, the state capital, and sometimes, Washington DC. But hearings on western land decisions rarely if ever occur in Miami, Los Angeles, Chicago, and other cities where most Americans live. • Hearings are stacked with shills for the extractive industries, such as local city officials, Congressmen, and labor groups, who are allowed to speak first, when the media are there. The American public is often shut out of the hearings, being allowed only to submit written comments.. In 2009 the Superior National Forest (Minnesota) held a hearing in Minneapolis on the DEIS for toxic, Sulfide Mineral mining next to the Boundary Waters Canoe Area Wilderness. Only pro-mining people were heard. The public was not allowed to address the hearing panel and media!

Members of Congress feel free to give away or damage federal land, if it lies in their state. Near Las Vegas, a huge federal land conveyance was pushed through Congress. Currently, Senator Tester of Montana has introduced S1470 to order the Beaverhead and Deer Lodge National Forests to create logging cuts that must be not less than a specified minimum per year. This bill would totally override the existing Forest Plans!

Why are Americans living near our federal lands given the privilege of deciding how these lands are used, while other Americans have no say? How can American public land be protected from these destructive influences? Can we ever have a fair process for deciding uses of OUR land?

The TGC appreciates the opportunity to present comments to this Initiative to enhance land conservation and reconnect the public with the great outdoors. More specifically, these comments address the needs of urban populations that have the equal and potentially conflicting needs for both conservation and public use within their urban environments

In 1959, William H. Whyte coined the term greenway in his monograph “Securing Open Space for Urban America” for the Urban Land Institute. Over the past five decades the term has been used and misused for everything from freeways, to abandoned rail-to-trail corridors, to landscape scale ecological networks. These comments are intended to advance the need for greater attention to creation of urban greenways systems that accommodate the dual purposes of conservation for ecosystem function, as well as for appropriate public use.

Raleigh’s population has just been projected to have exceeded 400 thousand. Its metropolitan statistical area including Durham, Cary, Chapel Hill, and numerous smaller communities is well in excess of one million population. As the northeastern anchor of the Piedmont Atlantic Mega-Region, the most rapidly growing of the eight mega-regions identified across the country, the future is clear and challenging. Given its thirty-five year head start with greenway implementation, Raleigh currently has 3,660 acres within its greenway system and 63 miles of greenway trails. Its system is already interconnected with adjoining communities, and about to be interconnected with adjoining counties into a Triangle-region network. While this is advantageous, it is not the norm across the country. The PAGO Initiative is an opportunity to create a support structure for conservation and public use that can lead to a nationwide network of interconnected greenway systems.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Limiting or even prohibiting continued development within floodplains would have beneficial water quality and ecological effects, but it would also reduce the ever increasing vulnerability of life and property to river flooding hazards. Flattening this curve will have long-term positive economic effects at the local, state, and national levels. Nevertheless a great deal of past development, encouraged by Corps engineering projects and FEMA subsidized insurance, remains vulnerable to recurring flood cycles. Some local governments utilize post-disaster funding to acquire and remove damaged structures from flood prone areas. More local governments would consider and undertake such activities, if there were a more robust national program with sufficient funding for matching grants to incentivize pre-disaster acquisition and removal of structures. After-the-fact enthusiasm should be projected for this programmatic approach, and significant funding over many years will be required to correct the failure of past policies. Such program should have significant dedicated and continuous revenue from multiple sources, and the reclaimed lands should be conserved and managed in perpetuity for their environmental/ecological system values and appropriate public use. Perhaps part of the program budget could come from a major assessment (fixed amount or percentage) added to each annual subsidized flood insurance policy premium, as well as a nominal assessment added to all other homeowners and corporate building insurance policies to take advantage of scale.

Green Infrastructure is a current “hot topic”. The foundation of the term is its relationship to systems function. The City of Raleigh addressed this in their recently updated Comprehensive Plan, by including greenways in its definition of linear public infrastructure along with roads, sewers, and potable water systems. This reinforces the holistic characteristics of these systems and the negative impacts of their fragmentation. Further, some engineered systems, such as stormwater, sometimes forget to include their natural components that can benefit from and function best where conserved. Unfortunately, attention is most often given to techniques, such as green roofs, rain gardens, bioswales, permeable pavement, etc, rather than a better understanding system function. S3561 & HR 4202: Green Infrastructure for Clean Water Act has the potential to address the weakness. If it is ratified the EPA will be charged with its management. Hopefully its research, guidance, grants, etc will identify and advance the greenways concept, as well as conservation and appropriate public use of riparian corridors in the urban systems context.

eastern state and local governments are likely to carry a greater burden for the provision of comparable parks and recreation opportunities for their citizens,

landscape ecology based conservation networks may strive for maximum function in the west, while struggling for optimum/minimum function in the east,

Thus, great caution should be exercised in the recommendation of one-size-fits-all strategies and programs for nationwide implementation of the PAGO Initiative. The greenways concept can embrace both ends of this spectrum [such as Yellowstone To Yukon in the west and Raleigh’s plan in the east] but PAGO recommendations must be context appropriate.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The HUD, DOT and EPA Partnership for Sustainable Communities is a breath of fresh air. Yet, the CDC is a conspicuous mission agency. It is the agency with the most robust research program on the impact of development patterns on quality of life issues, but without direct programs responsibility for development pattern creation. Thus, the CDC can play the role of a neutral expert/arbitrator among the other partners. Again, the greenways concept aligns well with many HUD, DOT, and EPA programs, and will hopefully be encouraged as a development pattern and systems solution through those programs.

North Carolina and Virginia have jointly pursued preparation of a draft EIS for their portions of the proposed High Speed Rail system, and are working through the NEPA process. An interesting element of the proposed project is a trail for non-motorized use between Raleigh and Richmond adjoining the realigned rail corridor. At its proposed terminus in Raleigh the trail will interconnect with the Capital Area Greenway system and the rapidly evolving Mountain-to-Sea Trail. This initiative is on the scale of interstate highway projects, but there is no comparable program structure to support implementation. Existing funding opportunities available to these state agencies and their federal program partners will be severely challenged to complete this project within any reasonable timeframe. Perhaps some of the following existing and proposed funding sources could be enhanced to assist in this process.

Urban and urbanizing areas are perhaps the most difficult place to pursue conservation, open space, and public use initiatives. They are the areas with the greatest total population and density, they are the most disrupted by development, with the highest fair market value on remaining lands, and the least available grant funding opportunities. In this difficult context, greenways offer a system scale conservation and land use pattern that provides multiple positive public functions. The Urban Park and Recreation Recovery Act provided some funding from 1978-2002, but has been unappropriated since. Currently, HR 3734 The Urban Revitalization and Livable Communities Act is proposed as an updated replacement. It better recognizes and responds to the complex multiple issues and needs of viable urban areas, and deserves widespread support. The proposed appropriation is greatly needed to fill part of the void in grant funds availability to address close to home conservations and public use where the vast majority of people live.

The North American Wetland Conservation program is a valuable resource for addressing international scale conservation. Yet, the North American areas subject to the greatest growth pressures may be losing their conservation resource base faster than protection can occur. More could be done to promote conservation friendly development patterns and invest in more urban conservation systems. While these may not be the most pristine large landscapes, they can be reasonably viable and functional smaller habitats that can prove to be important parts of a conservation landscape scale mosaic over time. To pursue this vision, enhanced levels of funding and reordered priorities will probably be necessary.

## Discussion Question 2

***(cont.)***

Support public Investments in family forest conservation and restoration. Private forests across the United States generate many public benefits – clean air and water, wildlife habitat and recreation opportunities. Many times family forest owners lack the technical and financial support to keep their forests as forests to maintain these public benefits.

The initiative presented by the Department of Interior is an honorable one. Urbanization, and all its ramifications, is a big concern to everyone, not just government bureaucrats. Without a BALANCED FEDERAL BUDGET, all honorable initiatives are meaningless. Redundant regulations, policies, rules, and resources need to be eliminated (in the best interest of the taxpayers within the next 6-months).

With each square foot of battlefield land that is developed, whole chapters of America's history are being ripped out of the book of national memory and an irreplaceable piece of our heritage is lost forever. Today, rapid growth and development threatens what remains of our Civil War heritage. Most of these battlefields are in close proximity to cities because cities were strategic objectives for both contestants during the Civil War. According to a 1993 study (updated in 1997) commissioned by the U.S. Congress, the Civil War Sites Advisory Commission Report, fully 20 percent of the hallowed ground of the Civil War has already been destroyed forever--covered by roads, housing developments and other inappropriate development. Battlefields such as Chantilly and Salem Church in Virginia are just two examples of battlegrounds all but destroyed. The Civil War Preservation Trust (CWPT) states that due to current rates of development and rapidly increasing land prices, the nation loses approximately one acre of hallowed ground every hour and estimates that the fate of the remaining unprotected ground will be determined within the next five to fifteen years, depending on its location.

There were literally thousands of armed conflicts all over the country during the Civil War and many Americans know very little about them or care if these sites are preserved.

In 1994 Gov. Arne Carlson introduced Minnesotans to the eminently sensible concept of sustainability. Since then, however, neither governors nor legislators have demonstrated the vision or the courage to develop the truly innovative, long-range policies and programs needed to protect and preserve one of the critical targets of the overall sustainability idea: the state's water resources -- its lakes, rivers, streams and wetlands. The current legislative session was no exception. Promises, yes, but little in the way of delivery.

My particular interest happens to be lakes. For more than 80 years I have fished and boated Minnesota lakes from the southern border to the northern lakes region. Those experiences and the testimony of other observers have convinced me that, to a greater or lesser extent, almost all lakes are suffering from a variety of "ailments": property development that is either inappropriate or excessive, septic and other waste contamination, air-borne and non-point source pollution, overly heavy fishing and boating pressure, wind and water erosion, agricultural runoff, industrial and municipal discharges, invasions of exotic species, habitat destruction, careless shore land management practices, and more.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Each alone is a clear threat to long-term resource health. Combine them and they spell looming disaster: serious and continued damage to the jewels in Minnesota's crown -- the thousands of lakes that annually draw hordes of visitors to the state, entice natives to vacation at home (and, increasingly, to make it their retirement choice), thereby providing a mega-boost to the state's economy. All of that bounty will fade as surely as the lake country is allowed to slide into decline.

Can anything be done? Yes. And, thanks to initiatives by individuals, lake associations and other local groups, and to the leadership and support provided by Minnesota Waters, whose goal is to preserve and enhance Minnesota's water resources, a few hundred lakes are benefitting from protection programs. But on far too many nothing of that sort is happening, virtually guaranteeing existing problems will only worsen.

All lakes age over time. The immediate challenge is to slow that process, reduce the effect of man's footprint, and even, where possible, reverse negative trends. Because no two lakes are alike, what works for one may need modifying for another. But certain basics are applicable to any lake. It's important to understand, though, that positive results don't happen overnight. Adopters should be prepared for a long-term campaign whose aim is steady, measurable progress.

It is difficult to find words to express the level of my disappointment with President Obama's performance in the environmental area -- particularly with regard to wildlife -- to the present date. The disappointment began with President Obama's appointment of Ken Salazar of Colorado as Secretary of the Interior, succeeding Dirk Kempthorne of Idaho, who succeeded Gale Norton of Colorado, a protégé of an earlier infamous Secretary, James Watt of Colorado. Secretary Salazar's ranching background in the West virtually assured that the days ahead would be difficult for wildlife, and that certainly has proved to be the case.

In March 2007 the U.S. Fish & Wildlife Service ("FWS"), an agency of the Interior Department, removed ESA protection for grizzly bears in the GYA. At the time of delisting there were only about 500 bears in the GYA, an increase of only about 200 during over 30 years of ESA protection. There were only about 1,200 of the bears in the western United States; almost all of the bears not in the GYA were in the Glacier National Park area in Montana.[1] Three lawsuits are pending against Interior and FWS to invalidate FWS's delisting of the bears. Two, including one in which I am the plaintiff, are pending in a federal district court in Idaho.[2] The third was filed in a federal district court in Montana, and in September 2009 the Montana court issued a decision in which it invalidated the delisting and restored the bears' pre-delisting protections under the ESA.[3] President Obama's Interior Department, rather than accept the decision of the Montana court, has appealed that decision to the U.S. Court of Appeals for the Ninth Circuit in San Francisco.[4] In other words, the Interior Department continues in litigation to preserve the Bush Administration's removal of protection under the ESA for the relatively few grizzly bears that remain in the GYA

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Many good and dedicated people worked incredibly hard to reintroduce wolves in Idaho, Montana and Wyoming after they had been eradicated by human-caused mortalities, but the slaughter resumed in Idaho and Montana due to the Obama Administration's removal of the wolves ESA protection in April 2009. A federal district court in Montana (the same court that issued the decision for the grizzly bears) issued a decision on August 5, 2010, restoring the wolves' ESA protection. The Obama Administration, through the Interior Department, instead of accepting the Montana court's decision, has stated that it is considering whether to appeal that decision to the U.S. Court of Appeals for the Ninth Circuit. In light of the Obama Administration's appeal of the same Montana court's decision with regard to grizzly bears to that court, as previously mentioned, it appears likely that the decision will be to pursue an appeal in the wolves case

In May 2009 FWS issued a News Release stating that a special rule issued in December 2008 for protecting polar bears under the ESA would be retained and that FWS would closely monitor implementation of the rule to determine if additional measures are required to conserve and recover the polar bear and its habitat. Polar bears are listed as threatened, not endangered, under the current rule. The rule also states that incidental take of polar bears resulting from activities outside the bears' range, such as emission of greenhouse gases, are not prohibited under the ESA. The rule has been properly criticized by many persons on the ground that it does not sufficiently protect polar bears.

President Obama signed a law in May 2009,[1] originally introduced during the Bush Administration, with the backing of the National Rifle Association, that allows loaded, concealed weapons to be carried in our national parks if permitted by state law (as is the case for three states within the GYA). That law surely will lead, among other adverse consequences, to the deaths, through poaching and otherwise, of wildlife in our national parks. We already know of the shooting death of a grizzly bear in Denali National Park in Alaska in May 2010 as a result of this new carry law.

These and other examples show why those of us who care very much about the environment and who were euphoric about the Obama Administration's replacement of the Bush Administration have been let down by President Obama. Today we feel that President Obama's campaign slogan, at least in the environmental area, should have been "no, we won't" instead of "yes, we can." President Obama's Interior and Agriculture Departments appear from the standpoint of wildlife to be carbon copies of those departments under President Bush.

The most important land and water issues facing North America —including land use patterns, water management, biodiversity protection, and climate adaptation—require new approaches. While most of these challenges need to be addressed at several scales simultaneously, ranging from the local to the global, it is increasingly imperative to address them at the scale of large landscapes. The territory of these issues often transcends the legal and geographic reach of existing jurisdictions and institutions. Since no single entity has the power or authority to address these types of crossboundary issues, there is a gap in governance and a corresponding need to create informal and formal ways to work more effectively across boundaries.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

With the increasing movement toward large landscape conservation, several barriers still must be addressed for this approach to land and water conservation to endure. Barriers include the lack of both scientific information and knowledge about the structure and function of large landscape conservation initiatives; the lack of capacity to organize, achieve, and advocate for large landscape conservation goals; the lack of a strategy to facilitate coordination among fragmented efforts and to foster innovative experiments; the lack of policy tools to implement large landscape conservation; and fragmented financial investments.

Growing numbers of conservationists, policy makers, and practitioners agree that the most important land and water issues facing North America require new approaches. Some of these challenges involve protecting ecosystem integrity and connectivity; restoring and protecting water resources; providing access for recreational opportunities; sustaining the working farms, ranches, and forests that are critical to local economies and cultures, and provide important wildlife habitat; protecting and interpreting cultural resources as part of our national heritage; enhancing economic viability and resilience in rural and urban communities; and adapting to climate change.

While most of these conservation challenges need to be addressed at several geographic scales simultaneously, ranging from the local to the global, it is increasingly imperative to address them at the scale of large landscapes because their territories transcend the legal and geographic reach of existing jurisdictions and institutions. Since no single entity has the power or authority to address these types of cross-boundary concerns alone, there is often a gap in governance and a corresponding need to create informal and formal ways to work more effectively across boundaries

The case for the large landscape conservation approach is readily apparent by examining a map of emerging megaregions in the United States. All of these regions, no matter how large the metropolitan footprint, include and rely on resources the cities cannot live without—water, food, energy, wood products, open space, wildlife corridors, and recreational opportunities—sometimes referred to as ecosystem services.

Other considerations such as drought and wildfire create a growing need to develop a capacity to address land use at a more appropriate scale (Stewart, Radeloff, and Hammer 2006). At least in the western United States, much of the rapid growth in recent decades has taken place at what is called the wildland-urban interface. Most of the wildlands fall under the jurisdiction of state or federal land management agencies, while adjacent land development is usually subject to the authority of local governments. Wildfires that start on public land often threaten nearby private homes, whose owners expect to be protected from the advancing flames. Land management agencies, their budgets already stressed, have to make judgment calls about which fires to suppress and which ones to leave burning. In the long run only a shared, cooperative approach to development decisions, operating at the landscape scale and involving local, state, and national entities, can provide a solution to this kind of problem..

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Like land use patterns, water does not respect the artificial boundaries that humans impose on the landscape. No major river basin in the United States conforms exactly to the contours of a state boundary. As a consequence, water resources administration has been characterized by multijurisdictional conflicts from the first days of the republic (Kenney 1994). The need to develop the capacity to manage water at an appropriate scale is heightened by the fact that many of the most arid regions have been, and are likely to remain, the fastest growing parts of the country. Growing populations mean more pressure on scarce water resources, the even greater likelihood of conflict, and the need to manage those resources at the watershed scale. The expansion of metropolitan regions throughout North America that are dependent on the quantity and quality of water often pits upstream and downstream interests against each other. As the frequency and severity of droughts increase, the tendency of water issues to divide rather than unite communities also increases.

Wildlife and plant species inhabit geographies of different sizes and shapes, none of which conforms to legal and political jurisdictions. For many threatened or endangered species, particularly megafauna and migratory birds, the range required for viable populations is very large, and almost always includes parts or all of several adjacent political jurisdictions. Concerns about what we now call biodiversity were present from the earliest stages of the conservation movement over a century ago, and they bore lasting fruit with the enactment of the Endangered Species Act in 1973. Since then, and especially over the past decade or two, there has been a steadily growing awareness that the preservation of many species depends fundamentally on the protection of habitat at a more substantial scale than had previously been understood or thought possible. Spatial scale is now considered critical for biodiversity, both to provide essential habitat and to protect multiple species. The resulting expansion and deepening of commitment to provide adequate habitat and connectivity to preserve these species is clearly a major contributor to the large landscape conservation movement.

Land use patterns, water management, biodiversity protection, and many other conservation issues facing North America are even more challenging in the face of climate change. A report by the U.S. Global Change Research Program (2009) concludes that current and future impacts of climate change are pervasive and wide-ranging, and affect the core systems of society—transportation, ecosystems, agriculture, business, infrastructure, water, and energy. Given this scientific understanding, the report asserts that it is imperative to take action now to adapt to changing conditions.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Climate change provides one of the most compelling cases for the need to develop governance capacity at the scale of the problems. Because greenhouse gases pay no attention to national boundaries, the individuals, communities, states, and nations affected cannot effectively address climate change by reducing carbon emissions unless such efforts are simultaneously undertaken worldwide. Within that global context, specific actions to mitigate climate change can and should occur at national, state, and local levels. At the same time, strategies to adapt to the effects of climate change on land, water, and wildlife must occur at the scale where the impacts are most apparent and the solutions most effective, often at the local level and, increasingly, across regions. When droughts occur, for example, they affect landscapes that bear little or no relationship to existing political jurisdictions. This simple geographic fact of life becomes much more important when climate change makes drought even more persistent across some of those areas. Many of the other effects of climate change, including shifting patterns of vegetation and species composition, and the frequency and intensity of storm events and wildland fire, will likewise manifest themselves regionally, regardless of legal and jurisdictional boundaries.

One of the key challenges facing Freedom to Roam is the lack of a central organizing theme to bring together all the existing, disparate, species-specific or geographically defined corridor efforts, and to harness the potentially great conservation values that would be associated with such a coordinated effort.

The central challenge for America's Longleaf Pine Initiative is moving from plan development to implementation and evaluation. Implementation of the plan relies on voluntary collaborative efforts among many partners. Establishing an effective network for communication, sharing opportunities, managing issues, solving problems, and consistently tracking accomplishments is proving to be a challenge. One specific need is to inventory and map existing longleaf pine restoration efforts in order to prioritize and target available resources. Several partners have already developed the internal strategies and additional capacities that will help them carry out specific components of the ecosystem conservation plan.

Platte River Recovery Implementation Program: The basic barrier or obstacle is to satisfy competing interests during implementation of the plan. Through joint fact-finding and adaptive management, participants are seeking ways to meet the environmental and species protection goals articulated in the plan while simultaneously attending to the competing interests of states and individual water users.

The Blackstone River Valley National Heritage Corridor faces the challenge of sustaining momentum into the future—nurturing existing relationships and partnerships, securing more diverse and ongoing sources of funding, providing collaborative leadership, and adapting to new needs and circumstances.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

**Comprehensive Everglades Restoration Plan:** The NRC also concluded, however, that agency implementation of CERP to date has been mostly programmatic. The NRC and other analysts have noted that (1) the condition of the Everglades ecosystem is declining; (2) the CERP is entangled in procedural matters involving federal approval of projects and lacks consistent infusions of financial support from the federal government; and (3) without rapid implementation of the projects with the greatest potential for Everglades restoration, the opportunity for meaningful restoration may be permanently lost. Other critics fault an unbalanced stakeholder process, which they see as emphasizing development interests concerned about maintaining water supplies over environmental water needs.

**Las Cienegas National Conservation Area:** During negotiations over the bill, Congress and the Arizona State Land Department removed the area between I-10 and the wilderness area from consideration under the SVPP program, thus creating a gap in coverage. The area, known as the Cienega Corridor, is important for cultural, economic, and biological values. Ongoing efforts to protect the Cienega Corridor show promise, but commentators are quick to point out that there are no guarantees. Implementing the adopted plan also seems to be a challenge. Funding staff and monitoring work also remain pressing needs, and the SVPP is currently exploring new organizational structures that allow it to be self-sustaining and play a more active role in helping the BLM implement the plan.

**Tahoe Regional Planning Agency:** TRPA's central challenge is to make continued progress toward the ETCC in the face of changing circumstances, including future and proposed development; fiscal constraints brought about by shrinking state budgets in California and Nevada, as well as uncertainty in federal funding; evolving relationships with local stakeholders; and changes in the environment brought about by climate change.

Policy makers and conservation leaders have responded to a number of emerging large landscape opportunities, but it is not always clear who is doing what within a particular region or across the country as a whole. In addition, the results or outcomes of these efforts often are not well-documented to show how they are building knowledge and relationships, shaping and implementing policies and programs, or improving on-the-ground conditions of natural and cultural resources and local economies. In short, there is no comprehensive inventory of existing and emerging large landscape conservation efforts and their effectiveness.

Likewise, the lack of scientific information and databases on the conditions, trends, and disturbances within large landscapes makes it difficult to set priorities, identify gaps in terms of what is being done and what should be done, and explore opportunities to link existing and emerging efforts. All of this baseline knowledge is critical to facilitate the advancement of well-designed and well-managed large landscape conservation initiatives. Clarifying the nature and scope of these projects, including both scientific and governance factors, will also help frame this important body of work in terms that will resonate with policy makers and the people who inhabit these places

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Another factor limiting the short- and longterm effectiveness of large landscape conservation is the lack of capacity, which plays out in two distinct ways (Center for Natural Resources and Environmental Policy and the Lincoln Institute 2009). First, there is a need to improve the capacity of individuals and organizations to work across boundaries at the scale of large landscapes. Regional practitioners have consistently expressed an interest in acquiring additional information, skills, tools, and resources; learning from one another; and expanding contacts and interaction with government agencies, universities, foundations, and nongovernment organizations. A related need (or opportunity) is to further develop and refine metrics for measuring the progress of large landscape conservation, which in turn will help clarify what is and is not working and why, and how to replicate best practices. Second, as more and more regions organize to advance the objectives of large landscape conservation, it is critical to bring various constituencies together to exchange ideas, identify lessons learned, and clarify best practices. Such efforts will help to develop a community of practice that can advise local, state, and federal government officials, and advocate for policies to promote and support large landscape conservation projects.

A third major challenge limiting large landscape conservation is the lack of an explicit strategy to facilitate coordination among fragmented efforts and to promote and support a variety of innovations and experiments. Policy makers at all levels are becoming more interested in conservation at the scale of large landscapes, but most of the emerging policy responses are still situated within separate legal and institutional “silos” created in the past. Parallel efforts exist within the federal departments of the Interior and Agriculture, for example. Even within Interior, the Fish and Wildlife Service, Bureau of Land Management, and Geological Survey are all pursuing different initiatives according to different spatial and administrative boundaries and overlapping objectives. While there may be good reasons for the variety of current programs, this new era of large landscape conservation requires a more integrated approach.

The nation’s major environmental laws and policies, including the Endangered Species Act, National Environmental Policy Act (NEPA), National Wildlife Refuge Act, and Clean Water Act, have created strong foundations for conservation through environmental planning, regulation, and public lands acquisition and protection (Coggins et al. 2007). Other laws and policies have established grant programs to enhance private stewardship, particularly conservation grant provisions of the Farm Bill and some Interior Department programs. Some state laws also support conservation on public and private lands. However, these federal and state policies were not designed to facilitate large landscape conservation projects in which multiple agencies must team with other public and private partners and landowners to pursue shared conservation goals.

Furthermore, many government agencies have developed tools and regulations within the context of their traditional statutes to facilitate multispecies protections, collaboration in the NEPA process to identify preferred management alternatives, and other measures consistent with landscape-scale conservation. As currently employed, however, these tools have limited applicability and often are not appropriate to promote and assist large-scale conservation efforts.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As demonstrated earlier, large landscape conservation requires and relies upon partnerships. Among the policy constraints faced by some federal agencies is the lack of clarity on the use of cooperative agreements through which agencies can partner with nonprofit organizations, academic institutions, and other nonfederal entities.

It is also not clear whether and to what extent federal agencies can expend federal funds to support partnership activities, including land restoration and conservation projects.

Another barrier is determining which types of federal relationships with other entities constitute contracting relationships for the purchase of goods and services subject to federal acquisition regulations, and which types constitute partnerships to advance a public purpose. The distinction is important since most contracts must be allocated through competitive bidding processes that are not designed to facilitate the types of ongoing conservation partnerships associated with many landscape-scale initiatives.

Most large landscape conservation initiatives rely on a medley of public and private funding, and over the past two decades diverse public funding sources have emerged to support these efforts. The Department of Agriculture provides billions of dollars in annual conservation funding through multiple grant programs, some of which support large landscape conservation initiatives. The Department of the Interior, Environmental Protection Agency, and National Oceanic and Atmospheric Administration, through its estuaries program, also provide conservation funding. As in the policy arena, however, these programs generally were not designed to support large, multijurisdictional conservation initiatives.

Most funding for landscape-scale conservation and restoration efforts remains within annual budgets and appropriations, thus limiting the potential for multiyear, integrated, and sequenced project planning and implementation

Many large programs must involve multiple federal (and nonfederal) agencies. However, budgeting typically occurs within bureaus that miss opportunities for coordinating and integrating priorities through cross-cut budgeting. Several exceptions that might serve as models for the future are the CALFED Bay-Delta Program and restoration funding in the Everglades and Klamath Basin regions

The Land and Water Conservation Fund (LWCF) focuses on specific projects and land acquisition, rather than strategies to promote and support large landscape conservation partnerships.

The Army Corps of Engineers budgeting for restoration projects has generally been undertaken within the context of the Water Resources Development Act, placing these efforts in competition with more traditional infrastructure projects and requiring them to use cost-benefit processes ill-suited to evaluating restoration benefits.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Funding levels for cross-agency restoration budgets are not commensurate with actual project and program authorizations and needs, and these gaps will grow as the effects of climate change unfold. They are already apparent for large projects such as the Bay-Delta, Chesapeake Bay, and the Everglades, as well as in spending programs such as LWCF, which is authorized at \$900 million annually but has seldom been funded above several hundred million dollars per year (with a few annual exceptions) over the past 20 years.

Some agencies face limitations on their authority to expend funds on lands other than those under their direct jurisdiction, or to pool agency resources into a common restoration fund dedicated to a specific, cross-jurisdictional restoration initiative.

Available funding typically has a targeted focus, such as for habitat conservation planning or wetlands restoration. Few programs are available to support general governance, planning, and monitoring of landscape-scale efforts or multiple project elements that transcend individual program purposes.

Federal agencies use both grants and challenge cost-share programs to fund conservation partnerships and leverage other federal, state, philanthropic, and private funding sources, but several factors limit the full potential of these opportunities. First, matching fund requirements by potential partners sometimes exceed their capacity to meet the match. Second, there is little coordination among grant programs to better leverage funds to focus on the highest priorities. Third, while agencies are improving the use of performance criteria for grant allocation, their application remains inconsistent.

Large landscape conservation is attracting increasing interest in both the public and private sectors, but numerous barriers must be addressed for this approach to land and water conservation to endure:

- the lack of scientific information about large landscapes and their governing structures;
- the lack of capacity to organize, achieve, and advocate for large landscape conservation goals;
- the lack of a strategy to coordinate fragmented efforts and foster innovative experiments;
- the lack of appropriate policy tools to implement large landscape conservation; and
- fragmented financial investments, especially at the federal level.

**Incentive-based Tools for Landowner Conservation** The participation of private landowners is essential, since large landscape conservation initiatives often include both public and private lands, but this may be difficult for several reasons. First, their engagement typically requires investments in time and resources, which may be limited. Second, privately held lands that could usefully serve conservation purposes are often dispersed and fragmented, suggesting the need to assemble multiple blocks of contiguous, high-priority conservation lands. Third, federal laws currently constrain the ability of federal agencies to engage in some types of conservation partnerships by limiting the conditions under which they can operate and share project funding.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Many federal grants and other programs provide conservation funding, but current practices limit opportunities to encourage large landscape conservation. Key challenges include how to better coordinate funding across programs and agencies to focus on shared priorities; sustain multiyear funding for projects with phases and sequenced implementation steps; better ensure program effectiveness by allocating funds based on performance criteria; and use funding to create incentives for conservation.

The Flathead Indian Reservation of the Confederated Salish and Kootenai Tribes is a shining example of the conservation leadership, commitment, and sacrifice of many native nations. Our reservation encompasses over 1.2 million acres of some of the best fish and wildlife habitat in the nation, including over four hundred miles of streams, seventy thousand acres of lakes, over a quarter million acres of uplands and wetlands, ninety-two thousand acres of tribal wilderness, nearly one hundred thousand acres of primitive areas, fifteen thousand acres of fish and wildlife conservation areas, seventy-two miles and ten thousand acres of scenic river corridor, over one hundred miles of trails and over sixty five recreation sites.

Under the US Fish & Wildlife Service's existing formula for allocation to the states and territories of Pittman-Robertson and Dingell-Johnson monies, license holders who utilize tribal lands and water contribute hundreds of millions of dollars annually (over \$740 million in 2009 alone and \$18 million to the state of Montana in 2008-2009). Despite this, American Indian tribes do not qualify for either Federal Aid funding or Land and Water Conservation funds..

Tribes also do not receive funding under either Section 6 of the Endangered Species Act (some \$67 million in 2009 to state and US territories, the Multi-State Conservation Grant program (\$6 million in 2009) or State Wildlife Grant Programs (\$9 million in 2009). Again, this is a particular concern for the Confederated Salish and Kootenai Tribes, who for many years have successfully managed numerous threatened and endangered species, including grizzly bears, wolves, peregrine falcons, and bald eagles, and have successfully introduced others, including trumpeter swans.

Tribes also do not receive any funding through the Clean Vessel Act (\$14 million in 2009) or Boating Infrastructure Grants (\$2.5 million in 2009). Again, this omission is a special concern for the Confederated Salish and Kootenai Tribes, who actively manage fish, water quality, and boating activities on Flathead Lake, the most popular fishing destination in the region, as well as other major bodies of water such as the Lower Flathead River, all of which are currently threatened by the potential introduction of non-native plants and mussels.

Today's children are spending less time outdoors in nature than any generation in history. Best-selling author Richard Louv coined the phrase Nature Deficit Disorder to describe this relatively recent phenomenon that is shaping the way our children relate to the natural world.

there is not ever going to be enough.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

One of the greatest attributes of this country is it's great natural beauty. Once it's gone, it's virually impossible to get it back. We don't want our great land turning into a barren, toxic waste dump! That's not a proper legacy for our children and the generations to follow them.

I sincerely feel sorry for anyone who doesn't love the outdoors and wild places enough to protect them. They should not be used for any individual or companies monetary gain.

Now more than ever, we need places where we can go for quiet recreation and to see wildlife and the natural world.

I recently spent a week in the Mammoth Lake/Devils Postpile area of the California Sierra - half the trees are dead. I then spent 2 weeks in Yosemite National Park - half the trees are dead. On the way back to Oregon I passed through about 70 miles of the Fremont Nation Forest in south central Oregon - half the trees are dead. Spreading bark beetle infestation due to a warmer climate. It may already be too late

To Whom it May Concern, Please stop closing our Public Lands. Access to the outdoors by the public helps keep our citizens physically and mentally healthy, thus reducing medical costs. Not all public land users are able-bodied youngsters. Vehicular travel (from motorcycling, ATV's and four wheel drive travel) is a neccesity for many so many Americans to see the beauty of this country. Please don't take any more land away from us, the people who love and recreate on our Public Lands.

What disturbs me the most is that Washington does not seem to be listening to the wishes of the masses. I want access to the public land that allows me to recreate in the manner I prefer. I believe we need wilderness areas but not everything needs to be wilderness. Remember not all Americans want limited access.

Provide Increased access to Our national Forests stop all logging in the national Forests fire Ken Salazar!He is no conservationist.

Preservation means saving from destruction. Why do we always have to fight to keep our natural resources and preserved lands from corporate greed. These wilderness should be saved for the American people to have and to hold as pristine as they were when our grandparents seen them.

We must share land with the rest of the inhabitants on earth, instead of conquering. Decreasing our dependence on fossil fuels (all the mining accidents and oil spills are evidence of this need) will also decrease the destruction of nature.

It would be unforgivable for us to eradicate the remaining wilderness areas in this great country and leave our children and grandchildren with no natural spaces, no wolves, no free-roaming bison or mustangs.

As an Arizona resident I am very concerned about the constant attempts to create industry and mining claims near the Grand Canyon that jeopardize what I consider to be an irreplaceable natural wonder. We simply must do all we can to protect our parks.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Oil and coal mining pollution has destroyed our landscape and done little to improve our energy resources. We are lightyears behind other countries in inventing and utilizing alternate energy solutions and if nothing serious changes we will destroy our beautiful lands.

When push comes to shove Nature is what makes life worth living. A future with nothing but concrete sidewalks and structures is a very bleak one in my eyes.

We need to keep as many natural places as possible. For one reason, they are much more healthier.

They are priceless and should be one of our country's top priorities.

Those who deeply love Nature are the most devoted stewards of the environment. If everyone truly loved our natural environment, climate change would not even be a concern. We must teach future generations to appreciate the wonders of Nature, and to do that, we must ensure that our great wilderness areas remain unspoiled.

Only a fool doesn't take care of what's taking care of him!

This year has been among the most brutal on our beautiful country's environment and we must take decisive action to correct the damage or we risk losing what we have.

I and many young people like myself care about animals and the environment. I only vote for those who protect and make laws to protect animals and will vote accordingly please please think and vote for these issues. I voted for you and hoped you would get a shelter dog due to puppy mills would you please do something in this area thank you.

It's a sad commentary that to camp out in our national parks it is necessary to reserve with tickets, months in advance. I want my grandchildren have open spaces and more parks available to them, not less.

Our country is unique in that it has a huge variety of landscapes and wildlife all in one nation, do we want future generations to view us as destroyers and takers of nature, or do we want them to view us as stewards of our natural and breathtaking surroundings?

I object to the idea of "fast-tracking" big solar projects. These projects are NOT green and will provide few permanent jobs and little energy. On the other hand, they are extremely destructive to fragile desert ecosystems and threatened species and are highly consumptive of precious desert water reserves. Unfortunately the current approval process allows for the best available science to be disregarded, just like under Bush.

It's time we take responsibility for our actions and do the right thing

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We are at a critical point in our history. The decision made now will irreversibly affect our children and our legacy.

Our very existence depends on how we preserve our land.

I am lucky to have open spaces near my home: the Allandale Woods and the Arnold Arboretum. My wife and I have personally seen mountaintop removal coalmining when visiting friends in West Virginia. We've been horrified by what it does to surrounding communities, their water supplies and their overall environment. It must be stopped. We must switch to a green economy and train those miners for green jobs.

End Mountaintop Removal Coalmining

Man NEEDS to preserve wilderness to save his sanity. Our minds and bodies were designed to be outdoors. Concrete and buildings only suppress our true nature and leads to depression and schizophrenia.

Stop "managing/killing" wildlife populations

Stop leasing public lands/wilderness areas for mineral exploitation by Big Business

Address Conservation at a Large Scale and from a mental and physical health standpoint

Consider the impact vanishing open spaces has on children

In North Carolina we added new state parks recently. But land is being developed quickly and we need to protect more of it before it is too late.

There are too many parks that have now been closed due to lack of funding for basic maintaining.

Fully fund the National Parks

Fund to eliminate the maintenance backlog by 2015

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

\* Fund to increase the parks that need it, and to buy new land for new parks.

Expand and protect our National Parks and Wilderness areas

Honor the endangered species act

It's too precious to waste!

I am fully confident that this administration is already aware of the importance of our environment, so this note simply serves as a 'reminder' and that it is of vital importance to me. Our planet has been evolving for millions of years; how can we destroy it in mere hundreds?

I grew up in the beautiful State of Maine, in a rural area where the elders taught me to recognize the native plants and trees. I knew them by name. I lost that connection to the land, which I took for granted, when I moved to the other side of the country. Whenever I return to Maine, I am shocked and saddened to see how many of the wild spaces I remember have been built up, cultivated, or "prettified" so that all you see is grass, rather than Queen Anne's Lace, daisies, milkweed, and joe-pye-weed. This is a huge loss--those who never knew those plants will not know what they are missing. I hope you will make the conservation of natural areas a top priority.

Please preserve Montana's Bitter Creek & Montana Glaciated Plains as National Monuments. Since the majority of these lands are already Federally owned, this will be a chance to preserve the great plains and re-establish Bison and Grizzly Bear in their original territory. Lewis & Clark first encountered Grizzly in this area and its time to preserve the Big Open. There are a lot of misconceptions and lies about taking over these lands from (heavily subsidized) ranchers, claiming the 'king is taking over our lands' (Congressmen Rehberg email). Its a shame that some politicians play the hate and misinformation games.

I grew up in the Pacific Northwest enjoying Mount Ranier, the North Cascades and the Olympic Peninsula and believe strongly that the National Parks, National Forests, and all our natural treasures are irreplaceable!

Not just for people, but for the animals that make these places their homes.

What we have is all there is - or will be. We must be faithful stewards of the earth.

We should be ashamed that it takes a letter to the White House to save a piece of nature for our children.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Ban all Mineral extraction and exploration, both currently and in the future

Ban all Fossil Fuel extraction and exploration, now and in the future

Ban all off-road, snow mobile, and ATV from Public Lands forever

Ban all hunting on Public Land

Make hunting on Public Land punishable with a 20 minimum sentence

Make hunting of Wolves punishable with a 50 year minimum sentence

Ban all current and future logging on Public Land

Fine anyone damaging Public Lands \$1,000,000 per incident

Buy more Public Lands and prevent any development on them forever

I am very worried that many people, especially people in metropolitan centers, often feel very disconnected from what people refer to as the 'natural world'. They may lack the opportunity or the inclination to become exposed to the 'natural world' that I believe is crucial to them developing that personal connection that I mention above.

In the United States, we are blessed by having public lands that are set aside for the use and enjoyment of all the people. The federal role in the administration of these lands is invariably driven by the agenda of the administration in power. The current administration appears sensitive to the interests of the conservation community but there is no guarantee that the next administration will share this perspective. I believe that a more comprehensive understanding of the 'natural world' serves all people regardless of political affiliation. As a world population we are presented with many natural resource challenges (e.g. climate change, deteriorating air quality, limited access to potable water, loss of arable land, etc). I believe that the federal government could be of great assistance in promoting the education of people with respect to the natural resource challenges that we face.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I believe in you, and your abilities to transform our nation into a better place.

I truly believe that if more people would go outside and reconnect with nature, that the world would be a better place. It always feels so good to be with the trees, breath fresh air and forget about one's problems. Nature is peaceful and replenishing, but the large corporations that run the world are exploiting it for profit. If something isn't done to protect the wilderness pretty soon, it will cease to exist and we'll only be left with cities and concrete - - how depressing!

We've been witnessing the devastation of our environment by private enterprises unconcerned with the future.

I grew up camping, fishing and doing many other outdoor activities. I want these opportunities to be available to the next generation. Without stronger protections for the beautiful wild spaces we have, and making additions of protected wild places, we will lose these beautiful places and have only concrete and polluted air and water to live in. I want fresh air, and tall trees to escape to, no concrete jungles and noisy traffic.

Roadless areas should remain roadless

The government was intrusted with public lands by American citizens for conservation not: mining, drilling, nor logging

Once it's gone, it's gone and very difficult to bring back.

It has been very hard for many of us this summer with so many parks being closed down. We are supposed to be working toward making our country better for the future not selling off our wonderful reserves. I so hope the funding can be found to reopen and fix up these parks so we all once again can go for hikes and camp in our wonderful park. We need to keep adding more new nature park areas not cutting them back.

I live in an area that is blessed with abundant natural beauty, and it is beginning to be eroded

Also, I feel it is imperative to re-green our cities to the fullest extent possible by reducing asphalt cover, introducing bioswale catchments around parking lots and roadways, and by planting native plants everywhere possible to create wildlife habitat, reduce flood damage and improve livability and quality of life.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It has been very hard for many of us this summer with so many parks being closed down. We are supposed to be working toward making our country better for the future not selling off our wonderful reserves. I so hope the funding can be found to reopen and fix up these parks so we all once again can go for hikes and camp in our wonderful park. We need to keep adding more new nature park areas not cutting them back.

Let's not forget that in order to protect these "outdoor" spaces that you MUST REGULATE THE EXCREMENT out of the greedy and power-hungry Capitalist Corpotechnocratic elements of our Plutonomy (Democracy died during the Bush-Cheney years). The richest people and corporations must not be allowed to pollute or develop these areas without receiving huge fines and prison sentences.

The wild places are becoming fewer and fewer, and far too few are presently being developed for short-term personal gain.

I am an Interpretive, Naturalist Guide, in Denali National Park, Alaska. It is clear that Denali, and the FEW places, left, like it, are dwindling islands. We ARE on the brink and I, sincerely, doubt anything can be done to change the non-caring, destructive and greedy, mostly, corporate tide, destroying OUR environment. Somebody should take notice and do something NOW!

Thank you also for all that you are doing to hold this country, this world together. Please don't let us lose our 'outdoor spaces' as we move on with progress. Once our nation is nothing but sidewalks, asphalt and shopping malls, well, it won't be much of a nation.

Saving America's nlast r emaining natural p[laces is not only about recreation. It is about survival for many plant and animal species and their habitats. And ultimately, it's about preserving our nation's character and legacy form further development and encroachment. We have already lost more than we should have. The destruction of more forests, grasslands, archaeologicvalk sites and other heritage resources is unthinkable. Conservation of these priceless resources is the only way to save them from destruction. It will take courage and bold leadership to resist pressues from many corporate and other special interest groups. To ensure that our nation's wildlife, plus its natural and cultural resources are protected and always available for future generations, please consider these priorities for America's Great

I do not feel our public lands should be used for business purposes, (ie timbering or mining) those ventures have their own capital to purchase lands and do not need the public lands, NO MATTER WHAT RESOURCES ARE THERE OR UNDER THERE. Timbering and fire burns for land management are necessary within reason, but not clear-cut thousand of acres in a swath.

Here in the northeast, so much land has been squandered in shopping malls, parking lots, and suburban sprall. These are so few natural areas left where we can walk, ride a bike, and generally enjoy the country side.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am amazed at how many petitions we have to sign and how many letters we have to write to try to secure some sort of legislation for what should be obvious; we need to respect and protect our natural resources! Isn't this apparent in the wake of these recent disasters? Isn't this a no brainer? What type of governing body would want to sacrifice our natural resources, which once destroyed, are nearly impossible to recover? And for what? Fuel, convenience, PROGRESS? How progressive will it be to future generations when they have no resources to fall back on? No land to cultivate or parks and forests to enjoy? What about the invaluable role these resources play in our fragile ecosystem? It is scientifically proven that when our forests and streams are irreperably altered, our country and the entire planet feels the effects and suffers for the mistakes we have made. The Forest Service is currently spending millions on road reclamation projects because of the now-realized damages that were done to the national forests when they built logging, lookout and recreational roads. While this is a step in the right direction, it will not restore the landscape to what it once was and it will not undo that damage that has already been done. It is so much more expensive to try to go back and fix mistakes that were made than it is to see the big picture and make decisions based on all the variable not just the current bottom dollar and instant gratification mentality the US has become infamous for.

I AM A REGULAR CAMPER AND I HAVE SEEN MANY AREAS WHERE I USE TO CAMP DISAPPEAR PLEASE REVERSE WHAT I HAVE SEEN.

Our beautiful land must be protected, not only for the next generation, but for ourselves. right now. Little by little we are exterminating forests, whole animal species, water resources, and we will end up exterminating ourselves! You are a great leader, and I am sure you can make a historical difference by taking the urgent steps for this important matter.

Address conservation issues - particularly poor city dwellers who do not have these opportunities - that do not include invasive or harmful roads or trails for noisy motorized vehicles - - Increase funding of programs that reintroduce top predators to natural ecosystems

There is so little left of America's great outdoors. We need to preserve it for future generations.

About twenty years ago, my wife and I enjoyed the privilege of visiting Glacier National Park. I wish every American, every human being in fact, could experience that beauty. Unfortunately, the glacier is receding and in a few more years will disappear entirely. This is due to global warming, but can serve as an apt illustration for anyone who would like to know what it would be like to lose any of the natural beauty of our wilderness.

If we don't protect it now, it could be lost forever! Nature is awesome!!!!

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

wild We have nature today, but future generations may not. As leader of the free world, please stand up for what is best for all people and our fragile planet.

The protection is important in more ways than just the enjoyment of the natural state. Areas like water sheds are vital to protect cities from flooding and water supplies purity

Remember, without protection for our planet and conscious stewardship of her many resources, we may soon have no planet upon which to stand.

As a concerned citizen and someone who exercises my right to vote, I am very concerned about the potential damage done to our country's wilderness areas and our now very fragile ecosystems.

For years now my touchstone with spirituality has been the time I spend in the natural world. My trips into the mountains, particularly the Sierra Nevada have been one of the strongest connections with my family as well. I want the next generation to enjoy America's great outdoors too. That's why I am asking you to seize this opportunity to create, expand At a time when the corporations are taking over our government, buying up farm and timberlands for their own exploitation, the preservation of what remains untouched is of paramount importance. - - - This is of the greatest importance to me, my family and future generations.

The world's wildlife habitat is shrinking at an alarming rate, despite ample evidence that the health of the planet and the human race depend on wilderness.

Without adequate funding, these ideas and proposals will not produce the desired results.

Urban sprawl has spread over so much of our increasingly congested, noisy and overpopulated nation. So much of this country has been paved over and "malled".

When I think of all God's creatures who have been killed, left homeless,ect.it really makes me sad. Animals, flowers, lakes , trees, mountains, oceans,praires, how we are destroying them and by doing this we are slowly destroying ourselves. All of us are a part of this universe and we all have a roll to play. I read this morning that people have the right to go out and kill wolves, adult and young. Who are we to go out and kill animals. Soon wolves, polar bears, tigers, elephants and more are being knocked right off this earth for selfish reasons.With abortion, killing of innocent animals, destroying our forests, taking away our farmlands for building houses which no one can live in because they are too expensive, leaving our own citizens on the streets with no source of fooding, clothes and shelters, killing other human beings because of a crime they may or may not have committed, treating Native Americans as something to forget about, and of course our still abiding racism. Our culture is a culture of death. I guess I went further into this than what was called for because the purpose of this email is to Protect America's great outdoors, but I want all good things to be protected

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I want the all of the next generations, human as well as non-human, to enjoy America's great outdoors. Our legacy as a species is wearing thin if we do not take some very bold steps to ensure life and beauty for future generations.

I relocated from an urban area to a rural one in order for my children to have greater access to nature. I am concerned that timber logging and water pollution will endanger the rural area in which I now reside.

Preservation of America's great outdoor environment was neglected, even endangered, for eight long years under the Bush-Cheney administration.

If we don't take serious measures to curb Global Warming, none of these other measures will matter.

, I am concerned about the future of America as reflected in the care we take of our natural beauty. We are a country of immigrants who have come to love our new homeland. In essence we do not own this land, it has been loaned to us by future generations.

Having access to the outdoors and learning about the natural world has always been an important part of my life, whether living in the Northeast, Oregon, or in Arizona. The recent loss of state funding for parks in Arizona, resulting in the temporary or permanent closure of many of my favorite beautiful, wild areas, including Red Rocks State Park, Tonto Natural Bridge State Park, and the park in Jerome, has been a horrible and scary loss for this state. Please do all you can to expand protections of natural lands and resources across the country, and to set in place policies that will protect these lands and connect our citizens to them for generations to come.

We have seen too many disasters in our generation that have spoiled the beauty that the US has to offer. Let's not keep making mistakes and let us have something to cherish now and for the future. I love all the wildlife and trails that the state of Washington has to offer, it wasn't until I was able to actually see the beauty firsthand that I started to discover and enjoy the diversity that we have in our nation.

The Obama Administration has a unique opportunity to set the course for America's newest system of protected public land, the National Landscape Conservation System- our National Conservation Lands. Without a clear vision, BLM lacks the direction to manage the National Conservation Lands as a truly unique collection of extraordinary places. The BLM needs clear guidance from the Secretary of the Interior in order to make the internal changes necessary to properly manage the natural and cultural treasures found within the National Conservation Lands.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

#### Name Change

One of the biggest issues facing the "National Landscape Conservation System" is the name itself.

The American public will have a hard time learning about and embracing a collection of lands, when the name is long, confusing and misleading. Our National Parks invoke an image of Yellowstone's Old Faithfull and the Teton Mountain Range. Based on focus group testing throughout the west- National Landscape Conservation System invokes an image of shrubbery or a bureaucratic system. Please officially adopt the name- our National Conservation Lands to describe this relatively new but important collection of lands, waters and trails.

Based on focus group testing throughout the west- National Landscape Conservation System invokes an image of shrubbery or a bureaucratic system. Please officially adopt the name- our National Conservation Lands to describe this relatively new but important collection of lands, waters and trails.

#### Policy Recommendations

1) Make the conservation, protection and restoration of the National Conservation Lands a clear management priority within the BLM

Despite the clear conservation-focused management priorities set forth in the organic legislation and presidential proclamations for areas within the National Conservation Lands, the BLM is not consistently managing the units of the National Conservation Lands to protect the values that led to their creation. As a result the National Conservation Lands are a hodgepodge of inconsistent management regimes. The National Conservation Lands deserve strong policy guidance from the Department of the Interior that ensures their protection.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

This year we celebrate the 10th anniversary of the National Conservation Lands. Even with much to celebrate, our National Conservation Lands still lack a unifying management vision as well as the necessary policies and procedures to ensure adequate protection of their outstanding resources. It is time for the Department of the Interior and the Bureau of Land Management to set the management directives that will protect the National Conservation Lands in a way that recognizes and protects their significant natural and cultural values and responds to this unique time in history.

Denver Post, September 19, 2010 opinion editorial

Ensuring full funding for Land and Water Conservation Fund

By Andrew Currie, Ken Strom, and Erica Stock

If you live in Colorado, you know that we are privileged to enjoy countless breathtaking vistas, magical wilderness areas laced with free-flowing rivers, and highly-rated urban parks and trails every day for recreation, sports or just some peace and quiet.

What many of us might not know is that a large number of our most beloved lakes, streams, woodlands, local parks and playgrounds have been protected for us by the Land and Water Conservation Fund (LWCF). The LWCF is the principal source of federal dollars for protecting land in America's national parks, forests, and other public landscapes and ensuring recreational opportunities for Americans in every state in the nation. LWCF helps fund many of Colorado's recreation areas like the Platte River trail system, Castlewood Canyon State Park and Garden of the Gods, as well as national treasures like Yellowstone National Park, California's Big Sur Coast, Florida's Everglades, and historic Civil War battlefields.

The Land and Water Conservation Fund was created by Congress in 1965 and is authorized to receive \$900 million annually in federal revenues from offshore oil and gas leasing. Unfortunately, the LWCF program has received full funding only once in its history. In recent years, it has steadily declined to a low in appropriated funding of \$155 million in 2008, and in total has been shortchanged about \$17 billion since its inception. Despite this, the LWCF has worked in every state of the Union - indeed nearly every county in every district in America - to fund state and local park activities. These projects contribute not only to our natural environment, but also create jobs and draw visitors for recreation, sporting and other activities.

Colorado's treasure of mountains, rivers and great outdoors brings in hundreds of thousands of outdoor recreationists annually - participating in bicycling, camping, fishing, hunting, paddling, snow sports, hiking, climbing and wildlife viewing - who generate an estimated \$10 billion in state tax revenues and retail sales and services across the state while supporting over 100,000 jobs.

LWCF began as part of a simple deal: as America's oil and gas was extracted from federal lands and waters, a portion of the associated revenue was intended to be reinvested in conservation of the lands and waters Americans care about. But even though there's been more than enough revenue year after year from the oil and gas leasing to fully fund LWCF at no cost to the American taxpayer, Congress has diverted the funds and failed to use the money for its intended purpose.

Efforts are underway, supported by groups across Colorado and the nation, to insure the long overdue full funding for LWCF. Recently on July 30, the issue to fully fund LWCF passed in the U.S House of Representatives. We applaud our Colorado delegates heartily for their efforts and role in this success. Congresswoman Betsy Markey, 4th District Colorado, cast her affirmative vote that day joining Jared Polis and Diana DeGette, and Colorado U.S. Senators Mark Udall and Michael Bennet were instrumental by cosponsoring legislation in the Senate that would ensure a dedicated source for permanent full funding of LWCF.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

But the fight to make things right is not over. Senate Majority Leader Harry Reid has tabled the Senate's discussion and vote on the L WCF until after the August recess, fearing he would not have enough votes to pass the issue. We must ensure that full and pennant funding for L WCF remains a priority in September.

Let's make this extraordinary value crystal "clear" for Congress. We greatly appreciate what Congresswoman Markey, Senator Udall, Senator Bennet and others have already accomplished, and we urge our Colorado Senators to keep up their strong leadership as the L WCF goes before the Senate, and to continue their robust support.

A victory here will finally and rightfully ensure full and dedicated funding for the Land and Water Conservation Fund, one of our best tools for conserving the Nation's great outdoors, increasing recreational access to our favorite parks and natural places, and supporting the tourist and recreation industry jobs and businesses that in large measure contribute to Colorado's economic health.

Andrew Currie is founder of Conservation Havens, LLC Ken Strom is the director of Audubon Colorado, the state program of the National Audubon Society. Erica Stock is the outreach director for Colorado Trout Unlimited  
Denver Post,

#### 3) Get youth more involved in their community

a. Drinking and drugs inhibit outdoor recreation on reservations and youth who want to get outside are made fun of. Adults need to get the message that they need to set better examples for the young people on reservations.

#### Conservation in America Faces Significant Challenges

While there is broad public support for conservation of natural, cultural, and recreational resources, these resources are threatened by an ever-growing population, unplanned development, climate change, and unsustainable demands on water resources. The cumulative impact of these threats, if we do not respond to them, will be an accelerated fragmentation of the American countryside, the separation of plants and animals from their essential habitats, of watersheds from downstream estuaries, of people from experiences in the outdoors, and of Americans from our common historic and natural heritage.

Protect natural system integrity and connectivity. Healthy lands safeguard our watersheds, providing clean drinking water for millions of people and habitat for the diversity of America's plant and animal species. Our protected lands and waters, however, are not always well-connected or large enough to maintain viable wildlife populations or sustain natural ecological processes.

The protection of wildlife corridors maintains the integrity of our past century's conservation investment and ensures that American citizens can be connected to the natural places they need for health and recreation. To not connect, to not protect, will jeopardize not just wildlife but the values in life that we Americans have enjoyed for more than two centuries.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Recent data indicates that the increased incentives have resulted in the protection of upwards of one million acres a year since they were first enacted in 2006. Despite this success, the incentives are set to expire at the end of this year.

There is a policy shift occurring in the U.S. toward enacting tax credits against income due for conservation related donations. Conservation experts agree that credits are a broader and more effective incentive than deductions. Two main factors are causing this shift. First, conservation tax incentives are a sound mechanism for creating certainty during times of inconsistent and unpredictable conservation funding trends. Second, growing concerns about uncontrolled exurban expansion (particularly relating to forest intrusions around metropolitan areas) continue to galvanize support for greater federal investment in private land conservation.

While the underlying policy rationale for the enactment of transferable credits is sound, there are a number of perceived and real difficulties inherent in establishing functional, sustainable, and enforceable credit markets that must be overcome to generate the support needed to enact federal conservation tax credits. Many of these difficulties can be reconciled through administrative adaptation as part of the implementation and enforcement process while others can be addressed through public education.

The science demonstrates that trees take up the carbon from the atmosphere which is then released upon combustion. To sustain the greenhouse gas benefits of the biogenic carbon cycle, trees and crops are re-grown, thus continuing carbon absorption across forested and agricultural landscapes and ensuring future supplies of biomass. When national inventories, such as in the United States, demonstrate that forest and other feedstock inventories are maintained or increased, there is no additional carbon released to the atmosphere.

If left unchanged, EPA's Tailoring Rule will impose significant and unnecessary regulatory burdens and economic impacts on biomass power producers and rural communities, and threatens to chill investment in renewable energy production. This will frustrate the environmental goals of shifting to renewable energy and will contribute to an international competitive imbalance with countries that do recognize this scientific principle. Ultimately, these impediments to the use of biomass for renewable energy generation will eliminate this market for working forests, thus adding to the economic pressures on maintaining forestland.

Furthermore, the Tailoring Rule and other related policies will depress markets for biomass energy in favor of fossil fuels and weaken the economic viability of working forests and the rural jobs they support. This contravenes both the President's renewable energy and AGOI objectives and creates significant confusion regarding the role working forests will play under the policies of this administration. NAFO explained these principles and consequences in detail in its recent comments in response to EPA's July 15, 2010 Call for Information. These comments may be reviewed at <http://nafoalliance.org/wp-content/uploads/NAFO-call-for-information-comments.pdf>.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To maintain their land as forests, landowners require economic and sustainable management practices. We support the government's conservation programs that support this management, but costs may be imposed on management from various sources, including tax, equipment, and most recently, regulation. Since 1976, the forest management has been considered a nonpoint source under the Clean Water Act. This means that forest landowners employ best management practices to protect water quality rather than obtaining NPDES permits from EPA or the applicable state authority. Studies have shown that nationally, the overall BMP implementation rate is 89%, and has been increasing steadily. Ice, G.G., Schilling, E., and Vowell, J. Trends for Forestry Best Management Practices Implementation. Journal of Forestry (September 2010).

Despite this record, recent federal court decisions have eroded EPA's regulation establishing forest management as a nonpoint source. EPA is proceeding with a general permit for pesticide applications pursuant to one decision. The second decision, affecting forest roads with stormwater control systems, has just been issued and its impact is unknown at this time. No matter how EPA proceeds, NPDES permits for these activities are redundant regulatory systems that will increase forest management costs.

The Mid-Atlantic Highlands Region of Connecticut, New York, New Jersey and Pennsylvania is within an hour's drive of 25 million people, supplies drinking water to 15 million people, and is under constant threat from suburban sprawl and industrial development.

To the vast majority of youth, the valleys, mountains, deserts and plains across our Nation are connected. Ribbons of highways and trains, skies, waterways, make a yet unrecognized frontier. But for many, their playgrounds are concrete, their food sources unknown. Their best friend may be a television.

On behalf of the youth of the Hudson Valley, the Hudson River Sloop Clearwater (Clearwater) is submitting the enclosed recommendations entitled 'The Next Generation of Environmental Leaders: Local Solutions for National Challenges' for your consideration.

'Start young, we should start with young people and getting them outdoors...We need jobs for young people, not just jobs but jobs that bring them out into the outdoors... I think the outdoors is such a great way out of poverty, of the life that people are living in today...The outdoors is a great solution.'

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

With America's Great Outdoors Initiative (AGOI), President Barack Obama has made it clear that it is a national priority to engage young people, especially those who live in our Nation's under-resourced innercities, and to find the means and ways to get them outdoors to experience our unique natural heritage. As Americans, we have conquered many new frontiers in our nation's history—one could say it is inherently American to strive for that next lofty goal. In the 21st century, we must ask what will our children's new frontiers be? In order to allow them to conquer the new frontiers of economic depression, childhood obesity, lack of access to the outdoors, and training in sustainable green jobs, we must support programs that implement the goals of this initiative. First Lady Michelle Obama's Let's Move initiative is yet another example of an attainable goal of combating childhood obesity within a generation. We must ensure that our next generation of leaders can succeed and, with the AGOI, we can solidify the groundwork for success for our children.

Children living in underserved and urban areas are the people most vulnerable to the effects of pollution: poor air quality has contributed to record asthma rates; lower income families are eating contaminated fish; exposure to contaminants lowers IQ and contributes to developmental disabilities and cancer. Yet it is our children who will be asked to solve the daunting environmental problems of the future. Too often urban children feel disconnected from the environment. Faced with the daily pressures of city life, the exploration of their available natural environment becomes an abstract concept, never mind the preservation and protection of their outdoors. If we want our children to grow up to be active and continually involved problem solvers they need to see that the environment is a vital part of their lives. In truth, they must realize there is no separation from human health and that of the health of their surroundings: public health is environmental health. Children from underserved and urban communities have the most to gain from such experiences, but these communities often have the fewest resources to devote to such programs.

According to a recent study through the University of Illinois, Chicago, more and more children are not experiencing the outdoors, leading to a detachment from nature and a trend in unhealthy lifestyles. Participation in nature activities is down 18 to 25 percent since peak levels (National Academy of Sciences- Oliver Pergams, University of Illinois Chicago, Feb. 2008). "The replacement of vigorous outdoor activities by sedentary, indoor videophilia has far-reaching consequences for physical and mental health, especially in children," Pergams said. "Videophilia has been shown to be a cause of obesity, lack of socialization, attention disorders and poor academic performance. We don't see how this can be good for conservation. We don't see how future generations, with less exploration of nature, will be as interested in conservation as past generations."

On the ground and on the water, Clearwater has consistently found that the cities that we all live and work in are all different—the main exception being that they all share the same environmental problems. These communities are cut off from the very river that first gave them their historical and cultural identity. Train tracks, highways, and industry disconnect these communities from the river: the biggest natural feature directly in many of their backyards. Such a separation cannot foster the development of future leaders willing to solve the serious environmental and health issues of the next decades.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Environmental education is widely recognized as vital in developing an informed and engaged citizenry. The National Science Foundation's Advisory Committee for Environmental Research and Education noted that "in the coming decades, the public will more frequently be called upon to understand complex environmental issues, assess risk, evaluate proposed environmental plans and understand how individual decisions affect the environment at local and global scales. Creating a scientifically informed citizenry requires a concerted, systematic approach to environmental education..." (www.cbf.org)

Fostering Young Americans to Become Hunters and Anglers – The past decade has seen a decline in the number of hunters and anglers in this country. This is attributable to many causes, but is undoubtedly reason for concern. Children today are spending half as much time outdoors as children did 20 years ago, which has immediate health impacts and long term conservation impacts. Young Americans who hunt and fish are more connected to the outdoors, more likely to develop strong conservation values, and will help support conservation efforts throughout their lifetime.

Supporting Private and Public Land Conservation and Partnerships – Wildlife does not know political boundaries or boundaries of public and private land. Wildlife habitat must therefore be conserved on public and private land across the country. Habitats such as grasslands, the prairie pothole region, forests, coastal wetlands and marshes, and sage brush are critical breeding ground for game species as well as good hunting habitat, as such they should be conserved and managed to support and enhance healthy wildlife populations. The Administration should support efforts to help private landowners enhance, restore and protect these and other natural habitats on their land, while ensuring that public lands are managed in a way that supports healthy fish and wildlife populations.

Providing Recreational Access – As many private landowners continue to restrict hunting and angling opportunities on their lands, and many public lands are developed for resource extraction, opportunities across our nation to hunt and fish are dwindling. The Administration should retain and enhance sportsmen access to public and private lands. Hunting and angling opportunities need to be given stronger weight during consideration of public lands development and resource extraction. Invaluable and irreplaceable wildlife habitat areas need to be conserved and properly managed to retain their values while other public lands must balance development and recreational uses.

Funding Conservation – Whether it's hunter/angler and outdoors education, land conservation or protecting clean water, inadequate funding is a major impediment. To conserve America's Great Outdoors for the 21st Century, the Administration must prioritize funding for conservation, including \$900 million for the Land and Water Conservation Fund.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As you all explained, the administration is in the process finalizing the basic organization of the AGO Initiative report and settling on a handful of unifying themes. Given the huge amount of data generated through the various listening sessions, reports and online submissions, this distillation process is exceedingly important to the overall success of the AGO Initiative. The themes need to be thoughtfully crafted so that, as one of you put it, “people can see themselves in the report.” We could not agree more.

Rocky Mountain Front Initiative, Montana. Where Montana’s dramatic peaks give way to the Northern Great Plains, the Rocky Mountain Front forms a landscape unlike any other in America. With its large working ranches, the Front represents some of the nation’s rarest wildlife habitat – where grizzly bears still roam freely from the mountains to the plains, as they have for centuries. Our changing climate is warming temperatures in the region, creating shifts in wildlife habitat and migratory routes. For example, grizzly bears are ranging farther north than ever before. While the habitat needs of wildlife shifts, increased demand for recreational property and vacation homes threatens this natural area.

Millions of acres across the West have been subdivided over the past 15 years. New homes and roads disrupt wildlife migration routes, and cut off access to breeding grounds, food, and safe haven. For generations, family ranchers have owned large swaths of the land in this region, enabling wildlife to freely migrate. But as financially-strapped ranchers sell off their land, this landscape becomes fragmented.

East Texas Forestland Ownership Use and Change – Longleaf Pine Focus Area. For more than a century, the culture, social fabric, and natural history of East Texas has been shaped by a prosperous, forest-driven economy. During this time, land ownership in East Texas has been relatively stable, with industrial timber companies owning 32% of all East Texas lands, including the majority of the most productive forestland which form the watersheds for a number of rivers that flow into the Gulf of Mexico. These large tracts of working forestland provided economic security and critical wildlife habitat. However, in the last ten years, this longstanding balance has all but disappeared due to global forces that have caused the sale, conversion, and fragmentation of forests across the country.

Since 2000, over 3.5 million acres of forestlands have changed hands at least once in East Texas due to increased global competition, tax policy, and investor demand. Grappling with these changing competitive dynamics, the forest products and paper sector suffered declining stock values, generating concern among Wall Street analysts that the companies had too much capital tied up in forests. These companies, including Temple-Inland, International Paper, Champion International, Louisiana Pacific, and Georgia Pacific, responded with a wholesale divestiture of all of their forestlands. Overall, an estimated 75 million acres – an area larger than the land mass of 45 states – have changed hands nationally, passing from forest products companies to investment companies. Much of this movement occurred between 1996-2006, culminating in International Paper’s 2006 sale of 6.6 million acres and Temple-Inland’s 2007 sale of 1.8 million acres to investment firms.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

These investment firms, called Timber Investment Management Organizations (TIMOs), were well-positioned to buy timberlands because they were flush with capital – most of it provided by large institutional and high-net-worth investors who were attracted to timberland’s modest risk profile and history of impressive returns. Unlike forest products companies, which focused almost exclusively on timber production, these new investment-oriented forest owners also seek to generate returns from parceling, fragmenting, and selling land to private recreation buyers, timber liquidators, and real estate developers.

This shift to short-term investment-oriented ownership has had serious implications for forest conservation. By over-harvesting timber and fragmenting large tracts into smaller parcels, these sales erode the region’s ecological integrity and long-term ability to maintain a viable working forest infrastructure. At stake in East Texas is a multitude of endangered and rare plants and animals, miles and miles of Neches River bottomlands and globally-threatened habitats, and the loss of community identity and population. The Neches River hardwood bottomlands and longleaf pine forests have long been identified as one of the South’s last best intact ecosystems by the FWS, the State of Texas, The Nature Conservancy, and TCF. Downstream, these forests and their watersheds protect drinking water, minimize urban flooding, and clean the air breathed by millions of Texas residents.

Of these lands for sale, The Conservation Fund, with our partners, identified for protection 350,000 acres of East Texas’ most pristine and ecologically valuable river bottom and longleaf pine habitats. For the nation, this is a rare opportunity to conserve forever the best of the East Texas forests that forest products companies, in particular Temple-Inland, assembled, managed and enhanced for decades. These large tracts along the Neches and Sabine Rivers and within Longleaf Ridge are still relatively intact, however as lands continue to change hands, these forests will be fragmented into increasingly smaller pieces and managed in ways incompatible with wildlife protection and regional economic development.

America’s Great Outdoors campaign should recognize that Americans typically take great pride in where they live – their neighborhood, town, metropolitan area and region – but may need some help in understanding how the natural and cultural assets at these various scales can provide increased sustainable economic returns as well as environmental and social ones. Small grants for various forms of technical assistance and education can be essential in increasing access to outdoor resources, developing stewardship needed for the long-term sustainability of land and water resources, and ensuring a livelihood can be made by those taking the lead to conserve America’s many special places for current and future generations. There are several proven ways to build on the pride of place to address environmental, economic, and social challenges, for example:

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

At the Fund, we believe kids have a basic right to a healthy childhood. With major advances in medicine, education and other fields, kids today should enjoy a higher quality of life than ever before. But children are developing chronic health conditions, such as obesity and depression, earlier and more frequently than ever before. Researchers suggest that the decline in children's health is linked, in part, to their growing disconnect from nature and outdoor activity. Children's disconnect from nature, if left unchecked, shortchanges their health and happiness now—and creates a future generation of adults that are less healthy. At the Fund, we also believe that young people who grow up without experiencing nature are much less likely as adults to be strong champions for protecting the outdoors. Kids today already are developing new ways to coordinate, collaborate and communicate for the issues they care about. Let's get the outdoors back on the agenda.

In addition to our wildest public lands, Americans enjoy city parks, waterways and green spaces. While experiencing nature is part of our heritage, we need to ensure that future generations have the opportunity to reconnect with nature.

While conservation successes are significant, so has been the pace of development, resulting in fragmentation of habitat and threats to water quality, as well as the ever-increasing effects of climate change. Our society needs to act boldly to address threats and protect nature for future generations.

We envision a future where there is a recognized national network of natural lands, ranging from city parks to national parks, wildlife refuges, waterways and wilderness areas, that are recognized by all Americans as part of our natural heritage.

These lands need to be protected and connected into the network. But America's Great Outdoors also is about better connecting people, especially our children, to nature. And it is about connecting people to each other, acknowledging that the best conservation outcomes occur when people work together.

While some of our public lands are pristine, many other areas have been degraded due to development in the form of road building, logging, oil and gas drilling and grazing. Many of these lands are the most productive and ecologically diverse lands in the public estate.

People are losing their connection with nature and America's Great Outdoors can focus efforts to help restore people's connection to nature.

As population pressures grow, so too will public demand for additional portals to nature. It is our generation's duty to carry on the tradition of previous generations to protect special places as national parks, wilderness, city parks, waterways, picnic areas and greenways. At the same time, we need to bolster our programs to ensure people have access to these lands through recreation and education programs.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While the boundaries and configuration of public lands that have been reserved for particular purposes such as parks, forests, watersheds and wildlife refuges have some semblance of order, the 254 million acres of BLM lands do not. They are a crazy-quilt pattern that does not lend themselves to effective or efficient land and resource management. As we look to manage for habitat connectivity and climate change adaptation, these land tenure patterns become even more onerous, reflecting the 19th century mentality of public lands for private purposes instead of a 21st century ethic of public land conservation.

In addition to private in-holdings, hundreds of thousands of acres of isolated state trust lands are dedicated to generating revenue and reside surrounded by BLM lands. Between 1862 and 1871 Congress granted 128 million acres to corporations for the construction of railroads. These railroad “checkerboard lands” cross vast swaths of the West making management of wildlife and habitat a nightmare. Nearly 150 years later, this legacy is most notable in Montana, Wyoming and Nevada, but can still be seen in states such as Idaho, Oregon, New Mexico and Arizona.

Core wildlands also are the cornerstones of large landscape protection. The ecological health and longevity of wildlands relies on the health and resiliency of larger landscapes. Therefore wildland designations are integrally linked to landscape-scale conservation. Wildlands designation efforts need to balance community needs and interests, economic issues and realities, and bring together a range of stakeholders in order to be successful in both the near and longer term. The Administration can play a key role in supporting both informal and formal collaboration to develop wildland designation proposals as part of landscape-scale conservation. For example, the Administration can encourage and support lawmakers to designate new conservation units across land management agencies, promote more integrated cross-agency planning and management of wildlands and landscapes, and develop and promote agency policies that ensure our wildlands are managed to retain their integrity and contribute to the conservation and connectivity of larger landscapes.

There are currently iconic special places that are unprotected and in need of immediate protection to forever protect the wildlife, cultural, historic or wild land values these lands hold.

In addition, there are some iconic landscapes that merit protection. In many of these areas, there is already strong on the ground support, comprised of diverse stakeholders that fully support National Monument designation as a way to protect key values found on the lands.

Past BLM leadership has never realized the untapped potential of ACECs, yet all of the authority currently exists to vastly improve conservation on tens of millions of acres of sensitive BLM lands. Unfortunately, BLM has not distinguished between ACECs that have been designated due to fragile or sensitive soils from those designated to protect rare archeological resources or unique wildlife habitat. The U.S. Fish and Wildlife Service has designated 25 million acres of BLM lands as critical habitat for listed and sensitive species, yet BLM has not used the ACEC designation to further the protection and management of these critical environmental resources.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While some of these lands hold some of our most pristine wilderness areas, other areas have seen much development in the form of road building, logging, oil and gas drilling and grazing. In the case of the Forest Service, nearly half of its 193 million acres have been roaded and developed.

Without question, one of the leading causes of water quality and watershed impairment on our national forests is sediment derived from decaying and under-maintained roads. The Forest Service manages about 375,000 miles of roads, enough to circumnavigate the Earth 15 times, yet only maintains to standard on average 20% of this massive system each year.

In 2001, the Forest Service estimated that its road system was oversized by approximately 25-40%, and promulgated a rule requiring it to identify its minimum necessary road system and roads for decommissioning. The idea was to develop a blueprint to guide the rightsizing of the over-extended system in a way that restores water quality, fisheries, and endangered species, reduces long-term costs, facilitates access to popular recreation destinations, and creates restoration jobs around road decommissioning and stormproofing in rural communities.

Create a team to transfer knowledge around successful collaboration efforts to other staff of the Forest Service, partners and future collaborators. Too often, some efforts are successful, but the agency fails to spread the information of that success to other parts of the country.

In the view of many past and present agency employees, a budget that is tightly prescribed/micromanaged by Congress and that has far too many line items is one of the biggest deterrents to the agency spending more time, energy and money on restoration. While poorly framed and rolled out, the intent of the new Integrated Resource Restoration line item in the President's Budget was to create more flexibility for regional foresters and forest supervisors to plan and fund for interdisciplinary restoration projects at the landscape scale. The following changes could help address this:

Work with appropriators to ensure that Stewardship Contracting does not score on the budget. It hasn't up to this point, but some on the Hill are advocating to ensure it does score. If this happens, its use could decrease greatly.

Roads to Trails Program. Roads are the biggest threat to clean water in our National Forests. In 2001, the Forest Service estimated that between 75,000 – 115,000 miles of these roads were no longer needed. In addition, the Forest Service is about to kick off a nationwide effort to identify mile-by-mile every unneeded road. By converting even a small percentage of these roads to hiking and biking trails, we can turn an environmental liability into a treasured community asset. Roads-to-trails projects are already being accomplished on a limited scale (for example, on Mt. Hood National Forest in Oregon, where the recent wilderness bill authorized roads-to-trails conversions), but could be easily scaled to a national level.

Address the worst barriers immediately through rapid administrative action, including seeking a letter from the head of each land management agency interpreting their policy guidance in a way that prevents groups serving disadvantaged youth from being captured in the "commercial guides" class, but still requires these groups to register with the agency before taking trips out.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

\_\_\_Says- " I just want some trails and the wilderness to remain off limits to them, so I can safely recreate the way I want to. " Then it seems selfishness is your motivation, eh?

Just because you can drive in an area and it is not over run and tainted does not mean there is no need for preservation and conservation. We need to plan carefully today if we are to preserve wild areas into the future.

Do you understand that Wilderness designations are a Federal Govt program? Do you honestly believe that steps are not being taken constantly by local land managers from the BLM and USFS to preserve wild areas? Do you think the Federal Govt knows better than the people schooled in this field and working on site? Do you know that Wilderness means trying to access millions of acres of land on foot? There are much better solutions than Wilderness, the land of no uses. What good is land, while "pristine", that nobody will ever see?

There is more to our remaining wild lands than what recreation we can use them for. I believe the only way to preserve land for the long term is through the federal government. I don't see how some people feel "locked out" of anything when the only thing not allowed in wilderness designated areas is motorized/mechanical vehicles. There is only 2% of the land in the lower 48 states that is designated wilderness. It seems some want roads in every last part of the country. If these areas aren't protected in some way, eventually they will not be wild anymore. You have to look past the next few weeks. I think steps are being taken to preserve wild areas. I also think steps are being taken to develop wild areas by others.

I suspect the question has been answered to your satisfaction but I would like some scientific proof regarding the implication we are sacrificing species in their natural habitats. Steven, You once again choose to manipulate the numbers to suit your argument. How about 33% of USFS land is designated Wilderness. Hits home a little more effectively when you put it in context. Do we really need to close more than 1/3 of the forest? There is enough Wilderness designation to cover the state of California. I have told you specifically why I feel locked out, 8 Wilderness designations within an hour of my home in addition to millions of acres of "closed to motorized use" USFS land. You don't THINK we are being squeezed, I KNOW we are because I live in the places you want to close. Fact is, the Federal Government is in violation of the Constitution of the United States of America for meddling in States issues. Land protection within states borders is NOT a Federal issue, it is a State issue. We need local solutions, not you clowns living thousands of miles from ground zero making choices for us.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I will stick by my comment you quoted. These remain local land use issues, unless you have been visiting often, I am not sure why you care? Is it because the sky is falling, the temperature and the oceans are rising, entire species of wildlife are sucked through the engine of my snowmobile and gone from the earth forever. Spare me the tug at the heartstrings. Steven, On the issue of compromise. Compromise is when there is a give and take between parties. In this case we have the environmentalists that want public lands closed to motorized use. We then have the motorized users who want to keep the lands open. The question is simple, if it is a compromise, why has the motorized community only lost access to public land? And if compromise is what you seek from me, here it is. Rather than file for a federal protection that ties the hands of land managers so tightly it is often detrimental to the forest health. Manage the land via the local level. Land Managers are college educated and have a passion for the public lands. These people know better than you or the bueracrats in Washington. If you can not see Wilderness designations as motorized access closures, that is a choice. They are in fact motorized closures. We have enough of them, 25% is more than enough. I pay my taxes and I vote, otherwise I wouldn't have much cause the dispute this with you, would I?

By closing lands to motorized access you are keeping people out. Since I happen to live near millions of acres of wilderness, I can tell you from experience that wilderness closures keep the vast majority of the public from gaining access. I agree that some wilderness is needed. We have at least 25% of forest service lands in this program, well over 100 million acres. That is more than enough. Are you honestly telling me that you review and advocate for/against wilderness proposals? Do you visit the lands in question before making a decision? This sounds like you have completely made it up. I snowmobile in an area of proposed wilderness. It is an existing use, can I expect your support to try and stop this expansion? Isn't it completely contrary to state that OHV use has grown so the lands open to them have shrunk? This is PUBLIC land we are talking about. If a user group grows, so should the lands open to them. It is so ridiculous now that I am fighting just to keep motorized and non motorized areas somewhat equal, which they are not. I cover 10 times the land of a skier, shouldn't I have 10 times the amount open to prevent user conflicts? So the people that want to USE the land are being told they can not because people who never use the land want to save it for posterity? You keep bringing up "open to development". We have a rule right now that states the USFS can not build a new road, unless they decommission the same amount of old road. As far as I know the USFS is not out selling off parcels for development, not where I am anyway. Our national forests are protected, well protected, wilderness designations once were helpful, today it is an outdated designation that is no longer the corect land management tool. Well, compromise is not what we have. What we have is 200 million acres of public lands closed to motorized use. We do not have any lands closed to non motorized users. Show me where the compromise exists? If you do not think it is the goal of environmental groups to stop all motorized access in the forests, you simply are not paying attention. It is all over this website, it is clearly stated on the websites of the groups pushing the adgenda. If most environmentalists do not want this, they need to start paying closer attention to the groups that claim them as supporters. If no motorized access in wilderness is the goal, then the compromise needs to be, no more new wilderness.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You came in on this discussion late and you are beating a dead horse, so to speak. \_\_\_ is a moderate person who has always said there is room for everyone. I, on the other hand, think OHVs should be given no access because OHV access costs taxpayers money. You want to cruise around and screw up the land for your entertainment and you want taxpayers to allow you to do that, even though your behavior causes erosion and gullying and degradation of water resources, and for what, just so \_\_\_ can get his ya yas in any manner that suits him. If you don't like the confines of that wilderness area next door, for Christ's sake, move. There's plenty of places to live where you won't have to ever look at a wilderness ever again.

I am tired of you thinking you have a free pass in these discussions to make false statements and intentionally try to steer topics off course so you can insert some touchy feely comments, or take a personal shot at other contributors. Expect me to show up and try keep you honest ;-). Beating a dead horse? Why because I agree with the idea as stated? Wildlife does not require anymore Wilderness designation. I will shout it from the mountaintops as long as there is breath in my lungs, better get used to it. OHV's pay their way, they always have. Please substantiate your claim that OHV use is a taxpayer burden. Even if it were, you do accept that a huge percentage of the population that pays taxes also use OHV's. When do we have our say? You also have no proof that OHV's "screw up the land", another hysterical unsubstantiated claim. I do not need to move, but you can rest assured that I will vehemently oppose all new Wilderness expansions. As mentioned elsewhere, the original Wilderness bill identified 20 million acres as suitable for the designation, today we have 6 times that amount. We simply do not need anymore. In that respect I fully support the "idea" as posted.

What I said is I advocate wilderness. That means I support it. I didn't say anything about reviewing and advocating for or against proposals. In my view, there too little wilderness land and I can't say I would be against any proposal. Although I would also say I advocate wilderness that is truly wilderness. I don't think the 2% we have now will be enough as the population grows. It may be enough now, since there are still areas that are wild and have not been protected. These areas will be fewer and fewer as we go forward. I did also say I advocate some existing uses remain in wilderness expansions. That seems reasonable to me. As the population grows and OHV use also expands, won't all areas eventually become crowded, even if every area is open to OHV use? When talking about national forests being open to development, it refers to things like mining, logging, drilling, etc. These areas are already covered with roads and have plenty of access.

The argument about areas being closed because it does not allow motorized access is still odd to me. When considering use, areas without roads are important to wildlife and clean air/clean water. These are issues to consider along with what recreation we are allowed to participate in on the land.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Please explain to me what you think the merits of a Wilderness designation are? Do you realize that the land locked up as Wilderness is no longer actively managed by the forest service? Do you realize that if there is a fire the mandate is to let it run wild within the wilderness? Do you realize that the rule is supposed to be no motorized incursions including the for the rescue of human lives? Now that some of the new expansions are within less than 1 mile from towns, what will that wilderness look like when it burns to the ground? What happens to the watershed that was supposedly protected by the designation? You state that you do not think 2% is enough. Is it enough that 1/3 of the forests are already wilderness? The 2% number is thrown out there to make it sound like there really isn't much protected land. That is because very little land in this country fits the designation. Did you know that the original plan was for 20 million acres? Do you know that we are now at 6 times that amount? How much forest land do you want closed, 50%, 75%, 100%? When will you be satisfied that it is enough, and what to you base that desire on, facts or emotions? Maybe it is substantially different where you live. In the mountains the access is much more challenging. There are precious few with the stamina to access wilderness areas here on foot. You can preach all day long that it isn't closed because you can walk in but you miss the fact that a substantial portion of the population is not physically able to make good on their desire to see these lands. So if you are somehow physically not able, it is just tough luck? Is that how this country is supposed to work? The point is, the 2% figure is wildly misleading. That needs to be viewed in the context of land even somewhat worthy of the designation. So 33% of public forest lands are already Wilderness. So lets be honest, 1/3 of the forest is already protected as you desire, and that isn't enough? You also want to revisit "development". Those issues, logging, mining, and drilling are all limited, and already managed under the pervue of USFS and BLM land managers. Development isn't the rampant beast you want to portrait. We have plenty of Wilderness designations already. Additional closures do not meet the criteria of the law.

You talk about environmentalists making exaggerated claims to make points and spread propaganda, your posts are nothing but exaggerations and propaganda. What's this "do you realize" crap? Like I said before, why don't you move to a city and quit trying to make the wilderness into one.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Well, the "do you realize" is meant to illustrate that I do not think most people understand what a Wilderness designation really means for the lands themselves. It is a dangerous, hand tying proposition with little merit to existing forest lands. If you could focus on facts rather than what feels good and sounds good, maybe we could have a productive discussion. Please dispell my propoganda with facts, I do not want to mislead. I have never advocated for more areas with roads, not once, so no argument there. It is my belief, and maybe this incorrect but, isn't there already a forest mandate that states no new roads will be built in the forests unless old roads of the same distance are decomissioned? I agree with that. What IS happeneing, is that areas not worthy of the Wilderness designation are now proposed Wilderness. THAT is a problem. I also have a problem with the notion that Wilderness is the only or best way to protect the lands and wildlife. That simply is not factual. My opinion is that it may be one of the poorest. We probably have to disagree on that point. T.Roosevelt was a progressive, much like todays crop in the administration. That is a scary bunch unless communism is your bag. I agree areas without roads should continue to exist. If we still have roadless areas, let us keep them that way. I support the idea of closing old roads to open new, that maintains the status quo. I think Wilderness is a bit too restrictive, I have seen many negatives in pratice with this policy. I like the over snow exemption, not everywhere, but it is an accepted fact that over snow impact is not an issue in the forests. I want the govt to stop closing areas I utilize for recreation for no viable reason other than envirokooks complaining. I think we actually are on the same page though most of this.

The simple fact of the matter is that the USFS is charged, by congress, with maintaining the forests for multiple uses. One of those uses is motorized recreation. The notion that OHV are on a rampage destroying nature is unfounded. Are there some bad eggs? Sure, just like there are hikers that leave trash in the forest, there are some bad ones. We as OHV users do not want all hikers banned though because their dogs poop on trails and they leave trash in the forest. We want those people to be held accountable, just like we want the OHV users held accountable. Locking everyone out based on a small minority of rule breakers is NOT how this is supposed to work. Unfortunately, that is how it was being done. I am glad to see so many OHV participants on this site making factual, reasonable arguments for our place in the forest. My kids will learn to snowmobile in the forest this season. I can't wait to share it with them, it is THE BEST way to see the mountains.

There should be areas for OHVs. With the huge amount of roads we have, I only advocate no new roads.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The reasoning you push is the protection of the environment. The fact is, green groups have OPENLY advocated closing lands to OHV users for decades. It is about some who think their chosen form of recreation is more valid than others. Green groups have petitioned the USFS and BLM land managers to close more land citing conflicts, which they can not substantiate, damage to the environment, which they can not substantiate, noise and pollution which they can avoid in the some 190 million acres of forests closed to motorized vehicles already. There is not a policy to punish, there is an effort to punish led by an opposing land use group. Get of YOUR lazy posteriors and go to the Wilderness designations you fools ahd to have so many of. You will not see ANY motorized vehicles there. Stop trying to close more lands, that is the idea. OHV users are a legitimate forest user group. They deserve more respct than you granola crunchers extend. Then ironically, you expect us to abide by closure you pushed?

I'm a fan of preparedness, but the best plans are useless unless talented folks are empowered to react to actual disasters. The best models and brainstorming won't be able to predict the exact consequences of a hurricane, or fire or beetle infestations killing millions of trees. In almost all cases, decisions need to be made with incomplete information -- and that comes down to judgement and willingness to take risks.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Fortunately motorized recreation is a long way from "unmanaged". OHV users typically are very involved in trail maintenance and trail damage mitigation. OHV users are good land stewards, and getting better every year as the interest grows. OHV groups have participated in noise abatement and law enforcement issues to help police their sport. Unfortunately people like \_\_\_\_ appear to have enough time on their hands to go out and secure obscure photos from all over the country and present them as a problem. The fact is, there really isn't as large a problem as you suggest. Fact is the problem is much less prevalent in the last 5-10 years because forest users are being educated on protecting the lands. I have also hauled out more hiker trash from forest campsites than I have ever seen OHV users leave behind. OHV users are not the only group with "bad apples", but they are the only group owning those issues and working to correct them. Banning them from the land is not the answer. I would be curious to know who did the user group study. There sure are a lot more ATV and Jeep users in the forest where I live than hikers, though we have a lot of both in the summer. You might also start to consider that penning all the OHV users into small areas actually increases the likelihood of damage to the land. Giving them room to spread out reduces concentrated use. Clearly though, that is the tactic being employed. Close areas one after another concentrating OHV use. Then pinpoint those areas as being damaged and push to close them as well eventually attempting to lock out motorized use throughout the realm of public lands. Unfortunately for you, OHV users are a legitimate user group. They are recognized as such in travel management plans all over the country. They are rapidly growing in numbers, and they are wise to the land grabs taking place. Admittedly we are late to the party as you greenies have been stealing public lands for a couple decades but, you may see the tables start to turn soon. The general populace is tired of liberal policies and can now clearly see through the green initiatives as the hoax they really are. I suggest you get used to the idea of OHV's in the forests. I suggest that you start trying to work with OHV groups rather than demonize them. We have more than enough Wilderness designation in public holdings already. The idea presented here is one I fully support. Local land management by USFS and BLM managers, that is the answer. 120 million acres of Wilderness is more than you greenies can ever hope to hike or ski. It is also more than enough to "save" for future generations that will also likely never even see a minute percentage of it.

Irrelevant until you start telling the truth about the numbers. 97% is "dedicated" to what purposes? Do you know how much is just plain desolate land with little redeeming value? The fact is, if we consider government controlled forest lands, wilderness now covers 33% of them, that is one third of the forests closed because you think the sky is fallin?. Now you want to close more? I agree, the results of what is "recommended" is just a political scheme. The Wilderness designation is being badly abused. The original intent of the law was to protect about 20 million acres deemed suitable. Since then it has grow six times over to 120 million acres. There are far better management tools than Wilderness designation. Closing lands without the parties involved having proper representation is not how this is supposed to work. The Federal govt shouldn't be involved in it anyway.

So if it is "art" as defined by the few, it is then accpetable to upset the wild lands that offer more beauty than any "art" ever will? Can you environmentalists please try to be consistent?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Wrong again, when will you learn? Just a little quick research indicates that around 93-94% of the land in the US is considered open land. Be it farmland or forests your contention that we are using up the land, and the cities are coming to you, is a completely false idea, what you are saying is not supported by facts at all, it is propoganda and hysteria. We already have over 100 million acres of Wilderness lands set aside. My guess is that most of you will never visit even 1% of those lands. This leads me to conclude that there is plenty for those who need such an area for mental health issues. Wilderness is extremely valuble. I think that most people do not distinguish between wild lands and Wilderness designations. I am not even exactly sure what the original poster was suggesting. Wild lands can be effectively managed in many ways. Wilderness designations are rarely the best management tool. We have plenty, we need to MANAGE the remaining lands. Wilderness designations stop land managers from doing their important work.

They already have flamethrower parties in the wilderness, it's called lack of management, due to draconian rules. Wildfire. It burnt yellowstone to the ground. Oh, did you know they cut hundreds of miles of fire lines, with bulldozers? There where 25,000 fire fighters on that fire, over 100 fire fighting aircraft dumped millions of gallons of fire retardant, chainsaws where used, hundreds of fire trucks, tent cities for the fire fighters all summer, and then someone tells me how nature took care of the park and it's so beautiful again. I find environmentalist have no perspective. As for the slavery quip, motorized users aren't the one's taking land away from other American's to enjoy how they see fit, while not damaging the environment. Your the one's implementing a king's forest, where only the healthy and strong, and advantaged can use. You don't own the forest, and if popular opinion can create wilderness, a swinging pendulum of popular opinion can take it away. Your probably one of those brain washed kids that believes the rivers are dirtier today, than 40 years ago. Let me give you guys some advise, get everyone as a stake holder in the National Forests, so we'll all be there to help protect it, when the socialist go looking for a way to pay off the national debt.

The Clean Water Act does support recreation -- but that doesn't mean that even good tools can't create mayhem. We need to prevent narrow interpretation of CWA provisions -- and also look at how we can mitigate the impacts of rand trails key to recreation on water quality.

Tribal partnership and participation in the recent Lewis & Clark Bicentennial (2003-2006) and Jamestown Colony Quadricentennial (2007) taught us many lessons that can directly apply to the goals of America's Great Outdoors. We learned that, locally and nationally, Americans are intensely interested in learning about American Indian lands, histories, cultures and tribal perspectives on America's public lands and our nation's history. They want to learn more about the histories of their own communities, national parks, forests, rivers and landscapes before European settlement. They want to know how Indians took care of the land before there were "public lands.: They are interested in learning from tribal members whose lands are now national parks, monuments, forests, byways and scenic rivers. They are interested in enjoying outdoors activities offered by tribal businesses, such as guided hiking, horseback riding, bird watching, river rafting, hunting and fishing trips. They're curious about sleeping in a tipi and hearing coyotes sing in the early morning darkness. They love the stories our elders tell. They call it the wilderness, and to us it is our home that creator provided with abundance and beauty.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Today, however, our country's remarkable conservation legacy hangs in the balance. A new wave of threats could well undo what has been accomplished. The cumulative impact of these trends, if we do not respond to them, will be an accelerated fragmentation of the American landscape—the separation of plants and animals from their essential habitats, of watersheds from downstream estuaries, of people from experiences in the outdoors, and of Americans from our common historic and natural heritage.

North America and the United States are blessed with a diversity and abundance of natural resources, natural systems and habitats that have been central to our growth and prosperity as a nation and a foundation for our way of life. Despite urbanization and the increasing use of technology, our health, welfare, economy, culture and identity still depend heavily on the quality and productivity of our land, water, oceans and coasts. While we rely on nature for our well being, no place in our country is immune from at least some human impacts. We depend on nature, and it now depends upon us for its survival.

Farmers, ranchers and forest land owners are finding it increasingly difficult to retain their lands in natural resource use in the face of increasing taxes, development pressures, competing land uses and changing markets.

Climate change is affecting the productivity of rural lands and the viability of wildlife habitat; it is altering traditional wildfire regimes, hastening the spread of forest pests and diseases, producing more erratic weather patterns—more floods, droughts, and major storms, and will affect our coastlines with rising sea levels.

Intensive use and development is stressing coastal areas, near-shore waters and estuaries.

Invasive aquatic species and other pests and pathogens are becoming particularly damaging to our freshwater and forest resources.

People, particularly young urban and suburban residents, are losing their connection to the land and to experiences in nature.

Providing the American people, working as individuals and through their governments, associations and institutions with the means to achieve these goals and attain this vision is a great challenge especially given the very real financial problems now faced by governments at every level. But we cannot turn away from the threats to the health of our land and water.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Public and tribal agencies, NGOs, and local communities have come to realize that piecemeal conservation yields diminishing returns and that we should be working to conserve large natural landscapes that are defined by the needs of fish and wildlife and the way people live, work and play in these places. This category of places should also include estuaries and coastal land and seascapes. There is a groundswell of place-based, collaborative efforts to sustain large landscapes; federal funding and programs should be enhanced to empower these efforts. Large landscape efforts range from several hundred thousand acres to entire watersheds and large ecosystems. Some of many examples include: Northern Everglades, Alabama River/Mobile Delta Corridor, Central Appalachians, Hudson Valley, Penobscot River Watershed, Maumee Basin of the Great Lakes, Upper Peninsula (Michigan) Forests, Crown of the Continent, East Side Oregon Forests, the Pioneers (ID), Colorado Plateau (UT, CO, AZ, NM), Longleaf Pine Initiative, Keeping Maine's Forests Initiative, and the Northern Sierra Partnership.

Great Lakes, Chesapeake Bay, Puget Sound, Mississippi River, Gulf of Mexico/Louisiana Wetlands, California Bay Delta, Greater Everglades, Colorado River

These specific places are often talked about in the context of the America's Great Outdoors Initiative. All of them, however, already have some level of multi-agency Federal and state involvement. Some, like the Chesapeake Bay and the Everglades, have been underway for many years, but they have proceeded slowly with considerable difficulty and with varying levels of funding. Others, like the Gulf of Mexico, have never been funded comprehensively and require accelerated investment and cooperative action. Large amounts of money, invested in targeted and strategic ways, over a long time period are required to accomplish restoration of these areas and in most cases there is also a significant regulatory component required to reduce water pollution and prevent further habitat degradation.

Build the Pipeline: Employ and Empower Youth on natural landscapes through volunteer and community service opportunities, employment and other means by building upon the Department of the Interior's 21st Century Conservation Corps program. Support passage of the Public Lands Service Corps Act (H.R. 1612 / S. 1442) and similar legislative initiatives that would expand the capacity for service work on federal, state, local, tribal and private lands, build and maintain the necessary infrastructure to connect youth with the great outdoors, engage and employ youth, especially youth from communities of color, and diversify our conservation constituency.

The rapid pace of climate change is itself a direct threat to the long term sustainability of natural systems in the United States as we know them and their associated benefits to human communities (ecosystem services). Fragmented and otherwise degraded ecosystems are less able to withstand and adapt to new climate impacts. Current science and policy suggest that watershed or ecosystem scale approaches are essential to help make natural habitats more resilient to the impacts of climate change and to ensure that those systems are optimally storing and retaining carbon.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Our country faces many challenges and a good deal of uncertainty as we prepare to enter the second decade of the 21st Century. Americans are struggling, as well, to find the common ground required to solve those problems. For more than 100 years, however, most Americans have agreed on the importance of conserving our country's legacy of rich and productive land, water, and coastlines. While we have made substantial progress in protecting America's environment and conserving our natural and agricultural lands, there are, today, many threats to that progress.

In a time of soaring federal deficits, this renewed commitment to conservation will require increased funding. But much can be done by more effectively targeting existing resources and by making conservation and restoration spending more reliable, predictable and responsive to on-the-ground needs. The additional investment in things like full and dedicated funding for the Land and Water Conservation Fund is extremely small in relation to other Federal expenditures and in comparison to the immense permanent benefits derived from that investment.

Agencies do not currently have all the tools they need to target resources and facilitate partnerships necessary to efficiently and effectively achieve national goals in priority landscapes.

Current performance measures and budgeting processes do not reward, and may discourage, interagency coordination that could enhance effectiveness and efficiency.

Problem: Uncertain and unreliable funding hinder effective planning and efficient implementation of long-term projects.

A number of federal conservation programs are funded with "one year" money that must be obligated within the fiscal year for which appropriated, and related budget guidance requires agencies to submit annual funding requests and justifications for such programs. This leads to uneven, "stop and go" funding from year to year, especially where there are delays in annual appropriations legislation (a not unknown phenomenon). This creates difficulties in effective long-range interagency coordination and in the planning for and implementation of large, multi-faceted and multi-participant actions of the kind vital to an effective AGO landscape scale program. It also creates serious planning and funding problems for local, federal, tribal, and NGO partners in such programs. Evaluate programs currently funded with "one year" monies to determine those programs where the effectiveness of the program as an element of landscape-scale AGO programs would be enhanced with multi-year funding and take the appropriate administrative and legislative steps necessary to convert those programs to multi-year or "no year" funding.

Problem: Effective and efficient partnerships among agencies are hindered by the lack of authority to pool or transfer financial resources to achieve shared conservation objectives.

Problem: Each agency involved in a multi-agency or multi-unit project may be required to do a separate NEPA analysis, wasting time and resources.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Problem: The lack of sufficient funding for technical assistance to landowners prevents the most effective use of Farm Bill program funds to maximize conservation benefits.

Problem: There is currently no incentive for states to use formula-driven "stateside" LWCF grants to advance national priorities.

Climate change is already affecting our ecosystems and it would be futile to launch this initiative without discussing how you will incorporate the latest science and climate change models into your efforts to maintain and restore America's most important landscapes.

Given that we are likely to face tight budgets for the next few years, it is difficult for me to imagine how you can achieve your goals unless this effort identifies priority landscapes and relentlessly focuses staff and other resources to advance the conservation of those landscapes. I believe such a place-based approach is critical to your efforts.

#### Large Landscapes, Natural Splendor Threatened

While great strides have been made in preserving the Hudson Valley's unsurpassed beauty and history--federally recognized through the region's congressional designation as one of America's first National Heritage Areas--many of its iconic landscapes and prime agricultural lands remain under severe threat from poorly planned development.

Sprawling residential and commercial development already has dramatically eroded the region's ecological resources.

In the coming decade, the valley will contain four of New York's 10 fastest-growing counties, exerting additional pressure on open space critical to preserving the region's natural splendor and enhancing recreational opportunities. Developers' plans to meet the anticipated influx of 1.4 million new residents sit on drawing boards, awaiting economic recovery.

Scenic Hudson alone is investing approximately \$5 million annually and leveraging additional resources. But at the current pace, Saving the Land That Matters Most will take 60 years. With federal support, success can be accomplished in a decade. By making the protection of the Hudson Valley's breathtaking landscapes a pilot project of the America's Great Outdoors Initiative, the Obama administration can achieve early outcomes in connecting more people to the country's irreplaceable natural treasures.

Despite these enormous benefits, 50 acres of Hudson Valley farmland were disappearing each day prior to the recession, leading the American Farmland Trust to designate it one of the country's 10 most threatened agricultural regions. At the same time, New York's Farmland Protection Program has a \$70-million backlog of approved transactions.

Yet the estuary and its watershed face unprecedented challenges. Sprawling development is fast diminishing valley habitats; roads and subdivisions are separating wetlands and rivers from upland habitats, also polluting tributaries essential to the region's water quality. Climate change will exert tremendous additional pressure on productive tidal wetlands and signature Hudson Highlands forests.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

#### Engage Youth with the Great Outdoors

A direct correlation has been made between the declining amount of time children spend outdoors and the skyrocketing incidence of childhood obesity. In addition, studies show that children must develop a sense of respect and caring for their natural environment during their first years of life or be at risk for never developing such attitudes.

For the Great Lakes Indian Fish and Wildlife Commission's (Commission's) eleven member tribes, located in east-central Minnesota, northern Wisconsin, and the Upper Peninsula of Michigan (for more information on the Commission, see [www.glifwc.org](http://www.glifwc.org)), connecting to the outdoors provides a vital connection to culture. The exercise of the Commission's member tribes' treaty-reserved, off-reservation hunting, fishing and gathering rights depends on an abundance of healthy ecosystems that support natural resources that the tribes depend upon for cultural, subsistence, economic, and medicinal purposes. Federal courts have held that these rights cannot be exercised on most private lands, making the quality and accessibility of public land extremely important.

A number of challenges face tribes in reconnecting members, particularly youth, to the outdoors. Some of these challenges are shared by Americans of any race – the increased role of technology in our lives and the lure of cell phones, Facebook, chat rooms, video games, cable TV, and DVD movies, etc. Other challenges affect tribes disproportionately – 50% of American Indian children live in single-parent families. These parents often find themselves lacking either the skills, knowledge, financial resources, or time to participate in outdoor activities with their children.

In addition, federal government policies of the 1940's, '50's and '60's relocated tribal members to urban areas. As a result, when tribal members return home to their reservations, they often do not have the outdoor skills developed by participating in traditional Ojibwe hunting, fishing, and gathering activities.

The Commission has also developed and instructed outdoor skill workshops as part of the Intercultural Leadership Initiative, a program whose funding was recently eliminated despite the fact that it won a Harvard "Honoring Nations" award in 2008. These winter-based day camps bring together Indian and non-Indian fourth through eighth grade students before they are integrated in high school. Students from different cultural backgrounds participate in workshops such as snow-shoe making, fire-making and winter shelter building, exposing them to outdoor activities while at the same time encouraging exploration of issues related to self-image, conflict resolution, race, cultural diversity, and tolerance through experiential learning.

**Private Lands:** Most of Missouri's grasslands and forests are in private lands. A significant portion of the state is managed for agricultural production. Supporting good conservation practices on private lands is essential for protection of the great outdoors. Initiatives for conservation easements, for example, are a good tool. However, such conservation easements need to be enforced. In Missouri conservation easements have been granted along the Ozark National Scenic Riverway, but not always fully enforced by the National Park Service. Crop Reserve Programs are another way to encourage stewardship on agricultural lands.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Missouri's outdoors are perhaps best known for our Ozark rivers and streams. We are blessed with the Ozark National Scenic Riverways, which include stretches of the Current and Jacks Fork rivers and is managed by the National Park Service. That linear park is currently undergoing a revision of its management plan. The process has highlighted some glaring management problems which have been a growing concern for years. The NPS has failed to follow the mission of the Scenic and Recreational Riverways designation and has allowed numerous illegal river access points, unauthorized ATV traffic and excessive equestrian use to mar and pollute the rivers. Due to agency analysis and public input, a goal of the management review now is to focus on improving water quality and river habitat and to provide for appropriate, but not destructive, recreation. Carrying through will be a difficult task. The background message to this experience is that proper management of public lands needs to be both consistent and participatory, but always true to the mission and resource protection principles for the area. Backtracking is hard.

Developing access to our rivers and natural areas needs to take into account the circumstances of many urban residents. Travel opportunities even to areas within the state may be limited due to poverty, extended family responsibilities, and disability. Thus, providing linear parks with river access or views can help those citizens enjoy and appreciate the natural history of the area in which they live.

Recreational anglers will continue to act as good stewards of the waters they treasure, but progress must be made to maximize their buy-in when it comes to federal management actions by meeting the goals laid out below.

Goal: Give Recreational Anglers Better and More Consistent Opportunity for Input

It is critical that across the federal agencies that have a role in water and fishery resource management, the 60-million-strong recreational fishing constituency be given adequate opportunities for a formal voice in resource management decisions. Currently, this is not being addressed in marine resource management in particular and this needs to change.

The main challenge to this goal is inconsistency. There is too great a variety of current interfaces between federal resource managers and the sportfishing public. Some federal entities, such as the U.S. Fish and Wildlife Service's Sport Fishing and Boating Partnership Council (<http://www.fws.gov/sfbpc/>), give the recreational fishing community a voice in federal resource management decisions. Unfortunately, there are far too few of these opportunities, particularly when it comes to more local and regional decision-making. This is particularly true with respect to marine resource management and the current make-up of regional fisheries councils.

Goal: Collection and Use of Better, More Timely Fisheries Data

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

A fundamental challenge to gathering adequate, timely fisheries data is the reality that recreational anglers disperse across broad areas and sampling can be very difficult. Enforcement and monitoring on the freshwater side, achieved through the state fish and wildlife agencies, tends to be more easily accomplished. Inadequate gathering of recreational fishing data on the saltwater side, where the federal government has jurisdiction beyond three miles, has been hugely problematic. Over the years, NOAA has been largely focused on commercial fishing to the detriment of the recreational fishing public.

Apart from gathering and using higher quality data of recreational fishing effort, better data in general needs to be gathered regarding fish populations. Timeliness and frequency of marine fish stock assessments are far too inconsistent and a national standard for stock assessments should therefore be established.

Goal: Re-establish the Primacy of Science in Fisheries Management

Fishery management decisions, in the view of ASA, should always be made on the basis of timely and definitive scientific information. There have been trends in recent years toward protectionist management that has been based on assumptions that simply are not born out by up-to-date, adequate scientific information.

The challenge in this area has risen through the allowance of arbitrary, emotion-based management decisions made for fisheries in the absence of fully adequate scientific information. Standards have slipped in this regard and this slippage must be stopped.

Goal: Differentiate Between Public Uses and Commercial Uses

We have a goal of seeing the federal government manage our aquatic and fishery resources in a manner that much more definitively recognizes public use of resources versus private use of resources. Particularly in the area of marine management, there is an unacceptable lack of attention applied to the fact that public uses of our public ocean resources, such as fishing, boating, and diving, are very different than private uses, such as energy development, aquaculture, and commercial fishing.

The main challenge here is overcoming the mindset that commercial and industrial exploitation of our marine resources are comparable to sustainable, low-impact public uses. They are not. ASA certainly supports the extraction of resources in our public waters when such activity is managed properly and carried out in such as to not have significant, long-lasting negative impacts on the given resource. However, preferential treatment, consistent with the public trust doctrine, should be given to public, low impact uses of this same resource. The mindset at the Department of Commerce and, to some extent, the Department of Interior has not been to elevate public use of our public ocean resources.

## Discussion Question 2

Goal: Passage and Implementation of National Fish Habitat Action Plan

A tremendous amount of work has been undertaken to conserve, restore and enhance aquatic habitats because of their recreational, ecological and economic importance. While there are numerous efforts underway to address the health of aquatic habitat on local scales, there is a need for conservation action on a range-wide scale for these efforts to be successful. Given the diverse array of federal, state, tribal, local and private jurisdictions, the need never has been greater for increased action and improved coordination of fisheries conservation actions across boundaries and jurisdictions.

Goal: Full Funding for Land and Water Conservation Fund (LWCF)

ASA has joined with its partners in the recreational fishing community to focus on disturbing trends in recreational fishing recruitment and retention. Despite the fact that Americans currently have the best access to quality fishing opportunities they have had in over a generation, fewer young people are going fishing and older Americans who have fished in the past are no longer participating. We have a major overarching goal of getting new anglers out and on the water and returning lapsed anglers to the sport.

Goal: Increase Federal Support for "Take Me Fishing" Program

Goal: Clearly Identifying Access as a Management Mandate

Over the 105 year history of the Forest Service, the predominant management activity has been the extraction of timber, particularly since the close of World War II. The emphasis on extraction has often come at the expense of the health of the natural resources the agency is mandated to protect and improve. Water provides the link between all resources on our national forests. Rural communities, fish, wildlife and forests will benefit most from focusing on the protection and improvement of water and watersheds. It's important to realize that managing water is one of the oft-overlooked components of the agency's mission as defined in the Organic Act: "to secure favorable conditions of water flows."

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Importance of Water - Impacts of Climate Change on National Forests: Climate drives the hydrologic cycle. Variation in climate can play havoc with our nation's water supply<sup>1</sup>. Changes in the timing and intensity of snow and rain events can produce either regional flooding or droughts depending on the region.<sup>2</sup> Reservoirs may be swamped early in the season and dry at the end of the season. There is considerable concern about possible water shortages across portions of the nation due to hotter annual temperatures. Water supplies are affected by shrinking glaciers and decreases in snow pack as they serve as reservoirs that provide summer runoff. Furthermore, meeting the water supply needs for the ever-increasing populace also adds to the concern over water availability. The U.S. has among the highest rate of population growth of industrialized nations<sup>3</sup>.

Our national forests may soon be the most important natural system capable of capturing, retaining and releasing water. According to the Forest Service, more than 60 million Americans get their drinking water from national forest headwaters. The role of the Forest Service in protecting and managing drinking water supplies affects approximately one-fifth of United States communities, yet few Americans know or understand the important links between forest management, watershed and fisheries health, climate and change and community drinking water supplies. We believe the management of watershed and fisheries resources should be an important priority for the agency.

Forest Roads – A Great Threat to National Forest Watersheds: One of the most significant threats to forest watersheds and their biotic communities is failing forest roads. Road-caused sedimentation fouls drinking water and is one of the least publicized but most widespread of the human-caused impact on coldwater fish. At least 15 different direct negative effects from sedimentation have been demonstrated to impact trout and salmon, ranging from stress, to altered behavior, to reductions in growth and to direct mortality<sup>5</sup>. Muddy water from failing forest roads makes streams wider, shallower and more susceptible to warming, thus harming fish that thrive in clear, cold water. Silt harms the gills of salmon and trout and smothers fish eggs when it settles into the clean gravel bed.

The same sediment fouls drinking water and may result in the need for communities to build expensive water filtration systems. Unmaintained roads, especially in mountainous regions, are more likely to fail in severe storm events, contributing massive amounts of sediment to streams. In 2006 and 2007 alone severe storms in the Pacific Northwest led to massive road failures and road-triggered landslides, resulting in tens of millions of dollars of damage to public and private lands. Storms such as this are increasing in both severity and frequency, likely due to climate change, further bolstering the need for an immediate investment in restoration.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Roads fragment wildlife habitat, spread non-native invasive plants, pests and pathogens, reduce wildlife security, increase the incidence of poaching and increase edge effects. They also lead to direct mortality through wildlife-vehicle collisions. Studies have found road densities of one mile of road per square mile of land as an average threshold above which roads will start to have negative impacts on wildlife. For example, elk habitat effectiveness decreases by 25% at 1 mi/mi<sup>2</sup> and 50% at 2mi/mi<sup>2</sup> 6. There is also a strong negative relationship between road density and population fitness of grizzly bears<sup>7</sup>. Roads act as complete barriers to movement for some small mammals, reptiles and amphibians<sup>8</sup>. When old jammer roads and motorized routes are added in to road density analyses, road densities exceed 20 m/m<sup>2</sup> in specific areas on numerous national forests, resulting in severe degradation of wildlife habitat.

State of Forest Roads: At best, only 21%<sup>9</sup> of national forest roads are currently maintained to "standard." The Forest Service never planned for nor assessed the impact of its extremely limited maintenance capacity on forest and water resources, and the impact becomes exponentially more significant each year. In 2001, the Forest Service estimated that it could remove nearly a third of its entire road system<sup>10</sup> (up to 186,000 miles out of the total 380,000 mile system), while still meeting the resource management and recreational needs of forest users. Many of these roads were built for obsolete logging systems and now are largely abandoned and prone to landslides from heavy rains or snowmelt. There is ample opportunity to put people to work restoring watersheds and remediating road problems.

To guarantee that Legacy Roads and Trails Remediation funds are spent effectively, it is essential that the Forest Service develops a strategy to rightsize its oversized, failing road system. The Forest Service estimated their road maintenance backlog at nearly \$8 billion in 2002<sup>11</sup> -- although when administrative and indirect costs are included the backlog may be closer to \$10.3billion<sup>12</sup>. Shrinking maintenance budgets have resulted in the downgrading of thousands of miles of passenger vehicle roads to high-clearance vehicle roads. At the end of 2006, the Forest Service estimated that the road maintenance backlog is now \$4.1 billion<sup>13</sup> but it is likely that this reduction comes not as a result of improved road management, but as a result of maintenance level reclassification (the agency budgets far less money per mile to maintain high-clearance vehicle roads as opposed to passenger vehicle roads). This creates the fiscal illusion that roads have been repaired but, in fact, the majority of the system is not being maintained (80% of the system is high-clearance or closed roads). It is this 80%, the vast majority of the Forest Service road system, that provides the least access and causes the greatest ecological harm.

***(cont.)***

National Parks in and around Urban Areas - Especially in the "Shrinking Cities" of the Rust Belt. Create more National Parks in and around urban cores. An excellent example is the Golden Gate National Recreation Area around San Francisco which offers exceptional and accessible outdoor recreational opportunities to many urban dwellers. It has also helped to prevent urban sprawl, and attracted national and international companies that understand that quality of life in and around a city is important to attracting high quality employees, especially in a knowledge economy. Applying this proven strategy to the shrinking cities of the struggling rust belt states could be pivotal to their long term economic recovery. For example there is lots of coastal and riverside land around the Great Lakes has been abandoned due to industry shut downs and foreclosures. With the help of federal dollars and local conservation initiatives, these lands could be restored to become some of tomorrow's proudest new National Parks/Recreation Areas/Monuments. Allow the struggling economy and abandonment in these states to be an opportunity for large scale outdoor urban recreation and habitat conservation corridors. For this idea there is no better time to act than now.

Thanks so much for all the conversation on this point. I am intentionally avoiding a discussion of the technicalities of what liability issues should be surmounted, how a recreation easement should be written into law, etc. I can't take credit for this "recreation easement" idea. It was a unique point, generated in the homegrown listening session that NOLS co-sponsored. We felt it deserved inclusion in this ideas space, as did all the themes and presidential messages that came out of our session. Access to private lands, or across private lands to public lands, has been a significant issue in Wyoming for many years. Your access to a favored recreation destination often depends on your personal relationship with a landowner who owns the private land between you and that destination. It is appropriate to consider many of these public lands with know public access as de-facto private lands. Conservation easements are gaining in popularity in our state, as traditional ranching families, who anticipate selling the family ranch, seek solutions to preserve the unique and diverse nature of their home place. The success of conservation easements spurred a discussion of recreation easements, where access rights could actually be sold, and maintained by a separate entity. This is one of many thoughts regarding access that came up in our America's Great Outdoors - Central Wyoming Forum.

one problem with grazing is that cattle are an introduced species that compete for the same resources as native creatures upsetting the ecosystem. Another issue is BLM is holding in "trust" Indian land and not paying them for it and mismanaging the land in the process.

"Stewardship is often talked about, but not practiced much" How loosely some people refer to themselves as environmentalists. I once heard someone refer to themselves as "going green" by drinking bottled water.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Here we go with the welfare forest user again. Roads cost big bucks to maintain. If they are not being used to extract some resource that is worth way more than road construction and maintenance costs, then those roads are costing taxpayers all across the country, money that could be spent on schools, health care, police. Branden wants this welfare cost to be permanently locked in by making the government do an expensive, taxpayer funded EIS just to close a road. It's a ridiculous idea.

I noticed in the article you linked to that the county is taking responsibility for maintaining the rs2477 road. I assume that costs quite a bit. I hope the road goes somewhere worthy of the expenditure. In my area a load of gravel costs over \$200. The grader in the background must be a hundred bucks an hour. Sounds like Kane County is spending big taxpayers dollars, including the court battle. I bet not everyone in Kane County is happy with that!

I don't see anywhere any attempt to control your access to federal government land. You may not be allowed to bring your truck along though. Trucks have a different set of rules. They are called objects, not people and are not participants in our society, though people like you, who probably call their truck , have trouble differentiating between a babe and a truck.

Motorized use makes the land closed to hikers and quiet seekers by design. Hikers don't like the noise and pollution, so they go elsewhere. I wish that hikers could be offensive to OHVers, maybe by crapping in the OHV tracks, so OHVers would know what we mean when we say YOU'RE OFFENSIVE. But alas, hikers aren't offensive. We're nice. So motorized users will probably never understand.

I decided to see what the buzz was all about with OHVs being so wonderful, so I drove up in the woods with my honda civic and found a skinny, ratty dirt road with lots of potholes and rocks popping up. I got on it and for a half hour I wove in and out and barely kept the oil pan from getting crunched. I had to watch the road like a hawk so I didn't see any scenery, just the road bed. I found a place to turn around and then I had to do it all again, for another half hour. I had on my heart monitor and I didn't see any increase in beats per minute. And I was kind of bored with the whole experience because I didn't get anywhere I couldn't have walked to in half the time, and walking, I would have smelled the roses, so to speak.

I mostly told that story about my OHV experience today to point out that my heart rate never went up at any time during the ride. I think that when people claim that OHVing is healthy, they are lying. When they say it connects them with nature, they are exaggerating. I didn't mean to imply that, just because I don't enjoy bumping down a ratty road, you shouldn't enjoy it. But really, hiking is infinitely better for you and you'll see a lot more of nature.

Glad you got out for the weekend. Put some black carbon on an ice cube and set it in the sun next to a regular ice cube and tell me which one melts first. Now, once the black carbon ice cube melts, put the remainder of the regular ice cube in your margarita and notice that, though the carbon cube would not make it colder, the non- carbon cube still makes your drink refreshing. I like refreshing. I don't like tepid. And the economic cost of melting the ice cap is going to be astounding. There's no doubt about it. Your so called studies were done by the oil industry.

***(cont.)***

Jets that leave trails in the shape of tic tac toe games are insulting to nature. Jet trails all over the sky and the shapes they create are insulting to nature and those who look to nature for artistic and design ideas. Jet trails make national park visits less meaningful by destroying the sublime lines of the natural world. Tic tac toe game looking clouds in the sky can't have a positive impact on children's minds. Jets should not be allowed over or upwind from national parks.

You need to pay the full cost of your actions and quit sluffing off. Take responsibility for your actions. I don't want to pay for your actions. Don't ask me for welfare. If you are screwing up my national park by flying over it, you are stealing from me. Pay up.

I said the contrails are insulting to Nature. I don't think you likin em makes em um um good.

I never said anything about my vision of a contrail making it insulting to nature. That's your interpretation and it is an intentional twist to warp this conversation. \_\_\_\_\_, go drink your own bong water. I don't have any.

Natures lines are sublime and could teach you something about the world you live in, if you were receptive. Instead people like you try to superimpose your trite vision over the sublime lines of nature. I guess that makes you more comfortable with the world. But it's insulting to everything that is bigger than you, and to the people who are not afraid to look at the world the way it really is.

Well let's give \_\_\_\_\_ some peace of mind and do a full EIS on contrails affecting public land so s collins and all his family and his little dog wolfie can sleep good tonight and not have to worry about terrorists.

Weather modification destroys recreation. Here is a satellite photo taken yesterday that shows a wide area of manmade weather. These manmade clouds are over the northwest US and they decrease my interest in going outdoors and recreating. Now, if you keep your head down and never look up, you probably wouldn't notice that the sky had the look of a big tic tac toe game, but if you like a real wilderness experience, this crap has got to stop! { <a href="http://rapidfire.sci.gsfc.nasa.gov/subsets/?subset=USA1.2010285.terra.1km" rel="nofollow" target="\_blank">Link</a> }

There are many theories and I'm sure that they all are possible, especially in light of the recently exposed syphilis experiments. { <a href="http://www.reuters.com/article/idUSTRE6903RZ20101001" rel="nofollow" target="\_blank">Link</a> } If you expanded on this idea or listed a new idea I would appreciate it. Aerial spraying of chemicals is a subject barely touched on in this forum and it definitely affects health and recreation and public lands wildlife and plants.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

The border of Glacier Park is the center of the river, so mining on the North Fork, which is crystal clear, will affect the water quality inside the national park. It's time for the US to add the whole North Fork Flathead River to Glacier NP. It's certainly scenic enough! And \_\_\_\_\_: you saying that, because the glaciers are going to be gone soon, it's OK for us to continue down fossil fuel road, just demonstrates how cynical humans really are. Here's how the human mind works: someone sees a beautiful place and they dump their garbage there. A bunch more people of the lowest common denominator see the garbage and they think it's a dump so they dump their garbage there. Pretty soon the county make's it into a bonafied dump site. Someone says clean it up, it should have always been a national park. But the majority say, it's a dump, it's always been a dump. We have to make the world better. It's easy to degrade everything, but it's hard to clean it up. Around Glacier Park, one of our oldest national parks, we can clean it up.

Control carbon at the source, geoengineering is not an option. Heres a link to a Washington post article: Threat of global warming sparks U.S. interest in geoengineering { <a href="http://www.washingtonpost.com/wp-dyn/content/article/2010/10/03/AR2010100303458.html" rel="nofollow" target="\_blank">Link</a> } There is only one solution to climate altering carbon. We have to produce less of it. A lot less. And we have to do it right now. Making Earth and all of it's inhabitants part of a global geoengineering experiment is scandalous and downright evil and would be a heinous crime against humanity and nature that will cause the slow death of millions of people and the extinction of species on a massive scale. Allowing the heat to come on is the only way people will come to see the light about alternative energy. Here's another article from London's top newspaper. { <a href="http://www.guardian.co.uk/environment/2009/jan/28/iron-carbon-oceans" rel="nofollow" target="\_blank">Link</a> }

Geoengineering in itself is a massive experiment. Any participation of anyone or government in any form of geoengineering that is meant to reduce the affects of carbon dioxide pollution and lower global temperatures is an experiment that, I assume, will be performed without the permission of the people of our country. That experiment, which will include stratospheric Welsbach cloud seeding from jet airliners as outlined in a 1991 patent by Hughes Aircraft { <a href="http://www.freepatentsonline.com/5003186.html" rel="nofollow" target="\_blank">Link</a> }, and ocean fertilization with iron to induce plankton blooms, will have grave side effects that will reduce the diversity of lifeforms on Earth. It is likely that many people will also suffer from this geoengineering of our planet because people will be breathing airborne mining waste pm2.5 every single day, indefinitely, in doses that will definitely have health effects. Geoengineering will give mining companies incentives to create and disperse mining waste into the environment, into the upper atmosphere, where it will eventually fall to the ground, without environmental review or critique, as they will call this dispersal recycling. Because geoengineering will all be an experiment, as there are no set of results that will be widely understood, and all of humanity will be affected without their permission, and geoengineering will definitely have health effects that will cause death to some people, probably a large portion of Earths population, this will be a crime against humanity and any perpetrators will be criminals.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

\_\_\_\_\_ said "But if scientist don't have the ability or are not allowed (by ideas such as this one) we would never know what may work and what would not work." They don't have permission to do geoengineering. If they do it, it's a criminal act, like rape. It is a violation of someone's body without permission. It's that simple. And I'm not talking about whitewashing rooftops. I said stratospheric seeding and ocean fertilization.

When I post an idea here it is for the people who initiated this list. It doesn't really matter if any one individual gets my drift or not. When the Obama administration refers to geoengineering to combat climate change, they are talking about a drastic alternative to carbon dioxide emission cuts which are proving to be politically unlikely because oil and coal money gets politicians elected. They are not talking about small actions. They are talking about hundreds of billions of dollars of geoengineering. If you think that you are just going to skate by and ignore the results of that geoengineering, you are sadly mistaken. You will be a part of an experiment without your permission, just like I will. And that experiment may have deadly consequences for you and your family, or worse yet, it may ruin the great outdoors so no one can ever enjoy it ever again.

\_\_\_\_\_ has absolutely no proof regarding any of the statements he has made. All the geoengineering articles I have read, which is many, (and they are available by simply typing geoengineering into a search engine) state that there could be dire consequences with experiments of this kind.

For every action there is an equal and opposite reaction. If we do something massive ( I'm talking massive, not just changing the color of our buildings or replanting trees that we've cut down) here in the USA, it will change something in the opposite way somewhere else on the planet. Now, a well educated guy like you should know that!

Trails in environmentally sensitive areas have always been rerouted and the damaging trails are closed permanently. I've never seen any sign of a hiker trying to reopen a wet meadow trail that was closed. I have seen plenty of OHVers try to open paths that were closed to protect the environment, and when they get to the wet meadows, they usually spin brodies all over them. It's just an entirely different way of thinking.

I see you have made one comment and have, to this date, cast one vote. You are villifying government employees and making it seem like they are somehow less worthy of jobs than the private sector. The private sector doesn't do a lot of things that are important to your life, like educate your kids, surface your roads and give you access to hunting and fishing. You disagree with some of the ways the government spends your tax money but you agree with some of the expenses. Same with me, but I think they should spend a lot more on research and monitoring and a lot less on roads. The government is the only entity that has enough money to regulate big corporations to protect little people like yourself from becoming slaves. As for government overspending, the whole world is in an economic crisis that is far from solved. If we don't spend money to get out of it we'll all be eating rat. Maybe spending the money won't get us out of it anyway, but we have nothing to loose.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

\_\_\_\_\_ said "Keep all the land open and MANAGE IT. Thus the USDA has a job to do." A great deal of the world has been stripped of trees. For centuries the hills of Ireland have had nothing but grass growing on them. The soil on those hills was so bad that crops would not even grow. So in order to plant a garden, inhabitants had to drag seaweed up from the ocean to make soil that would grow potatoes. In other words, where humans occupy the land for many years, eventually the land will be totally destroyed. That is our history. That is what will happen here in the USA. We have swept from coast to coast pillaging all of this continents resources in just 2 centuries. This is what humans call "management". It will not be very long before we are all sitting on a rock in a desert hoping that a goat we own will feed our families one more day. The human direction in this world is like an arrow that is shot and it will not veer from its course until it hits the target.

I think your statements are correct but incomplete. There may be more trees but there is much less biomass. Many forest stands are unhealthy and overstocked and prone to fire, but land managers have proven over the years that they are incompetent and are slowly but surly aiming at completely stripping the ground of all the forests over the next century, for mines, cities, power plants, toxic spills, wood products, and most widely, air pollution.

\_\_\_\_\_ said "Next time you are on an airplane, look out the window. " Most people on aircraft are too scared to look out the window, so they miss an incredible opportunity to see an overview of what people are doing to the planet. 1) the sky is becoming permanently brown throughout the northern hemisphere. 2) almost all of the land is being used by people 3) the population density is increasing in all areas that are not owned by the government 4) most of the USA is deforested for farms, cities, roads. 5) wilderness areas look remarkably beautiful even from 30,000 feet

Arctic Ocean should be off limits to development!. Russia is expanding their boundaries into the arctic for oil and gas development. The USA should also extend it's boundaries to the north into arctic waters and then declare those waters as off limits to development of any kind. The reason the Arctic Ocean is on the front burner right now, and you can look at news stories about this on the BBC website, is that global warming is making the ice cap melt and that ocean is becoming accessible. Drilling for oil and gas there will make global warming worse, which is the opposite of what we need. It is absolutely counterproductive and counter intuitive to take advantage of the catastrophe of global warming and make it even worse.

Invisible Benzene and the Great Outdoors. Benzene flows invisible, like rivers, down the canyons from freeways and factories. People have heart palpitations and doctors say that is normal. It ain't normal. People swarm the shelves for herbal remedies looking for something to make themselves feel better. How are we supposed to get out and enjoy the wild if benzene has made the whole atmosphere poisonous? In my area, the government doesn't even monitor gasses you can't see. It's not good for the chamber of commerce, I guess. They don't want to know. The fed needs to toughen measuring standards for benzene and invisible atmospheric pollutants. Sick people don't get out and recreate.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

Here is a link describing benzene from the epa website.

[www.epa.gov/ttn/atw/hlthef/benzene.html](http://www.epa.gov/ttn/atw/hlthef/benzene.html) This pollutant is widespread in cities and along freeways all over the world. Because it is invisible, most people can't imagine being poisoned by it. Sort of like carbon monoxide.

Thanks for reading the link. There's a mountain of info on Benzene and I don't want to get too technical as too much verbiage keeps people from reading. Here is another link [www.deq.state.or.us/news/prDisplay.asp?docID=2704](http://www.deq.state.or.us/news/prDisplay.asp?docID=2704) Keep in mind that this compound is common and widespread and that it has a high molecular weight so it lies close to the ground, displacing our normal, breathable atmosphere. It pools up and forms invisible rivers that flow away from transportation corridors and factories. Pools of benzene can be inches to many feet deep, usually in low spots in the landscape. Benzene is not affected by catalytic converters. Catalytic converters help out with about 95 percent of auto smog, leaving 5 percent untreated. Now there are twenty times more cars, so their polluting is back where it was before the catalytic converter was invented. Trouble is, now that pollution is invisible, so most people don't acknowledge the problem. Asthma in the USA is soaring.

Could you please provide me with a link to one of the enviro wacko lawsuit summaries. I really need to see what the reasoning is that defines an enviro wacko. Other than that \_\_\_\_\_, I personally believe you all should have a place to ride, and close to your homes. These riding places need to be well defined so I don't accidently end up hiking there. I have already suggested using highway corridors right of ways for this activity. That is government land and, for the most part, it is ignored by OHVs.

\_\_\_\_\_ said "46% of the Forest is Designated Wilderness" and "only 1% of all Flathead Forest visitors go there", I used to live in the Flathead. We are totally off subject now, but you brought it up. The Flathead is the most beautiful NF in the lower 48. It is also mostly rock and ice and for 6 months a year it is bone chilling cold. Trees grow extremely slowly there, about 25 percent as fast as they do in the Pacific NW, so, once a clearcut is always a clearcut, for all practical purposes. It is no wonder that most of the forest was set aside as wilderness. The part, though, that is not wilderness designated has not fared so well. Almost all of it is a solid, clearcut stumpland, with trees left along the main roads so visitors don't notice. The Flathead is not representative of any other National Forest in Montana. Most of Montana is wide open to logging, mining, cattle grazing and OHVs. You have chosen to highlight a very small area compared to the whole USA and you are suggesting that visitor usage should have something to do with the amount of wilderness set aside. Once again I have to say, wilderness is not for humans. Humans can benefit from it through clean air and clean water and a place to hike or hunt, but first and foremost it is set aside for nature.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

"The reality is that thousands of loggers are out of work for lack of timber sales" Thousands of loggers are out of work because they cut trees fast and efficiently and the forests were liquidated. Most of the wilderness areas contain very little merchantable timber. That is a fact. It takes 70 years to grow a tree that is worth the cost to cut it. Most of the trees that were cut already were two to four hundred years old. Trees grow very slowly at Flathead NF elevations. Human visitation has nothing to do with the value of wilderness.

Sick people can NOT recreate!. People who can't breathe can't get out and enjoy nature. Asthma and heart disease caused directly by air pollution is running rampant. Everyone in the USA knows a few people who survive on inhalers, including young kids. Wake up! These people don't think about anything but breathing. Recreation is a luxury to be experienced by people who are somehow unaffected by the atmospheric sewer of air that people have made. Here's the worst of it. We "recycle" our garbage including plastic by sending it to China where it is burned and sent back to us as toxic air pollution. On the barge to China, the worst, most polluting kind of fuel is burned to propel the ships. This is greed running our world, on the most retarded level. Should there be a government push to end disgusting behavior? YES, there should. The DOI and USDA can participate by reducing use of plastic and packaging, converting to electric vehicles, turning off lights, building smaller buildings and using solar hot water.

I'm going to have to agree with \_\_\_\_ here. The human experience isn't a very important aspect of of the whole.

Conservation is conspicuously, absolutely missing from the national debate, which makes me wonder, did Obama lie about his commitment to environment just to get elected, or did the big boys from big coal, oil and toxic waste, behind the scenes take him in the back room, put a friendly arm around his shoulder and say something like, 'if you want your pretty daughters and wife to stay alive, don't say another word about parks, climate change, ending the war and crap like that'.

Conservation organizations have been great about helping people understand environmental problems. The government has to use the billy pulpit to help consumers understand the consequences of consumption that is beyond the carrying capacity of the planet. The consumer is the key. If an airline is only allowed to carry so many passengers on a certain size of plane, why should we ask the Earth to provide lifestyles of the rich and famous to everyone in the world? There are a lot of really stupid things consumers are doing that actually diminish the quality of life for all of us and our future. One example is shipping things like steel and drywall all the way from China, things that we could make right here, heavy things. We send China our garbage and they use it to power their electric plants and cargo ships and send us a polluted atmosphere and a bunch of crap made by slave labor. Consumers need to say no! Pay a little more, but have a little class. Don't enable the slimiest possible behavior.

## Discussion Question 2

***(cont.)***

Too little too late is a sure recipe for disaster . Too little too late is a catastrophe for billions of people, and all the animals, birds and plants of Earth. Money and precious stones are going to be worthless and you won't be giving an inheritance to your grandchildren either. Environmentalists are not the only ones who need air to breath, food to eat, water to drink. There are tons of ideas here to improve the quality of life on Earth. Start now and get it done!

\_\_\_\_\_, did I do that? I apologize. Actually, it is 10000 feet of hazy air and there's not as much lift as there would be if the air was clear. It's quite frustrating to know that all those people who hang out within a few feet of the ground all their lives never look up and see the problem. The whole climate is being altered by pollution. Learn how to hang glide. You'll learn a lot and your kids will respect you more.

\_\_\_\_\_ said "very early years of the sport. Several deaths in the family" I'm sorry to hear that. The danger factor is now vastly improved, perhaps thanks to your flight pioneers. About your comment on the air being better than in the 60s: catalytic converters improved 95 percent of emissions, but now there are many times more cars, so air pollution is rising again; but now it is invisible. Benzene and other invisible gasses are becoming a serious problem. Ambient pollution from China, India and ships is also a concern.

I can't believe there are people who promote this kind of crap. Talk about shooting yourself in the foot. If this land were private you would not be allowed on it anymore. If you like recreating on private land, go ask a land owner for permission and stay off my government land.

Close roads of no proven economic use that are degrading environment. Close all federal public land roads unless it can be proven through EIS process that those roads are necessary for long term economic benefit and are not causing environmental degradation.

What? Do all you people who demote think it's OK that forty years has gone by and not one thing has been done about this problem. Do you think you're going to somehow breeze through this problem. You're not. The political establishment is planning on doing something to 'fix' the greenhouse effect. It's called geoengineering. They figure a good percentage of us are going to die of breathing problems caused by seeding the atmosphere with aluminum iodide. Collateral damage is what they call it. THERE IS NO TIME FOR BEING NICE ANYMORE. Congress needs to get it's ass in high gear and radically cut greenhouse gasses. And this is not just my 'opinion'. Almost every scientist in the world agrees with this. And the few who don't work for big oil and coal.

Federal Public land belongs to all Americans, equally, and all Americans should have an equal say in its use.. Local people should not have any more right to say what use federal public land is put to than any other American, any place in the country. The Whitehouse belongs to all Americans, the National parks belong to all Americans, and every acre of public land belongs to every American, equally.

## Discussion Question 2

**(cont.)**

\_\_\_\_\_ said "the locals should more say."... so... "land bills wouldn't be spearheaded by environmentalist groups any longer" BP buys a few congressmen and promotes an oily wasteland in a wildlife area and buys locals with short term but high paying jobs that wreck an area once and for all. But you don't want any outside interference in your local federal lands by environmentalists who don't want to see natural national treasures wrecked. Huh?

\_\_\_\_\_ said "What does BP have to do with this? " I was just using BP as an example of an interest group, British for that matter, that would have more leverage over US public lands if a few locals got to dictate what was going to be the land use pattern for all federal public land. If all they have to buy is a county full of votes in order to keep a wilderness area from being established it seems like that's how a huge mining corporation would want it. You talk about a couple of million bucks enviro groups are raising to promote a wilderness in Utah. A company like BP would spend that much every few seconds to prevent a wilderness from happening if there was oil under it. You say enviros won't allow a middle ground. Huge corporations are the entities that don't allow a middle ground. Proof of that is that almost the whole planet has been decimated for profit and there is almost no place in the world that has not been over run by people. If you don't like the wilderness proposal for Utah federal public lands, some of the most bone dry desert in the world, you really wouldn't like what's happening in the rest of the world.

Hogwash, Why should owners of the land who live closer to the area have any different rights than owners of the land who live further away?

\_\_\_\_\_ said "what recourse do I have for the expropriation of my property and violation of my beliefs while the hunters pass back by with carcasses slung on their shoulders or pagans parade around clothed only in leaves?" I think \_\_\_\_\_'s idea here needs a little work. \_\_\_\_\_, what are you going to do about the pagans?

There is nothing but truth in everything I post on this site. I said there are no OHV trails that have been closed in my area that prevent me from getting to the public lands I enjoy. That is the truth. In fact, if OHV trails were closed, I wouldn't have to walk as far to enjoy local public lands. I don't enjoy walking in ruts, seeing heavy equipment drive by, or listening to screaming motors when I walk. There are public lands where I don't go because they are already impacted by motor noise and gas fumes. Those are the public lands on highway rights of way. You will get no argument from me if you use those corridors for your activity.

I wish I could instill in your imagination what a national park would look like if the many visitors who now choose to see natural wonders on foot all decided to buzz around on obnoxious motor cycles. The only reason you enjoy your motorized sport is because many, many others are quietly making room for you, by walking.

Access to a fishing hole where parents can bring their kids is pretty basic. In my area, access is not really a problem. But if it had been when my son was growing up, I'd have been upset. Since we're on the subject: please parents, teach your kids to handle fish carefully and use barbless hooks so the fish you catch don't die. Kid access can be pretty hard on fish populations.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As cities expand, recreation use is jammed into a smaller and smaller space. Then it does more damage to the land that is left. Fight to keep the cities corralled. Fight for open space. Don't blame things like this on environmentalists. It's about urban sprawl, which is driven by population growth.

\_\_\_\_\_, arctic sea ice. Take a look at it. Compare it to 40 years ago. Two ships are trying right no to circumnavigate the arctic ocean, a fete hitherto impossible because of the ice cap. It's melting. Let me guess. You were totally surprise when the financial markets fell apart. Pay attention. You're on the Titanic.

\_\_\_\_\_ said "The problem is... this money is getting high-jacked!" From your comment I gather that your money was used to restore a trail to its natural condition and that is what the money was supposed to be used for if there was no way to use that trail without damaging the environment. Face it, you don't see the damage you do. You need some training so you can identify the problems. But I don't think it is mandatory to have a degree in fish biology or environmental science in order to ride an OHV. Maybe it should be.

A freeway is like the great wall of china for wildlife. The environmental damage it causes is a catastrophe. People need to take responsibility and solve this very serious wildlife access problem.

\_\_\_\_\_ said "After living in Japan, Germany and Italy for a decade, I have finally returned to Montana. I don't hear the roaring of the traffic from dawn to dusk and dawn again" Most of the Earth is populated and cities are much bigger than they are here in the US. For all practical purposes, Europe and Japan have no wilderness. The old forests disappeared centuries ago along with native wildlife. You came back to the states to get away from the hustle and bustle of Europe and you had to go all the way to Montana, one of the least densely populated places in the US to find a lifestyle you enjoy. There are not many places on the whole globe as wild as Montana. And then you complain about setting aside a little bit of land for a National Monument. The key to having your lifestyle for the rest of your lifetime is to protect what you've got. If you don't, it will be developed and populated and the hustle and bustle will come to your back yard. That is a world wide proven truth. The human population is growing and spreading out. I grew up in Montana, and believe me, it used to be a much wilder, even less populate place. \_\_\_\_\_ also said: "but I have this terrible feeling that the way I live will be taken from me." Yes it will. The house I grew up in was bulldozed and replaced with a parking lot. The quiet residential neighborhood was replace with a bustling city of square brick buildings and noisy trucks speeding around on freeways. And the quiet lake-sides where my family used to go to enjoy mountain scenery great fishing have been lined with three story mansions and private property signs. I shake my head in wonderment: how could you come to say:"I will be forced to move back into the cities" The cities are coming to you. Why can't you see that?

## Discussion Question 2

***(cont.)***

Jets create contrails. Contrails, due to fuel additives, expand and create cirrus clouds. These clouds are not natural weather and they affect many aspects of the wilderness area, including solar radiation, precipitation and atmospheric chemistry. Wilderness areas are supposed to be untrammled, which means that they are free to function without human manipulation. Weather modification is most certainly changing the natural function of wilderness areas. This idea has nothing to do with my pristine outdoor experience. It has to do with living up to the wilderness act and keeping wilderness areas 'untrammled by man'.

Keep wild places for the wildlife. Whether it is Bristol Bay, the Arctic National Refuge, the wild mustangs or the wolf populations, we are letting various industries and corporate interests encroach upon our wildlife and their habitat until we will be lucky to have any left. Mining in the beautiful wild area of Bristol Bay which sustains both wildlife and people. Do we really need to dig for gold and have to produce huge dams to store the polluted water which results/ Do we need to drill for oil in the arctic off-shore or on land? Drilling everywhere we can in this nation will not produce more than 10% of the oil this country uses so it would seem we are drilling to make money for the oil companies, not for necessity. Rounding up wild mustangs and warehousing them so that there is more room for cattle to graze? This costs the taxpayer much more money than it makes on the ridiculously low 'range rent' that the cattle industry pays. With the small amount of mustangs left to graze we will be lucky if we have any mustangs left. What about making and keeping a better policy to keep the wolves alive? The wolf hunts aren't about the wolves eating cattle, they don't that much and the government and private organizations have long been willing to recompense the farmers. The wolf hunts are about wanting to kill a predator that competes with man as a hunter or in some cases just to kill for the sake of killing something. These are just a few examples. How about assuming of policy of protecting wildlife wherever and whenever possible and stop making excuses for eradicating it. Our ecosystems are all interlocking and ruining one part will eventually ruin all.

***(cont.)***

Watersheds Work...Fund the CWMP. Landscape scale conservation work being conducted through a watershed approach is critical to the health and welfare of every American across the nation. Water connects us all. As a Headwater's State, Montana recognizes the importance of Building and Uniting Watershed Communities. Watershed groups emerge locally in response to local concerns and issues. Their success is often dependent on cooperative partnerships built on understanding, trust and respect. Because they reflect the needs of the community, on the ground projects encompass a wide variety of natural resource issues, but often include a strong education and outreach component. The Montana Watershed Coordination Council asks that the administration prioritize watersheds as part of the America's Great Outdoors Initiative and assist the efforts of local watershed groups, conservation districts and tribes across the nation by fully supporting the Cooperative Watershed Management Program (P.L.111-11). We believe that implementing the CWMP is an important first step in developing a comprehensive program that will provide the much needed financial, operational and technical support for the more than 1000 identified watershed groups across the nation. Montana is home to many success stories and is actively demonstrating the power and promise of local communities working collaboratively and collectively to address natural resource issues from the ground up. Conservation and education work that is accomplished through a watershed approach is enduring. It is enduring because it swells from the hearts and hands of regular folks in the local community, folks that care about the land and the legacy they are leaving for their children. As noted by Julie Cajune of the Confederated Salish and Kootenai Tribe at the 2010 Watershed Symposium: Connecting Communities in Helena, Montana September 7th: "...we have a generational responsibility to introduce our children to the delights of the natural world and raise them with responsibility as stewards of the land...we live in a finite place with finite resources and we are losing the battle...now is the time to be radical and creative in our thinking and actions to connect to the spirit of the land and each other..."

***(cont.)***

"Tread Lightly" doesn't work when the very purpose of an OHV is speed and thrills. The book "The consumer's guide to effective environmental choices: practical advice from the Union of Concerned Scientists" says that one of the most effective things you can do for the environment is, don't buy and ride an OHV. "Wilderness Quality" means an area of over 5000 acres without significant human impacts, so if people are riding ORVs on Wilderness Quality lands it means they are riding in places that have not yet been torn up by tires (or at least they weren't yet torn up 20 years ago when these pristine wild places were documented). In Utah elected officials (Mike Noel for one) have led groups to break the law and ride on closed trails in sensitive areas. OHV riders justify the destruction they cause either by saying "we have ridden here historically so it's OK to destroy this place" or by denying that there is any destruction. I have heard OHV riders say again and again that they believe riding in washes and rivers is benign because they believe (contrary to all scientific evidence) that the next rain washes away all traces. Areas that are heavily infested with OHVs become impossible for other users to use. The noise, speed and exhaust from the equipment makes the area dangerous for people on foot, especially those who don't want their children run over. Around Easter OHVs converge on Moab Utah and the resulting chaos is so vastly unpleasant that it is virtually impossible to visit the desert at that time of year without hiding out in a National Park or Wilderness Area where they are not allowed. In my strong opinion, public lands OHV use needs to be far more restricted, controlled, monitored and enforced than it is now, especially as the number of OHVs continues to grow with the population and the level of destruction rises. OHVs should not only be excluded from all identified wilderness quality lands, they be limited to designated trails. The most enforceable policy is that all public lands are closed to OHV use unless they are specifically marked as "open".

It is my understanding that this land provides water for thousands of homes west of I75, and that the development of this property would not only hurt native species, but would threaten the water supply of those thousands of people.

As someone who like OHV's and the outdoors I agree with this point of view that OHV trails dont need to be everywhere. Moreover I agree OHV trails should not be open to hiking. But all areas should be open to everyone. There is a balance. The extremes need to come to the middle and understand there needs to be comprise on both sides. Not black or white.

While you and I might be on opposite sides when it comes to wilderness and OHV issues, I have to agree with your comment above as there's not been much in terms of ideas on conservation. We should be doing what we can to conserve our resources in order to hopefully maintain our world. Why aren't we seeing a larger increase in fuel efficient cars? Or the reduction of the use of plastics, or electronic waste going overseas for processing? Why are we building more and more homes when people are loosing them at a record number? To me, something just doesn't add up.

Youth Outdoor Challenges for Tribes. For the Great Lakes Indian Fish and Wildlife Commission's (Commission's) eleven member tribes, located in east-central Minnesota, northern Wisconsin, and the Upper Peninsula of Michigan (for more information on the Commission, see [www.glifwc.org](http://www.glifwc.org)), connecting to the outdoors provides a vital connection to culture. The exercise of the Commission's member tribes' treaty-reserved, off-reservation hunting, fishing and gathering rights depends on an abundance of healthy ecosystems that support natural resources that the tribes depend upon for cultural, subsistence, economic, and medicinal purposes. Federal courts have held that these rights cannot be exercised on most private lands, making the quality and accessibility of public land extremely important. Traditional diets have been shown to improve tribal members' health. "[T]here is a relationship between use of traditional Ojibwe food and the health and wellbeing of Band members." The holistic physical and mental health benefits of traditional food use include: the improvement of diet and nutrient intake; the prevention of chronic diseases (such as obesity, diabetes, cardiovascular diseases and hypertension, gallbladder disease, and dental disease) associated with the consumption of non-traditional foods; the opportunities for physical fitness and outdoor recreation associated with harvesting traditional foods; the opportunity to experience, learn, and promote cultural activities; and the "opportunity to develop personal qualities desired in Ojibwe culture such as sharing, self-respect, pride, self-confidence, patience, humility and spirituality." Harriet V. Kuhnlein, Ph.D., *Ojibwe Health and Traditional Food Use*, Centre for Nutrition and the Environment of Indigenous Peoples (1995), at 39. Staff of the Commission offer the following with respect to Challenges: What obstacles exist to achieving your goals for conservation, recreation, or reconnecting people to the outdoors? A number of challenges face tribes in reconnecting members, particularly youth, to the outdoors. Some of these challenges are shared by Americans of any race - the increased role of technology in our lives and the lure of cell phones, Facebook, chat rooms, video games, cable TV, and DVD movies, etc. Other challenges affect tribes disproportionately - 50% of American Indian children live in single-parent families. These parents often find themselves lacking either the skills, knowledge, financial resources, or time to participate in outdoor activities with their children. In addition, federal government policies of the 1940's, '50's and '60's relocated tribal members to urban areas. As a result, when tribal members return home to their reservations, they often do not have the outdoor skills developed by participating in traditional Ojibwe hunting, fishing, and gathering activities.

## Discussion Question 2

***(cont.)***

What is Wilderness?. One of the greatest obstacles currently facing the conservation of wilderness is the lack of understanding of the term "wilderness." The Federal Government defines wilderness as "A wilderness, in contrast with those areas where man and his own works dominate the landscape, is hereby recognized as an area where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain." When most people think of wilderness, they think of national parks and reservations that have nice walking trails that conveniently end at clearings overlooking beautiful landscapes and scenery. These two concepts contradict each other in so many ways. Although it meets the requirement that humans do not permanently remain, it disregards the fact that walking trails, shelters, and the beautiful overlooks are creations of man that alter the wilderness, disrupting the "community of life" that is supposedly "untrammelled by man." There is no contrast to other "areas where man and his own works dominate the landscape," it is just masked by what we think wilderness should look like. Although, I believe people should have access to wilderness, there should be limits on the impact humans have on it. People who understand the importance of this distinction are willing to sacrifice the convenience of man-made structures to fully appreciate the beauty and grandeur of true wilderness. What is the point of entering the wilderness if you have to rely solely on human creations to enjoy it? When "googling" the term wilderness, the first suggestion that pops up when typing it is a link to a wilderness resort. This should not be the first thing we associate with wilderness. Rather than helping to conserve it, these associations ultimately hurt the whole concept of wilderness, catering to people who do not fully understand its importance. A compromise should be worked towards. Instead of the leveled, pristine walking trails that lead to convenient clearings overlooking beautiful landscape, a person should have to work for that reward. If that occurs naturally, then so be it, but if not, then man should not alter it to make it so. People who truly appreciate wilderness will either enter it knowing that they have to work for the reward of seeing it in its full beauty, or if they choose not or cannot enter, they will know it's because wilderness is being preserved the way it should be.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Well this is the same self serving IMBA nonsense that Hasenauer has been pushing for years. His point 2 is an out and out lie. 1964 Wilderness Act did ban bicycles since they are mechanical transport. In the early years Hasenauer and IMBA were able to trick some land managers into believing that they were "human transport" not mechanical transport. This allowed mountain bikes into some wilderness areas. Finally the feds had to put the 1984 regulations in place to make it clear the original intent of the Wilderness Act - Mountain bikes are mechanical transport. They are not allowed and should not be allowed in wilderness areas. They should not be allowed on the PCT which is primarily a hiking trail. They already have access to miles and miles of trails, they just want to consume everything. Some jurisdictions have tried to allow Mountain biking on trails with hikers and equestrians but there is a long history of failure of this approach: History of Failure "Share the trails" is the cornerstone of the national mountain biking interest's public relations campaign to successfully promote opening public trails to mountain bike use. In the 1980's and early 1990's, this philosophy was used to convince many decision-makers that a "Sunday ride in the park" was precisely what mountain biking is all about and that no social nor environmental impacts would occur once trails were opened to use by bicycles. By the late 1990s however, mounting evidence of environmental damage, user conflicts and use displacement convinced many jurisdictions to return to earlier regulations and ban the use from public trails. The public agencies' actions amplify growing discontent among officials with the problematic sport. Of eight agencies interviewed on mountain bike use compliance with rules and regulations, all stated that the single biggest problem was the disproportionate amount of time that officers and staff spent on enforcement (See "Liabilities" this report). It is a costly sport in terms of enforcement, but also in terms of medical costs. 1. Bryant Creek Trail in Banff National Park, Canada, was closed in 1998 by officials due to disturbance to wildlife habitats. According to the Parks Superintendent, the distance a mountain bike can travel effectively shrinks the wild habitat from a human disturbance point of view. Predictably, mountain bike interests charged "discrimination" and said the trail should be closed at all. However, no credible evidence was presented that habitat disturbances ever occurred in the past, prior to mountain bike use introduction. The fact that the bike can travel so fast and far may in fact disturb grizzly habitat, a concern raised by nature personnel in Parks Canada when the trail was closed. 2. Boulder, Colorado—home of the International Mountain Biking Association—opened 6500 acres of parks in 1983 after discussion among agency staff and mountain bike interests, who committed to maintain and monitor trail use. Prior to that date, city parks prohibited mountain biking use. In 1987, after years of multiple efforts to educate, post signs, distribute brochures and offer a college course in proper mountain bike trail etiquette, Boulder officials barred the high impact sport from the parks systems because of off-trail damage, community complaints and staff-observed conflicts between mountain bike uses and other trail uses. 3. Alley Pond Park, Queens, in 1999, stepped up enforcement to include fines and seizures of mountain bikes after cribbing, logs and other maintenance devices, installed to impede erosion and bike traffic, were torn out and destroyed by mountain bikers unhappy with the trail closure and bike repair. The Parks Commissioner stated "They kill the vegetation, they cause erosion and they turn the thing into a motorcross track. It's a public park, not a racing ground." The Parks Forester stated that the footpath had been expanded from 12 inches to 5 feet due to aggressive bike riding; that further evidence was present of bikers straying off trails, creating new trails and damaging tree roots. 4.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Palos Verdes, Rolling Hills and Palos Verdes Estates, California, in 1990, banned mountain biking from their hiking and equestrian trails, citing unmanageable conflicts. Some bikers are "courteous, others are not," but the overall assessment concluded that the uses are in conflict. 5. Point Mugu, California, was the site of radar guns purchased by the State rangers in 1995 to clock and ticket speeding mountain bikers on "multi purpose" trails. As one ranger observed, "a lot of hikers are no longer coming" to the area because they no longer can enjoy the hiking experience. Radar guns are a clear indication of a chronic, not an occasional problem. When the Golden Gate National Recreation Area (GGNRA) planners limited mountain biking use in 1995, there were sued by biking interests, including IMBA. On appeal, the Ninth Circuit Federal Court of Appeals opined that testimony about mountain bike use speeding, causing erosion and scaring horses are valid indicators of use conflicts and the Court upheld the extensive ban on mountain biking imposed on Marin County Trails in the GGNRA. The mountain bike interests tirelessly demand "statistics or scientific studies" to prove conflicts exist, but the published Court opinion has clearly set aside that false argument and has provided that letters and verbal testimony about social conflicts are admissible and clear indicators of past, present and the likelihood of future conflict. 6. In 1990, the MidPeninsula Regional Open Space District (MROSD), California adopted extensive guidelines, policies and standards in order to permit mountain biking on multi-use trails. The mitigation measures included: • a published etiquette brochure • caution and speed limit signs • increased ranger patrols in hotspots with persistent problems In 2000, the MidPeninsula Regional Open Space District (MROSD), California voted to ban mountain biking in seven preserves, approximately 40 percent of the parks area, because of repeated problems with user conflicts and long-term damage to the parks ecosystems promoting erosion: The Agency launched a review of its trail policies after receiving a steady stream of letters from people who complained that their outdoor experience was marred by a run-in with bicyclists...Often the letters were from senior citizens and families with young children who said that they were afraid to hike the most popular trails. 7. A Commissioner admitted during the reconsideration that opportunities for tranquil nature study and observation had been lost and that the Agency had strayed from its directive to provide a peaceful outdoor experience. Reported as a threat to close trails, the district Commissioners subsequently voted to ban biking in seven preserves. This significant development occurred in an area that spent countless hours detailing policies, guidelines and standards to permit mountain biking on multi-use trails only to reverse its own policy when too many uncontrollable problems arose because of the use. 8. The Tantalus Trail, Hawaii, near the Hawaiian Nature Center, was closed by State officials in February to mountain bike use. The officials said that the halt was needed to allow recovery from rutted and eroded trails. Conditions on the 18-mile trail system were monitored for five years and mountain bike use damage was witnessed and documented; a lot of "near accidents" were also reported where hikers had to jump out of the way, said the program manager for the State Na Ala Hele trail program. 9. In North New Jersey, the Morris County Parks Commission, in 1999, banned mountain biking use from all but two parks. The Commission reconsidered after predictable pressure from bike interests who promised to "educate" bikers on trail etiquette. Mountain bike use is already prohibited on unpaved trails in Essex and Union counties due to repeated reports of conflicts, trail damage and loss of solitude among other trail users. 10. Orange County, California, a parks system touted by IMBA interests as a model, is experiencing significant

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

damage from environmentally and socially irresponsible mountain bike use. In Aliso and Woods Canyons Wilderness Parks, there is now a visible decrease in quality of habitat because bikers ride off of designated trails creating their own and poach hiker/equestrian trails when rangers are not present. The effects have been cumulative: "Rogue mountain bikers ride right over the vegetation – even prickly pear cactus – commonly replanted to block illegal trails. Signs identifying closed trails are taken down faster than I can put them up," (Ranger) Maloney said. And so on and so on.....

I am a Yup'ik artist and fisherman from Bristol Bay. I have traveled the world, and I cannot tell you how awesome my home is. It's economic cash value in gold is deceiving on paper, because it is worth so much more to not only the local people, but everyone around the world. It is a place that can heal an unhappy person with one boat trip upriver. It is a place that makes you feel accomplished and alive after catching your own dinner. It is a place that has a traditional way of life that is worth fighting for. Our people believe in thinking at least 7 generations ahead. Today, this is not only a local issue. We, as a nation, have the opportunity to protect diminishing and essential resources for all life; Water and wild food. You will not regret saving this land for our future generations.

To quote a hero of yours, "YOU LIE!!" Your assertions and pseudo-facts are pale falsehoods that have clearly never seen the light of truth. While a large percentage of lands in the Western US are indeed public lands (even up to the 80% you claim, in a few particularly waterless states), they are not 'open space'. They are dominated by roads, agriculture, mining, oil and gas drilling, logging, ski areas, and general human development. Most of the open space in the US is west of the Mississippi, perhaps even the 80% of it. But it only constitutes about 5% of the whole landmass of our country. Hardly a substantial amount. Ask the animals: Here in Colorado, elk and deer populations and reproductive rates are down on the order of 50%-90% over the last fifty years, due to habitat loss and the increasing pressures of motorized recreation. These are verifiable facts that come from the Division of Wildlife. You did make me laugh though, so thanks for your "idea" -- keep 'em coming. As a grumpy conservationist who sees the truth of what's happening on our Western public lands every week, I need to laugh more often.

It is helpful to remember that the best definition of wilderness is a region that isn't "about us", it's about the ecosystems and wildlife. Access, sidewalks, overlooks, restaurants, gift shops, roads etc. -- those have their place in our Parks, which emphasize the relationship between humans and landscape (mostly through inspiring scenery and the emotions it elicits). But Wilderness is different. It is for the other species. Not for us, even those who might want to work hard for some rewarding experience by entering it without mechanized/motorized means, as I do.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You must not live anywhere near where you can see what these "private investors" of industry have done to our public lands. In Western Colorado, it is nothing short of a disaster zone throughout many counties where hard rock mining, logging, and oil and gas drilling have had their under-regulated ways with our environment. If we continue to externalize the costs of industry doing business (e.g. subsidizing them with public lands and resources), they will continue to exploit these opportunities for maximum short-term profit. Nothing surprising there; it is in the DNA of private capital interests to do so. Overall this is a terrible idea here, with perhaps the most insidiously undermining logic of any I've read so far. It would further sacrifice the public goods of our lands -- exactly the opposite of what is needed to protect wildlife, clean air, clean water, and quiet recreation opportunities.

Areas that are dominated by, or open to, "Human manipulation of the land" accounts for closer to 95% of the lands in the US, not 60% as stated here. Make no mistake, Kaitlyn, we're fighting over the scraps. More policy and financial support for 'alternative' (eg renewable, clean) energy is paramount, as you suggest. So is preserving the wilderness character of non-designated, and thereby unprotected, wilderness-quality lands, which speaks to your first point of 'changing how we dominate non-wilderness'.

Please help stop Mitsubishi's plans for an enormous, disasterous, toxic, open-pit gold and copper mine in the heart of Alaskan wilderness. Nothing less than an American natural treasure is at stake! Bristol Bay is home to orcas and beluga whales, wild moose and caribou, and one of only two populations of freshwater harbor seals in the world -- all intimately connected to the health of the bay and its world-class salmon runs. Those salmon runs also support thousands of sustainable jobs in fishing and tourism as well as Alaska Natives who depend on the salmon for food. The massive Pebble Mine would be dug right at the headwaters of the pristine watershed that feeds Bristol Bay. Anglo American (a British company) and Mitsubishi couldn't pick a much worse place on the planet to dig a 2,000-foot-deep open-pit mine. Sited in a known earthquake zone, the Pebble Mine's colossal earthen dams -- which are supposed to hold back some 10 billion tons of mining waste including toxic byproducts like arsenic and cyanide -- are a disaster waiting to happen. But it wouldn't even take an earthquake to irreparably contaminate this unspoiled corner of Alaska. Just constructing the Pebble Mine -- before it goes into full-scale operation -- will permanently destroy over 60 miles of salmon habitat. As all large mines do, it would leak, spilling copper -- which is toxic to salmon -- right into Alaska's biggest sockeye salmon fishery, on which wildlife, Native communities and commercial fishermen all depend for their survival. Will Mitsubishi back down when faced with worldwide opposition? It did 10 years ago. When Mitsubishi and the Mexican government planned a massive industrial salt plant in the planet's last untouched gray whale nursery at San Ignacio Lagoon in Baja, Mexico, millions of concerned people joined with leading Mexican environmental groups to oppose it. Working with an international coalition, public opinion was brought to bear on Mitsubishi -- deluging the company with more than one million petitions. In the end, the Mexican government called a halt to the project, and Mitsubishi abandoned its salt plant project! Today, Mitsubishi needs to know that proceeding with the disastrous Pebble Mine will give the company a black eye in the view of millions of American consumers.

I know that the Upper Peninsula has large amount of public lands. There are some great destinations in all of these states, but few are in "rust belt" areas. Northern Indiana has Indiana Dunes National Seashore, but you look down the beach either way and there are smokestacks. Southwest Ohio has the Wayne National Forest, but it is highly fragmented. Detroit doesn't even have any National Historic Parks or Sites. The lakeshore dunes are a critically endangered habitat with high biodiversity, but at the moment, they are a stepchild of the more glamorous destinations. Cuyahoga National Park is a good example of carving a natural destination out of an old industrial area. These lands don't need to generate taxes if they can generate other revenue. Most parks generate a minimum of \$2 for the local economy for every \$1 spent by the government. With more popular destinations, that ratio is ten times higher. Also, most of the lands within the National Forest system or the National Wildlife Refuge system would generate much tax revenue because they are too mountainous or too swampy to be farmed or developed and therefore would not be valued highly. Either way, I'm mostly concerned about restoring ecosystems that have been destroyed by industrialization. Places succeed when the people there take pride in their surroundings and restore the health of their lands. You can't have a successful community in a place that neglects (or forgets they ever had) a beautiful landbase.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The wetlands are our only natural water filter. A Brita filter can not nearly do the job of the wetlands. Even if we had a giant carbon exchange column or a reverse osmosis filter system on all major street corners around town, the toxic load would just increase with each year and be more difficult to handle. More sophisticated public water treatment facilities would have to be built. QUESTION: Would we rather preserve our precious wetlands or build new water treatment plants ? The latter would require even more land to be developed. No manmade water filter can replace these lands. Once the wetlands are gone, they are gone FOREVER !

Respect volunteers. Other threads have talked about things like providing volunteers with a free pass if they work enough hours. Last year I officially volunteered almost 400 hours - 10-40 hour weeks - but was still well shy of the time required to get an \$80 interagency pass. Volunteering for an interagency pass is a full time job for nearly 3 months, far beyond the reach of most Americans. Sometimes volunteers are offered a free night at the campground where they volunteer. But that doesn't cut it either. I don't volunteer at a soup kitchen in order to get a bowl of soup for myself. Likewise, I volunteer on public lands to give to others who enjoy the land but don't have the free time to volunteer. For that reason, I find it entirely inappropriate for Government agencies like the Forest Service to take the fruits of my labor and charge a fee for what volunteers like myself have worked to create.

The point is that the funding comes from our tax dollars. The labor comes from our hands. And then the government takes over and charges a fee for what we've created. Seems inappropriate to me.

I like the idea of a voluntary donation, but considering I haven't been able to afford a visit to a National Park in decades, I not sure what I have to gain. How about making the Park entrance fee a voluntary donation?

\_\_\_\_\_ wrote: "kids have a right to play in clean waters and hike scenic trails, and more" Its interesting that we seem to lose this right as we age and are then forced to purchase access to hiking trails, scenic rivers, and the like.

Please see \_\_\_\_\_ (15 Sep 2010) entry; I'm with her. Please ban mtn bikes on PCT!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While I've already cast my vote to demote, I'd like to add this little story: A few years back I almost fell off the edge of a cliff (this was in Griffith Park, Los Angeles, CA where mountain bikes are banned) when a mountain biker came careening down a deer trail; even he looked scared -- in the process tearing up the mountainside opening it up to erosion -- and came to a screaming stop at the feet of my horse. She jumped sideways to avoid the biker and almost lost her footing at the very edge of the trail. Needless to say, if we had gone over this very steep edge, neither of us would have survived. The mountain biker showed no concern over my safety instead, cussed me out for being in the way! I had to remind him that HE had been riding his bike in a restricted area and shouldn't have been there in the first place. He cussed even louder. So...please register and DEMOTE this measure. (Let me also add that equestrians are losing more and more trails while mountain bikers have increasingly more options open to them.) Not all mountain bikers are inconsiderate but, it's still dangerous to mix horse and mountain bike sports. Thanks for your concern and support.

This comment is poorly defined. I live in Utah and without the cooperation of ranchers and residents, waterholes become degraded and useless for any animal, including cattle as well as wildlife and non sustaining of botanical diversity. With the help of ranchers and local citizens the general range is preserved for wildlife and people. We have vast areas that few people in the eastern states can understand. What we do need is full access to our public lands and help with reclamation after fires. I would be heart broken if I could no longer visit many of these areas because I'm not as able as I used to be, or that my grandson would be limited from seeing these areas. Further, if these areas are designated wilderness, NO medical help would be available in an area already underserved by medical facilities. I don't mean to say that we throw these areas open for oil shale mining, which is a filthy, dangerous process.

I'd love to see more availability of National Forest recreation. As it is now it seems to be the domain of the big logging industry interests. The ugly clear cutting is merely convenience and the ragged roads are outright dangerous. Even when logging isn't an issue too often these lands are overgrazed, promoting undesirable plant species and the roads dubious. Not all of us can afford to stay with concessions in or near the national parks (especially seniors) or we'd like a peaceful place not overrun with people yet offering more than a downed log for an outhouse. We need to promote more jobs by hiring more staff and funding the projects fully. I'd be willing to pay a small fee to help. Our state parks have "campground hosts" who are often snooty and presuming and the fees are no longer in line with services received. There must be a happy medium here somewhere.

Sound science is not paid for by private, special interests. Funding must be made from neutral sources. Let's keep the private sectors/corporations out of this.

I would be careful of what Congressman Hinchey promotes. His treatment of western lands would lock them away from all but the vested interests with special interests. Also this sounds like the concept of gateway drugs, which is absurd.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In case nobody noticed, oil is past peak, in decline. I'm not saying that careful selective logging isn't a good idea, it is. But flight is polluting, expensive and in danger of going the way of the dinosaurs. "Flight" as in whatever you're promoting is odd.

Acquire Land. Take advantage of the decline in real estate values to acquire in-holders, adjacent properties, and in general expanding the public land base. Much of the original set asides are no longer used for their original purpose whether grazing, mining, rail roads, etc and some prime land is destined to become into accessible private property. Where ranchers, miners and railroads used to allow access the new developers of resort caliber property are prone to shut up miles of prime river and many square miles of land. In no case sell public land to satisfy the national debt. That is the equivalent of selling one's birthright. There may not be a better time for the next 15 years.

By definition, Wilderness Areas are to be sites of primitive use--where man is a visitor and not a part of the permanent landscape. Mechanical devices are not to be used in Wilderness Areas. For example, no chainsaws are allowed to clear trails, bridges are built by use of hand tools rather than electrical (generator driven) tools, etc. Mountain bikes do not meet the non-mechanical definition and should not be allowed access to Wilderness Areas.

yellowstones wild buffalo. I think these buffalo should be able to go onto our public lands freely. They need this land when there food souces are running low and they shouldn't have to compete with cattle when they get here. Who's idea was it to close this to the buffalo and allow cattle on them anyways it makes no sense. And no more hazing or costly shots for for the disease some carry that wouldn't help anyways.

I personally believe that some "wilderness" actually should be off limits to people and just left alone however idealistic or unrealistic as some think this notion to be... as far as going in naked, I'd at least have the Tarzan rule apply - loin cloth and blade allowed.

5) (29 Jun 2010) I love to hike and I agree that there should be areas set aside for hiking, but truly it is the hikers that are least compatible with other uses. OHVers are happy to share trails/areas with just about anybody - miners, ranchers, loggers, bicyclists, rock climbers, snow mobilers, horse back riders, etc. etc. I also agree that all motorized recreation should be as quiet as possible - loud pipes on vehicles are just plain annoying. I agree with ALL of your comments...well said! I especially agree that there is no doubt that hikers are some of the most hateful people I've encountered when riding my UTV. Taking a lesson from the training my children received when getting their license to drive an ATV, I move off the trail and shut off my engine to let most everyone pass by safely and respectfully. I have had very few hikers show any appreciation for this, rather I usually get snubbed with a dirty look and a grumbling. Others such as mountain bikers, people riding horses, etc. most always show their appreciation via a smile and a thanks. We need to learn to get along with one another. None of us have any more right to the lands of this nation than another. From what I've personally experienced many times, hikers could use the same training my kids got in how to respect others on the trail. My 8 year old is more respectful of people than many of you are!!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

14)(16 Sep 2010) I think God gave us feet for a reason. If you want to see all that remote territory hike it! I believe you are not only disturbing the wild life but other human life as well with ORV's. Your rights only go as far as not interfere with other's rights! My intent is not to trash you Carol, but only a recognition of your ignorance. Do you not recognize that not everyone has the ability to hike these areas. You are right, 'your rights only go as far as not interfere with other's rights!' Your view suggests that people who are unable to hike them do not exist or are not as important as you and those that share in your ignorance. State and Federal lands are there for ALL of us to enjoy regardless of our ability to hike or not. I am a Utah native and I can personally attest that many of the negative comments posted here are absolute lies. I honestly cannot remember any area that has been trashed by an OHV. I am not ignorant enough to say it doesn't happen as I'm sure it does. However, I take every opportunity to visit all parts of Utah and it's surrounding States and have not seen this. Additionally, there are few new trails being produced that I've witnessed. Of those I have seen, the Forest Service seems to manage efficiently by posting as closed or other means. To accompany this, I feel that the OHV training our youth get has been very effective for kids and parents alike. As one of those parents, I now go out of my way to protect our environment and would be the first to turn someone in for making new trails, littering, etc. By my example, my children have learned to pay attention to what others are doing and would do the same. I love the opportunities we all have to enjoy the varied environments of the Western States. Thanks to roads and trail systems that have been around for decades, I've seen and enjoyed scenery that I never could have otherwise. While I believe that some trails that duplicate another trail to the same destination should selectively be closed, I feel the continued efforts to close off large tracts of land to those who choose to access them by OHV are absolutely unacceptable, thoughtless, and self-serving.

We the people includes everyone...not just the environmental activist that has become well known for having the attitude that EVERYTHING is being destroyed by OHVs and the sky is falling. Guys we need to find common ground here. Not everything can be YOUR way or the highway. Most of us who enjoy recreating with an OHV agree that we must protect the environment that we have. Guaranteed, NONE of you love the environment more than we do. We don't advocate new trails and roads. What we advocate is the right to use what already exists. A bunch of our roads and trails have already been closed...most without seeking our input. We're tired of being railroaded and we are now letting our voice be heard. We are part of the "We are the People" club of the United States too. We love the mountains, sand dunes and all the areas we recreate in. With a consideration to taking care of our environment, we demand the right to continue to access these areas and we demand that our voices are heard before any more lands are deemed National Parks or a Wilderness designation.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

All the OHV (dirt bike in my world) users I know respect the land and other users, including hikers (I like to hike and mountain bike too). If a rut and a puddle is destruction then your definition is silly? A rut and puddle is a "drop in the ocean" of our world. I'm sorry, but your argument is nonsense and just not based on common sense. Proper trail building and maintenance techniques actually prevent erosion and protect the landscape. In addition, nature is not as delicate as you think. It can handle a few ruts and puddles. But, forest fires is another matter. Talk about destruction. However, eco-nuts prevent harvesting the good wood after a fire to let "nature take it course" - meaning "let the bugs have the good wood." This too is nonsense.

OHV use should be considered as any other recreational use in the forest. The impact (if any) is minimal and trails and roads help create fire break. A good trail system actually prevents erosion when proper trail building techniques are used. What is the point of creating more wilderness for the critters and bugs when we ALL (including humans) can play nice and enjoy the beauty of God's creation.

You are joking, right? Seriously, you are joking? What state do you live in? Not CO, not UT... I'll give you one easy example - BLM closures in the Moab, UT area. Lower Porcupine Rim Trail was closed to dirt bikes Oct 31, 2008 because it was not designated as a dirt bike trail in the TMP, regardless of the fact it was created by dirt bikes. That is one small section of Moab that has been closed, or limited to dirt bikes. When I pushed the BLM as to why it was closed, no other reason was given. That one peice of trail is maybe 10 miles of more than 500 miles (at least, probably more like 2 times that) that are now closed.

I am an engineer, I understand "contamination" in rivers/streams and how erosion carried into streambeds kill fish feeding bug larvea (among other problems). I have designed, installed and maintained erosion control measures. I have also seen natural streams (no mines, little or no nearby roads) turn brown with silt from natural erosion events (large storms, or cutting into natural hillside slumps, like in Southern CO). The question over whether a road will impact a stream is not cut and dry - it has more than a few "inputs" - how steep is the hillside, where is the nearest stream, what kind of soil exists, what kind of protection exists over the soil, etc... While you may brush off a quick reference to deer and elk (healthy fox and I even saw two moose a few months ago) still existing near my house, the fact is that my impacted land (by housing, OHV use, and historic mining) is still healthy. The big game is still here, the fish are actually increasing. Unmaintained roads and trails in my area do not adversely affect the land like it may in other areas. I can't say this enough, I want MY land (this is where I live, where I play) to stay wild. I also want access. We (well, the FS) is closing roads and trails right now quickly and with little reason. I want reason (I want the damage to be documented) for closure to be clear, otherwise, leave it as is. Where do you live? This is pertinent to the conversation now. It may explain why you feel that NF status is not enough protection.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

Michigan, that explains A LOT. Please, do not confuse eastern land use policies with the west. We have loads of NF and WAY less people. I could see how you are concerned being the entire east coast is a wasteland of people and private land, but that IS NOT happening in the West. We have NF, which balances recreation, use and conservation in a mostly adequate (until recently) manner. Much of the concern about land use in the West is driven by people who may have never been here, and certainly have never lived here.

Your entire post is great, but I want to repeat this, because this part is important: "These actions are costing the forest service, as well as a large portion of the environmental community, in terms of creditability" Could not agree more.

I would say we pretty much agree with each other. I just want the FS and BLM to stop closing roads in areas we already ride, that's all. Leave the roadless areas roadless, leave the lightly impacted areas lightly impacted, close the few trails or roads out there that are causing problems that can't be easily mitigated or re-routed. That's all I want.

The rest is the truth (the FACT is that in the past 10 years tens of thousands of miles of roads and trails have been closed for little or no reason), you want to sit around with your fingers in your ears, fine with me... you can delude yourself all you want. It shows very much the true value of your character. You want legitimate documentation, how the heck am I going to find reports or reviews where a government agency actually admits to closing trails for no reason? Do you even realize how stupid you look by repeating that stupid question? Seriously, do you have any idea? Someone like yourself, who lives in the Midwest or East coast (I know it's guess, but I'll bet anything this guy is from the VA/NY-ish area) doesn't see it everyday. I'll tell you what, go to BLM's Moab office website and check out the TMP maps - I can tell you areas where the BLM has closed dozens of miles of singletrack that you have no idea ever even existed. Then call the BLM and ask why the Lower Porcupine Rim trail was closed to dirt bikes, after being created by dirt bikes; I have, they will not give you a reason other than it was designated to be closed by the TMP. DO you really want people to start listing trails that have been closed, I can go on all day...

Thanks for the reminder on the rules, \*facepalm\* I appreciate it... You seem to have no idea what a Travel Management Plan is, how the FS is implementing these plans, how non-identified trails are now closed, etc... I am done with you, you are just not worth it. This will be my last comment to you: You don't want to do the research (otherwise known as learning) on your own, there is nothing I can do. I gave you instruction on how to do it yourself, but you refuse. Short of actually taking you on a trip around to the various gates they have installed on Apex Rd, along Peak to Peak Hwy, Switzerland Trail, West and South Magnolia, Rollins Pass, Hessian, 4th of July... (all within 30 minutes of my home) or to Moab to see the closure signs for yourself, there is nothing I can do. You want to keep going with those fingers in your ears, fine by me, but stop messing with us in the West; you just don't have any idea what you are talking about.

I don't know who is reading this, and if they "matter" or don't, but I was surprised by the support for OHV use. I think "ignore" is most likely what will happen. OHV users have been trying for years to get these land managers (BLM, FS, state, etc) to simply include us in the process, let alone actually listen.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Not true. All OHV users create tracks in the dirt, 99.9% of which is in the middle of a trail or road. Some of this dirt may be transported as sediment in stormwater; if that water makes it to the nearest stream and settles, it is hard on the aquatic life. In the West, in areas of low relief, most of the sediment (both non-natural and natural, AKA erosion) never makes it to the nearest stream and drops out into the forest soon after being picked up. In areas of high relief a large amount of natural erosion loads the stormwater with sediment anyway, meaning the additional non-natural sediment load is small in proportion. Some roads and trails may not be in the best spots and do contribute to sediment loading, however, these roads and trails are disappearing as they are now being closed. My statement is true; your statement is anything but fact.

There is no process needed to close roads. FS does it all the time, no reason stated. In fact, following a decision a year or two ago, every road in NF land that is not signed open or included within a TMP is closed, effectively closing tens of thousands of miles of roads and trails no reason, with no EIS process. Your "idea" is already happening.

Turning Wilderness Trailheads into crowded Disneyland style parks is not what I have in mind for the West. Heavily impacted areas need to be properly managed, but to see tents, horse corrals, signs and pavement at every trailhead = the end of the wilderness experience

I couldn't disagree more. I think of the entrance to St. Vrain trailhead when I see posts like this: campers, RVs, giant parking lot, trailers, etc. It is Disney-fication of our lands, and it is happening everyday (Disney's CA Adventure themepark has a little mountain thing, I also just visited it). I see our outdoor experience eroded every year (I actually live in the mountains, surrounded by National Forest) by trail closures, signage, parking lots, etc. I want back to the days when I could go nearly anywhere I wanted, people were smart enough not to do too much damage, I didn't see signs everywhere....

Complaining about dislodged rocks and ruts on a trail is humorous (seriously, for every one foot of trail width 0.12 acres are disturbed in one mile - that means that one half of mile you hiked was about 0.06 acres, not much). Trash is something to complain about, but it is not only OHV users that contribute to trash, hikers do it too. I live in the mountains, my home borders National Forest, and I can tell you hikers are litterbugs too. And, to repeat what has already been said above, dirt biking is one of the most physically strenuous activities I have ever done - right up there with mountain biking, skiing, trail running, etc.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Your world seems to revolve around the false premis carousel. First, I seriously doubt you have the stamina it takes to operate a snowmobile in the fashion I enjoy. I am a long way from lazy pal. Your ideas on how snowmobiles destroy habitats and nature are completely unfounded. I have read quite a bit of your drivel on this site, impressive in the sense that it is so wildly misguided and mis-informed. Your hypocritical stance on land use doesn't surprise me. Since when is it "me,me,me" when you, you, you have NEVER lost land open to your chosen use. Just because the snowmobile is my chosen recreation does not mean that I am against conservation and preservation. Your side of the argument has been wildly successful in pushing that adgenda. As for your "novel" approach. Do you read the stuff you type? You start off by suggesting I am harrassing people and then finish your paragraph by suggesting people are harrassing me. Maybe if "coherent thought" was in your bag of tricks we could discuss the issue. If you clowns would stop these incessent land grabs we wouldn't break "the rules". Well, hate to be the bearer of bad news bud but your dogs crap on the trails all over the place. That is pretty offensive. Folks like you purposely block parking areas to try and keep motorized users out, and I have been bothered by skiers in the parking lot more times than I have done the same to them. You guys are INCREDIBLY OFFENSIVE, just so you know. Who knows, maybe it isn't dog crap, maybe it is yours. I spent many years purposely avoiding skiers. I did this by choosing to ride weekdays and stay off the snow during peak skier time on weekends. I purposely rode the opposite direction of the skiers when leaving parking areas to avoid contact. I don't want to see you, anymore than you want to see me. I tried respectful. Didn't work because your clan was not respectful of my recreation. Sorry guys but the hassle started on YOUR end, and it has nothing to do with fair. If we are going for fair, you owe us what, 150 million acres?

I would prefer to share. I am willing to be very accomodating if you are willing to show me a smidge of tolerance.

For some reason you assume I do not own snowshoes and use them? I do my exercise at over 10,000 feet of altitude on a semi weekly basis. You have no idea what you are talking about. Have you ridden in my shoes? Have you ridden at all? Thank you for your expert testimony though. Talk to your Forest Managers, this is Forest Service land you are talking about right? That is what I am talking about. Development of private land is a different issue. You want to paint me into a corner? I am anti this and that, stunning insight from a guy who has read a couple of internet posts by me. Thanks again for your expert testimony sir. Why is it whining when we feel the need to have our voices heard? This depends on your perspective, and is in no way a matter of fact. What do you have to whine about? How much USFS land has been closed to your use? I ride the same places I have for years never bothering anyone or anything until somebody moved in from somewhere else and tried to change how we live our lives. The land is as wild and desolate as it has been for centuries. You seriously over estimate my impact, but that is what I might expect from a self proclaimed expert with no credentials.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I have very good friends that are die hard backcountry skiers. My friend met me on Molas Pass for a day of sledding. It was a deep snow day, 3-4 feet of fresh on 5 feet of base. His wife did some skiing, he joined me on a snow machine. He was flat whooped after 2 hours. I got him back out for the afternoon but in the end, he had figured this would be a good day of rest riding the machine but it turned out to be more strenuous than their ski adventures. So whatever guy, is this a measuring contest or a discussion of land use policy? Snow machines are proven to improve big game habitat making it easier for the animals to travel in deep snow. The argument that machines scare animals but people on foot somehow do not is absurd. I can drive by deer beside the road at 30,40,50,60 miles an hour in my big V8 SUV and they don't even blink. If you stop, open the door and walk towards them, they run. Wildlife doesn't recognize the machine as a predator, it sure recognizes a human on foot though. I can not honestly admit I support ATV, ie; four wheelers, as a good idea on trails designated for hiking. If you noticed this going downhill, you could have become involved for a solution right? Wouldn't it just be easier if we could show some mutual respect? There is zero compromise by the land grabbers. I reached out, got involved, went to meetings, wrote letters, ambassdored in a parking lot, posted no snowmobile signs, started a club, everything I could think of to try and reason with you people. One week ago I found out the group I had tried to work with was on a continuing quest against snowmobile use in the area I live in. It is time for motorized recreation enthusiasts to be heard. We are also outdoor enthusiasts. We are reasonable. We are also being stolen from, and I am tired of it. My solution is simple, split it up, you stay off of my half, I'll stay off of yours and I will bet anything, 10 years down the road, the motorized side will be in better nick. What we have been doing is, you folks have designated large portions of the forest off limits to me, but not yourselves, based on the type of winter travel we prefer. The argument seems to be conflicting user groups, sort of like irreconcilable differences. We are tired of being the user group that is groing in size being forced onto smaller and smaller tracts of land. This is directly opposite the directive of the USFS and BLM to support multiple use policies. I am all for working something out. Instead of poorly done insults, let us discuss the pros and cons of my idea, you know, the reason for the thread.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

My use of larger, more durable, more capable vehicle than you choose is out of necessity, not choice. I would prefer a car, but that just isn't viable in my mountainous western venue. I never claimed I was a conservationist, I am concerned about the environment, but I do not hold the extreme and unfounded beliefs you are clinging to. I hold radical environmentalists like yourself more to blame for the oil spill than anyone driving a big vehicle. Your assumption that my snowmobile use is causing extinction is completely baseless unfounded and unsupportable. Your admission that you have not even tried my sport, and probably never skied either makes me wonder why you are commenting in this thread at all. You have no idea what you are talking about. You most likely haven't even seen the western mountains, nor the vast open expanses of untouched land I have access too. Closing it just creates land of no uses and that is foolish. Snowmobiles harrassing wildlife now? First it was me harrassing people, then it was people harrassing me, now snowmobiles are harrassing the wildlife? This wild accusations are just that, really wild. If people are doing that, find them and hold them accountable. You create this false scenario where snow machine riders are all crazed again. Truth is, ohv users are not harrassing anybody or anything. Steven, Midwestern snowmobile use and western snowmobile use is very different. We have very few trails, I ride cros country almost exclusively. We ride on USFS and BLM lands, rarely on private property or on trail networks. The skiers are mostly just PO'ed that we beat them to the fresh snow. I am not asking you to understand or enjoy the things I enjoy. That is a pointless comparison. Your way is not THE way no matter how much you may want to believe it is. I don't care that you didn't enjoy yourself. The difference is that even though my choices are different than yours, I am not trying to take your choice away.

You can think what you want, once again it is not all about you. You are correct though, when I take the truck on the 4wd trails I do not work up a sweat, or generally get any exercise. When I ride the snowmobile it is a much different story. Not everybody rides like we do in the west, so I do not expect people to fully understand. Wrestling a 500lb machine in deep snow is more physical exertion that you clearly can conceptualize. That is why I posted MY story, which you clearly ignored. Wade, Well stated. I think some of the forest managers are starting to see increased participation by snowmobile groups, and they are figuring out that they need to start considering more than just the non-motorized users input. To those that think we will continue to lose as they push their "fully closed" agenda, consider this...When negotiations were being help regarding skier/snowmobile areas near Wolf Creek Pass in SW Colorado, the snowmobile club proposed just what we are discussing here, if snowmobiles lose one area, we want another back open. Forest Managers agreed, skiers backed down and decided to be reasonable and share rather than be locked out of some land themselves. The results are interesting when the shoe is on the other foot.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am sorry if it was too difficult for you to actually read the idea, rather than judge the book by its cover or title. I know that is a lot to ask. Fact is, this is about the skier/snowmobile conflict that the skiers have created. Are snow machine users complicit in the problem, certainly, but they are the only one of the two user groups looking for solutions beyond a lock out of the public. It isn't about the poor animals that live in the forests. You have repeatedly displayed your lack of knowledge about wildlife, and blatantly ignored when someone has attempted to enlighten you. The simple fact is that wildlife is not fearful of machines. Wildlife is fearful of man on foot. Funny how they seem to be able to identify the real threat through generations of instinct. You also have no concept of the lands we are talking about. I am travelling over land on between 5 and 15 feet of snowpack. The animals are sleeping for the most part. It is a harmless activity. More scientific facts, not that I expect you to comprehend them... Molas Lake has been a source of contention between greenies and the snowmobile users. To illustrate the amount of concentrated use in the immediate area, there is a snowmobile tour business on the shore of the lake, there is a large trail groomer operated around the lake, and it is the most popular venue for local snow machine riders. There is a LOT of riding on the lake. For years the greenies have been screaming about the certain pollution of the lake that just MUST be taking place. They have been sampling the water now for close to a decade and have yet to find even traces of the pollution that these evil machines are so certainly causing. Your tirades about noise, pollution, and physical damage are all completely transparent and baseless. You greenies have been pushing these ideas for a long time without having any science to back them up. The science has been catching up and findings do not support your tirades. You want to emotionalize issues where there are no problems, and push your agenda based on emotions and not facts. We are pushing back using facts and a willingness to compromise. I believe that your cause is doomed if you do not start coming to the table with rational arguments.

Clarification using specific examples, sheeesh! Currently the situation is precarious. There is pending Wilderness legislation on land I ride, and has seen documented snowmobile use for over a decade. Another area is currently open to motorized use, also documented back 10 years to the USFS planners. The south half of the pass is one forest district, the north half is another. Currently we have 1/4 of the land designated non-motorized. They can keep that 1/4, but I want the same 1/4 already open to me, closed to them and I would politely share the other half. The third documented use area under siege is tightly bordered by Wilderness on one side, non motorized closures on another, and a refuge area for x-country skiers on a third. Cat skiing outfits have a permitted closure on the snowmobile trail system. I was riding up the adjacent, open to motorized use zone only to find Cat skiers at the top complaining about me riding the good powder. It is NEVER enough for them, they want it all and openly admit it on their own public websites. We are legit forest users. There is no evidence to suggest that snow machines in the area over the last decade, in increasing numbers even, have caused a problem for the ecosystem. I just want a fair shot at what is out there. Wilderness...NO NEW WILDERNESS, this is really for another post, of which there are plenty but suffice it to say that process is corrupt. We have enough already, the remaining public lands should be managed on a local level by qualified USFS and BLM land managers. Any questions about my intent?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Is it the case that snowmobiles do not have a registration sticker in California? In Colorado we have to register our snowmobiles and either display the sticker provided on the machine, or have the paperwork on our person. The fee's are used for trail grooming operations and back country rescue operation funding, so there is a strong motivation to register your machine, not to mention a fine if you are caught not doing so. Enforcement is another issue entirely. Bigger, more visible tags are simply not the answer. Law Enforcement must make personal contact with the operator in order to be effective. Posting large tags on riders backs so that enforcement can be done from a distance is probably not even a legal avenue. The police, on a public highway, can take a plate number, or gather a plate number from a call in but in order for a citation to be awarded, a face to face stop must take place. Just as there are those who abuse their priviligages on a snow machine, there are those on the other side of the argument that would love to falsify reports to advance their adgenda. Affixing large orange flags with registration numbers to snowmobiles in order to catch offenders doesn't sound like a viable solution to me.

Oh golly, now you want the emotionalists to come up with facts? The notion that OHV users are bad stewards of the land is unfounded. There are just as many, if not more, bad eggs in the hiker/skier crowd. As motorized users we generally do not like to throw stones but, the fact is, I have cleaned up more non-motorized user messes in the forest than from my bretheren on motorized vehicles. I also happen to despise those who get on an ATV just to go tear up some trails, or worse yet, off trail areas. Funny thing is, I spend lots of time in the forest all year round. I would certainly turn in an ATv rider who was damaging the land intentionally. In the last 15 years though, I have never had to turn in a single person. These incidents are the exception, not the rule as the opposition would like people to believe.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Since you do not seem to approve of OHV companies making profits, I wonder how you feel about a company like General Electric? You know, the big corporation making hundreds of millions in profits, far more than all the OHV manufacturers put together, then taking massive amounts of our tax dollars in the form of stimulus money only to lay off ten of thousands of workers. Our system is very corrupt on many levels. Your "green" administration is also very guilty of corporate profiteering. You need to understand that as individuals in this free country, we all have our own ideas about what getting away from it all means. You want us to get away from our vehicles. I happen to use my vehicle to get away from the people. The hiking trails in my area are VERY busy all summer long. Camping along them requires luck to find a spot, and taking the risk that you may be coming back down and starting over in another place. If I load the truck with the camping supplies, which in my case does not include tv or cell phone, I can access clean, quiet, pristine places you could not access on foot if you had a week to walk in. Most of us do not race to these places, just leisurely trips back into the forest to set up tents from where we may hike a trail, or just explore the area. The problem I see is that you want to change the way I live my life, the way I want to use the forest because somehow you think your way is better, more enlightened, less impactful, quieter, or whatever. What you need to know is that it isn't all about you. I live adjacent to the forest. I have made MAJOR lifestyle sacrifices to do so. I do not need someone hundreds or thousands of miles away from here dictating how I can use the forest. The USFS is charged by congress with maintaining the forest lands for multiple uses. One of those is motorized access. If you do not like this, I suggest you spend your time in the the 120 million acres of designated Wilderness. That is what it is for, and we definitely do not need anymore of it.

Does \_\_\_\_\_ realize how much he has polluted the planet by flying all over the world in a jet aircraft? This must be one of those cases where it is OK for him to participate in highly pollutive actions but it is taboo for the rest of us. I am offering tours myself \_\_\_\_! I think we need to realize that we are most likely dealing with people that live in large urban areas on the east coast. They THINK they have seen the west but in reality they haven't, they could not have based on their comments. I can think of at least one excellent example right off hand. Drive I-70 west from Grand Junction Colorado, tell me just exactly how overrun and tainted that land is. You can drive for literally hundreds of miles and see exactly no human influence other than the road across the landscape. When I snowmobile to the top of a mountain, I can see for many, many miles in every direction, pristine open lands, most of it completely untouched by man without the need for federal government intervention, and still open to be enjoyed by all.

The Asbestos hazard area of Clear Creek isn't the only portion closed. I've never been there, but do know people now in their 60s along with their children and others who recreated there for years with no ill effects. Some of the people who mined there long ago lived into their 80s and 90s.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It's been my experience on mixed trails that bicyclists try to be polite when they approach. The problem comes from their preferred rate of travel. They are going to fast to stop or yield to the other forms of use as they should. If they conducted a large campaign aimed at teaching manners and trail etiquette maybe this would help their image. I for one won't believe it has happened until I see them show up for maintenance days on the trails they are allowed to use now. Most I've met think they are being polite by singing out which side they are approaching from as they zoom by. I don't like the I'm bigger and faster so you should get out of my way style they employ while saying excuse me. It leaves me a little flat. I say keep them out of wilderness areas and off the major scenic trail systems that travel thru and link together wilderness areas for the safety of all. No where in any of their arguments do they bring up the idea that bicycles will add safety to the wilderness trail systems. In response #33 above the person says that equestrians don't maintain trails. I'm sure that either the Oregon equestrians or the Oregon back country horsemen would love to show him the lovely and intensive trail work they've done. Not to mention all the packing they do for the different trail crews on the PCT. I submit that near Corvallis Oregon is the Macdonald Experimental Forest it is a close in mixed use area great for staying in shape in the winter or for a quickly reached hike anytime of year. The bicyclists who use this area are noticeably absent on any organized trail maintenance scheduled by any of the hiking groups who use the area, They fail to regulate their own use and don't pay any attention to trail closures at wet and goopy times of year and yes they do tear the trail up more than pedestrians. The equestrians don't use the closed trails at this time of year. I fear this is the treatment we could expect in our wildernesses should we allow bikers to use them. We should keep the no wheel no machine rule in place. I've done a lot of maintenance with single and double buck saws and carried many buckets of dirt and gravel. Yes a chainsaw or wheelbarrow would come in handy but it is nice to leave them home and follow the rules. If the mountain bikers want trails let them use existing roads that are open or closed and build trails to share just like the already do. The wilderness is no place for a mtn. bike.

"NOTHING good comes of introducing humans to areas animals live." So, if you believe this, let me ask you something. Do you practice what you preach by staying out of the woods? Or does this only apply to others, "do as I say, not as I do"? "I have watched deer, moose, rabbits, etc. run from the noise and presence of motorbikes on trails." I have no doubt that this is true. I have also seen them (add elk and black bear to your list) run very regularly when I have been on foot. (as an exception, I rarely if ever have seen moose run from either OHV or foot traffic, they tend to stand their ground). Specifically during hunting season, when I make far less noise and disturbance than the average "hiker". So, again, given that any human presence is a source of "disturbance" for wildlife, do you propose keeping all humans out of the woods?

Your ignorance is showing. Your thread title is about Wilderness designation, then you rail about OHV use...which is banned in designated wilderness. Then you whine about wolf management plans, which were in turn blocked by an activist judge. "when we are going extinct we'll regret our stupidity"...I can only assume that you are speaking for yourself.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We have the same issues here in Idaho and Montana. I've been working with the local forest service ranger district in regards to a planned closure in the Wallace area. It is one of the most popular trails because it allows a loop between 2 different riding areas, provides access to a rural town where we often stop for lunch, and offers some great views. The forest service's "justification" for the planned closure is due to the threat the trail poses to endangered Bull Trout. The trail does cross the creek over an area where the bottom is large rocks. I took pictures after 5 machines crossed the creek, there was NO turbidity in the water after this. I followed this up with a call to the US Fish and Wildlife service biologist in charge of Bull Trout recovery in this area. According to him: 1) There is no known Bull Trout population on this creek 2) There is no proposal that designates this stream as critical bull trout habitat 3) The stream in question isn't in an AREA even proposed for bull trout recovery. 4) Even on streams with endangered bull trout populations, motorized crossings pose no threat unless they are running across a reed (spawning bed), or across a really soft, muddy area that will contribute to sedimentation. These conditions are very uncommon on trout streams, which typically have rock bottoms. So, the entire excuse to shut down the trail is bull poo. Like most in the OHV community, I place the survival of an endangered trout above recreation on a particular trail. However, I don't appreciate being LIED TO with regards to the justification for a closure. These actions are costing the forest service, as well as a large portion of the environmental community, in terms of creditability. They are also driving the OHV community to be alot more resistive to closures in areas where there may be some actual justification for closures. On a brighter note, I have started a dialog with the biologist with regard to what we in the local ATV club can do to help him with a project on a local creek that does have an established bull trout population. We'll see what comes out of it.

It is unfortunate that it has come to this, but the OP makes sense. The non-motorized community is unrestricted with regards to wintertime travel, while over-the-snow vehicles are increasingly restricted to smaller areas. The non-motorized users should be focused on areas where motorized use is prohibited. This seems like a sensible way to reduce conflict between motorized users and those that want a quiet back-country experience. Snowmobilers pay some fairly significant fees for groomers to maintain their trails, there is no such fee program for the non-motorized community in most places. The non-motorized community would have to step up here, but the same time the trails wouldn't see the wear and tear of motorized use.

Which is why the OP makes so much sense. It provides seperation between motorized and non-motorized users, just like you ask for. This takes away the opportunity for a small handful of the non-motorized users to contrive "conflict". Please note that the OP doesn't even ask for any areas currently closed to motorized use to be opened. The non-motorized community has virtually unlimited areas to recreate in. Per your own statement "Motorized use makes the land closed to hikers and quiet seekers by design.", as such the impact of this should be minimal if motorized use is really "closed" to "quiet seakers" now. Lets make it official and avoid the whining. Vast areas where motorized recreation is currently banned would still be open to non-motorized use. I suspect that even such a modest compromise will be too much for some.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I fail to see why this is such a contentious idea. It's addressing the primary complaint of the non-motorized community, specifically motorized use on trails they currently share. All this idea does is provide the separation between the motorized and non-motorized recreationists that they have asked for. This should make it safer and more pleasant for both user groups. The only way this idea could be seen as a negative is if the real motivation behind a small portion of the non-motorized community is to create conflict, thereby providing justification for shutting others out of the woods all together.

What studies have been done comparing wildlife response to motorized and non-motorized winter recreation showed that wildlife were displaced further by non-motorized use (skiers). So if you are concerned about wildlife, you should be proposing keeping all human contact out of the woods. However, once again, you are trying to deflect the OP. The OP only suggested keeping non-motorized users off of motorized trails and out of areas currently designated as open for motorized recreation. The OP said nothing about granting "further access to vital wildlife habitat just to accommodate a greedy ohv user and to put entire species at risk of extinction is ridiculous and I will fight that every time." I know you have issues with making a comment without going off topic. How about trying for once. Why not keep non-motorized use off existing, designated motorized trails and access areas? This would address the conflict you are always complaining about. Or are you willing to admit that this is not your real motivation?

The OP seemed pretty clear in his post: "My suggestion to the skiers is to use what you have already closed to snowmobiles." No where has he said anything about adding access to new areas off limits to motorized recreation, nice try again at deflection. So back to the OP, would you support a ban non-motorized recreation on areas currently designated for motorized recreation? This would address conflict issues.

"So protecting the last 3 remaining animals of that species is not good enough reason to close an area?" IMO, the question isn't the value of those 3 animals...it's how much area is enough for them. Again, we're talking about approximately 500,000 acres, or 166,666 acres per animal. And with no evidence that snowmobiles are even an impact, let alone a negative one. I'd absolutely support closures in especially sensitive areas, say a breeding zone for example. I do feel that closure of half a million acres for 3 animals is excessive.

I wish them the best of luck. In this area, any time a comparable project is proposed a couple of the local "environmental" groups file a lawsuit and shut it down, or at least delay work until it's too late.

I'm voting to promote. State endowment lands are required by law to be managed for financial gain to support schools. It may make more sense to group state endowment land holdings, rather than have them scattered within federal lands. I disagree however that these lands are incompatible with conservation purposes. In my state, many of the forests on federal lands are in poor health due to overcrowding associated with a lack of harvest and fire suppression. Nearby state forests are generally healthier and provide more useful habitat for wildlife. The state has more of an incentive to ensure forest health than the federal government does.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In my area, we have lost probably 2/3 of the trails in the area. The introduction of the travel management plan has eliminated all off-trail travel (which was previously legal). Many areas have been set aside as designated wildlife habitat. Trails on approximately 300,000 acres have been eliminated to "protect grizzly bears". Another area of approximately 500,000 acres, larger than some states, has been restricted due to woodland caribou, even most cross-country snowmobile traffic is banned. Closing the vast majority of these areas, and limiting access to designated trails isn't what's bothering the OHV community. It's the closure of ALL trails through specific areas, that in turn takes out some possible loops that connect other trail system is a big issue. Adding to our problems is the whole "roadless" scam. Many areas currently restricted vis roadless designation used to be roaded...the foresst service simply removed the existing roads from the map. Trust in our federal employees is being lost. We have another trail system near Wallace, Idaho that has been one of the most popular in the country. They are implementing their travel management plans at this time. Several of the most popular trails in this area appear doomed, for no obvious reason. One of the trails that is popular because it connects a trail system to town was recently blocked. Hey, miles are open...just 50 feet are all thats closed...you know the part you need to access the entire system? Our most recent challange is the proposed expansion of a ski resort. They want to triple in size, clearcut upwards of 2000 acres and add additional runs. The property they currently have is adjacent to some of the most popular OHV trails, which may be absorbed in the expansion. OHV enthusiasts don't want ask for access to everything...but how about some small portion? OHV users have always been willing to share the trails they paid to construct...yet now are being locked out. Yet very very few hikers visit the areas in question.

"This is one of many such occurences that I can find where OHVer's have voluntarily vacated an area for various reasons under the promises of "We will find you another area." Yet it rarely happens. Once the greenies get what they want any and all deals are quickly forgotten." It isn't just the OHV community that the "greenies" renig on promises to. The same thing happened with the wolf issue. Defenders of Wildlife committed to reimbursing ranchers for losses caused by wolves. Yet now they often refuse to pay, even when wolf tracks are present and damage consistant with wolves are found on the bodies of dead sheep and cattle. "Something else killed them and the wolves were just scavanging" is the common theme. Especially true when an entire flock is killed...no other predator participates in "sport killing" to this extent. There were also only supposed to be a limited number, I believe 300 animals in the population before management would be turned over to the states. Now, with 2000+ wolves in my state alone (by many estimates more) there still "aren't enough" and the same orginazitions have sued and won to have them re-listed. The word of many environmental organizations isn't worth much. The public is slowly and painfully learning that lesson.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

"\_\_\_\_\_, you guys are amazing, claiming that enviros words aren't worth much. How many times have environmentalists sat at the good faith table and made deals and have been screwed. That is why enviros are constantly in court. That is why enviros consistently win in court."

\_\_\_\_\_, several issues here. First, it is typically the extreme environmental groups that give the entire "movement" a bad name. We have a couple in my area. Many times the forest service has attempted to have timber sales. Logging in many areas is an important step to reducing fuels and enhancing forest health by thinning stands and planting site-appropriate species. These are generally highly supported by residents and recreationalists in the area. Public meetings are held, with the "greenies" in attendance. A plan is worked out to satisfy as many stakeholders as possible. Yet when the "greenies" don't get 100% their way, they file a lawsuit over the sale. This puts forest health, property and lives in jeopardy, and costs the taxpayers money. Of course, that's the least of their concern. Lawsuits are an income stream for these groups, who's costs are reimbursed by the taxpayers through the EIIA. \_\_\_\_\_, where is it you live again? I'm trying to relate what you observe, vs what is happening here in Idaho.

"\_\_\_\_\_, just in response to a comment you made about the roadless rule. The roadless rule is a policy limiting road construction and re-construction. A lot of areas aren't really "roadless". It's not wilderness designation. Most of the areas in Idaho that are covered by the roadless rule allow road construction or re-construction. There is even a "back country" designation that I believe even allows OHVs. I noticed you keep referring to this rule as a scam. Aren't you the one who posted an idea about a "back country" designation for land?" The reason I refer to the "roadless rule" as a scam is that it was implied that it was for areas without roads, that never had been roaded and were in a near natural state. In practice this has not been the case. Areas that are roaded have been classified as "roadless" by erasing the roads from the maps, yet in practice many still exist but have been closed. The environmental movement attempts to portray these areas as just a few of the remaining "wild" areas in the country. Yet in my state, nearly 10 million acres, half the forest service land in the state, falls into this category. IMO people have been deceived with regards to roadless rule.

The wilderness areas I visited most recently already have horse corrals, camping and horse loading "docks" cut into berms every few miles. This was along the McGruder Corridor between the Frank Church and Selway-Bitterroot wilderness. The only people I saw using them along this entire trail were outfitting services preparing for the start of archery season. I see no reason to use public funds to provide services for private businesses who use (exploit?) designated wilderness areas for profit. Horse camping is particularly unsuited for camping at public access points for Wilderness areas. Horses trample the ground, turning it into a muddy mess for other users. Their leavings stink and attract flies and other insects. Allowing horses in or adjacent to public camp grounds leaves those places unsuitable for every other user group. I don't have much of an issue with horses in wilderness areas, but allowing them in campgrounds used by many different user groups outside of wilderness areas is a bad idea.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I agree there is a need for protection (I generally oppose the term "preservation" since it's undefined) of our public lands. However, protection doesn't mean keeping everyone off those lands, or even banning reasonable resource extraction, particularly well managed logging. There is a need to make the US less dependant on overseas sources of oil. If that means drilling on a small fraction of 1 percent of public lands, I say do it. With regard to the wolf issue, there are other threads going on it. I would support the presence of wolves as long as methods are in place to allow control and management of the population to a reasonable number. Unfortunately, that was taken away recently. If this dealt with specific areas and issue with regard to protection, there are a number I'd support. But with this blanket statement I choose to demote.

Idaho already has some 4 million acres of designated wilderness, the most of any state other than Alaska. There are other management themes within the roadless initiative that provides protection to this area without being as extreme as Wilderness designation. Among other issues, Wilderness designation bars the use of chain saws for clearing hiking trails. This area is also popular with snowmibilers, a major contributor to the local economy. They would be banned with Wilderness designation. Lets share the wealth. We can afford to allow some of the other states catch up with regard to Wilderness.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Thank you for the education on wilderness acreage, you made me do some digging. In addition to CA and AZ, Washington actually has more designated wilderness than Idaho does, I stand corrected. As far as snowmobiling is concerned, the Scotchman Peak area is utilized by members in the local snowmobile club. It is adjacent to the trail system accessed by Trestle Creek and from Clark Fork. Wilderness designation would of course preclude their enjoyment of this wonderful area during winter months. And at what benefit? Is there significant utilization of this area by non-motorized users during the winter months, who would be disturbed by snowmobilers? It is my understanding that it is a several mile trek from the nearest trailhead accessible via car to even the edge of the proposed wilderness area. If so, I can't foresee significant non-motorized recreation going on there during the winter. I am an active proponent of ATV recreation and enhancement of the trail system. However, I agree that the core Scotchman Peak area is not a suitable place for this use, and agree that we need to keep some areas free of constructed trails. That has been carried to extremes in areas outside the Scotchman area, to the best of my knowledge there is ONE ATV trail (Porcupine Lake) off the entire Lightning Creek/Trestle Creek road. One area that we would like to explore is a bypass around the washed out Rattle Creek connector that ran from Lightning Creek road to Montana's road system. My understanding from a recent (2 week ago) conversation with people that have recently hiked the Scotchman trail system is that many trails are in poor shape due to deadfall. I can not base this on my own observations. I would like to hike this next year, and would plan on bringing my chainsaw to do some trail clearing. I believe that this is currently allowed under the existing management theme. I'm a firm believer in leaving an area better than I found it. Doing the same amount of work with hand tools is MUCH slower...and apparently has not been happening. Wilderness designation wouldn't help with this. While I support protection of this area, I readily question if Wilderness designation is the best way. Within the existing roadless management options there are means of protecting an area from logging, mining, road building and development, without the restrictions imposed by Wilderness. Can you explain what Wilderness would gain over these other methods? I'm willing to be educated.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Thank you for the information, I'm enjoying the education. I'd like to hike this area and will sign up for your newsletter. I'll also withdraw my "demote" vote. To address one of your comments "There are approximately 12,000 miles of forest service maintained trails on the Idaho Panhandle National forest and the majority of trails maintained by the forest service are open to motorized use. " I would really like to see a map of these trails. This flies in the face of my experiences. According to the district ranger, the Kaniksu National Forest has 35 miles of designated ATV trails. The bulk of these 35 miles of trails are unfortunately dead end trails that do not provide connectors to more of the existing road system. Porcupine is a perfect example, it's perhaps 2 miles and dead-ends at the lake. Strong Creek is another, it dead-ends in Hope and does not tie into any other area or road where riding is legal. The entire Trestle Creek/Lightning Creek road system is "bound", there are no connector trails that connect to other systems, and no ways to do a loop ride. Of course riding on hwy 200 is prohibited. In the entire Kanksu forest, I can think of less than 10 trails. The 222 by Pack River, another abandoned road by Pack River, Strong Creek, Porcupine, Silverleaf, parts of the old 278 road by Lakeview (not sure it has a trail number) and one trail east of Clark Fork. The 111 trail is designated on the map, but in practice has been signed prohibiting ATV use. The "trail system at the north end of the drainage"-are you referring to the Moose Lake area? If so, I believe these trails are closed to ATV use. At least they were signed that way the last time I was there, about a year ago. If you look at the Kaniksu National Forest map and check the trail designators, you will find only a very few trails open to ATV use, believe me, I have looked. Contrast this with the hundreds of miles of designated hiking and horse trails in this area, plus the fact that cross country travel is of course legal for all non-motorized recreation. I have run a large percentage of the legal trails in the CDA, St. Joe and Kaniksu forests. The CDA forest has issued their motor vehicle use maps. The number of actual ATV permitted trails is very limited. I doubt the entire trail system consists of over 200 miles of trails, but I really do need to research this with the Forest Service and find out the exact number. The St. Joe is in the process of developing their MVUM. The situation is a bit better than the CDA or Kaniksu, but not much. Several of the most popular trails in the area are slated for closure, including the Champion Creek trail. I discovered just last weekend that the Forest Service, in their infinite wisdom, closed another half mile of trail. Unfortunately, it was in the middle of an approximately 16 mile "connector" trail. So they now have made two "dead end" trails, rather than one through one. It's stupid decisions like this that raise the ire of the riding community. Quite honestly, the discrepancy between motorized trails and non-motorized is a primary reason that motorized recreationalists are hesitant to support Wilderness designation. Which is unfortunate, in that there are areas where it makes sense. Wilderness supporters are seeing a backlash from recreationalists on non-Wilderness areas that have suffered some bad decisions at the hands of the Forest Service and other land management agencies.

My comment #26 wasn't directed at you. The OP was a reasonable suggestion and merited honest discussion. Unfortunately, we have a few posters on here that try to turn every thread into an anti-OHV one, even ones completely unrelated to OHV activity, such as this. It succeeded in this case, we never did even come up with any user-based funding ideas for non-motorized trails.

## Discussion Question 2

***(cont.)***

I voted to promote this. In my area we have virtually unlimited access for hiking and horseback riding, there are many trails and cross country travel is permitted. Single track (dirt bike) has a significant trail system. 50" and under UTVs and ATVs have a limited system. For 50" and over UTVs and mid sized 4x4s (Jeeps, Samaris) the system is nearly non-existent on the motor vehicle use maps (MVUMs), they are mostly limited to roads. This does need to be expanded to avoid discrimination against a growing user group. UTVs are one of the fastest growing user groups around here, but get very little support.

Close and Convert Zoos. Elephants do not belong in St. Louis. Tigers do not belong in San Diego. Giraffes do not belong in London. Convert zoos to urban open and park space, commercial venues and human housing. Use resources garnered from selling off zoos to create large nature preserves based on bio-regional science and populate those preserves with indigenous animals only.

let us ride or maybe will use your front yard as a track

The Klamath / Siskiyou bioregion has the most biologically diverse conifer forests in the world and contains a lot of endemic plants (especially in the areas with serpentine soil), it is largely federal land (with some wilderness areas that need better linking) where some forest carnivores such as Pacific fisher, marten, and wolverine still survive. Looking at a topographical map of California, the Central Valley is like an oblong salad bowl. At the southern end, the east-west link connects the southern Sierras & Angeles & San Bernardino Nat'l Forests to the Coast Range and its LPNF. The obvious high-elevation major biological corridor (and core habitat in places) for the east-west link along the Calif./Oregon border is the Siskiyou Crest. It would help water flows to support native salmon so vital yet threatened in these watersheds.

Non Native illegal wolves are not endangered either. Almost zero is far cry from the hundreds. Nope the problem is the wolves are wiping out the moose the Mt Goat and Big horn sheep but you people don't go out in the woods and just live in fairy tale land. Those of us that live out in nature saw the game herds get wipe out first hand. In the links I gave plenty of proof. But you don't care about the truth. The wolves are not benefiting anyone but DOW who makes Multi millions of dollars crying about them. It is high time you people that are supporting the wolves pay for the destruction they cause out of your own pocket.

FY 2011 USF&WS Funding. The US Fish & Wildlife Service and the many NWRs under their care and management, deserve full funding in FY 2011. The Gulf Oil Release disaster would have killed many more animals if not for the proactive and selfless action of hundreds of USF&WS Rangers, Biologists, L E Agents, managers and others. In addition to the great personnel assets, facilities and equipment, both on hand and leveraged from other sources, are what saved the region from a potentially devastating wildlife disaster. To reduce funding now is like selling the Firetruck after the fire is put out.

## Discussion Question 2

***(cont.)***

These conversations are always tough because strong emotions overtake logic and reason - which is a shame because at the end of the day we all want the same thing, access to our beautiful lands in whatever way we prefer to enjoy them. I know for many mountain bikers - access to the trails is simply a way to see more and experience more of the beauty than is possible in a day solely on foot or hoof. But lets start with some facts as a good basis for the discussion: 1. Trail Work - it's an absolute fallacy for anyone to believe that MtnBikers don't work and car for the trails they ride - there are numerous organizations across the nation that spend almost every weekend of the calendar working trails... the issue is that you probably don't see them on trails where their bikes are not allowed - please open your minds to this fact - we are more alike than we are different. 2. MtnBikers - some are very nice and respectful of other trail users; some are not - this by the way is no different than hikers or equestrians or campers. There are nice people in the world and some not so nice people in the world. It is impossible and improper to stereotype any of these class of trail users as wholly being one or the other. Again - protect your mind from making these simplistic conclusions. 3. Biking and Horses do not mix - this is a challenge because it can be true for inexperienced users (of the bikes and the horses). I've also seen many cases where hikers have spooked some horses and caused some pretty sketchy situations. But there are all kinds of very simple solutions - that are practiced in many parts of US and Canada to alleviate the risks (particularly in the Rockies Regions). Two very simple and easily applied examples: One: Separate access times for horses and bikes - can be even/odd days; or alternating weekends; or whatever - i'm sure the bikers would take mid-week if that worked best - as the timing plans becomes known trail users of all kinds learn how to plan around it and each group enjoys the trails without the danger/annoyance of the others. (this is actually less enforcement burden as rangers only need to be concerned half as much as closing a trail full time, etc.) Two: Separate Trails in similar areas: one for hike/horse - one for bikes... more trails can be concerning for ecological issues but it does solve the safety issues and if trails are built correctly won't harm the ecosystem really at all... Where there are existing network of trails - simply divide and designate. These simple tactics provide equal access to all US citizens and keep safety at the forefront. There are many land spaces in the US that have done exactly this with raging success for all users. Again - open your mind to innovative ways to get what you want - but also share the trails with others.. it can and has been done. 4. Trail Damage - this is flat out misguidance. There have been numerous studies that show that horse hoofs cause significantly more long term trail and erosion damage vs. bikes - particularly in softer/wet steeper terrain as horses stomp hard for traction. Proper trail construction/maintenance and closure for both horses/bikes in extreme weather generally preserves the trails the best. Again free your mind of the mis-perceptions related to bikes vs. horses in this regard. 5. Plenty of trails exist for bikes - unfortunately this is not valid except in a few select regions of the country like maybe the Rockies and the Appalachians where the communities have embraced the bike culture much stronger. And in particularly when we refer to 'trails' as the sweet singletrack, narrow trails that all trail users prefer and crave. I live here in the supposed Mecca of Mountain Biking, Northern California - but in reality in the greater Bay Area - there really aren't that many great single track places to ride --- maybe 5-7 tops. if we ride 1-2x per week, we've exhausted these trails within a month or so... multiply by years and things get pretty stale pretty fast. I know this to be true in many other major metropolitan areas - and in some cases even more true in remote wilderness

## Discussion Question 2

***(cont.)***

areas... so again - while it may seem like there are plenty of places to go ride our bikes - we crave the same serene deep scenery and remoteness that you do - and for the same reasons of beauty, wonder, and adventure. In the end there really is no valid reason other than safety not to make the same trails and/or spaces available to bikers - other than safety. All other reasons are really false and simply propaganda based on wrong facts and pure emotions. If the safety concerns can truly be solved via simple division tactics through time or routes - then all of us can enjoy these beautiful places together, in harmony - and we can join forces to protect and nurture these trails together. It can be done - put down your emotions, open your minds, and think creatively about how to divide but share the trails amongst us all. If you can't see this and see the other sides POV - then I wouldn't want you on the trails in any form - check yourself and your motives.

The problem with OHV use is that the minority of OHV-ers who are badly behaved can destroy vastly more territory than the same number of badly behaved hikers or equestrians. If a hiker or equestrian gets crazy and heads out cross-country, the impact is gone within hours. If an OHV does it, the scars from tire tracks can last years. Three or four of them can destroy a stream crossing or sensitive site in minutes. I appreciate that most OHV-ers are law-abiding, family oriented folks who want to enjoy their activity in the great outdoors but the fact is that the few bad apples in their bunch are incredibly destructive and, sadly for the others, that's why their vehicles deserve to be locked out of wild lands.

Only a civilization in decline will allow the loss of its major commerce and population centers. We are not talking about a few houses poorly located on a bluff here... Regardless of why it is happening, what is at stake is as \_\_\_ stated, "Billions of dollars" in the form of our major coastal cities and ports. You may say it is "Chicken Little", but like it or not this "Little Chicken's" prophecies are backed by mountains of data and hard science, the only debate is as to the reasons why. Maybe it is a natural cycle... so what! Does that mean that we should do nothing? In a world almost entirely shaped by man, would we really be expected to just watch as it all falls apart? From where I stand, anybody who refuses to act because of a political dogma, simply has their head in the sand. Good luck with that.

You are absolutely correct. I am well aware of the well documented human causes of global warming, I was simply trying to make the point that regardless of your politics, action is imperative. The rock hard science about the causes and effects of global warming is generally ignored by people on the political right wing, and is therefore considered a "vast political / scientific conspiracy of global proportions". The fact that this is utter nonsense has no effect on these people, so I tried to simply focus my comment on the fact of the problem we face, and leave the causes aside for the moment.

## Discussion Question 2

***(cont.)***

I AGREE, since we can't quantify the specific damage an individual causes... lets figure out the total damage and charge a use fee that is appropriate to cover the damages for each type of use of our common natural resources and allows us to keep environments in a sustainable condition that would be considered usefull to all. This would be fair-er to all concerned including future generations. This could be a nationwide or state wide fees dedicated to conservation of public lands. Lacking the funds necessary to conserve our public lands it would make sense to close damaged areas to overly destructive uses to allow nature to regenerate itself so future generations can enjoy their inheritance. Let's not rob our children and our children's children for our self indulgences.

STOP PEBBLE MINE-SAVE OUR SALMON!. Bristol Bay Gold mine is another corporate rip-off of the American people that will destroy one of the last untouched salmon runs left in our country. Seen the price of wild Alaskan Salmon lately? Bristol Bay Gold mine will rob us all of our natural heritage and source of good food.

A Federal Surplus Land UnUsed (Make a Public Park). This message is in reference to the Federal Lands to Parks Program. The BONUS Plant ([lm.doe.gov/bonus/Sites.aspx](http://lm.doe.gov/bonus/Sites.aspx)) administered in part by the Department of Energy (DOE) and The Office of Legacy Management is a good candidate to be considered for a public park. This property and land was expropriated for an energy research purpose. At this moment is not been using for energy research. Currently, there are many organizations interested in preserved this land in its natural state for its great value in helping many environmental causes. Currently, there is a movement in the community to preserve this land.

I think God gave us feet for a reason. If you want to see all that remote territory hike it! I believe you are not only diturbing the wild life but other human life as well with ORV's. Your rights only go as far as not interfere with other's rights!

Saving Our Natural Resources. I really have just 2 comments. The first being that Brisol Bay Alaska should nt be ruined by the pebble mining. The second is that all our National Parks beauty needs to be preserved and that includes the peace and quiet. Off road vehicles should not be allowed. They are distracting and disturb the wild life that we need to protect.

Unfortunately even if you are right the "cycle" is going to cause massive destruction to our shorelines.

Actually, OHV are a big deal! They create noise and erode the land. They also destroy the complicated relationships in the soil which are vital to the health of ecosystems. (Any Pro OHV people who really want to protect the environment should please take the time to study these matters.) In other words, OHVs are not sustainable.

All private businesses on public land should be severely limited. Why not just let this land remain wild?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I appreciate your idea. More recycling is always good. But, actual research shows that there is no relation of an area's recycling rate and the area's litter. And, in urban areas, about half or more of all litter is accidental, such as papers blown from a bench, paper cups flying out of the back of pickups, etc. I and others have studied what does work on reducing litter: Cities requiring use of non-styrofoam cups/take-out boxes, as do Seattle and San Fran. (recyclable/biodegradable ones are available) ; plenty of litter receptacles (but servicing these is expensive to cities); and threats of significant fines on litterers. The best approach is simple...pick it up! In Seattle many businesses keep their sidewalks and street gutters spotless. What does NOT work: education just against littering (but early-age proenvironment ed may work), "setting a good example" .. (Litterers do NOT learn.) and one-day "clean street" pickup campaigns ( the litter is back within 2 weeks, and people who participated in the campaign feel that they have done their share.)

Should wilderness areas become more handicap friendly even if it means changing the land? Should wilderness areas become more handicap friendly even if it means changing the land? As of today, people with disabilities may use wheelchairs in the wilderness. Is this enough to ensure that these people are able to enjoy the wilderness? And if it is not enough then how should the government change the land in order to accommodate more handicap visitors? I believe that the use of a wheelchair is sufficient enough for the handicap to enjoy wilderness without having to change the land. The majority of people visiting the national wilderness areas are not going to be handicapped. By changing the land for a minority of the visitors, the government would in turn be ruining the serenity of the land for the majority. As a country built on the principles of democracy, the government of the United States should follow the desires of the majority over the needs of the minority. Although I do not find that the land needs to be altered for the handicapped, I do see the importance for people with disabilities to enjoy the wilderness if that is their wish. I also do not believe that these handicapped persons would want the wilderness to be changed for their benefit. People visit wilderness areas to enjoy the beauty of untouched nature and this is no different for people with disabilities. They visit these areas of wilderness for the same reason any human would visit the areas. Whether it is to escape civilization or enjoy the view, people of disabilities have this opportunity with a wheelchair. A wheelchair is sufficient for people of disabilities to visit and enjoy a trip to a designated wilderness area. Many handicapped people are accustomed to traveling in a wheelchair so it is not as if the government is punishing them. It is very important for all humans to enjoy wilderness if that is their desire. I believe that disabled people have this same opportunity with the use of the wheelchair, but I am not handicapped and have no idea the needs of all disabled humans.

All ORV vehicles should have the right to use the open trails be it Federal or State owned.. There are many people that own side by side rec vehicles that appreciate the outdoors and gladly accept the responsibility of keeping it clean and natural. Their tax dollars are paying for the trails also, and therefore they should have the right to ride on these trails also. Here in the state of Michigan they are closing trails both state and federal owned land which should be open to all tax payers.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

If you think "sitting on a machine" is any less grueling than WALKING ON TWO LEGS it shows you are uninformed and ignorant. Have you ever tried to operate a snowmobile, 4 wheeler, dirt bike? If not then your opinion of the amount of effort required to do so is invalid. If you think a snowmobile is any more damaging to the environment than a skier, think again. Once again you are showing your ignorance. Because they travel over snow, a snowmobile has very, very little impact on the landscape underneath it. Go take a look at an area open to snowmobiling in the summer months and SHOW me the damage. Oh wait, you won't find any because its not there. How has an area being opened to OHV use "taken" some of your favorite trails? You are still welcome to recreate there I'm sure. People like you need to learn to show respect for those of us who prefer to recreate with motorized vehicles. There is a considerable amount of work put in by all kinds of motorized rec users (snowmobile clubs, dirt bike clubs, etc) into trail work and restoration work. Yes, we do give back. When was the last time YOU contributed something to trail maintenance?

Based on past experience, the "development" of this pristine area will negatively impact that watershed, wildlife and native people.

I am a mountain biker that says NO WAY!

I think you need to get outdoors. The US has more trees today than it did when the pilgrims landed. It is true that most of our forests were cut down in the 1800's to build homes, railroad tracks, support beams for mine shafts and to fuel steam locomotives. There is an excellent book that shows then and now pictures and in each case the areas that were in many cases totally denuded are now heavily forested. Most would say so heavily forested they cannot tolerate a natural wildfire. When John Muir roamed the forest he was able to stroll through the open forest landscape. When a fire came he climbed up a tree and waited it out. If one did that today you would be incinerated due to the overgrown forests. So there is plenty of forest, but it needs to be managed and thinned to be healthy. Our overgrown forests are also poor habitat for wildlife who cannot survive massive stand replacing wildfires. Wildlife also need wider spacing between trees to be able to travel in the forest.

Equal Use Rights for OHV. Please consider equal rights to all parties in the OHV use matter as this is the American way. Systematically off-road use is being taken away from OHV enthusiasts little bits at a time over decades. This is being accomplished by a non compromise policy by one party and a compromise policy by the other party. The other side has no intention of relenting until all trails are closed to motorcycles and ATVs. This is not a fair compromise this is a total block. I am a hiker and mountain biker as well and empathize and respect these concerns and desires within reason. Please be respectful of all rights of all taxpayers and I ask you to be considerate of the off road community. Most of us love our country and love to enjoy it's wilderness in our way so please always be sympathetic or empathetic of OHV rights.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I was hiking up a small mountain in Maine a couple of years ago. The hiking trail, which had been there for decades, took switchbacks so as not to cause erosion. But there was a newer OHV trail that went straight up the mountainside. All the soil was washed off of that trail, leaving only bare rock. Bare rock is not as much fun to ride on as dirt, so new trails get made. How can anyone be out there all the time making sure riders stay where they belong?

People sit on their butts watching TV, then sit on their butts in a truck, then sit on their butts on snowmobile or an ATV or a jet ski. This isn't exactly getting off your butt.

Old growth forests that have never been logged or have not been logged for 200 years or more have a mixture of old and young trees at a density that is sustainable. They are adapted to the fire regimes of their area. On the other hand, forests that have been clearcut grow up in even-age stands that become extremely dense. If unmanaged, the young trees will eventually crowd each other out and the strongest will survive - but it takes decades and leaves a lot of dead wood. These forests should be thinned near habitable areas to reduce fire danger. Old growth forests should be left alone. When forests have been clearcut in the past, fires have ensued. This happened in the early 1900s all over the upper Midwest. It happened in ancient Rome. It's a well-known phenomenon. Clearcutting increases fire hazard.

As a biologist, I believe that the only way to promote conservation of multiple species is to protect large connected habitats, while it's still possible. Climate change is happening, whether politicians want to believe it or not and now is the time to act.

I find the link to family recreation to be interesting but a non-sequitor. It would be just as logical to promote family spray painting of graffiti in the National Gallery of Art. I'm sure a family that enjoyed vandalism could bond together and have a good time. But that doesn't mean that cans of spray paint should be allowed in art museums. ORV recreation is a consumptive use of the public lands. The vehicles damage (at a minimum) and frequently destroy the ecosystem where they are used. That said, motorized recreation is a popular pass time and there ought to be 'sacrifice areas' where it is allowed. But given the consumptive and destructive nature of that 'multiple use'; those areas should be limited and carefully selected to minimize the impact.

As long as there is money available for real grass roots groups, who would otherwise find it impossible to get legal assistance on public land access issues, I'm OK with EAJA-type programs. Our local OHV groups, who depend on volunteer elbow grease for nearly everything, will be depending on these funds in our battles with the Forest Service over Travel Management plans, as will local governments and other aggrieved parties who have standing but lack the paid legal staff of the environmental groups.

This past week I heard a conversation on NPR by two experts on the plight of earth's oceans. I came away so depressed and felt that there is nothing that can be done at this point in time to redeem such valuable resources as the oceans provide. I don't know if that is really true, if there is no point to protesting and advocating and just plain raising HELL about the situation but I think that's what we, in all good conscience, must do. There are so few true treasures left, we must protect them.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

This isn't a case of Weyerhaeuser exploiting resources on public land. Their private land blocks access to public land, including existing USFS trails. It's simply a matter of location: to get to public land the public must first pass through private land. There is no easement, and Weyerhaeuser is balking at giving up CONTROL. This is a case where the USFS should gain a public use easement to the public's trails and lands, willing seller or not.

While I agree that better access to fishing is essential, a five mile hike with kids to fish is completely ok. Our family does it all the time. My biggest concern is public fishing areas blocked by private landowners. Most large rivers are "navigable" and in some states that means the "beds and shores" are owned by the people of the state, or at least the people should have the right to float the river. Where public and private land co-mingle, it is difficult to know legal access areas, so defined parking with defined access would help. Private landowners are also guilty of hoarding public waterways, and posting no trespassing signs on publicly owned beds and shores of waterways. I even know a case where the Forest Service refuses to allow any access for fishing, although the state (which legally must manages fish) wants to open the lake.

This situation isn't just about hunting. I know where public trailheads are also blocked. Weyerhaeuser (hardly what I would call a small private rancher) has complete control of access to a chunk of nearly 50,000 acres of public land near me. Nearby, private landowners have four USFS trailheads landlocked. Big timber pays lower property taxes because of the public benefits to forestland. One of those benefits is recreational access. If these companies insist on blocking access through their land to public land, their tax breaks should be reduced. Also, Federal agencies and local jurisdictions should be able to use all means necessary to acquire public use easements to significant blocks of landlocked public lands via roads or trails. The public should have rights to public land, just like if a private landowner was landlocked by public, they should have the right to access their land.

Berries, too. Wilderness areas do not allow berry or mushroom picking, even for personal use (unless eaten in the Wilderness Area).

There's a budget crunch here folks. The parks need to share all these "Ologists"--each park doesn't need it's own! Imagine the maintenance that could get done with the extra money.

This is a naive world view. In reality, people are in charge of everything, everywhere. When we leave an area alone completely, is not really for "wildlife", but to make US feel good about ourselves. And it is impossible to remove people from the equation anyway (global warming, pollution, etc.) When animal populations get too high in the preserve, what happens?--animals migrate to backyards. These off-limits areas would need big fences to let the animals "take care of themselves". I believe we need the opposite approach, get more people INTO the woods. Get more folks to touch the land, feel, experience, understand. The more folks really experience the land, the more support conservation has in the future. Remember, people control everything. They vote, pay taxes, donate, volunteer, CARE. We need to create a new generation of People who Care.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Nature is not a museum for kids to look but never touch. If children associate nature with getting in trouble, feeling guilty for being alive, thinking they must never step on the sacred ground, or pick a flower, rock, or other simple kid's stuff, we will lose them to TV's and computers. We must touch to survive. "Human entertainment" is touching, feeling, hiking, swimming, fishing, camping, driving, hunting, biking, and yes sometimes even ATV. These entertainments are creating the next generation of PEOPLE WHO CARE. The old school environmentalist view of "not even footprints" has got to go. Everyone must recognize that regulation and restriction has a real environmental cost. That cost is the loss of the next generation.

HELLO! There is a real budget crunch in this country people. As a former Park Service and Forest Service volunteer and employee, I can say that the Park Service needs to be more efficient and redirect their funding. More money for them doesn't necessarily more "services" for you. Do we need a ranger behind every rock? Do we really need \$250,000 pit toilets? Do we need to sponsor international scientists to come to our parks to study everything? Do we need every single park to have on its payroll a whole string of "ologists"? The park I worked at spent fire mitigation funds on a HORSE PASTURE where fire camp was set up! The Parks need to get efficient, direct money to repairs and services, and less study, litigation, planning, and visitor micro-managing. The USFS does much more with much, much less. The USFS even has to subsidise park visitors, since many roads leading to parks are USFS roads, and since Parks are very restricted on camping, USFS campgrounds outside their boundaries are "overflow".

I love a fast machine as much as anybody, and it's just my opinion, but it seems that there are enough areas for ORVs already - they don't need access to all wilderness quality lands or to all areas. ORV users are concerned about their rights, but giving them unfettered access to these lands takes away the rights of other user groups by ruining their quiet enjoyment of the land. I can see the joy of flying across the desert on an ORV. Can the ORV users see the enjoyment of walking through the natural quiet of wilderness areas and wilderness study areas? Seems to me there is enough land to go around for all of us if we are willing to give some consideration to the rights of others.

So many of these beautiful places are quite remote. If you are young and fit and have a lot of time on your hands, you can see them. But many people aren't up to a 4 day 60 mile backpacking event. Many of these people benefit from OHVs. Our government needs to think about them as well, and not just assume that a few paved roads and scenic overlooks is sufficient.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Thanks, everyone, for the comments and questions on this idea. Yes, the land is preserved. A permanent conservation easement would be a required component of using this financing tool. Yes, a conservation easement and management plan are both required to qualify. Duane: the timber industry is supportive of the concept, as is the conservation community (the list of supporters includes Plum Creek, Weyerhaeuser, and the National Alliance of Forest Owners, as well as Trust for Public Land, The Nature Conservancy, Sierra Club, and Land Trust Alliance). The reason that the conservation community is supportive is that it will bring new, private money to conservation deals. There are several differences between the current Community Forestry Bonds proposal and what happened in Montana, but the most important is this: the Plum Creek Montana deal was essentially public dollars to expand public land ownership while the bill now in congress will enable private dollars to put a conservation easement on private lands and maintain those lands in sustainable working forestry. This bill would actually not use public funds - that's one of the cool parts about it. Instead, it would authorize the use of private, tax-exempt financing for acquiring forestland, in just the same way a non-profit hospital would access this capital to build a new facility. So, it can add to the overall conservation funding pie by bringing in new money from the private marketplace. Thanks again, everyone, for the great comments and questions. Feel free to contact me directly with other thoughts:

None of the commenters on this idea seem to have any real knowledge of what the environmental impacts of the Bristol Bay mine might be nor of the economic benefits of the mine. I would suggest that this is an issue to be resolved by the citizens of the State of Alaska who are more knowledgeable on the subject and are more directly impacted by the decision.

I respectfully disagree with your characterization of the Flathead National Forest and with your statement that "Most of Montana is wide open to logging, mining, cattle grazing and OHVs." But the point is that the Flathead is not unique in the western states. For example, the Bitterroot National Forest is 47% Designated Wilderness with a 5% visitation rate. Indeed, Region 1 is about 25% Designated Wilderness with a 4% visitation rate. The reality is that thousands of loggers are out of work for lack of timber sales, we haven't had a new significant mine development for decades, and hard working ranchers are systematically being squeezed out of grazing permits on public land.

\_\_\_\_\_, you hit the nail on the head!! If we want to reconnect America with the Great Outdoors, we have to provide access to the Great Outdoors. Simple.

There should be more trails made specifically for bicycles, not on the PCT or through designated wilderness. There are many old, unmaintained dirt roads that could be made into bicycle trails. Bicycles need wider trails because of trail damage and erosion issues that their use causes. Old forest service roads that are no longer being used would be perfect bike trails.

***(cont.)***

Love it - my city has streetlights and also lights in the alleyways! Someone broke into a garage in my neighborhood, and now everyone is asking everyone to have lights on in their backyard, their garage, their front yard, and on and on. Very worried about thieves and so forth. I really really wish most lights could be replaced with high tech motion sensors, instead of being "always on." (Imagine a thief running down an alley way, and the police could see the motion detector lights all along his escape path!) Related, I understand lightning bugs/fireflies are on the decline. Their magical flashing lights are used to signal to potential mates. They don't like areas with lots of lights, because it upstages their bio-luminescence when they're trying to show off to their mates.

increase gov't solvency. The Federal Gov't has an enormous wealth in land. If the Fed's was more solvent it could be more credible when it made suggestions for land management. If the Fed began selling the land to private citizens it could use the money to pay off it's huge debt. This would be a form of voluntary tax collection that would help everyone.

There are better ways of getting your point across. The point is not whether someone follows the law or not. The point is do the laws and practices in place address the issue of protecting the outdoors while giving reasonable access to enjoy those areas. First, I agree that it only takes one OHV to ruin the experience of a wilderness area for everyone except others who are also on OHVs. This goes for the wildlife that lives there as well as all non-OHV users like hikers, fly fisherman, hunters, backpackers, horseback riders, mountain bikers, etc. The smell and sound of a single OHV can impact other users more than 2 miles away. That same area can be used by hundreds of lower impact users without detracting from the experience. It is wrong to assume OHV users are not following the laws any more than any other group of users just as it is wrong to assume that hikers and backpackers are careless and cause forest fires. There are no statistics to identify which groups of users are more likely to cause wildfires, but you can be sure there are careless users of all kinds that do so. Apparently it is not just "tree huggers" who are likely to "ignore facts and stick to lies and rhetoric (rhetoric) to stir up emotions." Clearly the OHV users have a challenge to be able to share the wilderness with other users and still enjoy their sport. It is possibly similar to smokers vs non-smokers in many respects. Some things that might go a long way to smooth things between users would be to improve noise and exhaust controls on those vehicles. A bit off topic, but if you have a dirt bike, you should check out where they are going with electrics. SERIOUS torque, kick-butt 0-60, and so quiet you sneak up on bears (that may NOT be such a good thing).

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Wilderness should be Wild. I think the Wilderness areas should be Wild. There should be no maintained trails. No trail heads. No trail head parking lots. No GPS, Cellphone, rescue beacons. If somebody tries to use an electronic device to summon help, it should be ignored. There should be no wilderness rescues provided by the government. Marked and maintained trails, and their associated trail heads and parking lots encourage concentrated use. This detracts from the wilderness experience. Of course there will still be a demand for more developed areas, with marked trails, and parking areas, and the possibility of rescue. These areas would have to be removed from Wilderness designation. Perhaps call them "backcountry" areas as a means of distinguishing them from areas that have paved roads. In the interest of fairness I think some of these areas should be designated multiple use. Not all the trails should be restricted to pedestrian use. Horses should be allowed on some. Bicycles, motorcycles, OHV, Jeeps, SUVs should all get areas their owners can use. The division of the available land could be based on the number of users in each group. This could perhaps be determined by trail registers at trail heads. Or perhaps each user would pay a fee based on which type of areas they intend to use.

My understanding is a US wilderness is defined as "A wilderness, in contrast with those areas where man and his own works dominate the landscape, is hereby recognized as an area where the earth and community of life are untrammelled by man, where man himself is a visitor who does not remain." If we are going to have wilderness areas (and I think we should) we need to be honest about it. In my mind, a maintained trail, with trail register and parking lot, is a permanent sign of the trammeling by man. They should be eradicated, just like other signs of previous human activity (roads, cabins, etc) are sometimes eradicated.

Look in a mirror. Every post you make is about the way YOU want it, and it's always against motorized use. You're a strange, simplistic creature with a tad bit to much anger harvested. Perhaps you should exercise a bit. The author has a good point. \_\_\_\_\_ attempts to paint a picture that by its very nature, accessible land is 'closed'. He's lying of course, but it makes a great bullet point for propaganda. I just can't imagine such a sheltered, closed minded, and twisted view of life as the the self pro-claimed 'anti-everything' live. Tell me, you don't plug your coffee pot into an outlet in your apartment. You hypocrite. Your very actions are "ruining my salmon runs", etc, etc, etc. The author's point is, if you can't get along with they way others like to do things, how would it feel to be on the receiving end? Be careful what you wish for and demand, for you might be next. Personally, I think sharing is a great idea. Currently, when I go cross country skiing, I have the choice of using their groomed trails and gaining better access to areas I would not otherwise be able to reach; or, not being around 'them' and going somewhere they are not allowed. In all fairness, I seriously doubt the guy on the sled appreciates me on a trail they are riding on knowing dang well that he is only allowed to access some small percentage of land because of groups that I'm associated with (skiers). And for all the complaints I hear about them, it's always amazing at how well they treat me. I have spoken often to dog mushers who share the same parking lot as we do (along with snowmachines). If any group of people would seemingly not like the noise of an engine, I would suspect it would be them. Let them seem to always have nice things to say. Again, look in the mirror. You are a selfish, insecure person. All I see when I read your posts is "me, me, me, I, I, I, give, give, give, take, take, take".

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I'll get a crayon.... write in big block letters so you can understand. Will that help? Sorry, that was mean. Naw, I could repeat myself, but your mind is seemingly so set, its likely closed to anything other than the way 'you' want it. Which, to put it bluntly (this should be simple, even for you), would make it selfish. Just because you 'think' that your way is the only way to protect wildlife, does not make it so. I think that's the hardest thing for many to grasp, yourself included. Your 'moronic' comment only announced to the readers your weak grasp of the issue. Most folks can probably see your attempt at lashing out and attribute it to the source. Your comments "I still find it laughable though that you people think sitting on a machine is strenuous exercise." only weakens your argument. It shows you as ignorant and blind to widely known facts, which in turn shows you (again...) as simple and closed minded. I quit donating to groups that support this closed minded thinking a long time ago. We're going to have to get along with groups that do things other than what we enjoy, whether we understand the attraction or not. I've never been to the dunes, can't understand the attraction to sand in the shorts nor blasting through hot air at high speed. Yet, who am I (or you) to say it's wrong, it's not exercise (that is a really lame statement and makes one look like a keyboard jockey) or should be shut down. Or is this where the 'holier than thou' and 'my way or the highway' attitude and beliefs come in? I don't apologize for mocking you and pointing out your short comings. You should have left the 'moronic' comment out. You earned it. Would you like to try again?

I live in Big Bear Lake, CA. There is an Adventure Pass fee to "park a vehicle and recreate" in the San Bernardino National Forest here. This is in areas that are unimproved and should be free to we Americans. As a Marine veteran I have to bite my tongue and use a restrained vocabulary to express my disgust and outrage at our govt. and politicians on this issue. The San Bernardino forest here has even gone so far as to offer "one free day" a year to veterans. You have to be kidding - what a cos. How much more disrespectful can our govt. get? You can't nickel and dime everyone to death. Everyone needs money, but our forests should be free for all citizens and families to enjoy, especially when on a tight budget. \_\_\_\_\_, you say emotionalism? We have a lake here and it costs \$90 a season to put a boat on the water - has nothing to do with an Adventure Pass. As for the San Bernardino National Forest here, the "improved areas" you mention require an additional fee. So if you don't understand our "emotionalism," then do further study.

I am a Utah native, and have seen the the damage done by OHV's on Forest Service land, BLM land, and private land. The use of OHV's has exploded exponentially over the last several years, which means the "small minority" of irresponsible riders has exploded exponentially as well. Places I have gone with my family, from the time I was a child with my parents, to now taking my own children have been damaged beyond recognition. Dirt roads that took us into the back country along the Wasatch Front mountains, my back yard, are now impassable. Streams and hillsides ruined and meadows turned into dirt racetracks (I have photographs). We MUST protect the last wild places and OHV use controlled and strict laws enforced or there will be nothing left for anyone.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I think it is time to tell the federal agencies that earning an America the Beautiful Pass should be doable during a week's vacation and two weekends -- say 50 hours. That would value our time at about \$160 an hour! Make sure that the volunteer effort is subject to documentation, but for goodness sake, make the volunteer recognition achievable by folks other than the unemployed and the retired!!!! Heck -- I get two free baseball tickets for donating blood -- a \$30 value for literally 30 minutes of my time.

Controlling the viewshed above national parks just seems way, way too big a challenge. You would be talking about buffers of 50+ miles around parks.

Do we alter fees according to how many people see the contrails? Over do we let flights go free if there is a cloud cover and no one's view is impaired? Reminds me of the classic philosophy question: if a tree falls in the woods and there is no one around to hear it, does the tree make a sound? Look, I'm sensitive to impacting the enjoyment of parks. But there are so many other more pressing issues for me -- acid and toxic rainfall, climate change and more -- that I'll just have to pass on believing this issue merits action.

We have some sympathy for both your message and the problems being faced at the grassroots level by the Forest Service. But first -- your descriptions of the federal pay scales is a bit off. There is no GS 25. For details, go to: { <a href="http://www.opm.gov/oca/10tables/pdf/gs.pdf" rel="nofollow" target="\_blank">Link</a> } We have found that adding funds to the Forest Service budget nationally is not a good way to get funds to the ground. The charges assessed against line items like recreation are exorbitant -- there are deductions for everything from EOE to new computer systems and overall administration. Lucky if \$1 in \$3 hits the ground. That is a big reason for our advocacy of retained fees -- which are generally exempted from these deductions.

The "we" refers to the dozens of recreation enthusiast and advocacy groups that have worked to increase resources for FS recreation programs for more than three decades -- through budget increases, fees, overcoming obstacles to volunteerism (including liability issues) and through federal funding for trails, boating and fishing access and more available for investments in national forests through state agencies, usually in cooperation with local trail/fishing/boating/hunting organizations.

Even worse, the AVERAGE American youth spends 7.5 hours daily watching a screen (and even higher for urban and minority youth) and 30 minutes outdoors. Source: Kaiser Family Foundation report in January 2010. This represents an hour a day increase since 2000. Researchers were amazed -- reported that they hadn't imagined that the hours reported in 2000 could increase because of other time demands like sleeping, eating .....

\_\_\_\_\_ is right. Simply calling for more funding are likely to fall on deaf ears during the next several years. We need to either suggest where other programs can be cut back or suggest ways to raise funds for our suggested new and expanded programs. The Congress and the Administration are forced to do that under PAYGO budget rules -- and to be effective in our advocacy, we need to help them with the rules they must play under.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Forest Service Planning Rule Needs to Facilitate, Manage Recreation. The Forest Service is going through an elaborate process to development a planning rule to guide planning efforts by national forests covering 190 million acres and hosting hundreds of millions of recreation visits each year. The process has included Federal register notices, a science forum, public roundtables and more. Recreation community leaders recently met with the Chief to praise the process but underscore that major change is needed to keep national forests relevant to Americans in the 21st Century. While we agree that the planning rule can't go into great detail about treating recreation in the forests, we do believe that the rule needs to signal a change in managing recreation, including strong direction to utilize state programs, volunteers, concessioners and permittees to head off the all-too-frequent clashes that occur between a dn among recreationists in the forests, and to be more forward-looking in planning efforts.

The data is clear -- recreation and wildlife economic benefits of national forests and most other public lands exceed the economic benefits of commodity uses. Has been true for years. And the recreaiton/wildlife benefits are sustainable. Yet getting recreation its deserved place in forest and public land planning is very tough and not appropriately supported by the agencies. Trying to change that in the new FS Planning Rule.

Sorry, but it is not clear to me -- are you proposing to buy private lands and make them into school trust lands or are you proposiong to buy school trust lands from willing states for placement in other conservation systems? School trust lands were designed to generate income for state educational programs, and is resticted to well under half of all states -- seems to me that this mixes too many concepts for a clear initiative.

Park Partnerships are Drowning in Red Tape and Process. There are wonderful partnerships at work protecting America's national parks and helping to create life-long memories. Many of the partners are non-profits like NatureBridge and the Golden Gate Parks Conservancy. Other partners are businesses operating in or near the parks. But across the board, these partners are finding the red tape and process to be growing dramatically and challenging even long-standing relationships. Fear of GAO and IG investigations is prompting NPS to shorten the terms of the agreements -- even as they are asking more of these partners -- and putting each agreement through hoop after hoop of local, regional and national clearance. The House Subcommittee on National Parks, Forests and Public Lands held a hearing on Parks and Partnerships on 9/23 and got an earful. The Congress needs to take action soon to overcome the surge in barriers to partnerships and to send a clear signal that creativity in "doing the right thing" by park superintendents will not only be tolerated but applauded. For copies fo the testimony detailing the problems facing park partners, go to: { <a href="http://resourcescommittee.house.gov/index.php?option=com\_jcalpro&Itemid=32&extmode=view&extid=388" rel="nofollow" target="\_blank">Link</a> }

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

FLREA fee options never implemented. When Congress passed the Federal Recreation Lands Enhancement Act in 2004, providing 5 federal agencies with fee retention authority and more, it also provided authority for some important additional fee programs -- like the ability of volunteers to earn a nationwide pass and an option to make fees simple for us -- with regional passes that would cover federal, state and even local entrance fees with the same pass. Lots of models to follow on the latter -- the fast pass systems now used for tolls on highways. or the addition of a stamp on the America the Beautiful pass, as is now done for hunting and fishing passes in various states. The FLREA fee authority expires in 2014, and no action by the federal interagency fee task force on this yet. Looks like it will not happen.

While I generally support this comment, I do not believe that management of our lands should be looked upon as a "majority vote" issue. Our federal land managers need to be trained and rewarded for developing consensus on land use decisions, as well as helping the public understand the science issues involved. And there needs to be consideration of the variations in public values within the one-third of the US managed by federal agencies. In short, national park system lands and wildlife refuges deserve more "national" consideration in use decisions than much of the multiple use lands systems.

We have made significant progress in water quality, almost all in the point source arena. Public and private investments have been large -- and regrettably, we have not acquired some of the real estate which could allow public access to these waters -- real estate which was made much, much more valuable by the clean up. Perhaps we have no choice but to pay the price now. but let's learn the lesson and as we turn to non-point sources, let's make certain that key access points near urban surface waters are not made still more unaffordable!

Permits are required for commercial uses of Wilderness -- or any FS or BLM area. The problem is that the permit process is hugely burdensome, very slow and works only with well-intentioned outfitters and guides. There is virtually no monitoring or enforcement, meaning that there are renegade operators ignoring the permit process -- and others who operate under the pretense of being educational/charitable operations when they are not. This is definitely an area needing major change.

I'm all for "spending on conservation" -- also on education, and medical research, and transportation infrastructure and defense and ... the point is, I also care about the total tax burden on me, too. This is an era when we need to grow park and conservation resources in areas other than straight appropriations. And there are lots of ways to do this.

The issue here is that we have ignored the inholding issue too long. Once the Congress designates a park/refuge/other special area, we need to proceed to either buy private inholdings at a reasonable price or impose development restrictions -- and pay fair value for the restrictions imposed. I do agree that Tom Chapman is engaged largely in a gaming process that needs to be discouraged -- but not at the cost of legitimate private property rights.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Hard to understand why you "can't afford to visit the parks," since well over half of all NPS areas have no fees and since in 2009 and again in 2010, fees were waived during many key periods. Switch your medical insurance to SeeChange insurance -- they will reimburse you for park entrance fees!

I think we ALL agree that sustainable, alternative energy needs to be advanced, but that we need to be mindful of unintended consequences. Our highways of the '60's and urban redevelopment efforts of the '60's and '70's proved that good intentions don't deliver good results. I'm reminded of a favorite saying: "There is always a well-known solution to every human problem--neat, plausible, and wrong." H. L. Mencken Wind turbines are good -- but not in the wrong places. Geothermal is good -- but not if it "kills" Old Faithful. Solar is good -- but not if the water demand exacerbates problems with groundwater mining.

Bad idea. Mountain bikes should NOT be allowed in the wilderness or on the National Scenic Trails like the Pacific Crest Trail. Mountain biking is an activity supported by a powerful industry (including auto and motorcycle manufacturers.) We as a society need a place we can go that has not been sold out to industry. A place where quiet, passive recreation is the most that can be done. Mountain bicyclists can enjoy the wilderness on foot like the rest of us, and ride their bikes elsewhere like they already have plenty of opportunity to do. Nobody wants to be run over while gazing in quiet contemplation at the view on the John Muir Trail.

Animals that require solitude (no humans) to thrive don't care what condition the road is in.

Quality family time does not include risking your child's life on an OHV in tough terrain. The results are clear to intelligent people. A single man trashes the land commensurate to a single OHV. A family of 4 trashes 4 times as much public land. There are 306 million owners of our national forests. Why should someone feel that they can harm the land that belongs to 305,999,999 people without permission?

No, this should be reworded to read: preserve OHV use to assure massive profit for corporations that manufacture OHVs. This statement originated with a lobbyist.

Every timber sale, every road constructed and every noisy OHV either destroys the wildlife habitat and/or drives our wildlife from their habitat. Currently 96% of the undeveloped land in America is developed and no longer functions as habitat. There is a time when there will be more than enough habitat ... after corporate development has forced the wildlife into extinction. Extinct wildlife species can get by with no habitat at all.

Fact: OHVs tear up the ground and create sediment that hammers the aquatic environment. It makes no difference who is riding them ... whether they are members of a family or unrelated.

When an ORV uses a trail they demolish the solitude enjoyment of hikers and scare horses.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

No! Ban children under the age of 85 from using OHVs on public land.

When OHV users expand to the point that they bump elbows, why not buy 100,000 acres of private land that has already been trashed and plundered?

The vast majority of Americans enjoy viewing wild animals interacting in their habitat ... not draped over the hood of a car.

National Wildlife Refuges are no place for motorized recreation.

More local open spaces!. Sidewalks are NOT nature trails! Newer developments seem to be about maximizing the profit by squeezing people into smaller and smaller lots , and the developers and the city officials run the show. Its like minimum requirements in some city's where one percent of there business has to be beautification. It is not enough. Open spaces should be a requirement! Not just baseball fields and golf courses that you and your dog are not allowed on. We should not have to drive 20 or 30 miles to an open swath of land. There needs to be a better balance for people to actually live and play.

You can stop beating the drum... Global Warming is over. We just got through one of the coldest summers in history. This winter promises to be the same. Al Gore made a 100 million dollars from a lie and scare tactics. Ha. Let's learn to share our Public Lands with ALL Americans.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

12): Many people don't trust federal politicians...so what's your point? I'll take a crooked local politician over a crooked federal politician ANY DAY! Which is why I feel land bills should start at the county level. As for the wilderness bills not passing without local congressional support, that is essentially how it is now anyway (so though people disagree with it, it's the way it is...with few exceptions), I just want to make it official. And the fact that historically congress hasn't passed wilderness bills without congressional support from the state the land is in, is for good reason! Right now, in Utah, there is a MASSIVE (and even "massive" is an understatement---the thing is larger than the entire state of Maryland) wilderness area trying to be FORCED down Utah's throat, by a radical environmental group. This group tried 20 years ago to get a Utah congressman to support the bill-and he was promptly voted out of office...so they realized they had to get politicians out of reach of Utah voters to progress their agenda. So here we in Utah sit, looking down the barrel of a HUGE wilderness bill that we don't want, that will hurt our economy, that includes non-wilderness act compliant land, is really unnecessary (the reasons stated for the bill are exaggerated or outright lies), and that we HATE, and there is NOTHING we can do about it. The politicians progressing it are out of reach of our votes (many of them won't even accept emails from people outside their district-Maurice Hinchey 22nd district in NY for example). We are helpless! That is why this is wrong! Utahns know what is best the federal land we live on, make our livings from, of which our livelihoods depend. And we're helpless to stop this BAD wilderness bill. In Washington County here, there was a very successful land bill that passed, it included nearly 300,000 acres of wilderness. Similar bills are in the works in Emery County, San Juan County, and Piute County...All will include wilderness...but this radical environmental group has promised to "kill the bills" if the amount of wilderness in each county is less than in their proposed wilderness bill. So for people to say that our local politicians don't care about the land, or won't designate wilderness, or will sell it to the highest bidder is just plain misinformed and WRONG. \_\_\_\_\_ 13) What does BP have to do with this? And in my experience, the REASON environmentalists are so against "local" (county and state) politicians is because they have MORE control over the feds (just like corporations do). Environmentalist groups are "big business" these days...they have MILLIONS AND MILLIONS of dollars (The one we deal with here in Utah has MAYBE 20 full time staff, and they have well over \$5Million in assets with nearly \$2Million a year in "donations"...and that's a small one!). They are just as eager, just as capable, and just as willing to "buy" congressmen, and their agenda is just as damaging and just as crooked as a corporation is. Environmentalists constantly try and dumb the discussion down into absolutes and exaggerations. They try and make it an "either/or" proposition. It's "either" wilderness, or its "wrecked once and for all". Which isn't even remotely true! There are many different, and sometimes more effective ways to manage public land than wilderness....but the environmentalists-the radicals that they are-only see to want wilderness. Why is that?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

...those county commissioners are wrong in that desire. If San Juan and Emery and Kane and Piute could spearhead the land use proposals without fear of a radical environmentalist groups threatening to "kill the bill" if it doesn't reflect what they-radically-believe it should, those county commissioners would feel they needed those drastic measures. The problem is that the environmentalist groups won't allow a "middle ground" (unless it's a forced last resort--Tavaputs Plateau), their radicalism and extremism breeds extremism and radicalism from the opposition. The opposition to these bills can't give an inch, because the environmentalists will take a mile. So they have to maintain these extreme-be it, unrealistic-positions to counter the extreme-and equally unrealistic-positions of the environmentalists. All I'm saying is that the county residents should have the MOST say (they should do the inventory, they should set the wilderness and other potential designation boundaries, etc...this gives them the most say), they should welcome input from everyone in the country, and at the end of the day ALL Americans would get a say via the vote of their congressional representatives when the bill is brought to the floor in congress (just like they do now on every land bill and every other bill on every other topic). That's all I'm saying.

As a point of clarification, OHV access to public land in UTAH is shrinking! Every year, OHV's lose access to more and more public land in this state. For example: When the BLM revised it's travel plan for the San Rafael Swell in 2003, OHV's lost 40% of their access to the Swell. 40% of the OHV trails/roads in the Swell were CLOSED!!!! (And, as a point of interest, Bush was president in 2003) More recently: When the BLM changed from an "Open unless designated closed" model to a "closed unless designated open" model, again OHV's lost access to their public land! I've been riding on public land in Utah my entire life, and I can tell you with 100% certainty that there are less places to ride TODAY, than there was last year, the year before that, 5 years ago, 10 years ago, 20 years ago. Certain groups and individuals would have America believe that OHV's are literally canvassing the entire landscape in Utah and destroying everything in sight. This isn't even remotely true! Don't let certain agenda's fool you, OHV's aren't proliferating into new areas they haven't already been. They are being shut out of more and more areas every single year. Quite honestly, OHV access to public land in this state, at least, is at a critical mass! More and more OHV's are being crowded into ever shrinking open areas. This trend can't continue.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

I take issue with the claim that ohv's "destroy" (as in "ruin forever") the land. A track or a trail through a landscape doesn't "destroy" the land scape. Stating such is an emotional exaggeration and misleading. I don't even see a track or trail (or even multiple tracks or trails) as "ugly" or "unsightly" (just my opinion, just like it's someone else's opinion if they feel otherwise). And the failure of the environmentalist community to acknowledge that the land will heal, is a huge hole in their argument! They will provide pictures of OHV tracks across the wet sand, and site it as evidence of the "destruction" of OHVs...yet fail to acknowledge that if they were to come back tomorrow, the tracks wouldn't even be visible. (Just one example) And for your information, OHV access to Utah public land is DECREASING every year! In 2003 when the BLM revised its Travel Management Plan, it closed 40% of the OHV trails in the swell. And more recently than that, when the BLM switched from an "open unless designated closed" to a "closed unless designated open" model for OHV trails and roads, MORE OHV access to public land in Utah was lost. This is important to point out, because it is an underlying factor as to why you are seeing more OHV damage in the areas they are allowed to go. As OHV increases in popularity, the places they are legally allowed to ride continue to shrink. So more and more OHV's are being crowded into smaller and smaller riding areas. OF COURSE the areas they are allowed to ride on will see more damage. (The environmental community lobbies to get areas closed, and are thus responsible for the over crowding, and increased damage, in certain areas....then the dishonest environmentalists use these open areas as evidence to close MORE riding areas. They can't have it both ways!) And if you have evidence of people illegally riding in areas they aren't allowed, we need to deal with those people via enforcement of existing laws, not by stereotypically banning all OHV's. OHV's don't destroy public land. People destroy public land. Do pencils misspell words? No. The people controlling the pencils do. Do OHV's ride irresponsibly on public land? No. The people controlling the OHV's do. We need to focus on the people! Not on their mode of transportation (be it a Honda or Nike's). Punishing ALL OHV riders because of the actions of a few, is wrong. Because some members of Islam are radical extremist set on destroying America, is it right to punish all members of Islam? Because some African Americans are gang members and damage society, is it right to punish all African Americans? Of course not! And it's wrong to punish all OHV riders for the actions of a few. Enforce existing laws to deal with the bad apples (just like is being done with gang members and radical Islam). Come on people...this broad brush that the environmental extremists in this country use in their dishonest attempts at gaining control of public lands needs to stop (and by "gaining control" I mean getting it designated in such a way that only the activities that they SELFISHLY approve of are allowed). Stereotyping all OHV riders, is wrong. Wilderness Advocates don't have any more right to the land than OHV advocates do. And it's incredibly selfish for them to attempt to have the land designated in such a way that only activities in which they approve of are allowed. It's PUBLIC, it has to be shared! If you don't like sharing land because it ruins your pictures, or you don't like seeing trails or the noise...go buy some land and do what you want with it. But you can't have your exclusive way with public land. If you can't afford your own land, tough cookies! Life isn't fair...so you are going to have to deal with other people while you use public land. I just do not comprehend the selfishness of the wilderness advocates. "I don't like OHV's, so I want them banned" "I only like to hike and paddle, so I only want hiking and paddling allowed"....come on!

## Discussion Question 2

***(cont.)***

All public land bills should start at the county level!. When it comes to public land bills, they need to start at the county level-with input from local citizens and businesses-spearheaded by the resident county commissioners, and supervised by the state congressmen. Once a land bill is finalized at the county level, the state congressmen then take that bill to D.C. for a vote. This is public land, and as such all Americans deserve a say. And this way the AMERICANS that will be most significantly affected by the how the land-those that live on/near the land-is managed get the most say. The Americans that live close to the land in question-residents of the state-get slightly less say than the specific residents of the county, and all other AMERICANS get a say by how their elected congressional representatives vote of the proposed bill. This way those that will be affected the most, get the most say. Yet all Americans still get a say-as they should. The current way of special interest groups (environmental groups)-who represent a small minority of the population-spearheading the movement and going over and around local politicians, and getting support for whatever bill they come up with from congressmen from the otherside of the country and then forcing the bill down the local residents throats, is broken and wrong!

From what I've seen Locals don't have hardly any say at all. The Red Rock Wilderness Act (which has proposed to designate 9.4million acres of BLM land as wilderness---an area larger than the entire state of Maryland, and which would be 40% of the total available public land in the state of Utah) is completely ignoring the will of the locals. There is no support for the bill from the Utah congressional delegation, virtually every county commission which has land included in the bill is against it, and there is very very very little general public support for the bill. So the environmentalist organizations got a Congressmen from New York (out of reach of Utah voters) to sponsor the bill (and he's been re-introducing it every year for the past 20...and there is nothing Utah voters can do about it). The environmentalists are 100% intent on forcing this bill down the throats of Utahns against our will. This is wrong on so many levels. As a Utahn, I expect to have very little say in what New York, or Montana, or Oregon or California do with their Federal land...and I wish they'd afford Utahns the same. We in Utah are very capable of taking care of the public land in Utah, and are intent on doing so on a county by county basis. It is proving very effective at representing the will of all stake holders. And if you aren't an extreme environmentalist that I'm not talking about you. So don't take offense.

***(cont.)***

I'm not opposed to wilderness. But 40% of the public land in one state as the very most restrictive of all possible land designations is WAY too much. The problem with this bill is that it's too large, it is being sold to America on false pretenses, doesn't represent the will of the majority, will hurt local/rural economies by limiting their access to fossil fuels which their economies so badly depend, not to mention the tourist dollars OHV's bring to these rural communities. The Moab Jeep safari is WORLD famous! There world famous Dirt Bike riding areas here, which attract visitors to otherwise irrelevant towns and keep them alive. Mountain biking in south eastern Utah is also world famous and the rural Utah towns depend on the tourism dollars these non-wilderness compliant activities provide. I don't think anyone is opposed to small amounts of wilderness (archeological sites, the very most pristine and sacred parts of public land, etc) as evidenced by the amount of wilderness included in the successful Washington county land bills, but when a vocal minority is trying to take a land mass larger than the entire state of Maryland and designate it as wilderness against the local state's wishes is just wrong. As I said, I don't expect to have a huge amount of input on how Americans in other states manage the federal land that they live next to and on, and I wish they afford Utahns the same privilege.

This is something that NEEDS to change. And suggesting it as an idea for better managing public land, to the Obama administration is relevant. I'm not saying that it shouldn't take an act of congress to designate wilderness areas, I'm just saying that federal land should be looked at on a county by county basis, and the local residents should spearhead any public land bills for the federal land in their county. All Americans get a say in how the land is designated via their elected congressional representatives vote on the land bill the county comes up with-just as they do now. Should congress change this law, the only difference would be that county commissioners and local residents-who know and understand the land better than anyone-would be spearheading the movement, rather than environmental groups with screwed views of reality-in that they believe "wilderness" is more important than lives and livelihoods. There is now way a person from Maine, who never has-nor never will-set foot on public land in California....should have more say over how that public land in California is managed, than a person that has been dependent on that land-sometimes for generations-for his livelihood. I don't want a huge say in how the federal land is managed outside of my state-above and beyond the vote of my elected congressional representatives-and I wish other Americans would stop being so selfish, and allow the people in my state to manage the land.

The OP says there is 6 million acres of "wilderness quality" BLM land in Utah. If that's all there is why is the Southern Utah Wilderness Alliance, along with about 160 members of congress asking to designate 9.4 million acres of land IN UTAH ALONE as wilderness? Does that mean they are asking to designate 3.4 million acres of land, in Utah, as wilderness that aren't wilderness quality? (Doing so via the Red Rock Wilderness Act)

Many Americans see the Great Outdoors as more than a recreation venue. It is where they connect with their spiritual side and experience re-creation. For these people, the Great Outdoors is church and nature religion. \_\_\_\_\_, you are a man of Christ and so I share with you something recently found on-line and directly relevant. Can you appreciate that it is a blaspheme to demand payment for walking in nature or seeking communion with values greater than Mammon? Or, as a lobbyist, can you appreciate only the values you are paid to represent? \*\*\* Jesus Christ announces new \$75/month Pay-for-Pray Subscription fee by \_\_\_\_\_ 10/7/2010 | BOISE - Lord and Savior Jesus H. Christ today announced new plans for Heaven's prayer service, as, starting Nov. 1, each Christian must pay a \$75 per month "Listen to Your Prayers" Subscription fee. "For too long now, we've allowed non-tithers to piggyback on true tithers," said Christ, 30-ish. "Now, you can still pray, but if you don't pay, we won't listen." The controversial Pay-for-Pray plan comes just days after a Tennessee man saw his house burn down, and have four of his pets burn to death as firefighters watched on, unwilling to help because the man had not paid his "subscription fee." Christ said that such things are to be expected. "If you don't pay your \$75 then that hurts Heaven," said Christ, sporting a new grill. "We can't use those resources and you would be sponging off your neighbor's \$75 if they answer your neighbor's prayers and you didn't pay for it." Christ went on to say that Heaven's finances have been in turmoil since the economic crisis hit, and that a "lot" of money was invested with convicted fraudster Bernie Madoff. "You'd think we'd have seen that coming," said Christ. The new subscription Listening Fee plan will start at \$75, and go up 10 percent every year to keep up with inflation. Jesus said that it was a bargain at twice the price. "Hearing your prayers matters. We're talking your eternal soul, here people," said Christ, noshing on a hot dog. "Just remember this - You shall enter God's glorious kingdom if you accept Me as your one true savior. And pay the \$75/month Prayer Subscription Fee. That's all we ask."

***(cont.)***

We have gotten ourselves into this unsustainable and disastrous predicament by pursuing exactly the policies \_\_\_\_\_ recommends! We need to learn from our mistakes and start doing things differently, in a way that is not only sustainable (which has become a buzz word, these days), but regenerative. By observing and understanding nature, we can learn to live in a way that renews the earth instead of always degrading and destroying it. This is not a pipe dream, we can do this now. We know how to do it. Organic agriculture and permaculture good examples of how to live this way in terms of food production. Solar and geothermal energy, among others, are good examples of how to do this in terms of energy production. There are many other examples and we are just beginning to see the countless possibilities as we explore other options besides the traditional Western notions of exploit, degrade, rape and move on to the next resource area. Eventually, you run out of new areas and resources to exploit and use up and you destroy the life-sustaining systems we rely on for survival. We are now approaching the limits of oil extraction and exploitation, referred to as "Peak Oil", where the only substantial, new reserves left are those that are increasingly difficult and dangerous to get at, and are much more costly to extract. A new regenerative model is clearly needed, one that allows us to live within the capacity of the Earth to sustain us by incorporating the principle of renewability as fundamental to the system. We will either adapt to this reality, or we will perish. The Earth does not care, it will still be here after we are gone. We still have a "frontier" mentality in America, but we no longer have a frontier to exploit. This is now the case on a global level and we must adapt to this reality.

Excuse, me! I meant to say "the policies that \_\_\_\_\_ recommends", not you. My apologies!! I agree with everything you said. I especially liked your comment "global warming is making the ice cap melt and that ocean is becoming accessible. Drilling for oil and gas there will make global warming worse, which is the opposite of what we need. It is absolutely counterproductive and counter intuitive to take advantage of the catastrophe of global warming and make it even worse". The oil and gas companies who will profit most from the exploitation of the Arctic as the ice caps continue to melt, must be literally giddy over the fact that global warming is making them melt and I believe they are doing everything they can to encourage it. They have a tremendous amount to gain. It is well know to anyone who cares to inform themselves that the biggest funders of global warming/climate change denial are Big Oil, such as Exxon Mobil and Koch industries, the latter is also the primary funder of the co-opted and now largely astroturf, "Tea Party" movement. People need to wake up and smell the coffee and see who is behind these campaigns that are hurting us all, yet massively increasing the profits of a select few.

I agree with everything you said. I especially liked your comment "global warming is making the ice cap melt and that ocean is becoming accessible. Drilling for oil and gas there will make global warming worse, which is the opposite of what we need. It is absolutely counterproductive and counter intuitive to take advantage of the catastrophe of global warming and make it even worse". The oil and gas companies who will profit most from the exploitation of the Arctic as the ice caps continue to melt, must be literally giddy over the fact that global warming is making them melt and I believe they are doing everything they can to encourage it. They have a tremendous amount to gain. It is well know to anyone who cares to inform themselves that the biggest funders of global warming/climate change denial are Big Oil, such as Exxon Mobil and Koch industries, the latter is also the primary funder of the co-opted and now largely astroturf, "Tea Party" movement. People need to wake up and smell the coffee and see who is behind these campaigns that are hurting us all, yet massively increasing the profits of a select few. \_\_\_\_\_ seems to have a "frontier" mentality, thinking that resources are infinite and inexhaustible. News flash, we no longer have a frontier, \_\_\_\_\_, and haven't for some time now. What's more, there are no more frontiers left anywhere in the world. We have reached and are pushing up against the limits of all of our resources, whether they be oil and gas, fresh water, and soon, arable land and food supplies. This is the reality that we must adapt to or perish. Unless we adopt a sustainable way of living upon the Earth, one that is regenerative and allows us to renew our critical resources, we will perish. We now number 6.8 billion people on this planet. There is no more margin for error or foolish wastefulness, selfishness and greed and a grand scale. We must leave our childish ways behind, grow up and face reality. The laws of nature are pretty simple and straight forward: adapt and evolve, or perish. The earth does not care, it will still be here after we are gone.

***(cont.)***

I agree with the previous comments. I think \_\_\_\_\_ needs to stop taking his cues from fictional novels, like "John McPhee's novel Encounters with the Archdruid" and get out and see the devastation of real places, parks, wilderness areas and other public lands, to appreciate what Aron has aptly described as the many disaster zones that have resulted from doing just what \_\_\_\_\_ recommends. I live in Pennsylvania where our rich state forests are now being auctioned off for cheap to Marcellus Shale Gas drilling companies that are polluting our ground water, using millions of gallons (free!) from the Delaware River for their hydrofracking operations and causing lethal explosions and degradation of ecosystems by the introduction of roads and spillage of fracking fluid and other drilling wastes. Our government officials have sold us out on the cheap and are not even taxing the gas drillers! Oh, and they send much of their waste water to water treatment plants to be "cleaned up". Many plants are overwhelmed and some will not accept the waste water because they do not have the ability to deal with some of the highly toxic chemicals, which the drilling companies refuse even to disclose. From my experience, this is typical behavior from "private investors". Face it, they care about one thing and one thing, ONLY: MAXIMIZING PROFITS and the expense of everyone and everything else! This should not be a mystery, it is the very nature of unbridled capitalism. Welcome to our nightmare...when will this insanity be stopped?? The Allegheny Forest in PA is the largest expanse of forest left east of the Mississippi River. It has taken it over 150 years to recover from the first disastrous episode of unrestricted, unregulated logging and now they are back to rape our forests again. Don't we ever learn?

Horses and History. On the East coast National Parks use birth control (PZP) to manage wild horse herds on barrier islands as opposed to the roundups of the BLM. This idea needs to be extended to the west where wild horses also have a legitimate historic as well as prehistoric place. The National Park Service could lead the nation in treating these animals as the native species they are. Americans are fascinated by them. Think of the history, the Native American cultures, the movement West, the Spanish. Climate change - how have things changed since horses originated here? How do they fit into the ecology as opposed to causing environmental problems since horses had long been in most of the west before the westward movement began?

govern nature as nature governs itself. What works for conservation and allowing nature to live in harmony with plastic. First lets define plastic.. plastic is a cover all word for something that is man made. I have found that anything man made can be traced to chemicals many of whom are by products of fossil fuel extracted as oil. Other posts of mine tell of my creating polarfleece and point out that corporations now deeply rooted to plastic man made products also called synthetics have organized into coalitions to try to improve recreation experiences and participation on public lands. Years ago in 1992 I was quoted in a feature story about polyester plastic underwear in the Wall Street Journal. quote: "layering irony upon irony Mr. Hoschek explained who was responsible for this winter wear revolution: hippies. The outdoor winter wear revolution of moving on from natural fibers to plastic fibers was indeed part of the strong hippie culture in Berkeley Calif. One name Sierra Designs rooted in name only to the more famous Sierra Club began the revolution. Contrast this hippie thing to today and a recent award winning documentary film about one of the founders of Jan Sport also acknowledged to be at one time a hippie. Are we going to connect the dots of Michael Moore and Bill Mahler todays voices that can swear on tv and make it okay as hippies swore at the gov't in the 60's and 70's. What kind of movement can deploy itself against the war on terror in todays world. The term grass roots comes to mind. Grass is a root of the land itself in real terms not just a tag line that might be linked to hippies. Every idea and post for the Great Outdoors I believe carries with it a real claim to preserving and protecting what we have set aside through time honored work and education from those before us like John Muir and Aldo Leopold and others. Every comment should be read by the federal employees who manage the lands of America that are NOT privately owned. That is why I offer up the goal of seeing a separate Department from the Department of Interior and Department of Agriculture when the word recreation is associated with conservation and the ethics created from thinkers and scholars like Aldo Leopold and John Muir. I learned from ten years of being asked by the DOI and trying to present things to DOA that these agencies have their plates full trying to administer what is before them and that recreation should find its own seat at the table. Plastic is simply my way of saying its man made and its purpose is to serve a corporate entity to make a profit. Nature is something humans have yet to control and certainly are not paying enough attention to in how it governs itself through all the lives and deaths and births it accepts in the evolution of its union with land air and water. The is a survival of the fittest in Nature but that also directly brings forth another species and the chain is not broken by plastic manmade intrusions less we begin that trail and do not have the right governing ways and means to sustain both our plastic and natures natural. I have always viewed recreation as a means to be upon nature and to employ our powers as human in conservation to its higher power and calling. Words today are not enough. Actions are needed and after ten years of following the conservation alliances of recreation coalitions I truly believe our government should create a new Department for Recreation to allow it the freedom to become what our public lands are asking from us as we continue in our world of plastic and design our way back to nature.

***(cont.)***

The whole state of Utah is amazing and should not have any more wilderness to prevent anyone from enjoying it. You say you have seen streams ruined by ORV's which is a made up story. Sure it happens but not the way you extremists make it out to be. There is more area to hike in Eastern UT then to ride a jeep, bike, or ATV so go enjoy that part of UT and leave the rest alone.

I am surprised anyone would demote this. In Sardine Canyon every winter there is a huge transitional range where the mule deer head down to there wintering grounds and there needs to be an underpass for the deer to go under the road and head to the wintering grounds. I bet I seen over 50 deer killed in one winter on less then 4 miles or road. There is 1 underpass for them already but it is placed to high. They need to place it lower by the town of Mantua.

OHV vehicles may have some impact on the areas we ride. No matter how much we dispute that there is evidence that some greenie finds. These facts are simply a smokescreen, the destruction of the forest from responsible ohv users is almost unachievable. at prarie city ohv area, there is a certain type of bush growing in this arid wasteland, and in this bush lives a certain type of beetle. The state has constructed wood fencing around these bushes to protect these beetles. these fences are concreted into the ground. was there an impact report on the bulding of the fence? Its a political battle. If your son or daughter runs into one of these barriers while riding, the result could be serious injuries. so the livelihood of a beetle takes precedence over our safety. PC ohv has existed for years. before ohv had gained the popularity and political attention that it has now. And guess what beetle was living there coexisting with ohv users. Or the big argument with the rubicon trail is sediment run off into tahoe. this is funny to me, that the couple hundred rigs that are out there on the bussiest weekend can cause more sediment deposits than the 5 million dollar homes that are built on the shore of lake tahoe. or the freeway that wraps around the lake, driven by thousands of cars a day. Lets not forget the hundreds of boats in the lake, and uncountable amounts of tourism that leaves behind litter, and excess waste. Some EPA investigator has a goal and its not related to the environment. Ive heard everything from beetles to eagles, and its sad that so much time and money is spent trying to scrape for any shred of evidence to blow out of proportion and destroy something that we love. why not look at the impact caused from the building of a new shopping mall or freeway in a public forum. Why is ohv, and public constantly under attack in a public arena. Has anyone seen the photos from the Arizona border south of Tuscon. Well I lived there for a while, and the amount of disgusting filth left by people coming into America illegally is heartbreaking. It looks like an interstate highway made of nothing but trash, cut right through the middle of a beautiful landscape. One would assume that the federal greenies would be all over stopping this destruction, but thats not in their political agenda. They need the filthy illegals in this country so they can have more votes. So they deny any knowledge of the trash trails and support amnesty. my point being, if we look hard enough we can find a beetle in any situation. Its just a matter of how much money your willing to pay a prius driving communist to find it.

We don't need to use birth-control on horses, and instead should drastically limit the number of privately owned cattle now ravaging our Western public lands. There are only a few thousand wild horses left and there are multi-millions of cattle on BLM/ Forest Service lands. With less cattle, horses could again increase to their optimum numbers.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To use the CCC to lower the cost of managing our forests, a few changes in management would have to take place first. 1 Lay off their army of Botanists and Biologists that do nothing but wander thru the forests looking for some form of plant or bug that they can declare as endangered, and spend the rest of their time doing paper work to apply for a grant that they can use to justify their job. 2 next the agency will have to hire some credentialed Foresters to manage our forests instead of political appointees that know zip about managing our forests, the last 40 years of the existing management have only given us overgrown forests that burn at the drop of a hat. only then can the CCC program become successful. eddie

The CDB & THE Earth Justice are basically one in the same separated so as one group CDB files the complaint and earth justice does the legal work. if you want to really see if either of these groups really care about the environment or the critters that live on our lands call your BLM agent or USFS agent and ask them How much of the billions of dollars in legal fees have these groups donated back to any of these agencies to help protect the lands and critters on them. the last time I talked to the managers of the Barstow BLM and asked this question after a long pause the answer was They could not think of a single instance where any money was returned to the agencies after their suits were settled. their interests seem to be closing public lands & collecting money and having power over public lands and the agencies that manage them. eddie

The individuals above are only attempting to give the cattle ranchers a black eye. The ranchers that graze on public lands are far better stewards of our public lands than the agencies ( USFS BLM NATIONAL PARK SERVICE etc.) that our gov. created to care for the public lands, all you have to do is check with the agencies and you will find that thousands of grazing allotments have been withdrawn from use by their respective agencies at the request of environmental organizations, these environmental groups have outbid ranchers for allotments just to take them off the list of active grazing allotments, When these allotments are not grazed they become overgrown with flammable fuels (Grass and Brush) and when this flammable fuel catches fire it usually causes catastrophic fires that we have seen over the past several years.

proclamation. I suggest a presidential proclamation to reaffirm that the federal government's role of protecting and maintaining the National Parks System as a national patrimony for the whole people, present and future. The National Park Service should encourage and welcome the cooperation of citizens and communities, but it should never fall under the sway of commercial interests or groups seeking to promote activities that are harmful to the environment.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Save the Chesapeake Bay by saving the tributaries. President Obama issued an executive order for Federal agencies to take all action to support the restoration of the Chesapeake Bay. Everyone agrees the Chesapeake Bay must be saved to preserve the way of life in Maryland and Virginia. All the scientists agree that the best way to save the Bay is by means of the Tributary Strategy; protect the tributaries and you will save the Bay. However, despite the pious pronouncements of the local politicians in favor of saving the Bay, they continually advocate projects that will destroy the tributaries and thereby destroy the Bay. The only source of the pollution that is destroying the Bay that is growing is urban runoff. Yet local politicians continually support projects that will increase runoff into the tributaries and thereby into the Bay. Case in point is the Cross County Connector in Charles County, MD. This road is not receiving any funding from state as it is considered unnecessary and extraneous. Yet it is proposed to be built through what the county describes as "the most pristine area" of the watershed of the what the state calls "the best most productive tributary of the Chesapeake Bay", Mattawoman Creek. This roadway was revealed in inadvertant statements by the Commissioners who are pushing it to be for the purpose of development. The current commissioner said "the entire deferred development district [the pristine areas referred to above] WILL be developed." This kind of attitude will end up turning the Bay into a sewer. The Federal government must do its duty and enforce the Clean Water act and protect the Bay from the local politicians who would destroy it.

Obviously you know nothing of the issue. In fact at the hearing on the Cross County Connector hundreds of people were in attendance the proposed 2 hour hearing lasted until well after midnight. Thousands of letters were submitted to the County Commissioners, the Governor, the Maryland Department of the Environment and the Army Corps of Engineers. Large protest meetings were held. Dozens of letters to the editor were published in the local paper, and who knows how many were not published. In fact in the election all the Republic Candidates for County Commissioner as well as the insurgent Democrats have come out publicly and strongly against the CCC being pushed by the developer supported good ole boy network of incumbents. The only ones who supported the granting of the permit were the developers who want to lay waste vast tracks of forest on either side of the road to convert them to large developments of unsellable or soon to be foreclosed houses. Their puppets in the local government though have had their come uppance. Only one of the incumbent commissioners survived the primaries. Only one of the 6 candidates for state delegate that survived the primaries favors this project. The planned mitigation for this project would trade off protection of the most pristine areas of "the best, most productive tributary in the Chesapeake Bay watershed" for a River that is already severely degraded by centuries of agricultural and urban runoff. How is this going to save the Shad and Herring runs that each spring are so much a part of life in Charles County, the best Bass fishing on the East Coast, and the crabs and oysters that make up so much of Maryland's heritage and culture?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Hogwash. The Clean Water Act of 1970 was passed by the Federal government because we citizens got tired of the state and local governments controlled by the good ole boy network ignoring the issue. In 1970, the Cuyahoga River in Cleveland would catch fire several times a year. Boy Scout Canoe trips on the Potomac River, the river that runs through our nation's capital, had to get off the river by 4:30 because the all the towns in West Virginia would dump their raw sewage into the River at that time. What a lovely view from the Jefferrson Memorial, and George Washington Home at Mount Vernon; turds on the Potomac. If the Federal government had not got involved the the Potomac River would now be one large sewer. Even so the Potomac is still pouring tons of urban runoff into the Cheasapeake Bay, creating vast dead zones and killing off the crabs and oysters that are the livelihood of so many in Virginia and Maryland. If it were left to the state and local governments, the Mississippi would be a concrete lined ditch, Niagara Falls would be dammed for hydro-electric power, the Bison would be extinct, Yellowstone would be converted to a geoelectric power plant and the Grand Canyon would no longer have a River in it. As it is now the Colorado River is an empty ditch when it flows into the Gulf of California thanks to the state and local governments that suck all of the water from it on the way.

Mountain bicycles are not compatible with horses and hikers on single track trails, including the Pacific Crest Trail. Mountain bicycles have no business in the wilderness areas of the United States. Mountain bicycles are free to use scenic Rail Trails, dirt roads-(many miles of scenic dirt roads are located within the forestry) and then there are streets, and bicycle paths. The wilderness and historic trails should be protected from mountain bicycles. The back-country wilderness should remain as it was originally designed to be experienced. Hooves and boots... No Wheels!

What about the native population? This mine proposal threatens their way of life, the safety of the water and the food supply. And for what? More computers and cell phones? Profits for a few? This mine would cause such an upheaval and such destruction on so many levels in a place that today is still pristine, still a miracle to behold. So few places like that left and so important to preserve them.

Protect Bristol Bay: Stop Pebble Mine. The projected Pebble Mine promises environmental damage on a large scale in a rich ecosystem that needs protection. Bristol Bay's unspoiled waters and wildlife are threatened - and so are traditional subsistence ways of life. Enough is enough. We can no longer buy the arguments of 'minimal disturbances' and 'environmentally-conscious mining' (or drilling, or whatever). It just doesn't work: accidents happen. Even construction activity is too much of a disturbance for the very ecosystems on which we rely. Please, let not be swayed by huge corporate interests. Our commons are at stake, we must protect them now more than ever. No mining in Bristol Bay. Thank you.

We in Fla have always supported everyone sharing OHV trails (hikers, campers etc.). After pondering this idea I see how seperation could be a viable strategy to possibly reduce extremists attacks upon the ORV community. If they don't have the chance legally to stumble in an ORV rut maybe they won't litigate so much. Probably just wishful thinking on my part.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

During our current depression all of the governmental (borrowed) money we spend on roads should be for road construction and maintenance rather than wildlife related issues. To support this ideas issues another agency should be created by Congress if the general public so desires. Well intentioned but not appropriate at this time in our Nations history.

Playing with weather I would agree is a dangerous game. It can destroy a lot more than recreation. Florida experienced extra bad hurricanes many years ago due to cloud seeding in attempte to make a hurricane run out of rain out at sea. It did not work and the storms wound up deluging land masses instead. Right on!

From what I've experienced in Florida, heritage, culture, traditional trades (fishing)and local economies suffer tremendously from draconian regulations that accompany Federal control of property. A recent prime example of Federal callousness is the refusal of Nat Park Service (NPS) to mention in the draft Addition Plan two local cultures the plan could devastate. (Independent Seminoles and Gladesman) . NPS may think this intentional oversight will provide a legal foundation to run over these cultural communities with their steamroller of a plan but it will not work this time. In an idealistic sense this idea has merit but due to reality I will vote to demote.

In order for folks to bond with and support protecting Americas Great Outdoors they need jobs and money. In order to do that for the next 100 years or so they will need gas and oil products for many reasons. According to the climate change theories which abound lately the glaciers are due to be extinct soon. So my question is - Are we supposed to further enslave ourselves to foreign oil product producers to save glaciers that are due to be extinct soon just because canada does? Possibly this idea would be better suited for a web site titled- "Let's destroy America".

I just think ideas that include balance of all of Americas needs are more appropriate. Ideas leading to polarization are not too productive in my opinion.

Once again you attempt deflection of the topic at hand by trying to divert this to an OHV issue, it's not. The topic here is entirely different. The proposal includes LOGGING of a specific area in order to reduce the risk of catastrophic wildfire. In my area, (presumably) well meaning, but often ignorant, environmental organizations attempt to stop nearly every project that involves logging. The term is scary to them, they would rather leave an area at high risk of wildfire than allow any logging, no matter how well managed. They have been successful in preventing or delaying many similar projects here. People that actually spend time in the woods around here have seen the damage done by a century of fire suppression, the resulting bug and insect damage and yes, poorly managed logging. Entire mountain sides are covered with dead and dying timber. To some of us, it makes sense to harvest that timber, though most is too far gone to have any commercial value. There may be opportunities to use these trees for biomass energy projects. Replanting with species appropriate to the site, followed with careful management, including controlled burns, can enhance forest health. Our local environmental groups oppose even this activity...and when the catastrophhc fires do hit, they attempt to deflect the blame. If you took the time to read the OP, you would see that part of the proposal involves destroying roads, which is something the OHV community generally opposes. Just the same, there are places where it's appropriate.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Coming back to the OP, his idea is to have a sticker or sign with a characters large enough to allow identification of machines violating rules in that area. I'm not opposed to this, but I don't know that it has to be via a site-specific permit. Many states require snowmobilers to display registration numbers in some minimum size on their machine. This would accomplish what the OP stated he desired without creating another bureaucratic maze of permits. "A snowmobile does not automatically 'tread lightly' - operator discretion is crucial. The snowmobile will not keep itself out of unsuitable conditions, nor can it prevent its driver from pursuing clandestine bushwhack routes through breakable tree tops, etc. A snowmobile does not automatically 'tread lightly' - operator discretion is crucial. The snowmobile will not keep itself out of unsuitable conditions, nor can it prevent its driver from pursuing clandestine bushwhack routes through breakable tree tops, etc. Even though thoughtless pedestrians may adopt unsuitable routes on vulnerable terrain, they quickly tire of post-holing into brush, and soon turn around whereas a snowmobile just keeps going and going - even when it trenches foot-deep through unresponsive snow into underlying material. Like any remotely operated vehicle, a snowmobile must be driven with discretion to minimize its impact on the resource and on other forest visitors. Like any remotely operated vehicle, a snowmobile must be driven with discretion to minimize its impact on the resource and on other forest visitors." I agree with the first sentence. Responsible operation is important rather we're talking an over the snow vehicle, OHV or non-motorized recreation. And yes, there are irresponsible operators of all types. I do have to debate this statement: "Even though thoughtless pedestrians may adopt unsuitable routes on vulnerable terrain, they quickly tire of post-holing into brush, and soon turn around whereas a snowmobile just keeps going and going - even when it trenches foot-deep through unresponsive snow into underlying material." I believe what \_\_\_\_\_ is describing is a circumstance where a brush field, new growth seedlings or small trees exist, and are covered with a layer of snow. The vegetation creates air pockets where the snow is not fully supported, allowing the snowmobile or skier to break through into the void. In my experience, these are conditions that snowmobilers actively try to avoid. This unsupported snowpack may give way at any time, resulting in the machine getting stuck. "Unsticking" a 500 lb machine is far more unpleasant than it is for a skier to extricate himself from a "post hole" scenario (I believe by this \_\_\_\_\_ means where a skier sinks up to his knees or deeper when the snow gives way). This is a circumstance most riders try to avoid. In general, there are two types of snowmobile "configurations". The first are designed for operation on maintained trails or hard-packed snow conditions. These machines typically have (relatively) short tracks, and a wide ski stance for stability on twisty trails. Designated trails don't seem to be the issue the OP is discussing. Mountain sleds typically have much longer tracks to provide flotation and allow them to operate in many feet (10 or more) of snow. They typically are operated on deep snow off of groomed trails. They don't perform well on trails or hardpack conditions. The snowpack in preferred locations for these machines would tend to put seedlings and brush out of reach most of the time. That of course assumes that riding areas in higher elevations where these machines truly have no impact has not been closed to the snowmobiler. The specific conditions that these machines excel at are typically devoid of vegetation (above tree line and buried under snow) and have no wildlife during the winter season. This is not to say that there can't be issues at certain times of the season, and when operated in sensitive locations. Perhaps some snowmobile riders familiar with the area in

## Discussion Question 2

**(cont.)**

question will chime in.

Prediction-The USDA and the Obama administration will bury the results of this forum. This is purely speculation on my part, but I predict that the Obama administration and the USDA will ignore and do their best to eliminate any record of the results of this forum. My opinion is that this forum was intended to provide justification for expansion of designated Wilderness areas, and for additional restriction to access on Forest Service and BLM property. I don't believe that they expected (or wanted) a large variety of actual users of our public lands to actually get on here and comment or vote, nor did they anticipate that ideas favoring multiple use would become prominent among the top 10 ideas. Opinions?

I, and I believe most other OHV users, agree that there is a need and benefit to Designated Wilderness areas, off limits to motorized recreation and management. They should exist in as near an untouched condition as possible. I'd go so far as elimination of manmade hiking trails, but that's for another thread. We also are a country that needs natural resources, including mined materials, timber and energy products. We need to be able to utilize some portion of our public lands for these purposes as well. In between are what some are proposing for "backcountry" designation. These areas could be utilized for ORV use on designated trails, a limited road system to allow access for camping, hunters, fishermen, etc. In addition, some logging, when done in areas where thinning and fuels reduction promotes forest health and recovery, makes sense. This type of compromise is opposed by at least a portion of the environmental community. A great many people, and I believe this includes both of us, recognize that there is need to achieve a balance between these uses. However, the perception is that there are extremists on both sides. The perception is that some in the "environmental" community want to eliminate all resource extraction and motorize recreation on public lands, and would restrict nearly all areas without a paved highway as wilderness. The opposite perception is that some that ride an OHV or supports some logging wants to see every inch of public land developed and cares nothing about nature, wildlife or our scenic backcountry. Like most issues, the truth, at least among rational people, is somewhere in the middle.

With regard to the OP, it is my opinion that this forum was really indented to solicit responses from the "Environmental" community. I put that in quotes, not as derision, but to separate the more extreme people I describe above from the rest of us that recreate in and enjoy our backcountry, and are every bit as much environmentalists as those in the first group. I may well be wrong with my supposition, and hope that this forum was intended to solicit a variety of inputs, not just those that supported a pre-conceived agenda.

Challenge to those opposing Bristol Bay mine. I have generally not voted to support or demote the multitude of Bristol Bay threads. Quite honestly, I am not sufficiently informed about the area to make an informed decision. Based upon some of what has been posted, I lean towards opposition to the mine. We do require natural resources, particularly ores and minerals (are metallic ores minerals?), I don't think anyone with any common sense will argue that. It requires mining to extract those materials. Bristol Bay may well be particularly unsuited for this activity. My challenge is, for those that oppose mining at Bristol Bay, what area with similar deposits would you recommend or propose for mining?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

"I promote this idea. But, OHV use is just one of many user groups. Its my observation that the OHV users are the most vocal and therefore, OHV users are not in danger of losing their rights to existing, designated trails on public lands. OHV riders' appetite for new trails appears insatiable. There should be some land preserved as wilderness for its intrinsic value. Future generations of families will be thankful for that, just as we are thankful to our predecessors for preserving our national parks." Wilderness designation precludes OHV use, all motorized and mechanized use is already banned from wilderness areas. To the best of my knowledge, ATV and dirt bike use is not allowed in any National Parks either. If someone can demonstrate otherwise, please correct me. What I do KNOW is that you are incorrect in your statement "OHV users are not in danger of losing their rights to existing, designated trails on public lands". In my area I discovered another closure just this past weekend. There is, or rather was, a nice, maybe 16 mile trail that connected between two existing forest service roads, and provided a popular access into a local community for a lunch break. The forest service, in their infinite wisdom, closed about a 1/2 mile stretch of this trail, about 12 miles from one end and 4 from the other. It is malicious decisions like this that raise the ire of the OHV community. While closing "dead end" trails into sensitive areas makes sense, closing the middle of a connecting loop does not. And this was done with no public input. That's just the start of it. Many, if not most, forest service roads have been closed and are now "off limits" to motorized recreation. This is just in my area, in Washington state, even forest service roads are off limits to ATVs in most places. In most places in my area, the only places you can take a quad I can drive in my Pontiac. Perhaps hikers need to be limited to the road system as well.

Where will the funding for this program come from? It should be via the user groups that utilize these spaces. Hunters and fishermen already contribute vis license fees and tags, OHV users by registration and permits. We need a means of collecting from other users to make this happen. To the OP, please define what you mean by "fully fund", and explain how you propose to do so. With this, I could promote the idea.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Yep, I vote against all biggoted "ideas" that arbitrarily limit the ability of a large portion of outdoor recreationalists to utilize their public lands. I wont bother to try to educate the OP this time though. Looks like another one that got his "talking points" from the Sierra Club. Should have a nice ride tomorrow, I have to scout a trail system for our club ride in a few weeks. It should be about a 60 mile loop, with some great views. I'll let you know how many hikers I see out there. With all the posts about how OHV use "disturbs" hikers I keep thinking I might see one on the trail some year. Though this time it's possible, hunting season is coming up in a couple of weeks, I may find someone out scouting. Oh heck, I can't pass up the opportunity for a little education after all. "Clearly the OHV users have a challenge to be able to share the wilderness with other users and still enjoy their sport." I suppose you're right, it is a challenge for OHV users...since they are banned by law from designated wilderness areas. You appear to have the mistaken idea that they are allowed to share these areas. As far as "ruining the expeerience" for other user groups, I hiked, fished and hunted far longer than I have ATVed, and I can't say that the presence of an ATV ever "ruined" my experience. When a ATV passed me, the sound of it disappeared in less than a minute. In wooded areas you can only hear them for a couple hundred yards. Passing a group of hikers that were talking was worse, voices carry at nearly as far and since they were going slower than the quad the noise lasted longer. My only grumble with the Quad riders was that they were having a lot more fun than I was. Some friendly riders offered me a chance to try one of their machines...and I was hooked. ATVs give me an opportunity to see country that very very few people do. They have also allowed me to meet some great people and have some great times.

The OP doesn't adequately explain the idea. A decommissioned nuclear plant doesn't on the face of it seem like the best place for a public park... Without knowing more about it, I'd wonder if there wouldn't be some value as an interpretive center?

Please no cyclists on PCT because: 1) There would be increased traffic on the PCT. They do outnumber equestrians. 2) Due to increased useage there would be more damage to the eco-systems from sewage, erosion, and garbage. There are not fasilities for increased use. 3) There are rules banning mechanical devices. If they can use bikes on the PCT, then perhaps wheel barrows, chainsaws and other mechanical methods could be used. 4) There would be an increased need for managing the trail due to access by greater numbers of people. Therefore there would be an increased need for paid personnel to keep order, to help in crisis situations, and to maintain the trail, etc. Currently with the economic situation this is not feasible through the USFS. 5) Equestrians do need to have some areas to ride that are in the wilderness. I prefer not to ride where there are cyclists even though my horse and mules tolerate them. Thanks, The Starrs

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

I can only surmise that anyone who would suggest that horses and bicycles could share a trail has never spent any time on a horseback, nor been injured or know someone injured/killed after being thrown from a horse. Any animal with a high flight reflex can put life in danger when mixed with unfamiliar fast moving vehicles. This is only compounded by adding variable of uneven terrain, speed, blind curves, cliffs, etc, etc. Many of our trails are not intended for vehicle use and can put those the use and enjoy them at risk. Being married to a avid cyclist, I mentioned this quote to my husband, "Pure hiking trails like the AT may not be suitable, but any trail that accommodates equestrians can certainly accommodate bicycles." His response was this, "The last thing we need are bikes and horses startling and subsequently trampling one another. There are plenty of places to ride your bike, not too many places to ride your horse." I would hope that any reasonable cyclist would agree with this statement. The equestrian & hiking community isn't vying to clog up the american bike lanes and knowing the threat to my safety I do not use mixed use trails. While I respect mountain bikers rights in many varied areas where they are allowed, I would hope that intelligent decision making will prevail and vehicles will continue to be banned on hiking / equestrian only trails.

Our Greatest Challenge: Ourselves. One of the main challenges wilderness faces, is the inability of Americans to describe what wilderness is. It's hard to preserve it if we don't have a general consensus on what it truly is. Some people think it's just that land that the government tells us is wilderness, but since when does the average American believe what the government tells them? Others say that wilderness is an area where no humans inhabit the land, and only wild animals make that area their home. However, how would we describe wild animals? Aren't we all in a sense wild animals? I seem to agree with \_\_\_ when she said, "Wilderness is not a single region, but a condition of being of the natural world." She also brings up the idea that much of our wilderness is used for other purposes by the government. In the western states, vast areas that could be wilderness are used for nuclear weapons testing. So our modern country's obsession with war impacts our use of wilderness. Another challenge facing wilderness preservation in this country is companies that deal with natural resources. These companies don't want the natural resources to be protected and unaccessible by them. So they spend their money on lobbying to get their way. Some even go as far as political corruption and pay off legislators to support processes such as mining even though they destroy the wilderness. Designating large areas as wilderness and restricting the use of these areas would help the environment and endangered species as well. Not everyone has to be an advocate for wilderness areas, but everyone should appreciate the wilderness. Just like history, you don't have to love it, but everyone should know where we came from. As American citizens, it's our duty to preserve what the human race is slowly destroying. If we fight so hard to win a war to be proud of our nation and patriotism, why can't we fight just as hard to preserve the wilderness to be proud of our country and it's beauty? As \_\_\_ said, "Humankind has no enemy but itself."

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Answering people that don't travel at all if difficult indeed as they can't see the effects of Global Warming for themselves. If you travelled, you would indeed see the results of GW in just the last five years or so. Try Glacier National Park for starters. The glaciers? They are gone as in melted, no more. Let's visit Canada to the east and wonder why all the gorgeous trees are dead. No frozen temps equals hordes of bugs that have eaten them. Blistering coral reefs the world over. Bleached out by warming seas, dead, never to return. Don't take my word for it. Do some research on your own. Icebergs melting, no habitat left for the fabulous polar bears. For the animals, marine and land, it's habitat loss. For the mountains and Arctic, it's the warming of our Earth. Just wait. If you live near the coast, you may see the seas rising and wiping out coastlines in your lifetime.

It's a shame that you don't travel around a bit, for if you did, you would have your own view of how swiftly our earth is changing. According to leading scientists, temps have warmed 4 degrees in the last ten years and that is way too warm for the glaciers. Visit Glacier National Park why don't you? No glaciers anymore. Visit the upper East coast to see the turning of the trees and witness the death of many species from a bug that no longer dies in winter as the temps warm. Millions of beautiful trees have died. If you think I am making any of this up, just Google any of it and go and take a look at what is happening in our world. Take coral reefs. Warming seas cause bleaching and death to them. It is tragic enough that the earth is dying, but then to find people who won't open their eyes and see it happening is even more tragic. In the beginning, man depended on nature for his survival. Now that nature depends on man for hers, she is out of luck.

I can understand why so many national or state parks feel the need to resort to money making activities like golf courses, boating, camping, etc., but it seems an oxymoron to set aside land to "protect" natural resources and wildlife and then interfere with it by over use and excessive human activity. Do we really need to subsidize an 18 hole golf course with taxpayers money? I would like to see state and national parks protected in every sense of the word: limit human activity to the enjoyment of the available resources, not man made, and limit the number of people visiting places like Yellowstone. The excessive amount of visitors has created some serious problems that is costing animals lives. Just like the NYC marathon has a lottery system, parks like Yellowstone should establish a system by which to limit excessive human interference. WE all need to be on board and willing to sacrifice if programs of conservation stand a chance for success. I am willing, are you? Set limits on how much land "developers" are allowed to destroy and demolish in order to build human habitats. Limit how much open space can be destroyed. Set restrictions on how far into wildlife habitats we can extend our cities. We buy homes in the canyons off LA county and then complain when coyotes visit, or build in the mountains and demand the extermination of raccoons and bears. Set limits. No more unrestricted "development". "Real Estate" is a growing venture to the detriment of our open spaces and wildlife. A Separation of agencies (National Wildlife Refuge System} and the United States Fish and Wildlife Service (USFWS), this union reeks conflict of interest.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We have similar problems with a trail here in my area. There is also a problem with homeless camps along the trail area. The answer to both is enforcement, but we all know law enforcement agencies are stretched to the max. There are numerous examples from all fields of recreation for using volunteer rangers to maintain order. That would fit right in with user fees.

If you'd stopped at the first paragraph I could totally support this idea. Like \_\_\_\_\_, I think there should be places for all kinds of recreation. Including OHVs. The problem is that all forms of recreation are growing, right along with the population. You may not understand why the sound of a distant motor ruins a day of quiet, just as I don't understand how a mudbogger can rip through a sensitive wetland. But that doesn't mean either activity is not viewed as o.k. by the user; it's just the inherent differences of human nature. The goal here should be to recognize that we all view the outdoor experience in different and unique ways. That means we should tolerate those activities we don't enjoy, provided they are in the appropriate place. Unfortunately, intolerance is too often seen in the emotional arguments on this site.

\_\_\_\_\_ will continue to turn any idea toward an OHV argument. Check his profile. He sounds like a mouthpiece for the Blue Ribbon Coalition. He will also continue to post if you respond to him. Please check my latest response under "Volunteer Management Program for OHV." The theme that has emerged here is clear from the first ideas posted. The off-roaders have had free rein for a couple of decades and now think the trails they created belong to them. What's happening is that the government is finally, if belatedly, addressing the issue. Reasonable people like us believe there should be appropriate places for off-road recreation, but they just want to ride wherever they want to ride. Read "Off Road to Ruin." There's a great quote: "Because they can go wherever they want, they do." Reasonable controls on all forms of recreation are necessary. Hikers, horse riders, bicyclists, hunters, fishermen, boaters, etc. etc. have accepted this for years. So don't bother to respond to \_\_\_\_\_. He'll just keep blathering on with the same old same old. Let's focus our energy on the discussions that are civil.

5th Amendment: "...nor shall private property be taken for public use, without just compensation" Unless and until there is justice and equity in the definition of "public use," we should all be skeptical of eminent domain.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The arrogance of this "idea" is amazing! (#13) said it best. All we hear from the off-road enthusiasts is how much they love the land, how healthful their activities are, how they are losing trails, and how much volunteer time they put in. Here's my view....and before the two-wheelers start screaming for proof, it is based entirely on a mere forty years in the backcountry, dealings with BLM, interaction with the local off-road enthusiasts club, and more than a few confrontational encounters with off-roaders acting illegally. Only recently have public lands been restricted to "Closed unless marked open," and this only by Forest Service and many National Forests have yet to complete their transportation plans. BLM lands are still "Open unless marked closed." Most of the trails created over the past 30 years have been created by riders without regard to whether or not they are appropriate. Trails that are being closed are trails where there has been documented environmental damage. In my experience, the clubs talk about controlling it through education, but fail to do so. The local club advocates for management, but the enthusiasts outnumber them considerably in disagreeing when BLM says management will mean closing trails. Volunteer activities in my region by the off-road club are mostly self-serving, cleaning up areas around their riding terrain. Local bicycle clubs, equestrian clubs, hikers, hunters, fisherfolk, . etc., etc. not only clean up their areas, but they donate both time and money to other organizations, such as Boys & Girls Clubs, Food Banks, etc. etc. One thing that is constant among local off-roaders is the continual lobbying for more and more land dedicated to off-road recreation. In my area hunters, mushroom gatherers, hikers, photographers and others avoid miles of terrain because it echoes constantly with the thrum of off-road machines. Taking \_\_\_\_'s comment a step further, off-roaders should be honest with themselves about how much their sport is incompatible with other outdoor activities. "We the people" means all of us, not a selective slice of society advocating for a particular special interest.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There is NO confusion on my part (and I doubt \_\_\_\_\_'s part) about the program in your state. One of these days I hope maybe, just maybe, you will be able to understand what the ATV funds are all about, how they are funded and allocated in your state. There are two funds within the category we have been speaking of and both come through the Oregon's Department of Parks and Recreation. Neither of which you seem to have a grasp of - you are making progress, so there is some hope for you. But your lack of knowledge continues to discredit what you say. There is the state ATV fund that has an advisory committee which you were, and probably still are, very incorrect on and I have already explained to you in previous post. There is the "Oregon RECREATIONAL TRAILS PROGRAM" which is the Federal RPT program. It must be represented by a committee that is both motorized and non-motorized recreational trail users. In Oregon the committee provides advice to the State Trails Coordinator and the Oregon Parks and Recreation Department Director regarding program policy and procedures. The committee is represented by Federal Lands Representative, David Lewis Cyclist (Oregon Bicycle & Pedestrian Advisory Committee), Terry A. Wheeler Equestrian, Bill Law OHV, Dave Eaton OHV, C. John MarÃ Hiker, John Vogel Snowmobile. States must use 30 percent of their funds for motorized trail uses, 30 percent for nonmotorized trail uses, and 40 percent for diverse trail uses. Other than OHV (motorized) uses (30%) the majority of the funds go towards trail uses including hiking, bicycling, inline skating, equestrian use, cross-country skiing - are these the special interest you are making reference to? Is this what is being "...administered to the detriment of citizens" you make reference to? Or maybe it's the handicap access that the funds often go towards that you find so objectionable! You still - just don't understand. There is only one person confused, that is - \_\_\_\_\_.

So is that your excuse for refusing to admit that you are consistently wrong, confused and DON'T UNDERSTAND! You really expect me to believe what you are now saying with every false thing that you have already said! Nice try - just reading your posts here and the article you wrote for the newspaper website are all filled with lies about the subject at hand. You may indeed have all the problems that you have just stated - but that does not make it right to misrepresent and flat out lie about successful programs as you consistently do! Its called lying! It is very apparent that you are consistently incorrect and like most when in your situation you grab for whatever straw you can in desperation to change subject from "Volunteer Management Program for OHV", reaching to archaic mining laws, and now to "... local club shold be indicted for fraud, based on the record of their grant requests to the State." Can you back up the fraud like you are stating? You have yet to be able to substantiate ANYTHING that we have disagreed on! You are one thing and that is being consistently WRONG.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In your web article you and I both know that the statement about funds taking away money from schools and roads are outright lies! Those funds were never allocated for the purposes you lied about. So they never could have taken the money away. Nice try but I seriously doubt that the proof was required and if it was, then you are as guilty as your accusations of the club you are now making reference towards. In fact you also know that so many of your statements here on these post have been filled with "false and misleading statements" and those have been proven! If as you have said, no law enforcement agencies are willing to undertake an investigation, it is as I figured - just nothing more than your outright lies! The program you and I have been talking about is not a success for me (as you stated) - it is a success for the State of Oregon and its citizens. It works and you just can't understand that!

Sorry for the redundancy but in your way of putting your own twist on the facts with Rebates, Refunds, Special Tax, special fund, etc, etc - you have shown time and time again your failure to understand and misrepresent the program and the value it has. The redundancy is only for the point of trying to help you realize the fact that you don't understand it. The program(s) we have talked about give valuable benefits for more than the OHV community. You write a newspaper articles and deliberately place misrepresentations in it. It is easy to make the allegations of fraud, but you lack credibility and have presented no proof. I would never have expected to change your mind of the OHV fund - it was very easy to continually point out that you don't understand and are incorrect for the purpose to counter the misrepresentations you continuously post. I think the public has decided - by allowing the fund to continue in the successful way that it has.

Nice link - I would have never thought that it was that bad! Thanks for the education on the subject. \_\_\_\_\_ posted a similar thought - "Stop Using our Taxes to Sue Ourselves". Maybe you should post an idea based upon the article if it is factual - its an eye opener! Makes you wonder if this might partially be why our National Parks and Forrest are under funded!

At least in San Diego County, California, \_\_\_\_\_s comment (#3) that mountain bikers do not contribute to trail work is wholly erroneous. Around here, it's the mountain bikers who do the lion's share of trail maintenance and construction, and any of our many land managers will attest to that since they depend on knowledgeable volunteers like us to get much of the needed work done. There are multi-use trails here today that would not exist without our efforts. Our volunteer hours now run into the thousands per year and are still increasing. Why? Because there are lot of concerned mountain bikers committed to making things better for all trail users. This is good for all since it means more trails. As for all the horror stories about careening mountain bikers, this is indicative of inexperienced users on too little available trail. Concentrating use by limiting where biking is allowed only leads to these sorts of incidents. I have been riding mountain bikes for twenty years and I have never spooked a horse. Perhaps it's because I rode horses before that. We strongly discourage idiot behavior and do not tolerate it on our sanctioned rides. Every group has its bad apples and we do our best to cull such behavior. It's all about education.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

I must respectfully bring to your attention that motor vehicle use is heavily subsidized. Our roadways are paid for by everyone, whether they drive or not. How much of an impact on roadway maintenance does the average bicycle create versus the average car? On top of that, you can park 12 to 20 bikes in one typical vehicle parking space. Space for parking is not cheap and it eats up our urban landscape. Everyone you see on a bike is saving a parking space for you. \_\_\_\_\_ is absolutely correct in his additional costs, which just pile on the justification for better bike facilities. Incidentally, like the original proposer, I also live in San Diego and I own two cars, but only drive when I have to, which I have been doing for over 11 years.

I live in the San Bernardino National Forest. The Adventure Pass up here is a disaster. I'm a criminal if I pull to the side of the road on the way home from work to enjoy the view. I don't think anybody minds paying a fee for using a developed facility like a campground or picnic area, but to threaten fines and jail for visiting raw undeveloped space is pathetic. The Adventure Pass certainly has "bleached" the visiting demographic. Minorities just don't like being buttonholed by gun-toting rangers asking for ID and proof of admission.

The "advisory committees" you said were supposed to approve fees were a joke, at least here in Southern California. The so-called public meetings were never public. I called the FS numerous times, was given the runaround about when and where and was astonished when the local paper published a press release that described a "public meeting" that supposedly happened.

as an OHV user i used to have this much area to recreate -----  
even back then the area to which we could not recreate was  
still -----  
----- some 20 years later we only have this much  
area ----- and the area to which we cannot recreate is even  
larger -----  
-----  
----- and  
now we are looking at losing even more area to which we would only have this much - really?  
seriously? when the radical environmentalists complain about noise or beatin trails. well. look at  
all that area they have to use where OHV's are prohibited already.. duuuuhhh.. go there! and let  
us use OUR land and take care of is as we have for generations. i just don't see the debate. its so  
far fetched in mine and so many peoples minds that there closing more and more PUBLIC land to  
us and our families..

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

How about donating some of your Manhattan address lands to the Wilderness Preservation Project and leave ours alone. Has it occurred to all of you east coasters that you are the ones who have destroyed what were once beautiful lands in the East? We, out here, preserve our lands well on the state level in Utah. The lands that we always find are managed poorly are the ones you have taken from our state without our permission. In Utah we need less federal regulation and bad advice from people who already messed up all their lands. Demote.

The medicine man may have known the wilderness better than I do, but he could not even save his people from progress brought to the land by common sense (progress minded) people. Medicine men seem to be almost as lost as the dinosaurs. The medicine men were good at rain dancing and dancing with the wolves, but did not dance to reality. Did the rain come and did not the wolves go extinct? Also Mr. Rohde needs to show and tell us where is the houses and flying helicopters in the wilderness areas. Don't spread lies to try to prove a point. It shows just how uninformed (or ignorant) you are. Also everyone should remember the movies (even documentaries) are mostly make believe, not reality or real life.

Multi-use trails don't work in the sandy soils of northwestern lower Michigan. I am a long time bicyclist and hiker, and I am not even sure if bikes & peds can enjoy the same trail unless the numbers are low, and the individuals courteous. And horses do not blend with either group. Our Michigan DNR has tried valiantly to have shared use trails, but ideally, each user group is different with their own needs.

Michigan has Sleeping Bear National Seashore, Pictured Rocks National Seashore, Isle Royale National Park, quantities of state forest lands and national forests. We are already a state with great outdoors trails and lands for all kinds of activities. A problem with state or federal land is that local governments have a funding problem, since those lands don't provide taxing revenue. I agree with \_\_\_\_ about the CCC -- their work is still a pleasure and inspiration that I wish our current politicians would replicate.

The people don't want Pebble Mine on Bristol Bay, Alaska. Anglo American and Dynasty Minerals are planning a 2000 ft deep mine in the Bristol Bay watershed, with 60 miles of salmon habitat slated for destruction. "CEO Cynthia Carroll and former board chairman Sir Mark Moody [said to Alaskans that] Anglo American [British Mining giant] would not develop Pebble Mine if local people did not want it." --Bobby Andrew, spokesperson for Nunamta Aulukestai, a coalition of eight village corporations that then commissioned a survey. The Craciun Research poll (published September 22) found 79% of Bristol Bay residents against the mine. Fisherman and Native Communities have asked Anglo American to honor its promise and not go ahead with the mine. "We will not go where communities are against us," Cynthia Carroll has said. Despite this community opposition, to all appearances the company is still moving ahead with their plans. Some links: { <a href="http://ithinkmining.com/2010/04/16/pebble-mine-a-test-of-anglo-americans-integrity/" rel="nofollow" target="\_blank">Link</a> } { <a href="http://ourbristolbay.com/blog/?p=489" rel="nofollow" target="\_blank">Link</a> }

## Discussion Question 2

***(cont.)***

Strong oversight of the permitting process, analysis of cumulative impacts, strengthen relationships between federal and tribal governments..... .....good principles in themselves and they should always be implemented and should already have been implemented but they are easily abused. In this case protection of unique habitat, subsistence and recreation resources will be served by no mining. A very large number of jewelers, including some very large jewelers, have pledged not to use gold from the Pebble mine if it goes ahead.

Although I wish we could all get along, bicyclists, hikers, and equestrians are a poor mix on the same trail. While most animals avoid hikers on the trail, I find it enjoyable to meet a horse on the trail, it enhances a natural experience of seeing various wildlife scamper away, additionally, if I had a physical emergency on the trail, an approaching horse and rider would be a blessing. Although most bicyclists are very considerate on the trail and a pleasure to meet, many speed recklessly, and present a serious physical hazard to themselves and others. The bicycle we knew has evolved into a full suspension vehicle like a motorcycle which can approach freeway speed on a downhill trail and is not a safe mix.

How long will your area stay wild with a growing population. I would say the west faces alot of the same issues that are in the east, maybe on a different scale. Michigan is in the midwest, not east coast.

Access is important. Areas without roads are also important. Here is something I read recently that I agree with. While roads are important for providing sportsmen with access to the lands they use to hunt and fish, too many roads are associated with increased big-game vulnerability and fewer mature bucks and bulls. Too many roads also can decrease the quality of important spawning habitat for fish. Because you saw wildlife does not mean we should not preserve some areas for the good of people and animals. I think there is room for both, motorized access is some areas, and areas without roads, for all the benefits that provides. Some people in past generations saw the benefit of preserving wildlife and wild areas. I think most understand that if we want to ensure that enough habitat will be around for future generations, we must plan carefully today.

I snowmobile. In Michigan, we have far more snowmobile trails than cross country ski trails. I don't cross country ski, but I can tell you I would not want to try it on a snowmobile trail the way some snowmobilers ride. There should be areas for snowmobiles and areas they are not allowed. Just like any other activity.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You know this is a Chinese company that wants to mine this area. The appetite the Chinese have for natural resources is insatiable. I believe what they want to mine for is gold and copper. They can go to Africa to mine for gold as far as I'm concerned. If your looking for an area in the lower 48, they have mined for copper in Michigan for years. The boom and bust industry of mining hasn't made the area they mine for copper here very prosperous. Some things are more important than the money to be made by developing every concentration of minerals they find. With 50% of our national forests open to mining, I'm sure there must be a better alternative. There will probably be opposition from environmental groups no matter where they mine. I don't think mining has a good environmental track record. I would rather see them find an area where they could buy and own the land to be mined, especially if there are already roads and development present. They can lay on the ground and f\*ck the land then for all I care. Here's my question for you. In the past you have said you are against areas being designated as wilderness that are not truly wilderness. Here we have an area that is wilderness. Do we let this go, other areas go, like the Peel Watershed in the Yukon (not U.S.), and then every other wild area that people want to develop. What area should we save?

Most people don't consider farms as wildlife habitat.

I guess anything is wildlife habitat then. I live a suburb about 10 miles from a major city. I've seen most of the animals you listed near my house in the few areas awaiting more development or next to railroad tracks where there is a small clump of trees. I suppose that means we don't need to preserve ANY wild lands. Farms are fine, but I think it is reasonable to preserve some true wild areas that don't necessarily have people occupying or using ever acre. A farm is home to a person and family. Although there are animals present, most would not consider this the staple of wildlife's home range. This also raises a question of animals that require more solitude and are not always welcome by farmers and their families. If a wolf were to kill livestock, I would think some farmers would want them gone. At least that's the idea of some of the comments that I've read on this forum. Not to mention grizzly bears. They may not be in Minnesota, but I'm sure there would be some action taken against the bear if it frequented somebody's farm. Sorry, farms are fine and it is a respectable profession, but there needs to be true wildlife habitat, also. We can't expect animals to survive on the fringe of what we leave behind and don't consume. I also would not like to pass on to the next generation a country that only had farm land and urban habitat.

I agree, there is room for all types of recreation and room for things like wilderness as well. What I find ignorant and disappointing is people who fail to see the value of preserving things like wilderness and only see land for what they are able to get out of it. Land is more than that. Wildlife and people depend on wild areas, for numerous reasons. Living in the midwest, I have seen areas change from having a wild character to development. That is not what most want for all of our public land.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I don't think anyone could argue that there is more wildlife habitat now than when pilgrims landed. It seems odd to me that after all the development and habitat people have used, and continue to use, that there is still a segment of the population that will argue there is plenty of wildlife habitat and we shouldn't be concerned about or preserve the environment. I guess we should just continue the status quo and keep using everything up until it's all gone.

You can try to "spread out" as much as you want, but with the population growing, eventually everything will be congested. That's why it's important to preserve some areas. I don't think anyone stated all wildlife is nearing extinction, but should we wait until it is. Because you looked out the airplane window and saw more dirt and trees does not really change the issue.

Guys we have and continue to reduce oil consumption or at minimum the rate of increase in consumption. Increased gas mileage is one way in which oil consumption is reduced and there are other ways such as solar, wind etc. The problem is that when alternatives are proposed on a large scale many begin bitching immediately about enviro impact. It seems that some will never be pleased with anything. I just believe domestic oil production is a good strategy to keep America as strong and secure as possible economically. Domestic oil production could help in my opinion. We will need oil from SOMEWHERE for many years no matter what happens. That is REALITY! Let's don't be comparing apples and oranges folks - necessary oil products aren't trash. Try never adding or changing oil in your vehicle and see what happens. Eventually the vehicle won't function and that will cause the production of a replacement vehicle producing more pollution. I guess one can take their pick - I don't know which would be less environmentally negative. Maybe someone here does.

\_\_\_\_\_ broad policy idea is no different than many other existing policies that put large areas of land off limits to the a group of visitors due to a few bad apples of that particular group of visitors or citing the "precautionary principle" when the so called science we use today doesn't support a closure, restriction etc. We see this routinely in So Fla and elsewhere.

This is nothing more than more of the propoganda campaign for The Wildlands Project. LAND off limits to Humans. Boo-Boo - Boo. Reed Noss and his accomplices hopefully will never accomplish their subversive goals regarding Americas Great Outdoors. They need to go to some 3rd world country that isn't on to their feindish concept and accomplish it their. Leave Americas Great Outdoors alone you subversives.

I haven't become accustomed to the new name yet but am aware names change as folks catch on. I must differ that it is mainstream due to the fact that the likes of David Foreman, Reed Noss et al developed it. I cannot consider Earth First/David Foreman/Reed Noss mainstream. The anti-human bias expressed publicly by these folks is what prevents me from considering them or this concept mainstream. After the Cenezoic Society/Earth First distributed 70,000 copies of the Wildlands Project land management strategy, according to them for free, they went on to facilitate its infusion into the brains of many if not all biological, ecology etc. students heads for the next many years up to and including today. Some might think my attitude is somewhat paranoid but there is an old saying " Just because you think the SOB's are after you doesn't mean they aren't". I would take you up on the offer to have a beer some day.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I feel the SOB's are after us due to the fact that most land acquired in Florida recently does not allow much ORV access if any. They come to us hunters for support of acquisition of land for "conservation purposes or Multiple use". The trouble is that hunting is one of the multiple uses and many acres of acquired land winds up not allowing hunting to be supported by ORV's even to haul out animals taken during hunting. ORV use as associated with hunting is totally traditional for nearly a century in Florida and recent management philosophies are not acceptable and often parallel TWP ideas. This is very bothersome to me. I do not believe it is justifiable considering other much more horrific mis-management going on in Florida regarding fishing, hunting and endangered Species. If folks knew the truth they would NOT believe it.

Excluding the accomodation of human desires to visit public lands that they are as natural in as a cougar along with the fact humans vote and pay for the lands protection only breeds animosity and negative attitudes towards conservation and land preservation.

Teddy did not live in todays modern times. We need what we need and we need to go get it here rather than importing. Sane conservation is one thing but a total hands off policy is National suicide.

The author should explain the down side of this idea for all of the not so financially secure folks living around these parks on fixed incomes or just poor. The "Repayment would be through a tax-increment process based on redevelopment around new or refurbished parks." This idea sounds like a plan to help cities duplicate more redevelopment as discussed in the Kilo Supreme Court case minus the condemning of poor folks properties. What a gift.

Maybe this idea could also include a committment that the non-motorized boating community would cease and desist their consistent attempts to gain exclusive use of Americas Great Waterways Waterways for themselves by their organized lobbying of State and Federal agencies to prohibit traditional motorboating that predates the recent canoe trend by decades. It seems to me that some canoe folks could start a business scouting streams and producing a guide book for paddlers not competent to do their own scouting. I do not believe any level of government should have to do that for them except if a stream somewhere is very dangerous for some reason. In that case the land manager could post a notice of danger. What happened to the Great American Spirit of ADVENTURE and RISK TAKING.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Minimum of 22,000 miles closed to ORV access at Big Cypress National Preserve (BCNP) in the year 2000 due to an ORV plan developed due to an out of court settlement(back room deal) of litigation between Extreme enviros and NPS. The ORV plan only allowed 400 miles of primary trails within the 582,000 acres (909 square miles)of BCNP. It is quite a coincidence that the 400 miles + a few trails to inholding property equals 1/2 mile of trail per each square mile of land which basically is a perfect match to The Wildlands Project trail limiting criteria. I know 22,000 miles sounds outrageous but when I did the math using NPS demographics for ORV types (indicating tire widths) used there, the total amount of land that a rubber tire had ever touched was only 1 1/8 percent of the 909 square miles of BCNP. Believe it or not there is enough space in 582,000 acres to have put a whopping 2,401,411 miles of ORV trails in BCNP if folks had chose to because it was technically legal prior to the draconian ORV plan being implemented currently. Folks never chose to use all of the BCNP with ORV's since the main purpose for their use has been to get to inholder camps, hunting areas, governmental land management and law enforcement. The terrain itself there physically limits where anything even animals can go to. Now the ORV plan reduced the access to 2/100th of 1 percent of what was technically legal all along. We are now in a process of recommending and having secondary trails approved for future use 10 years after the ROD was signed. It is a very time consuming and arduous process that doesn't seem like it will help regain the reasonable access people thought it would. We may not have actually needed the 22,000 miles of trails we had but we do need a trail system with trails within a mile of one another to facilitate access to the treacherous and sometimes impenetrable terrain of BCNP. Walking long distances with large Alligators underfoot is a pretty hairy experience forced upon all visitors by NPS. Even a few miles of trails that folks worked with NPS for 14 months to have re-opened were attacked with litigation by enviros. That litigation is unsettled so far. How's that for a loss. I know some will cheer over our loss but folks need to be sensitive to our Gladesmen Culture and other cultures being destroyed by government actions.

As one seeks to promote tourism and folks getting into America's Great Outdoors one should be ready to accept all who come including off road motorized enthusiasts. Apparently according to this idea even the NPS was accepting of all who came. My compliments to NPS for their planning actions. I will to vote to demote this idea due to its bias and discriminatory attitude against selected visitors. Some local businesses may be very appreciative of motorized visitation. I doubt this idea is supported by all locals in the area.

Question - Does our Nation or States or local communities really have the money to do this these days without the beneficiaries of this idea kicking in some of the money for amenities they will be using. All of us need to begin thinking about living within our means including folks here and all of our governmental entities. We need to get back to the basics at least until our financial houses are back in order. Can anyone take a guess at when that will be?

Please be honest with the kids and explain how dangerous some animals are plus the fact that people are eaten by some species. An example of what I mean here is to tell kids that Alligators do not really ever smile and they eat dogs and kids on occasion.

## Discussion Question 2

***(cont.)***

To \_\_\_\_\_ and other mountain bikers, To address the point regarding the fault of improperly trained horses being the issue with regard to trail safety, may I tell my story: A few years ago circa 1998 I was riding on what used to be the mecca of hiking/riding trails before the invention of mountain bikes, The Sunset Trail in Altadena, and was making my way alone carefully along the narrow winding ledge trail on my steady, calm, well-trained horse when from around a blind turn a mountain bike came at us at a high rate of speed and was unable to stop in time before ending up coming to a sliding rock-spraying stop UNDERNEATH my horse. Thankfully neither my horse nor I were injured, but we could've easily ended up being PUSHED off the ledge by the cyclist. So, my advice to bikers: TRAIN YOURSELVES. As for equestrians being lardos who let the horses do all the muscle work...How many bikers will be riding the same trails at 100 years of age? I ride with many quite elderly equestrians, including a centegenarian--Are you saying they don't deserve to enjoy the outdoors on their horses because they can't WALK or BIKE the trails themselves? All of the elderly people I used to ride with in Altadena refuse to ride there, and Malibu SP, any longer because they are afraid of the speeding cyclists. They have been, de facto, removed from the same trails they have ridden since the 1930s, the same trails THEY BUILT in some cases over 50 years ago. For Shame! How selfish of mountain bikers to suggest that slower, older equestrians don't deserve to be there because we can't train our horses to GET OUT OF YOUR WAY. Cool your jets...we'll all be dead within a couple of decades, then you can turn the PCT into a highway and no one will be around to stop you.

***(cont.)***

Conservation in a Progressive Society. Conservation in a Progressive Society It is hard to deny that most of us feel some sort of awe or reverence to wilderness. Whether it is scenic mountains, raging rivers, or wild dunes, wilderness seems to have some strong hold on us. Perhaps it is the grandeur of such images that makes us feel small and insignificant. Perhaps we realize how little we matter in the large scheme of the world. Nevertheless, it is in these places that many people experience some sort of spiritual revival or self-discovery. Away from the hustle and bustle of life, in the tranquil, raw wilderness, we find ourselves reflecting on our lives, and often, we walk away changed. How then could we destroy something so mystical and mighty? Ironically, in a matter of hours, we can destroy something that took thousands of years to form. It is clear we should take steps to prevent such destruction, but obviously this proves to be complicated in a progressive society. I recognize that the standard of living must be maintained. It is simply unreasonable to suddenly force people to live like Native Americans, for a dramatic example. Regardless, America is obsessed with expansion and competition. We are not maintaining the standard of living but constantly searching for untapped resources so we can become richer and more powerful. There is a constant race to have the most advanced technology or to be the most powerful nation. Such expansion requires a continual supply of resources. We destroy whole mountains to obtain a small amount of copper. We strip the land of nutrients to acquire the resources we need to progress in this competitive world market we have created. This is the challenge we face. Where do we draw the line? When are we going too far and taking more from the land than we actually need? We cannot expect to continually take from the earth without repercussions. There will come a point when we have destroyed the very places that always provided for us. Therefore, in the process of our extraction, we must be environmentally aware. We must give back to the land that so amply gives to us. Conservation needs to play a key role in the system of removing resources. These are the points that need to be considered. The challenge: find a balance in conserving the wilderness while maintaining our place in this fast-paced world.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Wilderness Lost in Tourism. It is my personal opinion that "wilderness" is losing its allure to vacation spots, gift shops, and casinos. It is becoming far too commercialized, even with modern advantages. Often times these are located immediately outside of the designated wilderness areas. The Carlsbad Caverns, for example, has a giant gift shop in the bottom of the cavern equipped with electricity, elevators, and restrooms. While you're walking through this natural underground world, you notice signs everywhere reminding visitors not to touch the walls, yet those signs are illuminated by bright lights that are found all throughout the caverns. I loved walking through Carlsbad, but these modern advantages took away from the natural elements. I may even go as far as to say that I would rather miss that experience than have the caverns turned into my own personal tourist attraction. A similar experience occurs along the rim of the Grand Canyon. Once a visitor steps foot inside the Grand Canyon, they are in wilderness and enjoy it as thus. However, once your voyage through one of the most beautiful spots in the world is finished, you instantly find yourself surrounded by gift shops and hotels. These are wonderful amenities, but I believe that they should be spread out. There was a wonderful glass skywalk built over the Grand Canyon. How amazing it would be to look down on the Grand Canyon! That is, if it didn't cost from thirty to seventy dollars a person to walk around the overlook. This money does not go towards the Grand Canyon. I'm sure it goes towards the huge lounge that sits right on the edge of the skywalk. I would like to remind the Nation that wilderness is not our personal property. It was not created for profit, and thus should not be dominated by investors with buildings. I like the way the Yellowstone and Yosemite National Park's handle their tourism. Yosemite's gift shops blend in with the nature around them. They are not huge and are not located every three feet. If we could make our wilderness follow this model, the entire experience of a wilderness trip would be much more enjoyable.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Overall there are many aspects of your proposal that I agree with, but there are a few that I would like clarified, revised, or removed. I do think there should be some trails left natural for the more experienced and patient hiker, as well as areas that should be maintained for more accessible use. To an extent, I would even agree with distinguishing the two areas. I concur that the wilderness should be wild, left for man to fight through for himself, and that parking lots are a large distraction to the wilderness aesthetics. However, I have always been told that no more than ten people can be allowed in a group in a wilderness setting. So this concentrated use that you're speaking of cannot have an extreme impact, unless every trail and park that I have ever visited made up that rule coincidentally. I also prefer to hike in a more solitary state. That is why, when I know it is going to be a beautiful hiking day, I choose a trail less known and less accessible to all people. If I cannot find one of those, I enjoy the beauty around me and the comradeship of meeting new people on a trail, and maybe that is something that you could look into. As for technology goes, I agree that cell phones take away much of the experience and a GPS ruins the excitement of blundering through the wilderness alone, and yet I cannot agree that signals for rescue should be ignored. That is not only irresponsible to our fellow citizens, but also far too dangerous. I'm sure that the many people who have died in the wilderness would highly disagree with that idea. If help had been available, I have a feeling even the most rugged wilderness man would have accepted it. Since you disagree with GPS systems, do you also disagree with maps of the wilderness? Do you wish that we all had to make the deathly trek through the Sierra Nevada's for the first time, or even through the Appalachians? As much as I love the wilderness, I am appreciative of the work that volunteers do to keep up trails. Your last paragraph is very interesting to me. By "these areas" I'm assuming that you mean the designated areas that you were speaking of. I'm sure that you know that Section 4 C of the Wilderness Act of 1964 bans any permanent or temporary road systems and use of the vehicles you mentioned. "Except as specifically provided for in this Act, and subject to existing private rights, there shall be no commercial enterprise and no permanent road within any wilderness area designated by this Act and, except as necessary to meet minimum requirements for the administration of the area for the purpose of this Act (including measures required in emergencies involving the health and safety of persons within the area), there shall be no temporary road, no use of motor vehicles, motorized equipment or motorboats, no landing of aircraft, no other form of mechanical transport, and no structure or installation within any such area" (Wilderness Act of 1964). I am just slightly confused by the fact that you want wilderness to remain wild and that overcrowding is a problem, but you would be okay with OHV's going through the wild? Or with trails being cut down and maintained so that a jeep can fit through? Does this make your quest for absolute wilderness a selfish act, since it seems like you only want the areas you will be in to be kept as close to their natural state as possible?

Multiple use trails work for MTBs, ATVs, and even hikers, but not for horses. Horses really tear up trails and leave their "exhaust" behind.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

No environmental impact statement has ever been written for the Pebble Mine. The mine will need a permit from the US Army Corps of Engineers, so it's definitely a federal issue. It has been opposed by many Alaskans, including the late Senator Ted Stevens, who was seldom a friend of the environment. They will need the help of people from across the United States to stop this project.

Too many OHV groups insist that every mile of trail is sacred. I'm for negotiation and compromise, based on the principle that every user of federal lands has an obligation to keep the lands and waters in good condition. OHV routes that abuse the land need to be closed and restored to nature. The same goes for hiking and horse trails.

Some of the southern Utah county commissioners would like to dictate how federal lands are managed. I don't think commissioners representing 6,600 people (the population of Kane County) or 15,000 (San Juan County) should be calling the shots on lands that belong to all of us from coast to coast. They will have their input on any wilderness bills, but the final decision is not theirs to make.

Wilderness bills are normally written, negotiated and enacted with the support of the affected state delegation. The only exception I can recall is the Alaska National Interest Lands Conservation Act of 1980, which designated wilderness, national parks and national wildlife refuges. I don't support the author's idea as a requirement, because the Alaska law demonstrates that there are cases where the national interest must come first.

The Bureau of Land Management found 6.6 million acres to qualify under the Wilderness Act criteria, but BLM is allowing ORVs to run all over them on a network of routes. The vehicles should be kept out of these areas until Congress decides for or against wilderness status. That would still leave more than 15,000 miles of routes open in southern Utah. My wife and I have visited most of the areas by walking in, as they are readily accessible from public roads. It's America's greatest unprotected wilderness.

I can't agree that the industry has "no interest in land with no reserves." When I worked at BLM we heard from the oil and gas industry regularly, and they argued that estimates of oil/gas reserves or potential were fallible and temporary. They wanted the freedom to lease and drill everywhere. By the way, the industry wasn't starting at the county level, so I don't believe conservation measures have to start there either.

Blockage by private lands is a genuine problem in some national forests and in some BLM public lands. This is worth more effort by both agencies to acquire rights-of-way. If the private landowners hold federal grazing permits or buy federal timber, they should be required to grant a free public right-of-way.

Some people would oppose anything with the name "conservation" or "environment," not to mention "nature" or "ecosystem." Environmental education has made great progress, but there is still work to do. I'm thankful that high school students today have a better understanding of ecology than many adults.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The same concern has been expressed by a pro-OHV group, the National OHV Conservation Council, in their "Management Guidelines for Off-Highway Vehicle Recreation" (2006): "Stream crossings should be located where the stream bottom is solid, stable or modified to support the expected uses. Stream banks should be hardened or stabilized, if necessary, to prevent unacceptable erosion or sediment delivery into the stream. When local regulations require and when crossings cannot be stabilized, streams should be bridged." That guidance is widely ignored.

At this very moment millions of mountain pine beetles are hard at work to counterbalance the unnatural density of pine trees in western states. This is the very same unnatural density that is a result of groups like this. If you want to preserve the forests, and the accompanying landscape that they produce, we have to stop trying to put everything in a bottle. Nature was never intended to remain in one state of being at any one time. In fact it is the exact opposite, nature is constantly changing and evolving. Yes that is right, has anyone here ever heard of evolution? Change is the most natural process of all processes and should be welcomed instead of feared. Our insistence of trying to control nature will only lead to a quicker destruction thereof.

I am inclined to agree with you. The government should stay out of the green movement. I have seen so many examples of bad supposed environmental legislation. Something that is lost on so many people is that for every action there are consequences. We had better start looking at the consequences to the environment of the actions proposed in the "Green" movement. Two examples are the additive MTBE in fuels and the compact florescent light bulb. Since 1992, MTBE has been used at higher concentrations in gasoline to fulfill the oxygenate requirements set by the United States Congress in the Clean Air Act. Because of the high water solubility of MTBE, it led to the contamination of ground water wells all over the United States, which finally resulted in a reduced use of MTBE. Great, we got cleaner air and contaminated water. There is also a push to outlaw incandescent light bulbs and push Compact florescent light (CFL) bulbs on everyone. Here the goal is to reduce power consumption. Indeed a noble goal, and all of the politicians jumped on board to say that they were on top of the green movement. The problem is that every CFL bulb is manufactured with mercury. Not only is the manufacturing process dangerous for the employee, but now every household in the US will have Mercury in it. Wow we are using less power but contaminating every household with poisonous Mercury. And if we are lucky enough not to break a bulb in our house and expose our family to this toxin, they go to the local landfill and potentially contaminate our soil and water sources. These are only two examples out a countless number of examples of how the "Green" movement is only a commercialized means of selling more products to the gullible guilty conscience of the public. Again I try and remind everyone that every action has consequences. Before we fall victim to the commercial entities trying to push the sale of new products through lobbyist introduced "Green" legislation, lets think about the consequences. Pushing this or that in the name of saving the environment is no different than declaring war in the name of Christianity.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Trouble is, as always, if the government closes all of the access down to the natural areas I'll have to watch it on TV anyways. I'd rather share it all with my fellow brothers and sisters and actively use and maintain it, as you have recommended in other posts. Oh and by the way I'm not destroying the "natural" environment anymore than those who choose to walk in it, Or in your case clear cut forests for take off and landing zones.

I don't think there are enough words in the English language that would satisfy your request for recognition. No matter what the OHV community does or says, your preconceived notions are likely too entrained to ever convince you otherwise. The fact that we love this land and want to share it with our friends and family so that all can grow to appreciate it, is lost on people like you. The more we try and exclude "we the people" from public lands the less "we the people" will have a connection to the land and the more the land will suffer from a lack of interest from "we the people" and fall victim to the likes of developers and rapers of our natural lands.

I couldn't agree with you more. I was just at Mount Rushmore National Monument. In the visitors center they had a two pictures of a valley taken from the same point. The first picture was taken by a member of then Lieutenant Colonel Custer's expedition into the Black Hills in 1874. The second picture was taken in the present day. It really opened my eyes to the effect that fire suppression has had on the environment. In 1874, the landscape was much more thinned out with a greater variety. The current photo showed a dense forest with no variety. This has led to the current situation with the pine beetles devastating the forests. I guess it goes to show that Mother Nature will have her way one way or another. The goal to preserve everything in some artificial state of suspension, will only lead to us losing everything.

That is where you are wrong , that is the goal of every Environmental group out there. Preserve everything as it is in this second, or some second in time in the past. They constantly ignorantly and arrogantly proclaim that this area or this population of something shall be protected against all threats, even natural ones. Mother Nature does not stand still. She is ever changing everything. Climates and habitats have changed constantly from the beginning of time and the species that inhabit them either adapt, move, or die off. It is a natural process; in fact it is the force that causes evolution that the left is always proclaiming, except when it doesn't suit their agenda. No one here wants to "build into every last region" and no one here has suggested that. I think what we are after here is a little bit of truth in advertising. If an area is designated as a roadless area, it ought to be without roads. Just because there are limited roads in an area doesn't mean those roads that exist should be abolished. In fact those areas with less roads is appealing just for that reason. That is what we strive to find and experience. But if all of those areas are closed down then all we have left to enjoy are the areas crisscrossed with roads, which doesn't provide the same enjoyment. We don't want more roads, we just want to keep access to those places that we currently have access to so that we can enjoy them.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Okay I will give you that, I generalized the Environmental groups (not the people). Maybe what I should have stated was that the governmental policies that come from the agenda the environmental groups push results in policies that don't jive with the natural changes mother nature is constantly enforcing. As far as my limited knowledge of the roadless designation goes, is that they are to be preserved until congress can decide if they will act to make them designated wilderness or not. That is my fear that all of these places that I enjoy to visit will be shut down in the future. What we need is a new designation that protects our public lands from development, but leaves it open for all kinds of recreation, for all to enjoy.

Yes some people choose to abuse our public lands instead of use our public lands. What would you suggest though, should we not allow anyone into our public lands in the fear that they might be abused. Just like you I don't want to have to get my fix for nature by watching the discovery channel. I want to go out into nature and enjoy it, instead of becoming a big fat pig by sitting in front of the discovery channel.

Debate is what this forum is all about. People from different viewpoints have the opportunity to express their opinion and others have the opportunity to comment on those opinions. I agree with you that "Land of Many Uses" means "Use" and in people using and enjoying the land they develop a desire to "conserve" said land. Thereby giving credence to the motto and what it achieves. If you had never been in any natural setting and experienced something grand from it before in your life, would you have been on this forum taking an active role in conservation? I highly doubt it. I think everyone on this forum has developed a connection to the land in different ways and through different medias and thus they are here debating how it should be addressed in the future. So again I rally behind the motto of the National Forests and encourage all to enjoy our "Land of Many Uses" through a broad spectrum of activities, so we all may develop that connection to the land.

You are welcome, and I believe we have preserved *\*some\** undisturbed natural environments. I am very happy that we have too, so yes we are in agreement here. I am not against Wilderness designated areas and I believe most OHVer's think likewise. What I and others are against is designating Wilderness areas that don't meet the definition. Places that are disturbed and do have roads through them are being declared wilderness and roadless areas. There are plenty of wild areas that currently have access to and though them that are providing great habitat and that is a great thing too. Why do we need to change that? I think that wildlife and recreating humans can share most wild places. Resource extraction has a far greater impact than recreation and maybe more protection is needed from those activities in certain places. By the way I take a little offense to the implication that I am an anti-environmentalist, as I am not anti-myself. Maybe a more appropriate term of endearment would be anti-exclusionist.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

My biggest problem with your last statement is that you are assuming that a "bushwaked trail" is going to cause harm to some critical habitat. It has been my experience that most of the "bushwaked trails" are much less intrusive on the environment than the actively "maintained trails" by the forest service. The forest service comes in with a trail dozer and widens the trails and cause unnatural surfaces like cuts and fills that are subject to increased erosion and sediment transportation. Natural trails that follow the landscape and are crisscrossed with roots and rocks hold the soil in place and cause minimal erosion. Your assumption that trails and roads in "less roaded areas" cause damage to critical habitat is just wrong. The mistake made in the past is to assume that every footprint that man makes is detrimental to life on this planet. In fact, the environment of these so called roadless areas have no bearing on their boundaries since a description of what kind of habitat is there or what species may live in them is irrelevant. They are only defined by whether they have roads in them or not, and then they don't even follow that definition. This is where my frustrations stem from.

So be it. How do you think the beaches and bluffs were formed in the first place. From the destruction of what was there before the beaches and the bluffs. If you build your house on a bluff overlooking the ocean, you should expect to loose your house overtime. It is called the power of mother nature and we have no one but our own ingnorance to blame.

Yes I am "finding it harder to have a genuine outdoor experience and not feel crowded" and I have wondered why. I have also come to a conclusion. It is because the government keeps closing access to public land and converging everyone into smaller and smaller areas. They are hearing us down into insanity.

I'll tell you why I demoted this idea. It doesn't work! How many rangers are you going to hire to direct the wildlife to use the crossings? What is the penalty for not using the designated crossing? Oh that's right death to all animals who would circumvent these crossings. If you really want to protect wildlife from road kill, sell your car to the junk yard and have it smashed. Instead of paying millions of dollars for bridges, Maybe we could have a new taxpayer funded initiative: Wildlife for Clunkers

It has been my experience that the legislation that comes from the government under the pretense of helping the environment ussally does more harm than good. What we need is education of our piers and to get them out into the outdoors to experience what we have so that they develop and attachment to it. If they develop that attachment then they will want to perserve it. More legislation will just make things worse.

The discovery channel is nice and all, however, when the next program comes on the previous program is quickly forgotten. It takes more than knowing that something is out there. It takes that personal connection. A multiday trip in our National Forests with a vista from the top of a mountain or a view from the shore of lake, river or mountain stream is something that stays with you throught ones life. The same thing on TV has on comparison. We have to get out there and experience it for ourselves to fully comprehend and let it affect us personally. Restricting access only hinders that endeavor. Just knowing something is there gives me absolutely no comfort what so ever.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Wolves should be treated as any other predator. Why should wolves have any right over any other predator? Wolves are one of the most wasteful of predators. For instance in August 2009, outside of Dillion, Montana, 120 sheep were killed in one night by wolves and only a handful were actually eaten. Luckily our tax dollars reimbursed the rancher for about half of them, since those were all that were "Confirmed". Now tell me why we shouldn't have at least a wolf season? Why they can't be shot at any time like a coyote is beyond me? Anyone wonder why our ancestors almost eradicated them in continental US? They obviously are having no trouble growing in numbers and need to be controlled.

Some of the comments here are very entertaining. Glad I brought this subject up. Last I looked we were at the top of the food chain and we should be able to effectively manage game. My main point is that wolves damage livestock. Then we pay for part of it and the rest comes out of a rancher's bottom line. If anyone doubts my story, here is a link { <a href="http://missoulian.com/news/local/article\_5ff01772-938f-11de-9aca-001cc4c03286.html" rel="nofollow" target="\_blank">Link</a> } I would like to see them treated as Coyote and stop having everyone pay for their damages. Let people shoot them when they bother livestock. Also, as a hunter they definitely move the elk around and effect their populations. Bottom line that wolves kill anything they can and are just about the only thing that do except for people.

Differentiate Between Public Uses and Commercial Uses. The American Sportfishing Association (ASA) has a goal of seeing the federal government manage aquatic and fishery resources in a manner that much more definitively recognizes public use of resources versus private use of resources. Particularly in the area of marine management, there is an unacceptable lack of attention applied to the fact that public uses of our public ocean resources, such as fishing, boating, and diving, are very different than private uses, such as energy development, aquaculture, and commercial fishing. The main challenge here is overcoming the mindset that commercial and industrial exploitation of our marine resources are comparable to sustainable, low-impact public uses. They are not. ASA certainly supports the extraction of resources in our public waters when such activity is managed properly and carried out in such as to not have significant, long-lasting negative impacts on the given resource. However, preferential treatment, consistent with the public trust doctrine, should be given to public, low impact uses of this same resource. The mindset at the Department of Commerce and, to some extent, the Department of Interior has not been to elevate public use of our public ocean resources. To see what works when it comes to this goal and its challenge, one need look no further than the management of our public lands. For over 100 years, we have managed our public land, for the most part, in a manner that balances public use with private commercial uses such as grazing and energy development. Our marine fishery resources should be managed more like our public land resources.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Collection and Use of Better, More Timely Fisheries Data. Federal resource managers have a decidedly mixed record when it comes to gathering adequate data on fish populations, habitat quality, etc. necessary for effective fishery management and conservation. The federal government should establish a standard that is applied across agencies, which will ensure that there is consistency when gathering fisheries data and a high national standard in terms of the quality of that data. A fundamental challenge to gathering adequate, timely fisheries data is the reality that recreational anglers disperse across broad areas and sampling can be very difficult. Enforcement and monitoring on the freshwater side, achieved through the state fish and wildlife agencies, tends to be more easily accomplished. Inadequate gathering of recreational fishing data on the saltwater side, where the federal government has jurisdiction beyond three miles, has been hugely problematic. Over the years, NOAA has been largely focused on commercial fishing to the detriment of the recreational fishing public. Apart from gathering and using higher quality data of recreational fishing effort, better data in general needs to be gathered regarding fish populations. Timeliness and frequency of marine fish stock assessments are far too inconsistent and a national standard for stock assessments should therefore be established. In terms of what works when it comes fisheries data gathering and use, new technology and techniques have been identified and are currently under discussion between our community and NOAA. The recommendations we are considering should be reviewed with an eye toward broad adoption. The federal government's role in meeting this need is fairly simple: a commitment must be made to achieve a much higher and consistent standard when it comes to gathering fisheries related data across the country. That requires making it a priority across the federal government and, as a result, dedicating adequate resources to this incredibly important and fundamental need. -Gordon Robertson, Vice President, American Sportfishing Association

Re-establish the Primacy of Science in Fisheries Management. Fishery management decisions should always be made on the basis of timely and definitive scientific information. There have been trends in recent years toward protectionist management that has been based on assumptions that simply are not born out by up-to-date, adequate scientific information. The challenge in this area has risen through the allowance of arbitrary, emotion-based management decisions made for fisheries in the absence of fully adequate scientific information. Standards have slipped in this regard and this slippage must be stopped. We know that it is possible to conserve and sustain our natural resources, but only when we manage them with the best scientific information in hand. Again, a review should be carried out across the federal agencies with fisheries management responsibilities to determine current standards for the use of science in fisheries management decisions. The results of this review should lead to the establishment of a clear fisheries science standard with obvious thresholds for what managers must have in hand, in terms of scientific information, before making a significant management decision. -Gordon Robertson, Vice President, American Sportfishing Association

I'm a road biker - done 3 cross country rides (2 x-usa, 1 x-canada), raced road and track in the 70's; likewise a backcountry/wilderness hiker... but sorry: bikes have no business in the back country. At the very best they destroy the wilderness experience for many, for the benefit of one (if that). Why the mtn bikers can't understand this I don't know - are they really that self-centered/conceited??

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Like \_\_\_\_, you keep getting hung up on a specific word. Two people go to a gas station and each fills a five-gallon can with gasoline. One uses it to work on a fuel-reduction project, the other uses it to put in his play machine. The worker gets no special fund from the government for the gas tax he spends, but the playboy does. That is fundamentally unfair. I never cried about hiking trails. I maintain that you get a much better outdoor experience on foot than you ever will on a machine. I'm not trying to destroy a program that creates trails....I'm opposed to a program that favors one special interest group, particularly a special interest group that exists for the optional purpose of recreation. Maybe what Uncle Sam's minions taught me about survival, plus what I learned in forestry school, plus my forty years on the land, would make for a great outdoor survival competition. But from your posts it appears you'll need more than the pocketknife I'll start with. AND it really doesn't matter why you call names. It's still immature.

I feel for your confusion. In Oregon the ATV Fund is exclusive to off-road recreation and administered to the detriment of citizens such as myself. You keep confusing it with a federal program. You want to maintain your special fund. I understand that. There are thousands of laws and funds in this country that benefit special interest groups. The 1872 Mining Law comes to mind. Many of them should be changed or eliminated because they do not benefit society at large. Yours just happens to be one of them. You folks say you pay your own way, but in Oregon I end up paying gas tax to enrich your sport. (And I don't think government should buy stadiums for sport teams, either.)

Here's what you don't understand: I have more than a hundred photos, and access to hundreds more, showing the destruction of public and private lands by unregulated off-road recreation. My home has been invaded by the species. Regulation on neighboring BLM lands was non-existent until a few years ago and now is minimal. The local club should be indicted for fraud, based on the record of their grant requests to the State. I have been threatened, shot at and nearly run over by dirt bike riders. And you tell me I shouldn't oppose the fact that part of the gas tax I pay goes to a fund to support an optional recreational activity that creates all of these problems? Clearly, you do not understand.

Before they ran that newspaper article the local editor required I document the issue. The proof is in the record. The local club used false and misleading statements to obtain grant money. Under Oregon law that is Public Investment Fraud. Neither local nor state law enforcement are (so far) willing to undertake an investigation. It is exactly because I have all the problems that I stated, and more, many of them exacerbated by the funding obtained through the State, that I can say the program is not successful. As I stated earlier, successful for you does not mean successful for all of us.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

This will be my last response to you, regardless of how you may respond. In reviewing your comments on this site your narrow views and redundancy are sophomoric at best. You have helmet visor vision and repeat the same phrases I hear time and time again, as though you'd memorized the Blue Ribbon Coalition's talking points. (Just as you claim people echo Sierra Club language.) I post this response only to clarify for the larger audience that there is a systemic corruption in the program you defend so ignorantly. My attempts to secure an investigation into this situation did not produce results because of a lack of evidence, but rather because none of the agencies chose to investigate. There has been a lot of buck-passing, which I suspect has more to do with protecting the image of the State Parks than anything else. Here's the 4-1-1 on the grant application for a land purchase that I believe constitutes public investment fraud under Oregon Revised Statute 162.117. The land is a 140-acre parcel, formerly in private hands, purchased by a local motorsports dealer when the applicant's first application was denied. The land is an isolated parcel. The grant application: references a "BLM trail system" that did not then and does not now exist. alleges an "environmental study" that does not exist references a "Staging Area" that does not exist alleges the applicant has agreements with BLM that have never existed alleges meetings with members of the public that never took place provided a letter of support from a man who had been dead for ten months, alleging he was the "only neighbor," though his surviving brother actually lives closer to the subject property. The entire neighborhood association of more than thirty families are on record as opposed to the grant. alleges applicant has provided "law enforcement" when they are not a law enforcement agency alleges agreements and potential agreements with industrial forestland owners that do not exist The application was tabled at the first hearing, pending BLM's completion of a Record of Decision for the area in which the land was located. The applicant then secured an attorney, who appeared non-agenda and implied litigation. A subsequent hearing was held with invitee-only testimony. Neither the County nor the nearest adjacent city chose to attend. Only BLM testified, representing falsely that the land purchase would solve all the problems with local landowners. The grant was approved with the sole condition that the land be immediately turned over to the BLM. BTW, the motorports company, now out of business, made a tidy profit on the deal. These facts are available through the Oregon Parks and Recreation Department, but the record is not easy to obtain. They do not keep verbatim minutes, so you would have to request a recording of the meetings and copies of all written testimony. Nothing that you have said or will say can change my mind that the ATV Fund program in Oregon is inequitable, corrupt and not in the best interests of Oregon taxpayers. Therefore, post what you will, I'm not going to trade barbs with you any longer. Let the public decide.

I have watched as private, non-industrial forestland is cut into ever smaller chunks. This idea offers some protection for some of the best-managed timberland in our country.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Forty years of living in and studying northwest forests shows me something different than "overgrown forests that burn at the drop of a hat." I agree that the forests have been mis-managed. They have been overcut and the resulting unmanaged mix of saplings, brush and grasses are what fuel the fires. Our forests are overstocked, but not with mature timber. On federal lands and industrial lands the timber is too often cut and the landscape left untended. Fire management has created similar problems. If you want to see well-managed timberland, look to the private, non-industrial forestland owners.

ORVs Are Inappropriate for Wilderness-Quality Public Lands. In eastern Utah alone, there are over 20,000 miles of designated ORV routes and a few cross-country ORV "play areas." Some of these routes cross through ancient Native American cultural sites, scarce desert streams, and proposed wilderness areas. Many of these are trails that don't actually go anywhere, or there is no compelling reason for their existence; many duplicate another route. By eliminating only 15% of these trails - which would leave about 17,000 miles of ORV routes in eastern Utah available for use - some of Utah's most spectacular redrock country would be protected from off-road vehicle damage. A similar idea would help protect wilderness-quality lands in other states as well.

Even if some of the designated off-road vehicle trails are closed (and many miles would remain open), there still would be many ways to access these areas - hiking, horseback riding, paddling, etc. 80% of the lands that are proposed for wilderness would be within 2 miles of a road. Here is an example of the area near Moab (all of the routes in green would remain open to off-road vehicles if all proposed wilderness was designated): { <a href="http://www.suwa.org/site/DocServer/moab\_ORV\_plan\_wilderness\_map.pdf?docID=2183" rel="nofollow" target="\_blank">Link</a> }

In this "idea" I am referring to the lands which have wilderness character but currently ARE NOT being protected by the BLM as Wilderness Study Areas (WSAs). Wilderness Study Areas in Utah are also included in the about 9.4 million acres of America's Red Rock Wilderness Act.

Proposed wilderness areas are places that are wilderness-quality. In this "idea" I am referring to those wilderness-quality lands that are currently not designated as wilderness or as wilderness study areas. The BLM is part of the Obama administration.

I am a frequent visitor to southern Utah, particularly the area surrounding Lake Powell and the Glen Canyon Dam. Each year I go there, damage from ORV use has been increasing by leaps and bounds. It astounds me that Utah residents and visitors from out of state seem to think of this beautiful 'moonscape' as a playground for ORVs. It's gotten so bad that it is next to impossible to photograph nature's grand design without hundreds, even thousands, of ORV tracks marring the landscape. There are already enough places where ORVs can be used legally, yet many on this and other boards insist on having more. Are these places becoming "boring" to ORV users? Is it not enough to destroy what God gave us where you're already allowed to do that? We NEED to protect the areas around Glen Canyon Dam and Grand Staircase/Escalante, Factory Butte, and others from this scar of human recklessness. I fully support ANY effort to restrict ORV use to certain areas until this scourge is brought to a decline, not the rapid increase I've been seeing since the early 2000's.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I volunteered at B.L.M. for Public lands day and recieved a day pass to any facility. I had no Idea I would receive a pass. I volunteered for the experience. On that same note the purpose of volunteering should not be a prize. Yeah it sucks that the government is screwing you over on an annual pass. If the only reason for service is the pass pay the \$80 (which would be much cheaper that 400 hour ) and quit volunteering.

No Bikes on the Pacific Crest Trail, or in wilderness areas. Please leave us to our peaceful SLOW way to enjoy nature. Every other trail we have to fear, that a thrill seeking usually young man will knock our horses legs out from under them. Or our horses will spook and fall off of a narrow trail in to a canyon. This has happened to me from a BIKE. Bikes and Horses should not share the same trails. There are too many blind curves and bikes are going to fast. My motive for writing this is I am 65 years old and I need a safe place to ride my horse, I do not want or need to be hurt by some thrill seeking junkie that doesn't care about me or my mount. People that ride Bikes are doing so for the thrill, because when they are moving they cannot look at nature, they must look at the trail. So why would anyone vote for them to ride the Pacific Crest Trail or in our wilderness areas, we are there for peace and quiet and to view nature as its should be. Slowly and Greatfully. We have lost many trails to bikes. PLEASE, let us enjoy what nature is left, without fear and worry of being hurt.

Control the wolf population. Acceptable numbers should be defined and wolf populations should be managed accordingly. Wild animals should not be given priority over domestic animals. Ranchers should have legal authority to shoot wolves if they are killing livestock. The special interest groups that instigated the re population of wolves should reimburse ranchers when livestock is slaughtered, not the taxpayers. Human society does not mix well with certain predatory animals. Human's are more important than animals. Manage accordingly.

\_\_\_\_\_ in comment 1 You are the epitome of the problem with environmentalism. You obviously place higher importance on animal life than human life. Stewardship of our environment does not preclude human life. \_\_\_\_\_ in comment 2 HUMANS are a part of our "natural ecosystem" not an "invasion / disruption" as you seem to think.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Watch how a minority (equestrians are maybe 3-4% of all trail users) will say just about anything to protect their privileged access. Some on the nonsense read above: - Bicyclists don't show up for trail maintenance day: what a lie. I've yet to see an equestrian at a trail work day. On the other hand, I've seen plenty of trails pulverized by their animals hooves, not to mention the feces left over wherever they go. - Wilderness bans wheels: that is the current interpretation of the act since 1984, not the intention of the 1964 Act. - Bicycles are power forms of transportation: muscle powered, unlike the equestrians who simply sit on their animal. - Cyclists are rude: wow, that's interesting. Apparently, the mere fact of riding a fact makes millions of people rude all of a sudden. Truth: most people I meet on the trails are nice. A minority is rude, and somehow it does not correlate with any singular activity. - Those trails are MINE: another lie. Trails are funded by taxpayers for the enjoyment of all as long as we do not impact them. Bicycles have the same impact as hikers and much less than horses. - Bicyclists and OHV have nothing in common. One is muscle powered like hiking (or maybe riding a horse, although the poor horse is doing all the work), and the other is motorized. - Cyclists spend much more time going up hill at 3-4 miles per hour than they spend going downhill. - Horses are spooked easily: that is true. Horses are prey animals that are spooked by just about anything including but not limited to: a dog, a snake, hikers, cyclists, etc. Frankly, if those animals are so easily spooked, and therefore so dangerous to other users (anybody seen a galloping horse coming at you on a narrow trail?), why are they allowed on public trails? Equestrians should train their horses to get along with other users. If they can't, then they should stick to private trails. Cycling a healthy activity enjoyed by millions of americans who want to be in the great outdoors. I support this idea.

In the US, there are approx. 30 mountain bikers for every equestrian, yet equestrians have access to many times more trails than cyclists (including 53M acres of wilderness in the lower 48). Reading G.S., it's pretty clear that their intent is to maintain this discriminatory practice for as long as they can so that they don't have to share. Again, if your horse is that dangerous, you should not be riding it on public trails. As for cyclists being adrenaline junkies, most of my riding buddies are well into their 40s and 50s, hardly the young punk people are trying to paint here. As for trail work, in Northern California, you won't see too many equestrians wielding a pulaski. Truth is that the scare tactics are not supported by statistics. Documented dangerous encounters between user groups barely if ever occur. Perception might be different, but fact is that 99.9% of all encounters go just fine. Cycling is a healthy human powered activity that needs to be restored in wilderness and other public trails.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

More lies from the usual hiker/equestrian lobby. Par for the course. The 64 Act does not ban bicycles from Wilderness. The 84 creative interpretation of the Act did. It's been proven that Congress intended to have bikes enjoy wilderness. BTW, pedal powered kayaks are legal in Wilderness despite being mechanical forms of transportation. Then, hikers call bikers conceited for breaking hikers' tranquil enjoyment of nature. Wow, the nerve! it's a public good, not your own private backyard. Learn to share. It's an especially galling claim when we know that the backcountry is pretty much empty. As for the PCT, we've been riding it for years. You might as well make it legal. Here are the facts: hiking and horse riding are on the decline while mountain biking has been progressing for decades. What we have is a bunch of old timers that are trying to cling on to an undeserved privilege with the hope that the wheels of change turn slowly enough so that they don't have to experience it during their lifetime. Sad state of affairs.

So funny. Trekking poles are not green enough for wilderness. I say: no trekking poles, no GPS (not close enough to the near religious wilderness ideal), no horses (because of their impact on the trail). Heck, no human!! (FYI, the above is all sarcasm)

I hike a lot of trails that are open to bicycles. It is not fun and bike cause a lot of damage to trails. However, I do see the value in mountain biking as a form of outdoor recreation, but national scenic trails such as the PCT would be the last place that I would want to encounter a biker.

Mountain bikes should have trails dedicated for their usage. Mountain bikes should not be sharing the trails with hikers and equestrians. High downhill speeds, blind curves, trail erosion, lack of safe passing areas, and steep drop offs endanger lives. It is hard to imagine a worse setting for horse and bicyclist than the Pacific Crest Trail. It is far too narrow and steep for safe passage for any but hiker and horse. My greastest fear is a tragic accident in such proportion that trails will be closed to EVERYONE. This is a case where I support the concept of separate, but, equal.

I'm not sure I'd support logging increases unless there were some supervision. And DEFINITELY no clear-cutting. Thinning out diesased trees sounds good on paper, but would it stop there? This has to have some supervision. No cutting of Old Growth healthy trees for profit!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As someone who is involved in putting on volunteer trail work parties on state and federal public lands throughout the year and on any given week, I will say that most consider the ATB 500 hour recognition insulting, and we generally choose not to mention it. Sure, the hours are accumulative, but to be honest, it is a hassle to track by volunteer organizations for each of so many different people, and it just reminds them of what an insult it is to have to do 500 hours of volunteering for a pass good for one year only. Better not to have it at all. As Derrick pointed out, volunteers start to boil it into a net worth agenda (like \$1.60 per hour). Just.....don't go there, or make it more functional like the USFS. As to the attitude that we should just be happy to volunteer and be happy to pay the fee or not volunteer.....well, that may work for some highminded, but has little value in the trenches. Trail volunteerism needs a lot of willing folks coming from a number of different political viewpoints and economic strata. We need these folks desperately to build trail and to run equipment, from tractors to chainsaws, particularly on the poorer funded USFS recreation sites. Frankly, any "pass" is a hassle for volunteers. I may visit sites multiple times over a couple of weeks, and so I have to carry a pass in any vehicle I may drive depending upon whether I am doing light work where a car will do or heavy work transporting tools and supplies where a truck is needed. Sure as shooting, my volunteer pass is in the vehicle I left at home. You have no idea how depressing it is to get a ticket for no pass when you just spent \$50 in fuel and a day's worth of labor and maybe \$200 worth of equipment time. Sure, you can usually get it removed later once you explain what you were doing, but the point is that pass management for volunteers is a pain in the rearend. Typically I have one volunteer USFS pass and an ATB pass that I buy, and even then, both may be left at home!! Anyway, if you care about volunteers, offer them a cheap credit system. It inspires them to come back even if they don't use it (since they feel appreciated), and I'm talking about the folks who swing pulaskis, dig with shovels, operate crosscuts and chainsaws, and pack heavy loads and materials into the backcountry. The USFS relies heavily on volunteers since they don't have in many places paid trail crews. The USFS gives a pass for 16 hours. The NPS is much better funded with many paid trail crews. So they want 500 hours. Fortunately, where local NPS parks must rely on volunteers, they have their own volunteer recognition system that is far more practical since they must deal with reality. So give me a meaningful credit system or don't waste the time.

I support this idea whole-heartedly. Two comments though. I find the staff in the USFS very hard working and dedicated. The problem that has occurred is with limited staff and resources they have to deal with more paperwork, more studies, and more litigation. They sometimes can't pursue worthwhile projects or provide on-the-ground support for what seems obvious improvements since they know they can't get all of the required pre-work done. So they start operating from a defensive custodial position not a proactive one. I can't say I blame them but I do wish the situation could improve. The Secure Rural Schools and Community Self-Determination Act is no longer funded at all after this year. Expansion isn't so much an issue right now as reauthorization. Some legislators are trying to make this happen. Please support their efforts.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Under the topic of reducing irresponsible snowmobile activity, for what purpose do you suggest 'compromise'? I am assuming that you do not seek to ratify unsustainable snowmobile off-road practices like marginal snow driving and bushwhacking exposed vegetation. Snowmobiles, skis & snowshoes are all designed with enough 'footprint' to 'float' (or not sink far into) most snow surfaces; all three, when laden as intended, will have very similar ratios of surface area-to-weight; overloaded, any of these conveyances will cease to 'float'. I can report that, on fresh snow, when a climbing snowmobile crosses over my fresh ski uptrack, the snowmobile typically penetrates about 1" to 3" deeper (but sometimes MUCH deeper) than my uptrack. I attribute this not to difference in flotation so much as to the dynamics of motion: the greater forward thrust of the snowmobile and the widely shifting weight distribution of its (body-steering) driver. (It could also be that I'm using skis that are too big for me) . In any event, the ability to 'float' on snow is, at best, incidental to the topic at hand because ordinary snowmobile practice is not at issue here: I'm talking about curbing IRRESPONSIBLE snowmobile activity. A snowmobile does not automatically 'tread lightly' - operator discretion is crucial. The snowmobile will not keep itself out of unsuitable conditions, nor can it prevent its driver from pursuing clandestine bushwhack routes through breakable tree tops, etc. Even though thoughtless pedestrians may adopt unsuitable routes on vulnerable terrain, they quickly tire of post-holing into brush, and soon turn around whereas a snowmobile just keeps going and going - even when it trenches foot-deep through unsupportive snow into underlying material. Like any remotely operated vehicle, a snowmobile must be driven with discretion to minimize its impact on the resource and on other forest visitors. Your suggestion to steer motorists away from pedestrians is a popular paradigm, prim on paper, but such arrangements fall short wherever motorist compliance is unreliable. As I've noted, at least locally, snowmobiles routinely travel out-of-bounds (on mapped and posted wilderness) in places where pedestrians seek to distance themselves from impacts of vehicular activity. Repeat violations and unsustainable practices need not dog the wake of snowmobiling. Hence, my suggestion for prominent display of a permit/ID tag to introduce operator accountability and thereby reduce occurrence of irresponsible snowmobile activity.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

According to \_\_\_\_\_, the use permits that make campers, hikers, hunters and fishers accountable for their conduct will be unlikely to improve snowmobile compliance because the ID # on the snowmobile permit will probably be obscured by snow. And since those paper tags surely cost money, he suggests that we should spend even more public funds on futile and ineffective efforts to police specialty craft that remain exempt from license plates! But take heart: we're told that the irresponsible, unidentifiable snowmobile off-road motorists who are willing to break the law need little more than the guidance of a few more signs and, of course, some 'education'. \_\_\_\_\_ is quick to follow with the first installment of instruction: while finally acknowledging that snowmobile motorists are indeed indisposed by occasional encounters with unsupportive snow, voids and discontinuities mid-mountain, we are told that the motorist need only throttle FARTHER UP the mountainside into the rarified alpine life zone where, he declares, snowmobile off-road specialty craft "truly have no impact." If we're to rely on education to address problems of snowmobile misuse, we better make darned sure that off-road specialty motorists come away with more than empty slogans like 'our tracks don't last'. Following is a list of snowmobile impacts that accrue in high alpine environments of the Sierra Nevada. I have personally observed, experienced, and recorded every one of the impacts listed here. As you might guess if you've read this far, I will be happy to elaborate in detail on any of the following points as the discussion proceeds: Snowmobile off-road impacts which occur at treeline and above: 1) sonic pollution of rarefied atmosphere (sound waves travel farther above treeline than in the forest) 2) chemical pollution (carbon monoxide, hydrocarbon, etc.) of rarified atmosphere (aesthetic and physical impacts on forest visitors) 3) chemical (sooty hydrocarbon) pollution of remote snow and riparian headwaters with long-lasting contaminants like PAH 4) trampling (breakage) of slow-growing timberline elfinwood exposed above the snow (300 year-old whitebark pines, not seedlings) 5) contact damage to alpine vegetation BELOW the snow surface (during soft snow conditions) 6) trampling of (unseen) scarce wildlife and riparian habitat (e.g. Yosemite Toads overwintering in snow burrows ABOVE 9000' - yes, some animals actually live high up in the mountains year-round) 7) snowmobile driving on high terrain unprotected by snow (overdriving exposed soil & tundra on high wind-scoured ridges to link patches of discontinuous snow) 8) debris stripped or lost from moving snowmobiles (such as busted windscreens, torn belts, red shards of shattered reflectors, torn rubber track lugs, etc.) 9) violations of law (out-of-bounds motoring) and attendant public costs 10) conflicts among snowmobile motorists (who aggressively compete for, and rapidly chop up, trackless natural snow scapes) 11) degradation of bipedal access and opportunity (fall-line vehicular snow ruts impede or foreclose knee-reliant travel) 12) unsafe practices - reckless driving endangering others in the alpine environment (high-speed passing, avalanche triggering) Recall again: these are snowmobile impacts which Brian claims don't even exist at high elevation. That said, I should mention that nearly all of the above-listed snowmobile off-road impacts can indeed be minimized and possibly even reduced to insignificance. It will take awhile, sure, and will certainly take improved enforcement efforts, improved (honest) education, improved snowmobiles... and, above all, operator accountability. There's no doubt in my mind that snowmobile recreation is dear to many persons and is one of the few outlets that bring satisfaction for some souls in the cold season. As well, I know that snowmobiling has responsible and respectful sportsmen who are now beholden to, and constrained by, the least respectful of the anonymous operators. This

state of affairs is unnecessary, unreasonable and should no longer be tolerated.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Snowmobiles, by their design, don't do anything without an operator. Nothing at all. By design! But at least someone here appears to recognize that, in careless or inexperienced hands, a snowmobile can make a costly mess... A snowmobile will run over whatever the operator drives it over (or through), or whatever he fails to avoid; snowmobiles can and do come into contact with stuff other than snow, both accidentally and deliberately. While snow tracks of course vanish with spring thaw, snowmobile contact-damage to unprotected soils and trampled vegetation does not disappear and thus may accumulate over multiple seasons. Sometimes impacts of a single misused snowmobile can be pronounced: fall-line snowmobile ruts which are cut directly into sodden soil or through thin, unsupportive snow can channel snow melt, fostering erosion, stream pollution and stream turbidity. Vegetation exposed above the snow can be overrun, damaged or destroyed. Slow-growing timberline vegetation is particularly vulnerable, and alpine forage suffers too. Rare wildlife (like the Yosemite Toad) overwintering in snow burrows can be suffocated or crushed, especially in late season. Such snowmobile impacts can be acute since a snowmobile travels much farther per visit than a self-powered user, affecting perhaps ten times more terrain per hour. It's no surprise that the range and impact of a negligent forest visitor (the inevitable 'bad apple') is greater when he throttles a snowmobile in lieu of a pair of snowshoes. A snowmobile does not automatically 'tread lightly' - operator discretion is crucial. The snowmobile will not keep itself out of unsuitable conditions, nor can it prevent its driver from pursuing clandestine bushwhack routes through breakable tree tops and other forest life. Even though thoughtless pedestrians may adopt unsuitable routes on vulnerable terrain, they quickly tire of post-holing into brush and soon turn around whereas a snowmobile just keeps going and going - even when it trenches foot-deep through unsupportive snow into underlying material. Like any remotely operated vehicle, a snowmobile must be driven with discretion to minimize its impact on the resource and on other forest visitors. This is true on private property and equally true on public estate. Yet, a pernicious disparity continues to grow between what is preached and what is practiced - a duplicity sadly corrosive of sport. It is disturbing to see this 'snowmobiles are magic carpets' fiction so ardently hawked when bare truth is plain to see - in the mountains, sadly enough, and much closer at hand for the cognoscenti here, a link to [verit@e...](#) Following is a brief but plain exchange which appeared on the popular Snowest.com snowmobile talk forum just three days ago (an ordinary, fairly common discussion). The conversants are referring to specialty snowmobiling in the region surrounding Lake Tahoe. Responding to a prospective visitor, the local motorist describes the expressly typical practice of local snowmobile off-road motorists: his warning (or is it a challenge?) makes it crystal clear that snowmobiles routinely - and indeed violently - contact stuff other than snow. I have added CAPS to TWO of the words to emphasize extraordinary additional concerns, which should be self-evident to every honest defender of sport. Note that the term 'sled carnage', as used below, most probably refers to significant damage received by the snowmobile as a result of contact with one or more terrestrial features that failed to yield when they were overrun or otherwise impacted: 10/4/10, 1:19 pm TWOSTROKE - ...where's are best bet for early season riding near tahoe? 1-2 hour drive okay. where gets the best coverage first or does it vary year to year? 10/4/10, 2:13 pm ZRIDER - It all depends when the 'white' starts flying... ...Early season riding down here is usually road/trail riding till the meadows and bowls fill in, unless we get a big dumper right out of the hole. Early sled carnage is NORMAL. To[o] many guys can't wait and go find

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

rocks, tree stumps and whatever else might be lurking BELOW the surface. A-arm and trailing arm [impact-absorbing snowmobile suspension parts] sales are usually good early in the season. Here's the link for fans of frankness: { <a href="http://snowest.com/forum/showthread.php?t=227338" rel="nofollow" target="\_blank">Link</a> } I vote to demote Tom Lund's 'snowmobiles don't touch the ground' sloganeering because the habits of too many (though not all) snowmobile specialty motorists in my neighborhood, and elsewhere, betray this myth openly and often. It's especially disappointing to find the even more flippant 'our tracks don't last' mantra hawked here under 'what works' because this simplistic feel-goodism works, above all, to deceive; an unabashed con - now even a 'motto' it seems - designed to dismiss, if not to deny, the potential for snowmobile misuse. Here we even see the slogan used as a pretext for officially excusing snowmobile motorists from common standards of conduct. 100 horsepower personal off-road chariots of any kind come with tank-fulls of responsibility - but snowmobiles don't even have license plates! (See the 'Reduce irresponsible snowmobile use' topic situated - justifiably - in the 'Challenges' idea space.) Snowmobile specialty motorists will have to offer more than repetitious 'we ride magic carpets' plainchant if they expect to be excused from all accountability, much less if they expect any sport to emerge from this wink-wink, nudge-nudge doublespeak.

I spent the Labor Day weekend, on foot, sharing the trail with mountain bikers on a segment of the Tahoe Rim Trail that is open to bikes. Most with whom I spoke were nice enough, but NONE offered to stop and give me right of way (as is the rule of the trail - Bicycles yield to pedestrians, pedestrians and bicycles yield to horses). IMBA rule #4 "Always Yield Trail. ... Yielding means slow down, establish communication, be prepared to stop if necessary, and pass safely" Some of those I met even came on with an attitude that suggested I was "on their trail". Due to the bicycles (and their riders' attitudes), I would not choose to ride this segment with a horse if I had the option to walk instead. I think it is best to keep mechanized vehicles separate from foot/hoof traffic.

All trail users are not compatible on the same trails. Wilderness and National Scenic Trails with restrictions were created for the reasons stated in the law. Nothing has changed. I support the bikers having a place to recreate. Create these places through your support groups. Don't try to usurp existing areas said aside for other uses.

It is easier for the Forest Rangers to maintain the forest by excluding the people, closing areas, locking gates, exclusions of every sort. This gives the Forest Service personnel time to sit around their offices and figure out how to close and exclude more public use from the forest. It is easier to designate wilderness study areas to keep human activity out, especially the handicapped. Do Federal lands really belong to the PUBLIC.....I think not...they are owned and controlled by the government and you have to have a permit to do any activity. Give these Federal lands back to the states and let them manage them according to their historic and cultural use.

You are so correct. I see closures all of the time, and am getting very tired of it. I think we should close off hiking trails, let's have no one in the wilderness. That should make the activists happy. I have been riding my bike since I was 8 years old, respect the trail and others on it. These narrow minded activists only want their way and don't care about anyone else.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You are so right. Earth goes through changes on it's own, NOT man-made. I think it is pretty big-headed to think that man has caused all of these changes. First it was global warming, then when that did not work, they changed it to climate change. What will it be called when that does not work? These activists have too much free time, you can prove anything if you throw enough b.s. at it.

Where do you come up with this b.s.? Obviously you are just saying this without actually witnessing this happening. I have been riding my dirt bike since I was 8 years old. I respect the trail, others on it and pick up after the hikers. If there are horses on the trail, I shut my bike off until they pass. I think that you are self-centered to only want things your way and yes your comments are rubbish!

1 for 1 is not a great idea. If the roads get much worse downtown streets in many american citys will be OHV roads. WE have more virgin forest than we did 150 years ago here in the states. We really don't need any more.

this is the greatest challenge but to be free to enjoy the wide open spaces some time we must give a little. I will put up with the loud ATV blasting by my slow moving Jeep if it keeps the roads open.

I am the person who recently got his ticket for not paying a recreation fee in the Sedona area dismissed by a federal judge. I would like to address some of the issues raised here. Forest Service policy is that anyone who parks on Forest Service land anywhere within the 160,000 acre Red Rock Pass Area near Sedona without displaying a Red Rock Pass can be ticketed. This is true whether or not there is a trail of any kind. Parking and hiking cross-country can get you ticketed. The closest "paved area" to the trailhead where I received my ticket is miles away. The closest picnic table, trash receptacle, and public toilet--all amenities required by law for a fee to be charged--are 7 to 10 miles away. The Forest Service violated the law. The judge wrote:"...the Forest Service is not authorized by the FLREA and indeed is prohibited by the FLREA from citing Mr. Smith for failing to pay the subject fee." Forest Service officials need not worry about fines or prison time, however. While citizens face punishment when they break the law, government agencies apparently do not.

I think the main issue here is the rule of law. The right to have fees and taxes imposed only by our elected representatives was an issue that founded our nation. Many of the founding fathers paid dearly for that right. We should not surrender it so easily. Perhaps some of those who argue against me have not read the FLREA. The pertinent provisions are only a few pages long, and plainly written. The Forest Service is authorized to charge an amenity fee where specified amenities--including picnic tables, a trash receptacle and a public toilet--are present. There are specific prohibitions against charging fees only for parking or for hiking across National Forest land. I encourage those who have not read the FLREA to do so. As for whether someone who drives on a forest road should pay a fee, that is a different issue. There are many considerations about fees for driving on forest roads that I don't have space to go into here. I will simply point out that Congress has already made that decision.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

"the FS fee program is largely legitimate". The court record show that 18 recreation sites in the Red Rock Pass area qualify for fees. These are mostly campgrounds and day-use sites along Oak Creek. They comprise a minuscule amount of the 160,000 acres of land in the Red Rock Pass area. At least for the Red Rocks area, the fee program is not "largely legitimate". He then says "There are ways to curtail attempts to charge where no services are sought or provided." The only way is to refuse to pay, get ticketed, and go to court.

The FLREA is deeply flawed legislation. Land management agencies like the Forest Service are allowed to keep fees they collect in their own budgets, rather than forward the fees to the U.S. Treasury. The legislative history of the statute shows this arrangement alarmed those who no longer trust the agencies with recreation fee authority. In 2004 Rep. Richard Pombo sponsored an amendment that contained, among other provisions, prohibitions on the Forest Service and BLM to charge fees solely for parking and hiking across undeveloped land. On August 14, 2010 a federal judge in Flagstaff, Arizona dismissed a citation issued by the Forest Service in the Red Rocks area near Sedona. The Forest Service was attempting to charge a standard amenity fee 7 miles from the closest toilet facility and 10 miles from the closest trash receptacle, both amenities required for that fee. The agency ignored, through the designation of a HIRA, the prohibitions on charging fees solely for parking and hiking. The judge found this use of a HIRA to be "contrary to the clear statutory language of the FLREA". The Forest Service is breaking the law in the Red Rocks and in many other areas of the country by charging fees that are not authorized, and indeed, are prohibited by statute. The solution is revised legislation with fees going to the U.S. Treasury, and appropriations from Congress directed to the National Forest districts with greater Congressional oversight.

The use of Mountain bikes on a trail is an accident waiting to happen. When a bike is zipping around a trail with no regard for anything but there "Need for Speed" hits a family and takes them out will the restrictions be placed on everyone. When I use a trail I expect that I can enjoy the sights without the fear of getting hit. Mountain bikes belong on a single track that is for bikes not people. It may limit bikes but public safety must come first. We do not allow people to target practice on trails, why should we introduce a new hazard on a trail. Also, the damage from erosion or worse yet, modification of the trail to attain more speed or a better angle for the bikes.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I participate in all forms of outdoor recreation, mountain biking being one of them. Mtn bikers are already allowed on plenty of trails. Our wilderness should NOT be open to mtn bikers. As stated already, mtn bikers can often be rude, they do not help with trail maintenance in many cases and in many cases they break the rules by riding where they are not allowed or building structures that are not allowed or both. The wilderness is set aside for historic uses, mtn biking is not a historic use. The poster admits mtn biking was in it's infancy in the 19980's and then later tries to imply mtn biking is a historic use?? Huh?? The poster stated any trail open to horses should be open to mtn bikes, absolutely not! Wilderness and other historic horse use trails should remain free of mtn bikes. Mtn bikes tear up the terrain on some soil types and steep areas. To a mtn biker this is great fun and too much of a temptation to miss even when it is not allowed. Dealing with the speeding bikers and ruined trails left behind is no fun for the other trail users or those of us who maintain them. Some of the trails I maintain are so trenched from mtn bike use on steep soft soils if myself and others did not volunteer and build water bars and rework the tread every year we would soon have the Grand Canyon out there. In all the years I have volunteered to maintain trails I have only worked alongside one mtn biker. The rest were all equestrians and hikers. There are plenty of trails out there open to mtn bikers already. You can even open more WITH PERMISSION and labor from the mtn bike community. But they should never be allowed in wilderness or on all trails. Some trails can not safely support mtn bike use and others like wilderness should remain free of all mechanical use! I support multi use trails where it is safe, I also support wilderness staying wild and trails designated for only those uses that are safe and sustainable. Sometimes one or more of the recreation community needs to be excluded from a trail and those rules should be respected and followed.

For many years, people have promoted and worked on a foot and bicycle trail linking several communities in our county. One obstacle to completion of the trail is residential property owners who fear intrusion by loud motorized vehicles, that is dirt bikes, ohvs, atvs. The property owners, who are used to seeing dirt bike tracks through the tank traps and vandalized "no motorized vehicles" signs, assume that motorized riders will use the trail, whatever the law says.

The people of Washington need schools and jobs more than we need green lawns and pavement. In a vacation there, I found the Mall an exciting environment, with thousands of people milling about among museums, the botanical garden, and lasting reminders of great men and military adventures. Better to spend more on the Smithsonian, for example, by replacing the polluter-funded climate change doubt promoting exhibits forced through by the last administration.

For the children, we need reliable security and sanitary services. We need rangers patrolling. We need cleaners. Our parks provide those services. The senators and representatives who subsidize billionaires through regressive taxes are not interested in spending more on health, let alone recreation, services for children.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Recreation is play. Management of play areas requires security and sanitary services, which require money to build infrastructure and pay staff. Do you think we have money to spend to expand opportunities for play when we are cutting food stamp benefits and refusing to support healthcare for our children, handicapped, and chronically ill?

Preservation of land FROM WHAT? From development into cemetery-like towns with chemical-dependent lawns, impervious surfaces, vehicles leaking oil, heavy metals, etc. that replace wetlands and forests that filter run-off before it reaches our drinking water.

To provide recreation services responsibly you must also provide reliable security and sanitary services. You must patrol. You must empty the trash, clean the outhouses, and evict squatters. There is more to it than putting up signs and cutting brush.

I have pictures of bike damage to both Pacific Crest Trail and Continental Divide Trail. The trails in places were designed for foot traffic. They've allowed horses, which also degrade the more delicate trail.

I am not trying to reopen a can of worms -- just make a point. You made a comment to \_\_\_\_\_ -- "The answer to both is enforcement, but we all know law enforcement agencies are stretched to the max." -- And no question I think (as most would) you are correct. My point is only to show a small part of your states Oregon's Parks and Recreation ATV Grant Program does to help resolve this problem you see. Year 2009 grants towards law enforcement programs -- 15 for \$1,725,505.00. Year 2010 grants towards law enforcement programs -- 14 for \$561,394.00. This is the program (ATV) that you are so adamantly against! It is a major factor in attempt to correct illegal OHV (camping, homeless and others) violations.

Personally I am not sure on the overall subject matter, there seems to be consistent differing opinions and studies all the time. \_\_\_ points to an older study by NASA on black carbon soot. Newer studies on glacier ice loss have come out pointing out results of "...find that the amount of ice lost to the seas is smaller than scientists previously thought." NASA studies in combination with other studies are now talking about "...shift of water mass" and "shifting Earth's surface around the globe..." rather than arctic ice cap melt. One finding in the latest study I looked at -- "The motion is only less than one millimeter a year, so it won't have any impact on life..." Black carbon soot may well be a problem and may need to be addressed. But newer studies may show be showing different results and make the \_\_\_\_\_'s statement of "The economic cost of melting the ice cap is going to be astounding..." incorrect.

\_\_\_\_\_ try starting with \_\_\_\_\_'s statement of "I keep saying that replanting trees that are logged is not geoengineering. Neither is painting rooftops. Those are local actions and I have never heard them be classified as geoengineering except by the completely uninformed." This came from his statement in his idea -- "ontrol carbon at the source, geoengineering is not an option" Scientist say different! But he is \_\_\_\_\_ and he is informed where scientists doing the work must not be!

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

Re comment #5 Public Imposition tax (fee)! - Now there is a new one that everyone who wants to raise taxes and tax everything they can should be able to sink their teeth in too! Let's tax every airplane that is flown, every car that is driven, every person that walks -- OH Wait! We already do in some form or the other! Well - just throw more taxes on an overly taxed nation.

When \_\_\_\_\_ referred to jet trails in his idea I was under the assumption that it was in reference to what is commonly known as contrails. Contrails are basically water vapor. But in his last comment posted he now states that it is - "The tic tac toe is the acid rain is the climate change." There is a BIG difference from jet trails that are water vapor to now acid rain! When in fact the contrails are really beneficial in helping to reduce global warming and climate change. I know this only from another post where \_\_\_\_\_ listed a link for explanation on jet trails (contrails) - { [Link](http://en.wikipedia.org/wiki/Contrail) } Under the section titled -- "Vapour trails or contrails and climate" it clearly states that -- "Therefore, the overall net effect of contrails is positive..." (they reflect incoming solar radiation (negative radiative forcing). If I understand this correctly now, jet trails are beneficial to nature in the long run and are not "... insulting to nature"!

\_\_\_\_\_ may like the sight of contrails and you feel the sights of them are insulting to nature. Just two difference of opinions on the visual aspects only. Look at the articles you have post to the beneficial aspects of the contrails for the facts not opinions. Just because you feel they are insulting -- "I don't think you (not) likin em makes em um um (not) good"!

You right that is my interpretation! But your statement in the idea is -- "Jet trails all over the sky and the SHAPES they create are insulting to nature" -- an interesting statement. Could you explain how the "shapes they create are insulting to nature". I am under the impression that shapes are determined by vision! Without vision how could someone (or nature) determine they are insulting?

The article you posted with your idea clearly states "vapour trails or contrails". If you read the start of the article you posted -- "Contrails (short for "condensation trails") or vapour trails are artificial clouds that are the visible trails of condensed water vapour made by the exhaust of aircraft engines. As the hot exhaust gases cool in the surrounding air they may precipitate a cloud of microscopic water droplets. If the air is cold enough, this trail will comprise tiny ice crystals.[1]" Your idea, as posted, is based on water vapour not chemical spraying. The "Contrails have a lasting effect on public lands." Statement you made is a positive effect not negative as stated by what you posted in the idea -- "Therefore, the overall net effect of contrails is positive" Your statement -- "You say they're harmless, but you have absolutely nothing to back that assumption up." Maybe you should read what you post prior to making a statement like that, as what you post and what you say in your comment are contradicting!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am sure every meteorologist does know about contrails -- never said they did not! The reason I posted the first part of the article you listed, that you may have obviously left out, was for those that may not have know what contrails were composed of. You stated "To the people voting this down..." they were making "...assumptions about contrails." You also stated that "You say they're harmless, but you have absolutely nothing to back that assumption up." Contrails are water vapor! The article you quoted basically states they are harmless and are "...overall net effect of contrails is positive...". But you have once again decided to (your statement) - "...belittling thousands of scientists worldwide who have facts that differ from your childlike observations." I seriously doubt anyone with knowledge would consider water vapor as harmful in this application. Your comment -- "You said "chemical spraying". That is not in any of my arguments." - yes the word "spraying" is not used within the text. In your comment # 5 you state "...chemicals dispersed along with jet fuel..." -- if they are not sprayed how are they dispersed with the jet fuel? Do they just magically combine! Spraying and dispersed -- either word I think would be synonymous for the explanation of how they would added for weather modification application -- which is not what this idea is about. This idea is about jet contrails -- water vapor. The problem you are having with so many of your thoughts, ideas, and comments is that the vast majority here are informed and don't buy into your rhetoric. You contradict yourself many times and I think you might consider trying to get more informed on your own subject matter.

Much of the threat of Global warming is caused by mankind's technical advancements. It would be narrow minded to think that mankind's technical advancement in the future may not ALSO PLAY A PART in correcting this same situation. Who has the ability to see what may developed in 10, 20, 30 years from now? But if scientist don't have the ability or are not allowed (by ideas such as this one) we would never know what may work and what would not work. Personal opinion I would agree that carbon reduction and total elimination would be best - but elimination is not going to happen any time soon. And perhaps even with elimination it might not be enough. Geoengineering techniques can range from painting roof tops white to who knows. Wouldn't it be simply amazing if all that was needed to be done is as simple as your best impression of Tom Sawyer and whitewashing your roof? But without the ability for scientist to properly research the various ideas we would never know! The author of this idea most always posts his ideas as this one - with fear mongering and deception. Using associations with Hitler, genocide, scandalous, downright evil and heinous crime is preposterous for this forum. I suggest you read the article and not \_\_\_'s personal opinion and make a decision prior to voting. If you don't wish to take the time to read, keep in mind just theses three statements from the article: "At this point, many scientists argue that it is worth scrutinizing different geoengineering techniques to see what could work and what will not." "If solar radiation management is a bad idea, the sooner we discover that the better," "Those who have been most skeptical about dire warming forecasts, however, are unlikely to embrace climate engineering."

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Your statement -- "I post an idea here it is for the people who initiated this list." So then the purpose of your post is to dish out rhetoric like Hitler, genocide, scandalous, downright evil and heinous crime to the people who initiated this list! Why! When your title of an Idea is "Control carbon at the source, GEOENGINEERING IS NOT AN OPTION" -- that pretty much says "NO" - no matter what, nothing would be allowed -- no matter if geoengineering is good or bad. White paint on the roofs or otherwise. If you really think that I would believe you on "You will be a part of an experiment without your permission..." with your lack of credibility and, as usual, no facts to back up your claims, then you are sadly mistaken. You have not displayed any facts about your statement of it being illegal and a rape either. Your statement of "They are talking about hundreds of billions of dollars of geoengineering." is directly disputed by the article you have linked -- it states "In fact, starting to investigate the feasibility of deliberately changing the climate won't require a massive allocation of federal dollars...". That's where this program is at -- the feasibility stage -- what will work -- what will not work. If ideas like yours were widely accepted we would never know what might have made the planet a better place, what might have been useful in turning global warming around. There is no "experiment without your permission", there is no "deadly consequences for you and your family", there is no "ruin the great outdoors so no one can ever enjoy it ever again.", there is no "slow death of millions of people" and there is no "extinction of species on a massive scale" going on -- AT ALL. Seems like there is just \_\_\_\_\_ over reacting for votes!

By definition Geoengineering : The modern concept of geoengineering (or climate engineering) is usually taken to mean proposals to deliberately manipulate the Earth's climate to counteract the effects of global warming from greenhouse gas emissions. That could mean proposals as simple as painting roof tops white, or that the facts of an article posted by you that jet contrails have a positive effect of combating global warming. Geoengineering is not doom and gloom. One article states --"To date, no large-scale geoengineering projects have been undertaken. Some limited tree planting and cool roof projects are already underway..." Yea! Tree planting and cool roof project will lead directly to your point of "...heinous crime against humanity and nature that will cause the slow death of millions of people and the extinction of species on a massive scale." Get a grip!

A well educated man I think would say -- we just don't know! Without studies and the ability to look at all possibilities how could we very know! That does not mean to go forward with just any hair brained idea. Studies and EIS are needed and not the idea that no geoengineering should be looked at all. Unless you have a crystal ball that can look into the future you can't even have a clue as to what might and might not work. The simplest study such as reforestation of the Amazon area to counter the over logging might help -- that is geoengineering! Are you saying we should not look at the aspects of reforestation and the positive and maybe negative effects it might have? You made a statement to me in another post "...quit belittling thousands of scientists worldwide who have facts that differ from your childlike observations." That statement sounds more and more like it should be direct towards yourself.

## Discussion Question 2

***(cont.)***

This is a hard call for me. On one hand I feel strongly that the Forest, parks and all belong to everyone and we subsidize them with our tax dollars. Yet I see the need for more localized funding to support the local effort with improvements and maintenance. I have paid for years the "Adventure Pass" that the Forest Service sell to access several areas in many of the Southern California Forest areas. This pass has also often been controversial. But it allows for those of us that use and access these areas, and the forest in general, more often the opportunity support what we use. I personally access the areas way more often than the average person and don't mind paying the additional fees -- but that does not make it correct for everyone or for that matter legal if it is not.

As usual you Sky Is Falling! 1) "the sky is becoming permanently brown throughout the northern hemisphere." That is, as usual, very inclusive and not correct. I am looking at perfect blue sky right now. Permanent its not! 2) "almost all of the land is being used by people" -- You are kidding right? Again to inclusive and not correct. 3) "the population density is increasing in all areas that are not owned by the government." Yup! too inclusive -- when was the last time you drove by a farm or a ranch? Density of zero is not increasing. 4) "most of the USA is deforested for farms, cities, roads." Then we have no forest at all is what you are saying? Think again. 5) "wilderness areas look remarkably beautiful even from 30,000 feet." -- Yes they do along with all of the non Designated Wilderness areas! Wait I thought you said the sky is PERMANENTLY brown -- so which is it -- brown is beautiful -- wilderness is beautiful and you can see it because it is not all brown?

Ah, there you go - just reading into what I say without even a clue as to what I said. Even in my last comment I stated - "It does not take a satellite photo to realize we have air pollution, the overcrowding of areas, high demands on our natural resources, etc. etc.". I am not a "doom and gloom" kind of a person. Your own little world must be very sad - try opening your eyes and realize that it is not all doom and gloom. Realize that there are A LOT of environmental, habitat, etc. etc problems out there that need to corrected. But some progress has been made and a lot more needs to be done. Be constructive and don't insult peoples intelligent by telling them things like THE SKY IS PERMANITLY BROWN. If you have facts that it is permanent that's one thing and if you don't - statements like that just reinforces Chicken Little - The Sky Is Falling. Your little "hunky-dory" story just displays your lack of facts and reality.

*(cont.)*

It is so nice to see that I am judged by someone as pompous as yourself! I am a frontier type personality and there is nothing wrong with that. Just because I may feel an idea is too inclusive does not mean I think "...resources are infinite and inexhaustible." And nowhere did I even come close to infer we should "...error or foolish wastefulness, selfishness and greed and a grand scale." Don't read into something that you obviously don't have a clue of on my intention, it only makes you look like an idiot! There is nothing wrong to put tight restrictions in areas to prevent development that could be environmentally disastrous. But unless you are psychic and have a crystal ball there is no way to know what developments, new technology, resources that may totally unknown to mankind now that will be developed in the future. If you think we are all knowing now (well - by your comments of me you must think you are) you are a fool. Your "...foolish wastefulness, selfishness and greed and a grand scale..." fits you to tee in that you want it all locked up with no hope to the future. If \_\_\_\_\_ had his way he would eliminate certain types of people (overweight) and it looks like you fit the same mold as well - just write off the 6.8 billion people by taking away opportunities to correct what is wrong now. Narrow minded and short sided is what that is. Mankind is always moving forward and we are starting to move more on the right track to improve this planet and there should be responsible, environmental sound ways developed to keep going forward. Both you and \_\_\_\_\_ demonstrate best your comment of "leave our childish ways behind, grow up and face reality"

The only person hung up on specific words is you! And specifically using words that are incorrect and flat out wrong only to suit your misleading and incorrect statements. The only reason you do this is to misrepresent and flat out lie! The program is no more special (not at all) than any other fuel taxes that are collected and used for other specified uses. You know in the past they were eligible for return back to the person that paid the taxes - now they are put to better uses for ALL of the public. In the case of the RTP program is "... to help the States provide and maintain recreational trails for both motorized and nonmotorized recreational trail use. The program provides funds for all kinds of recreational trail uses, such as pedestrian uses (hiking, running, wheelchair use), bicycling, in-line skating, equestrian use, cross-country skiing, snowmobiling, off-road motorcycling, all-terrain vehicle riding, four-wheel driving, or using other off-road motorized vehicles." - Federal Highway Administration. Your statement - "The worker gets no special fund from the government for the gas tax he spends..." he gets the exact same fund with a different allocation. THERE IS NO SPECIAL FUND!!!! Motorfuel tax is motorfuel tax with different allocations - it is all the same and put to uses from maintenance, bridges, highways, walking, skating, equestrian, OHV ect, ect.! No difference than the government funding other projects in National Parks, forest, ect. ect with other tax revenues! Everyone benefits!

Bristol Bay. Bristol Bay has to be protected from the Pebble Mine being planned to be built there. The mine would create huge amounts of toxic waste, to be held back by earthen dams, but the area is frequented by earthquakes, so the dams are likely to fail, killing the area's salmon, bears, wolves and forests. Its native people should also be protected. The region should also be carefully managed, so that it is protected from poachers and loggers.

## Discussion Question 2

***(cont.)***

Being productive does not include making accusations and being nasty to one another. While folks are speaking from their own experiences and or beliefs, it does no good in this forum to venture from the point. History has shown that NO ONE is supported and trails don't happen when the name calling and fighting are louder than the reality of each given situation. We all have our own perception of course but this forum did not ask you to attack one another. Here is what is has asked.

- Challenges - What obstacles exist to achieving your goals for conservation, recreation, or reconnecting people to the outdoors? Time, money and other resources are the biggest challenges. We have space and trails but getting access to most is costly in so many ways.
- What Works - Please share your thoughts and ideas on effective strategies for conservation, recreation and reconnecting people to the outdoors. Working together for the common goal and taking into consideration every appropriate user group for each area and trail.
- Federal Government Role - How can the federal government be a more effective partner in helping to achieve conservation, recreation or reconnecting people to the outdoors? Cut the chit and move on appropriate access.
- Tools - What additional tools and resources would help your efforts be even more successful? This is an ever work in progress! We'll never make progress unless we get to work and stop the fighting.

I thought this was for comments on Cattle grazing and ranching. I am a livestock owner and I completely oppose cattle grazing on public lands. I own cattle--they are hard on the land--on public lands they compete with native species. Also, livestock owners fence property and fence off water from other species. If any cattle are allowed at all (this applies to sheep too) it should be numbers based on solid research AFTER taking into account the needs of native animals, including mustangs and burros. There should be NO fencing and no private ownership of water on public lands. The exception for fencing could be to keep all animals off busy roads.

As a rancher using public lands instead of your own privately owned land, you need to take a complete back seat to all other species on the land, including mustangs and burros. You should not be allowed to graze any higher number of animals than that which would have NO impact on existing species and you should not be fencing off water from those native animals or fencing off available range. Many ranchers acknowledge their "guest" status and comply with these goal. Many don't. As a public land owner, your cattle are not my responsibility. The native species are. I have cattle myself and graze them on my privately owned land. Even there, I am subject to endangered species law. On public land, you should be even more so. My personal preference would be for all domestic animals to be removed from public land except for short term recreational use.

I strongly agree with this idea. Besides the destruction of riparian habitat from dewatering the springs, thousands of birds drown each year as they try to drink from the cattle troughs.

## Discussion Question 2

***(cont.)***

re "America's National Wildlife Refuge System is our only federal conservation land system devoted primarily to wildlife, plants and their habitats. Its status remains an unfortunate artifact of history ... Any such land conservation system, created today and containing as it does 150 million acres with astounding reach and diversity, would automatically be established as a separate, stand-alone federal agency"..." it needs to be at the peak of its capabilities" The Gov mis manages too much land that fails to maximize public access to OUR living natural resources in the public trust, including free roaming wild horses and burros. They are aboriginal by fossil evidence, re introduce in the 1500s, and a historic wild life heritage by Congressional Act of 1971. There are between 16-27,000 left on the western ranges which constitutes less than one percent of all grazing/browsing wild life and livestock . Habitat critical and necessary for genetic health herd has been diminished to the point that distinct population segments are extinct on Our historic landscapes. Herd areas that remain contain small herds that are threatened and endangered by loss of critical habitat. Unfortunately these icons of Western Settlement, supposedly protected under the Public Trust Doctrine, are non gratis on public lands in the wild life and multiple use communities. Americans that experience their living resources now are most likely to conserve them for every generation.

After many years of riding in California parks, I can say from experience, that bikes on the trails are not safe. I ride, and used to hike, and cannot count the number of times bikes have come out of nowhere and collided with hikers and horses. A friend of mine was riding one horse and leading another, when a mountain biker ran right into the horse being led. It spooked and the rider fell off the horse she was riding and landed on her back on the trail. The bike rider looked at the scene, and then continued riding down the trail. After yelling at the biker, he finally came back to the woman who had fallen. She had to tell him to call 911, which he reluctantly did. She had broken bones and was rescued from the scene and hospitalized. The level of awareness of their own impact, seems to evade those on bikes. Once in a while, I encounter a courteous bike rider. All of them either ride horses, or have family members that do. The vast majority of bike riders are there for the thrill of going down hill as fast as possible, because it is exciting. Taking in nature does not seem to be part of the agenda. Parks are no place for thrill seeking bicycle riders. Possibly ski trails could be opened to them in the off season. There is better visibility on them, and no hikers or horses. Alternatively, bikers could have their own designated trails. This would be suitable as a private enterprise, than a burden on the parks.

Mountain bikers travel much faster then hikers & horses on trails like the PCT. I do not feel it would be safe to have them on trails that are so popular with hikers, and horseback riders. They can come up very fast, and tend to spook horses and could cause serious injuries to riders.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

My biggest issues is that some bike enthusiasts can be out of control and don't realize that a horse or person just might be right around the bend. This can lead to deadly conditions for both of the parties involved. Bicyclists need to remember that horses don't see right in front of them only to the side so, when a horse sees one thing from one eye the other object from the other side of there face the horse may not realize what the object is coming towards them and may run off or spook. Since horses have their own brain humans cannot always control what they are thinking or perceiving since they do have a brain. Not all bike people are bad and most are curious but it's the few that don't respect other people and their animals that spoil it for everyone else.

Throughout America there are areas of great beauty, as well as areas that were once legendary for beauty which are now degraded by humans--humans searching for wealth and comfort, humans not thinking any generations ahead, but only of our own selves. When we have a place of such pristine beauty as Bristol Bay we must deflect disastrous encroachments such as Pebble Mine. The Mine will have a deleterious impact on the Bay's clear waters and wildlife, as well as tribal ways of life. And it is not just Bristol Bay that is in danger; the federal government should require more stringent control of all use of large-scale metallic sulfide mining, working with local government to strengthen regulation of development and impacts on wildlife and wetlands wherever such national treasures occur. This is beauty that will never, once sullied, return. We must stop robbing future generations of their rightful heritage.

As I read the comments posted here, I think it's fairly obvious that the criticisms posted by the equestrians are generally nothing more than anecdotal assertions and opinions with no evidentiary back-up (for example that bicyclists ride too fast, "one slid under my horse", or that bicyclists don't participate in trail maintenance - where is your survey evidence or study results in support of any of this?). By contrast, the points made by bicyclists are true by definition or simply incontrovertible (for example, that bicycles are propelled by human muscle power and can't go more than 3-4 mph in soft dirt or uphill; and equestrian use of trails leaves tremendous amounts of excrement on the trails, attracting biting flies which all seriously interfere with trail use by those on foot). It is simply undeniable that equestrian use places tremendous demands upon trails - many times more demand and wear than hiking, running and biking \*combined\*, and leaves behind "externalities" that equestrians don't carry "pooper scoopers" to clean up. The non-equestrians have \*a lot\* more to complain about concerning equestrian use of these trails than the converse. The fact is that bicyclists greatly outnumber equestrians, and therefore statistically they greatly outnumber equestrians both in (1) promoting the existence and expansion of \*any\* shared use trails, and (2) their efforts to clean and maintain them. Majority rules in this country. But most of us who have worked very hard to promote the existence of these trails have been \*inclusive\* in our efforts and have worked in support of "shared use" trails for hikers, runners, bicyclists and equestrians. To our way of thinking, the more constituencies in support of non-motorized use trails, the stronger our coalition. For equestrians to "turn" on the rest of the users and argue that bicyclists (or hikers or runners) should be barred from using these trails makes about as much sense as taking a pick-ax and digging a hole in the center of your own wooden lifeboat 1,500 miles out to sea. In short, it makes no sense at all.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Gee, I had not previously been an advocate for banning equestrian use of trails, but the intolerant, selfish comments I've read here posted by those favoring only equestrian and foot use of these trails makes me want to oppose and protest equestrian use at every chance I ever get in the future. The horse poop on these trails and the noxious insects that attracts ought to be sufficient reason alone. There are some pretty obnoxious and rude postings here by those favoring equestrian use and opposing bicyclists. My touring bike won't go on these dirt trails, so I've got no dog in this hunt. But I will certainly remember the rude and arrogant comments I've read here. I guess equestrians don't care about anyone perceiving them negatively. They don't care about their PR image; well, they'll reap what they sow.

I am a volunteer "C" certified buckler and faller with chainsaws and crosscut saws, and am welcomed in anyplace in California, park or forest. The sawyer is the final decision-maker in what is cut, and are trained to do so. The decision to cut is for safety, not for aesthetics. Too much work to bother with that! It should be said that all the agencies, just in the last year, have all agreed upon a single saw course and curriculum, taught across all agencies, for certification, employee or volunteer. This is now implemented, and should make things easier. In my experience, VERY few volunteers are experienced in working with saws IN THE FOREST ENVIRONMENT, which is markedly different than your backyard! The log you are working on is probably not the one that is going to kill you.

I have grave concerns with this proposal. I am a volunteer "C" certified buckler and faller, with both crosscut and chainsaws. When I'm out on a crew with other volunteers, I am often astonished and horrified by what I see. Astonishingly unsafe acts, that put a lot of people at risk. Most common, people go to work under a tree that is about to drop a ton of limb right on top of them. No situational awareness. It AIN'T your backyard! Particularly with chainsaws, things happen.....FAST. You better have it all thought out ahead of time, because you won't have time to figure it out when the log starts to roll towards you! The FIRST priority HAS to be safety. Once accident can shut a volunteer saw program down, can deplete the Ranger District's budget (the payment for medical injuries is not paid by some insurance, but by the budget of the agency. If you have a \$100k medical expense, and the district's budget is \$300k, you've used up 1/3 of the budget, and they'll be laying people off) There are some that may be willing to work without insurance coverage, but I'm not one of them! Some insurance policies will not cover volunteer work of this type (often consider worker's comp)---you might want to check your own.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Wilderness Act states: PROHIBITION OF CERTAIN USES (c) Except as specifically provided for in this Act, and subject to existing private rights, there shall be no commercial enterprise and no permanent road within any wilderness area designated by this Act and, except as necessary to meet minimum requirements for the administration of the area for the purpose of this Act (including measures required in emergencies involving the health and safety of persons within the area), there shall be no temporary road, no use of motor vehicles, motorized equipment or motorboats, no landing of aircraft, no other form of mechanical transport, and no structure or installation within any such area. There is nothing prohibiting explosives in the provisions, or anything that would imply explosives. I fear when people start citing unstated "spirits" of something. I could see someone trying to bend the provision having to do with no permanent structures or presence of humans being morphed into "no humans". One of the big uses of explosives is the removal of extremely dangerous hazzard trees, that cannot be safely removed by sawing. This saves lives, being a MUCH safer technique of removal.

I do suppose this was meant to be funny and I took it that way. But this idea is far from ridiculous. Let us look at some of the issues commenter s have brought up such as trail degradation and erosion. You have to be really ignorant to believe a 200 pound bike and rider with rubber tires will do more damage to trails than a rider and a 1200 pound horse wearing steel shoes. Think about it - Would you rather have that horse step on your foot or would you rather have a bicycle roll over it? What is truly ridiculous is that they (whoever they is) actually entertained the idea of not allowing wheelbarrows for trail maintenance. These hikers who want to exclude everyone else from the trails are just selfish.

In my opinion bicycle and hiking trails are already getting way too high a percentage of the funding of the Recreational Trails Program. The money that funds this program is taxes paid on gasoline. Taxes were placed on gasoline to fund the building and upkeep of public roads. Dirt bikes, atvs, boats, and snowmobiles have to pay those taxes even though they aren't allowed on public roads. The Recreational Trails Program was set up as a way to give back something to those who were paying for something they couldn't use. Hikers and most bicyclists do not use any gasoline for their sport hence they do not pay anything into the fund. I'm not against bike or hiking trails but you can legally bike or hike almost anywhere. Here in the county where I live there is thousands of miles of public access for bicycles and hikers but not one mile for motorized recreation. In fact I have to travel 75 miles to get to the nearest public cite that allows (for a usage fee) motorized recreation. Doesn't seem fair does it?

I have always found the Fee Demo program to be offensive. Many generations have contributed to the creation and preservation of our national lands. Access to these lands should be freely available to all Americans. This land is our land.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am surprised that at my old age I am still surprised at all. What I mean is how narrow minded can people be? The conservationist community, the OHV community, the "XYZ" community can all have what they want if we all band together and build our requirements list of how we can all access OUR SOVERIGN RIGHT TO BE ON OUR COUNTRY'S LAND and preserve the interests of all. How hard is this? We can all have access and preserve the interests of the land, wildlife and the citizens. Anyone who feels there is only one absolute option is simply not using that space between the ears. Don't count on the Government people. If you like what you see with public housing, balanced budget, jet setting officials living in one state and commuting via private jet (on our nickel) to DC to work, then let's let the Gov. give more of what we already have.

I will be happy to respond to #2 above on \_\_\_\_\_'s behalf. The case he refers to is U.S vs Smith. It was recently decided in favor of Mr. Smith and against the U.S. Forest Service in federal court in Flagstaff Arizona. You can find a summary of the case and a link to all of the legal filings and the court's decision under Court Cases at the website of the Western Slope No Fee Coalition, [www.WesternSlopeNoFee.org](http://westernslopenofee.org). Here is a direct link to the relevant web page { <a href="http://westernslopenofee.org/index2.php?display=yes&pageid=33" rel="nofollow" target="\_blank">Link</a> } The Forest Service has a terrible and longstanding problem with fiscal mismanagement, and they can be very creative about how they interpret the law. In fact "absurd" is the adjective the Flagstaff judge used. To save you the trouble of asking, you can find documentation about the fiscal mismanagement statement I just made at the GAO's website, [www.gao.gov](http://www.gao.gov). Type GAO-09-443t into the search box for the GAO's latest report on the topic, of many.

(#11) Had I supplied a "summary" of US vs Smith, you would no doubt have accused me of injecting my own bias into it. Hence I provided a link to the source documents so you could draw your own conclusions. Yes, there is a haystack of them, which goes to show how much time and effort Mr. Smith had to put into his defense, and how much taxpayer money was spent by the Dept of Justice trying to convict him. I salute you for wading through it all. The sentence you quote is an important one. \_\_\_\_\_ never claimed that there are no locations within the Red Rock HIRA where it would be illegal to charge a fee. Indeed, he supplied the court with a map showing all the sites that meet the legal requirements. Had he been ticketed at one of those sites, he would have paid the fine. However, he would not have ever received such a ticket, because he is a law-abiding citizen. All he asked is that the Forest Service be a law-abiding federal agency. Seems reasonable to me. Since the decision was rendered, the Coconino National Forest has announced that they will continue business as usual in the Red Rock Pass HIRA. I find that highly disrespectful of the judicial system. If they want to fight this battle one at a time, that is going to be very costly. But of course they don't pay their legal bills. You do.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In many cases, it's not even as straightforward as "get ticketed, go to court." The Forest Service frequently uses a device called a Notice of Noncompliance (NNC), which was recently renamed a Notice of Required Fee (NRF). The renaming came about because the NNC looked too much like a ticket - never mind that the new NRF still looks just like a ticket. A NNC/NRF is not a ticket, and you can't challenge it in court. It's sort of a warning, but unlike a warning for speeding for example, you are still expected to pay the "fine," i.e. mail in your fee after the fact. In southern California the Forest Service contracts with a private company (Kinsail Corporation) that operates a website where you can "resolve" NNC/NRFs online. Whether Kinsail's contract is a percentage of the gross or fixed price is unknown, but you can bet they are not providing the service for free. You cannot plead Not Guilty to Kinsail, and whatever they are charging for the service, none of that gets to the ground on a National Forest. { <a href="http://www.fs.fed.us/r5/sanbernardino/ap/nnc.shtml" rel="nofollow" target="\_blank">Link</a> } And that brings up yet another example of Forest Service numbers that just don't make sense. According to a Forest Service memo filed with the Colorado District Court, the collection rate on NNC/NRFs is 72%. In FY2008, according to the memo, that amounted to \$120,000. If an average fee is (conservatively) \$5, then about 24,000 people "resolved" their NNC, and there were about 33,000 total NNC/NRFs issued. Yet the same memo says that southern California forests write 40,000 NNC/NRFs a year. If 72% of those 40,000 sent in their \$5 Adventure Pass fee after receiving a NNC/NRF, then there should have been about \$144,000 just in southern California alone. Yet the Forest Service took in only \$120,000 nationwide? The memo says, "NNCs are a non-enforcement compliance tool that provides visitors who have neglected to pay a required recreation fee the opportunity to pay without law enforcement action" and describes them as "a tool that is neither a Warning Notice nor a Violation Notice to encourage recreation fee compliance." Tony Soprano would certainly recognize this system, including the missing dough.

Here's an idea to make paying fees really really simple: collect them on April 15 as part of our taxes! Oh wait, we used to do it that way and then \_\_\_\_\_ led the effort to start nickel and diming us to pay a la carte for every forest trail and picnic table. The idea was that the fees would stay at the site where you paid them. Oh, but that became complicated so we got regional and then national passes, and then interagency passes, and then regional interagency passes, and now you have to navigate some pretty complicated websites just to figure out who and where to pay for the privilege of taking a walk in the woods without getting a federal ticket. And none of those pass vendors have any idea what specific sites you visit so there is no way to tie what you paid to the facilities you used. Thanks \_\_\_\_\_ you took a system that was fair and equitable to all and worked well for over 30 years and gave us the cluster we're dealing with now. You have a lot of nerve to presume to tell us how to fix what you broke.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Whoa \_\_\_\_\_ you need to get out of the office more. In southern California, Washington, Oregon, New Hampshire it's not possible to park your car at a trailhead and take a hike without risking a federal misdemeanor if there's no pass displayed on your dashboard. Can't drive to the top of Mt Lemmon or Mt Evans without paying - or at least you can't stop, get out, and take a walk or enjoy the view. Mirror Lake Scenic Byway, American Fork Canyon, Sandia Crest - pay up or stay out. Tonto National Forest? \$95 bucks for an annual pass. Wilderness areas with by law no developed amenities? You'd think at least those would be free. But try Aravaipa Canyon, Paria Canyon, Desolation Wilderness, Gunnison Gorge, many others, and they are making a play for Cloud Peak and Sangre de Cristo. I suggest you stop reading what the law says and go out and see how it's being implemented on the ground. A federal judge in Flagstaff just found the Coconino National Forest in gross violation for charging a fee in the entire 160,000 acre Red Rock Pass area around Sedona - developed facilities and backcountry alike. The decision is a glimmer of hope that we might finally regain access to our own land without being double taxed, but your friends at the Forest Service are probably going to appeal it. Why? Because fee retention, which you love so much, has made them greedy. They have lost sight of their role as public servants and now think of themselves as entrepreneurs, using our public lands as their working capital. It was the worst idea you ever had. If it's facts you want you'll find plenty more at our website.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

\_\_\_\_\_, in congressional testimony you gave on February 26, 1998 you said: "Recreation fees on public lands were one of the issues which prompted the creation of the American Recreation Coalition [your organization] in 1979." Can you explain that? Why should a lobbyist for commercial recreation interests find it so important that legislation be enacted to require the Forest Service and BLM to charge people simply for hiking, biking and horseback riding upon their public lands? At the same hearing, you said, "And we are proud to say the American Recreation Coalition and the Recreation Roundtable - a related group of recreation-industry CEO's - have invested heavily in staff and member time in helping the federal agencies covered by the fee demonstration program with project-level and national support and advice on sound fee programs. We have arranged for top marketing and communications executives from Disney, REI and other companies to work with the Enterprise Forest fee team in the design and implementation of that project; we have assisted more than a dozen additional Forest Service fee sites with specific communications efforts, enabling them to reach the general public and likely visitors with fee program information prior to arrival." \_\_\_\_\_, can you explain why you think it's a good idea for public land management to be designed by Disney and REI? Under Fee Demo, the Enterprise Forest (Adventure Pass) program imposed entrance fees to four entire National Forests in southern California. Fee Demo also brought us the Northwest Forest Pass, which locks up almost every trailhead in Washington and Oregon behind tollgates, and the White Mountain Recreation Pass, required for all parking on National Forest land in New Hampshire. I guess back in 1998 when these were still "demo" programs, you thought that by now the public would be skipping happily up to the tollgates, thrilled to have their automated pass electronically scanned so that they can get access to a little fresh air and scenery. You mentioned then that the Adventure Pass was resulting in 10,000 notices of non-compliance a year. Today, the Adventure Pass forests write 40,000 notices of non-compliance a year and the Tonto National Forest writes 9,000. The US Attorney for eastern Washington is refusing to prosecute Northwest Forest Pass violation notices because that program is so far out of compliance with federal law, and a federal judge in Arizona has thrown the Red Rock Pass out the window. The fee programs at Mt Lemmon and Mt Evans are headed for the 9th and 10th Circuit Courts of Appeal. I believe you have underestimated the extent to which Americans will fight for access to their public lands. In 1998 you asked Congress for "a prohibition on use of the [fee] authority to replace, disrupt or jeopardize the provision of public recreation services on federal lands by permittees and concessioners." Earlier this year, when the constituency for which you lobby - private concessionaires - tried to cancel the lifetime benefits that Congress has promised senior and disabled campers since 1965, you backed the concessionaires. Your agenda is to facilitate making private profit from our public lands, not getting more Americans outdoors.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

For most Americans, our public lands ARE an emotional issue. Labeling other people's emotions "ridiculous" confirms my opinion, Derrick, that your approach to public lands is solely based on a cool analytical assessment of their profit potential. That is the heart of where you and I disconnect. Glad to hear that you only support fees for use of developed sites. If the FLREA were being followed according to its plain language that would be the case. Instead, Forest Service and BLM are charging for backcountry access, including designated Wilderness, parking, entrance, and just "walking in the woods." To get an idea how widespread backcountry access fees are, check out the interactive map at [www.WesternSlopeNoFee.org](http://www.WesternSlopeNoFee.org). ARC was created to promote the idea that the Forest Service should be marketing outdoor recreation as a consumer product. Francis Pandolfi, former Chairman of your Recreation Roundtable who moved to the Forest Service as Chief Operating Officer, wrote: "For example, a product or brand could be defined as 'Hiking,' 'Fishing,' 'Camping,' 'Skiing,' and other activities. Thinking of outdoor recreation activities as products or brands, of course, suggests applying the principles of sound, private-sector marketing as an approach for meeting recreation demands and providing satisfying outdoor recreation products and services." Americans are surrounded day in and day out by marketing, advertising, and "branding." We go to the outdoors to escape that, not for more of the same. As far as fee retention by the public lands agencies without congressional oversight, that is just another tax. Why should we have to open our wallets, again, when we already support the public lands agencies through our taxes? Do you think that we should have to make up in direct cash what the agencies squander in tax revenue? That's the definition of "double tax." In 1998 you testified to Congress regarding the Forest Service, "It appears that 50 percent or less of the funds appropriated by Congress actually reach the forest district level," and, "We find that a substantially higher portion of congressional appropriations for recreation appear to be vanishing before hitting the ground today than ever before. Our attempts to investigate don't give us a clear picture as to where that money is going." Elsewhere in this online forum you said "Lucky if \$1 in \$3 hits the ground." The GAO agrees. They testified in 2009, "the agency has not always been able to provide Congress and the public with a clear understanding of what its 30,000 employees accomplish with the approximately \$5 billion the agency receives every year" and noted that the Forest Service's lack of fiscal accountability is a longstanding problem that has never been effectively addressed. (GAO-09-443t) Derrick, this is one thing that you, the GAO, and I do agree on. In fact I would put the administrative overhead at more like 80%. Yet you want Americans to throw good money after bad. What makes you think that an agency that cannot account for its appropriated funding can do any better job of accounting for a direct stream of cash revenue?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I know that you have great influence in Washington. You have lobbied in support of recreation fees since the earliest days of the Reagan administration. In 1998 you wrote the Secretary of Agriculture that Fee Demo was "the direct result of our [ARC's] efforts." The fees we now pay for recreational access to our National Forests and BLM public lands are your handiwork. You are also the man who can bring much-needed reform to these recreation fee programs. Wouldn't you agree that what we have now is a mess, both legally and from a public relations standpoint? If we can find some common ground, would you and your cohorts use your influence to make things better? In this forum you have said that you do not advocate recreation fees for use of public lands without significant services, but that a fee for a developed campsite or other developed or specialized facility is appropriate. I agree with that. Do you agree with me that it's equally important that the authority to charge fees for developed facilities must not be used as the justification for putting such facilities in places where dispersed facilities, rustic facilities - or no facilities at all - are working fine? The deeply flawed language in the FLREA is not doing the job of limiting fees to use of developed sites. Even if you haven't been out on the ground personally, from the posts on this forum it should be clear to you that people resent being charged for basic access, and that they are in fact being so charged. What are you and your industry colleagues telling the congressionals with whom you have influence today? What new ideas are you and the interest groups for whom you speak presenting to them for the next, new and improved, version of recreation fees? Is there a solution that will stop the war between the agencies and the public?

Defend our national resources for Americans, shut down Pebble Mine!. Pebble Mine must be shut down and blocked at any cost! Destruction of US lands, environment, wildlife, and natural resources cannot be given over to greedy foreign interests that will stop at nothing. BP, Shell, and the list goes on are all foreign business that have made false promises, created massive environmental disasters such as the Gulf, destroyed livelihoods for American citizens, caused billions in economic damages and continue to promote their own self serving interests. Now the Anglo American company wants to do the same with the Pebble mine. They cannot ever protect lands, waters, and wildlife that do not belong to them, nor will they! Generations of families have depended on that area for food, shelter, businesses and economic support. Now Anglo wants to erase all of that permanently with a massive destructive mine. Our government has an obligation to protect our citizens, our lands, our waters, and our wildlife from foreign invasion and that is what the Pebble mine represents. Invasion by British interests! The time is now to fight this problem before we have another "Gulf disaster" on our hands!

The whole Spotted Owl panic, and all the loggers who were hurt, some maimed for life-by radical, extreme enviros spiking trees--and it was another species of owl killing off the Spotted owl all along. In many cases, the locals do know what is best for the area THEY LIVE IN--someone who is a couple thousand miles away, and is getting all of their information from a few sources, and not taking ALL who use the lands into consideration is NOT always the best qualified person to make decisions on how to use an area of federal land. More control of federal lands needs to be given to the states.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Lack of access for hunters and fishermen. Provide better access for hunters and fishermen- there are places where groups buy up all the land that surrounds the forest service, or state forest, or BLM lands to prevent people from gaining access. Some states are working to solve this issue, but it needs to be done at the federal level in cases of forest service, or BLM lands where private property blocks access- due to group purchases of land. In W.Va. my relatives have some property that is surrounded by the Monongahela National forest- and they have to allow people to access the trails, and the National forest land, they can not block off access. There have never been any problems- it's a narrow trail on the edge of the property that we built so others could get through to the National forest lands, it is marked, and keeps people from wandering around the property. This costs the government no money, the forest service no money- it just allows people to get to the forest service land.

The Monongahela river has been a dumping ground for the coal industry for years, not just the mining, the "coke" that is made from coal and used in blast furnaces is made along the river too, and along the Tygart Valley river, and the West Fork river, which join near Fairmont W.Va. to form the Monongahela.

I agree 100% with the fact that the Bristol Bay area needs to be protected, and the Pebble Mine plan should be stopped. Several groups of people have been opposed to this plan for quite some time now, and more people need to get involved with the issue, or the mine may be allowed to proceed! This is one of, if not the most important spawning grounds for salmon in the entire world- the mine could destroy it forever. Off road vehicles are NOT allowed in National Parks. They are allowed on some BLM, and Forest Service lands, also on some state run recreation areas, No off road vehicles are permitted in the National Parks. I am voting your idea as promote, but please understand that off road vehicles, while not allowed in our National Parks, should continue to be allowed on BLM, Forest Service, and state recreation lands, the parks don't allow them, go there for quiet, otherwise, please respect the people who do use off road vehicles right to enjoy recreation as they see fit. Most Off road groups maintain their own trails, and help maintain BLM, and Forest Service trails too. They are not damaging the environment any more so than people who ride horses, or hike in backcountry areas that normally would get no foot traffic.

Access for Fishing. There is a need for more, and better access for those who want to fish the rivers and streams in our parks, on Forest Service lands, and in wilderness areas. Many places are surrounded by private land, and no one can get to the rivers and streams to fish, unless by water. There are many places, in many states, all across the country, where more streamside access is needed. How can we get children to enjoy the outdoors, and learn about aquatic life, if we don't have any way of getting them to the rivers and streams? This would not require a lot of money, or a lot of land, just a simple gravel road, and a parking area, so people can park their cars, and not have a 5 mile hike carrying fishing equipment with them, which is next to impossible to do when you are taking children fishing. This has nothing to do with people being too out of shape to hike, or any other health issues, just make it so we can get to the rivers and streams to fish, not everyone can afford a boat, or canoe. We just need a way to get somewhat close to the rivers and streams.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I'm not talking about a paved road, in most areas there are already dirt/gravel roads that could be used, with permission, and minor disruption to the land, how much would it hurt to dump some river gravel, or recycled concrete gravel on an existing dirt road, or driveway to an abandoned campsite? The state of W.Va. added some gravel parking areas along the roads to give fishermen better access to some of the rivers, and it did not create any problems. There are many areas in the Rockies where a simple parking area along a road would give access, no new major roads-just short, side of the road areas, so people can park somewhere while they fish.

You gave a typical extreme enviro view-this is about fishing access for CHILDREN-and you turn it into no roads-a gravel driveway length access road and a parking area is not going to hurt an eco system-PEOPLE live on the planet too. Not everything is an enviro issue-there will be new roads built-there will be new parking areas built-why not let people have access to the rivers and streams? Only those who hike in should get to use a resource? The resources are for ALL people-not some unspecified subset.

Access for Hunters. Many areas of Forest Service, National Forest lands, BLM, and state lands-where hunting is legal- have access blocked by the surrounding private landowners. There is a lot of public land that hunters can not get to because there is no nearby access. To get to some of these areas would take a multi day hike, or horseback ride, when there could be access points much, much closer. Our land in MT borders National Forest land where hunting is legal, and we let people park on our property, as long as they ask permission, and do not leave trash laying around. We have never has any problems with the people we allow to use our land as an access point. We still hear about the lack of access every year though. How hard can it be for the state game agencies, or the USFWS to get permission from a few landowners to let some people park on their property? Maybe charge a small fee? The little money collected could pay for some gravel and a trash can for a small parking area.

This idea has been brought up multiple times, at least 15 times-and has always been promoted, as it should be. Bristol Bay is the largest spawning area in the world for the salmon that return there each year. The gold extracted is not worth risking the future of the best salmon fishery in the world.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

No, you need to use facts-wolves kill FAR more than 1% of livestock that is killed by predation, wolves have just about wiped out several elk herds, and are working on moose and other species-wolves are not endangered-if you want to use judge Molloys logic-there are tens of thousands in Alaska, which is part of the US, so they are not endangered-there are wolves in Michigan, Minnesota, Wisconsin, North Carolina, and a few other states-so they are not endangered. The endless lawsuits brought by groups like "Defenders" (should say destroyers) of Wildlife, The Center for Biologic Diversity, The Nature Conservancy, and all the other extreme enviros do nothing for the wolves-they just keep a lot of lawyers employed, and spend the money donated to them by people who live in the cities, and have no real clue as to what goes on in the Northern Rockies. My family has had land in NW Montana since the 1800's, we hunt, we fish, we trap, some of us are guides/outfitters-soon to be were outfitters and guides-the wolves are wiping out the elk, they are killing cattle and sheep, they have killed two of my families horses, a mare and a foal, they are killing dogs, cats, and next it will be someones child who is attacked by wolves. Hunters have done, and still do far more for wildlife conservation than any enviro group ever has-we pay an extra 11% tax on firearms and ammunition, which goes to USFWS, and the state fish and game agencies, we pay for licenses, tags, and land use permits, all of which go to the state fish and game depts, all the enviros do is file an endless stream of lawsuits, or do like the Center for Biologic Diversity, and try to ban hunting by banning lead ammunition- Lead shot is already banned for waterfowl hunting, and not one study has shown lead from high power rifle ammunition to have an ill effect on humans, or wildlife-just the opposite-the studies showed zero effects. We hunt, our children hunt, it is legal to hunt, and we will not be stopped by a bunch of enviro nutcases who use false and misleading data, outright lies, half truths, and obfuscation to make us out to be bad people. Several states are now putting hunting rights amendments to their constitutions, due to the actions of the extreme enviros.

This mine is getting opposition from just about every group that has anything to do with the outdoors-the fishing and hunting groups have been fighting this mine since it was first proposed. Bristol Bay, and the drainage the salmon swim up to spawn could be destroyed for salmon if the mine is allowed to proceed.

"What do you not understand about the word "vote"? This is America" Is this forum how voting works in America? NO! This forum is dominated by extreme enviros, NOT a cross section of voters. They vote "promote" on only ideas which go along with their agenda, and "demote" on all other ideas. What gives one group of people the right to tell others how to live? How to spend their time in the outdoors? What gives one group the right to call for bans on OHV use? To try to close off even more areas to OHV use? I rarely even ride my dirt bike anymore-or use the 4-wheeler I own, I use the 4-wheeler sometimes to haul out an elk, or a big deer, that is a rare occurrence-I usually travel to the areas I hunt by horseback, then hike on foot from there to actually hunt. I just see all the hostility to ohv use on this site-and it is not fair to those who use ohv's.

More government land grabbing-NO thanks!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I have experience in Parks and forests. Please do not let bikes in. They destroy wilderness.

This mine makes absolutely no sense. Bristol Bay is home to the LARGEST SALMON RUN IN THE WORLD! You can't live on gold (or other metals), as King Midas learned to his chagrin. People need food to eat, clean water to drink and clean air to breathe. People also need beautiful open spaces in order to thrive. I don't know how this mine even came under consideration. We need to take a really close look at how the federal government approves mines - what are the criteria? It sounds like important criteria like 'source of food', 'wilderness', 'native population', 'clean air and water', 'species diversity' were ignored or downplayed in this case. These criteria are not just some 'soft' treehugging concerns - they are the foundation of LIFE ITSELF (We NEED clean air, clean water, food, wilderness, diversity and respect for others). We literally will not survive if we keep ignoring these basics. I think our country has lost sight of the fundamentals as we kowtow to corporations and put money above all.

I agree as well. After living in Japan, Germany and Italy for a decade, I have finally returned to Montana. I don't hear the roaring of the traffic from dawn to dusk and dawn again. The stench of city living is far behind me, I wake up every morning with a smile on my face and my children are happy, but I have this terrible feeling that the way I live will be taken from me. They want to turn where I live into a National Monument. I will be forced to move back into the cities which I despise. I don't want my property rights taken from me for the benefit of wildlife. Wildlife IS existing right now... Humans are more important than wildlife. Can't we co-exist.

Bikes are destructive to trails. I have been hiking some trails for years and have noticed a lot of erosions to these trails because of the bikes. V-shaped grooves down the middle of the trail and increased water erosion because of it. Let the hiker only trails remain, there are not that many of them that are this way. I have run into bikers on the PCT, they know they are not supposed to be there and have been incredibly rude almost running over myself and dogs as they came blasting by. Mt Laguna section.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While I praise \_\_\_\_\_ for volunteering (and I've volunteered thousands of hours for a state park), I will point out that the point of it is to give of your time and talent to helping the agency, learn new skills, meet new people, and enjoy being out in the wildlands, typically without having to pay. The pass is a mere token of gratitude and not meant to be a quid pro quo. The spirit of helping out is the real reward. Volunteering is also supposed to enhance the amenities offered to the visitor (which could include better trails, less litter, someone to answer visitor questions, repair of facilities, etc.). If you insist that there should be fewer fees because you volunteer, then there could be a net loss in what the agency can actually provide. If you feel strongly about that, you should only volunteer in places that do not charge a fee. Effective volunteering for most tasks requires a significant amount of oversight and training, so requiring fewer hours could result in less effective volunteers. Having worked in a large volunteer program, I know it is not easy to find things to do for everyone who just shows up and wants to work a day or two. Litter picking will only employ so many volunteers, and even with such a seemingly simple task, there are potential problems which you may need to train for, e.g. disposal of hazardous waste (such as used condoms, hypodermic needles, and batteries), care around broken glass, steep terrain, potential for trampling rare plants while searching for litter, and in general, keeping the volunteer and the environment safe. Many projects that a staff member might be quite willing to delegate to a volunteer require a significant amount of time to complete, and may not be something that can be just left half done. So, while I have no problem with the agencies re-examining the minimum number of hours required for a pass to see if it can be lowered without impacting the effectiveness of volunteer programs, lowering it to a weekend or a week of work is way too little. Parks do have special volunteer days when they have projects lined up when they can supervise a large number of volunteers of varying abilities, and on such days, entrance fees for them are typically waived.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It is sad to impugn an entire large agency full of many talented and conscientious people based on the actions of a few administrators one disagrees with. "Out of control, rogue agency"? Hardly. The Forest Service is a multiple use agency and as such has a lot of balls to juggle. One of the benefits of having recreational user fees which are retained in the area they are collected, is that this counterbalances other economic interests, such as logging, mining, and, to a lesser extent, hunting, that are not always compatible with hiking and backpacking. I support the basic concept of Forest Service fee collection in high use areas, while recognizing that any organization, public or private, is subject to administrative errors made by fallible humans. If you think they have misinterpreted the law, by all means, challenge them. But judges are fallible, too, and other judges may or may not agree with what was decided in \_\_\_\_\_'s case. Meanwhile, hyperbole does not help your cause, \_\_\_\_\_. The fee program was meant to address the highly variable and usually inadequate congressional appropriations that were allocated for National Forests in the past. The only realistic alternative I see that would help keep them properly funded but which would place the greater revenue burden on the actual users, would be to have a special federal tax on recreational equipment. This could be even more problematic than the system of collecting fees on site, because of the difficulty of defining what constitutes recreational equipment. When is a shoe a trail boot, for example? What kind of backpack is primarily recreational, versus used to carry books to school? How would you readily define tents used for camping, versus those used only in a backyard to screen a picnic table from bugs?

The Anti-wolf folks don't have any scientific legs to stand on. There is simply no way that a species that has lived in a region for millions of years can harm the natural ecosystem. If wolves were a problem for deer or elk herds there would be no deer or elk herd on the continent. There were a lot more deer and elk throughout the united states back when wolves present. Hunting, development, and other forms of environmental degradation are the biggest dangers to all of our wild species. I understand that people suffer some economic losses from wolf reintroduction and that should be addressed, but the idea that wolves are a problem for deer and elk herds is beyond foolish.

Standards for Non-point Source Pollution. Our public waters will not be clean until there are standards for non-point source pollution like there are for point source pollution. Voluntary-only practices for non-point sources like agriculture and urban lawns will not be sufficient to restore our public waters to swimmable and fishable conditions. Some practices, like appropriate fertilizer management could be required for Farm Bill commodity subsidy participation as well as through setting of enforceable standards.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

I was born in Moab, Utah in 1965 and have remained here to watch some pretty amazing changes. No more. I'm against any more wilderness. I have many reasons to argue this but since most people on the other side think that \_\_\_\_\_ and his motel are better for the environment than \_\_\_\_\_ and his cows were, I don't see the point in trying to talk sense to them. 1000's of cars and showers and dinners cooked and dishes washed are better for the environment than \_\_\_\_\_ and the cows? FUCK ME!!! He's rich and he gives money to your groups which \_\_\_\_\_ didn't. That's the difference. Arguing anything that makes sense to someone like that is pointless. As I said I've seen a lot of amazing stuff over the years. I know what i'm talking about. NO MORE WILDERNESS. Enough is enough. Don't drive in and tell me I shouldn't have drove in. If we all got what we wanted, you people would go home.

Thanks to the personal efforts of President Roosevelt and other forward-thinking Americans over one-hundred years ago, today we're able to enjoy pieces of our national heritage in the vastly individual and highly unique National Parks sprinkled all across this blessed and beautiful nation. All Americans are, indeed, forever indebted to those other Americans who have helped to preserve precious pieces of this gorgeous nation for all -- American and visitor -- to enjoy. This imperative work must continue... However, the American Great Outdoors video states that now fully 80% of our U.S. population live in urban areas. That incredibly alarming statistic only makes it only more imperative that in this century present President Obama and other forward-thinking Americans continue this very vital work to ensure that National -- and indeed, even City, County and State -- Parks are available to all, as essential and vital components of the fabric of our every day lives... This means that every American, regardless of race, color, class or creed has an inalienable right -- and, yes, need -- to (and for) the full access of every available breath of fresh air, opportunity for physical exercise and every hint of beautiful nature needed for mental refreshment that's absent from the communities in which so very many of us presently live. As in the song, "America the Beautiful", the bounty of our beautiful spacious skies, amber waves of grain, purple mountain majesties and fruited plains belongs to each and every one of us, from sea to shining sea. One generation was blessed with the grace and foresight to have established the National Parks. Let this generation be the one blessed with the wisdom and determination to ensure that they are fully available to every one of us. { <a href="http://www.cyberhymnal.org/htm/o/b/obfsskis.htm" rel="nofollow" target="\_blank">Link</a> }

Mountain bikers should have places to go, but not in the wildernesses or the PCT. These trails were created for (and are built & maintained by) hikers and stock people, both historic users, so that they can enjoy the quiet & solitude of the areas. One can not have a relaxing and scenic hike or ride when worried about bikes screaming around corners and confronting us as we already have to deal with in non-wilderness areas. (#53) did a great job on the 'why nots' of bike use in some areas. They need their own designed, designated and maintained areas to ride or share the ORV trails and abandoned roads. They can help that user group get more trails and facilities that they desperately need. Unfortunately the bike user #'s are growing so fast that the good guys of the sport can't keep up with the education needs of the newbies. I either meet extremely gracious & helpful bikers or extremely rude ones, very few in between. This is a big problem that needs to be dealt with soon.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Establishing wildlife corridors is essential at all levels. At the community level wildlife corridors that are agreed upon and established would provide important educational opportunities and clarify smart growth boundaries. The same would be true at the national level, particularly with respect to how these overlap with utility corridors, transportation routes and the infrastructure network of human settlements.

I find it interesting that there is an underlying assumption that the land we live on is still considered only in the name of what it can provide for us now. As if we are masters of these complex ecosystems of which we do not fully understand. Perhaps there is benefit to having land that is not easily accessible by the convenience of modern ATVs. Perhaps there is benefit in having land preserved even if it will NEVER be seen by our grandchildren's children. I am thankful for this forum and know that this will bring us closer to a compromise. One of my largest concerns is about the protection and growth of "wilderness" areas. Why is there nearly as much concrete as there is designated wilderness area (approx. 2.5%) in this country? Should wilderness be protected from our use even if we can not objectify exactly what the short term benefit is, and is it possible to increase the percentage of wilderness areas or is that number inevitably going to decrease as it is slowly chiseled away at over the years? If we do see benefit in increasing our wilderness areas and giving back areas which have already been impacted, where will that land come from, and will it be accepted, as is a part of the wilderness policy, that motorized vehicle will no longer enter into them?

No doubt our nations natural resources are critical to not only protect but to use as well. It is also no doubt that our nations success is in large part due to the fact that we landed upon a continent of vast resources and that we were able to sanction them off for ourselves. Without the use of our resources we would not prosper as a people, and never would have. In fact many of us would not be here. However, where I believe your comments are perhaps short sighted is in the question of what it means to prosper as a people. As a nation we use, use, and use, and without a sustainable infrastructure that use creates waste. If we used less, or used efficiently, and invested in a more efficient infrastructure we would not need to worry about severely limiting our use of virgin resources. I wonder too if having a strong concern for "running out of wilderness" is perhaps the most rational path. Can privatization protect our nations "wild" resources? I have not yet seen a large corporation make a decision that in some way did not make them money. It is quickly becoming profitable for companies to invest in protecting natural resources, or at least appearing as if they are doing so, but in the end the for-profit companies will function in the best interest of the company, not the people as a whole. And who's to say what that interest will be. At this point it seems that the federal government, with all of its imperfections, has the means to protect our wilderness lands and natural resources for their long term use. The Feds also have the added benefit of answering, at least on the surface, to tax payers and voters. We have a great chance to let nature stay intact, without the destructive actions of people, as it continues to make this world the hospitable place it has been before our irresponsible use of its resources.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

SAFETY, SAFETY, SAFETY! Yes lets be safe on the trails. Most of the equestrians I know personally are embarrassed by those who cannot control their animal in public. If you cannot control your animal, keep it on private property. That is SAFETY! Just because you enjoy John Wayne movies does not give you the right to endanger others. Your horse is not some sacred exemption from personal responsibility! If a bike rider, hiker or equestrian endangers your "experience" then report them. Do not paint all others with the same brush or you may find yourself "painted into a corner of your own." Co-operation is the answer! You can slow a bike down by trail design or retrofit without disrupting other users.

Bicyclist can ride anywhere - horses can't ride on the roads or sidewalks and the two don't mix. There needs to be a place where people can quietly ride or hike without anything speeding by them. There are plenty of bike paths around the Los Angeles area. I can't ride my horse on the beach and I don't expect to see bicyclist on the hiking and riding trails. If the bicyclist want to enjoy the mountains they can do it on foot.

"As for the PCT, we've been riding it for years. You might as well make it legal." "I am pedaling along on a so called 'illegal' trail' ... 'aside from my supposedly not supposed to be here, what have I done to offend you?'" I will paraphrase \_\_\_\_ and ask you, Who is really the belligerent and unruly person in these stories? With this kind of obnoxious, self-righteous and illegal behavior, what makes anyone think that these mountain bikers, and others like them, will follow any restrictions on use (days, speeds, etc,) that may be put in place if the currently off limits trails and wilderness areas are opened to them? As it is now, if mountain bikers are on the PCT or in wilderness areas, they are illegal--no diversionary arguments about whether or not they were following any speed limits, staying on the trail, etc.

Mountain bikers want to see the forests and mountains where we ride protected in their natural state, with clean air and clean water. Bicycling draws young people to outdoor activities and improves their stewardship of public lands as adults. Bicycling is a sustainable, low-impact activity and a viable economic redevelopment option for many communities. Public lands do not belong to a small group of equestrians, but to all of us. The idea that horse on the trail are environmentally benign, while bikes "rip up the trail" is laughable. Almost every study done on soil lose from recreation shows that hiking and biking create pretty much the same effect and much less than equestrians.

I am sorry that you are so hateful. It must be difficult to live in such a state (I only glean this info by reading your angry comments all over this forum.) I was just speaking out of frustration. It seems as though this forum is getting so sidetracked by these OHV issues when there are so many other important and immediate issues to address. I have relatives that own OHV's and use them on their private property and they have a great time. I am all for that. Really, I am. But what I don't want is to have a solitary afternoon walk or a peaceful camp out with my kids disturbed by loud, and frankly, smelly OHV's encroaching on my peace and quiet. If you have private property to ride around in, God bless.

## Discussion Question 2

***(cont.)***

I agree and furthermore, all of the mountain climbers, hikers, etc. who require being "saved" at the taxpayers expense should have to reimburse the government. It costs a lot of money to go mountain climbing. People who are fool hardy and can afford it but can't do it should be made to pay. If you can't afford the rescue fees then know your limits!

I don't know . I teach high school in an affluent suburb and I was shocked that (at least 2 wks. after the BP spill) the majority of my students had no idea about the fact that it had happened! Some even went on to say that it wasn't going to effect them because we don't live anywhere near the Gulf! There is a lot of work to be done in educating today's youth and there is no time to lose! I guess you have more faith in our educational system than I do. I see so much apathy about this subject with the kids, but especially the educators I work with. It is really sad!

What idiots would want to vote against this!?! Children should be taught as much as they can about conservation and being good stewards to the land. It is imperative to the survival of future generations and certainly more necessary than a lot of the curriculum that is forced down the throats of students whether they want it or not!!

Wow! I didn't even know that that was the case! That is so wrong. As you said, it's a REFUGE! I want to expose my child to nature-- not firearms! It is so counter-intuitive?! The gun lobby is certainly well-funded.

Conservation. I think the Endangered Species Act is a wonderful tool enabling the conservation of species. The problem is that it doesn't protect the ECOSYSTEMS that these individual animals live in. It is impossible to save a specific animal if it doesn't have it's particular ecosystem to survive in. Also, I think all government entities need to work in conjunction with the species on the list. For example, the government has spent millions of dollars raising Black-Footed ferrets in captivity, preconditioning them for release, and then releasing them in the few remaining prairie dog colonies. On the other hand, another government entity is paying millions of dollars to poison prairie dog colonies. In fact, even persons who own private land are forced to poison any prairie dogs living on their property. This just doesn't make sense. They contradict one another and once again, this brings up the whole ecosystem that prairie dogs create. Not only are Black-Footed ferrets on the Endangered Species list, but so are Swift Foxes and Burrowing owls, which both also depend on these prairie dog colonies. The obvious solution is to stop poisoning Prairie Dog colonies and the animals that depend on them will no longer need to be on the Endangered Species list saving the government and people millions of dollars. I think the governments needs to create a new bureau dedicated solely to animal and ecosystem conservation. They need to hire more biologists and environmentalists who understand these complex systems to help manage our wildlife and public lands.

## Discussion Question 2

***(cont.)***

I would like to start by stating that I am an avid trail runner and mountain biker. I have also been a park representative for a few local and state wilderness parks. This being said I have dealt with all of these issues many times. One thing that everyone has to understand is that these trails are here for all of us to use responsibly, no matter what your mode of transportation. Each group has rude people and very friendly, respectful people, that is just human nature. Both horses and bikes are controlled by humans. It's our responsibility to operate them with control and consideration of all trail users. There is no doubt that horses can be startled by bikes, runners, hikers, snakes etc. With this in mind we all need to be considerate when using trails in multi use areas. One of the main issues I have seen over the years is trail users not understanding or not knowing the trail rules or etiquette. As the economy has gone south and healthy living has become more popular, we have many more trail users than ever before. Rather than arguing about who can use what trail, maybe we should focus on educating people on responsible trail use. We all love the outdoors and there is no reason we shouldn't be able to work together to satisfy all users.

Complete Park and Trail Maps. Maps and Trail system maps and databases are not updated, ie. USDA's National Forest and Park maps do not include all trails in their publications which are distributed to the public. In a publically distributed, Mount Rogers National Recreation Area Trail Location Map. 18 trails are listed, and an additional four trails illustrated. Four trails and an access road are omitted. Sawmill Trail (4556), Buzzard Den Trail (4582), Wright Hollow Trail (4548) Feathercamp Ridge Trail (4550) and Forest Service Road FS287. Recommended Edit: The insertion of SR 731 and SR 605 roads on the map and showing more four trails, the Income Generating Consumers realizes there is more national park located on the north side of Iron Mtn. I'm sure there are 100's of similar maps out there which direct the consuming public away from private businesses which have been encouraged to start with the many economic development programs across rural America.

The name needs to be changed. When I heard the original name I pictured a gardner installing lawn and planting decorative shrubs...not natural landscapes...more as in landscaping a property after new construction. The name isn't self explanatory. 'National Conservation Lands' sounds like natural landscapes and doesn't bring to mind urban landscaping.

Wilderness trails should NOT be open to bicyclists...I have personally witness a mountain bike coming up behind a horse and rider on a blind corner and the result of the horse going off an edge and the rider seriously hurt. Horses hear the bicyclist, but the bicyclist are zooming along NOT seeing or hearing the horses around blind corners and on cliffs. HORSES AND BIKES ARE NOT A GOOD COMBINATION... There do need to be places for bicycle riders to ride, but not in the wilderness or on shared trails with equine!

***(cont.)***

The Wilderness Act of 1964 defines wilderness as "an area where... man is a visitor and does not remain." Your idea concerning Wildlife Refuges and National Parks therefore goes hand in hand with the government's legal definition of what constitutes "wilderness." Many pass through the states that you and Mr. Harris mention, but do not pause to take in the land around them. A National Park with a well maintained camp ground would then afford visitors a place to appreciate the natural beauty of those states. And as you noted this would also stimulate the economy of those states. Most of these states' economies are solely based in agriculture (whether corn, potatoes, or otherwise) and many of the residents are living loan to loan. Since most of these states also have low population densities it would then not be hard to find areas that could be transformed into either Wildlife Refuges or National Parks. History has shown us time and again that the overgrazing of grass lands can lead to devastating consequences. The most extreme being the dust bowl of course, but that had a number of factors only one of which was the excessive grazing by sheep. Although it is unlikely that we will have a repetition of this tragic natural disaster, there are many other valid reasons for conserving, preserving, and revitalizing the lands in question. Sigurd Olson, writer of the essay "Why Wilderness," would argue that such parks and wilderness areas provide a necessary relief for many people from their everyday lives. But there are more persuasive arguments than that. For those who argue against wilderness conservation due to what geologist \_\_\_ might term "the cost" of "(a decreased) the quality of life" (Encounters with the Arch druid by John McPhee) for "present generations," simply look at the benefits hard working men and women of the Midwest would receive: greater tourism, greater economical diversity, and healthier land to name a few. One of the above alone would be enough to make it worthwhile for the government to look into the Great Plains States as locations for National Parks, Reserves, or Wildlife Refuges.

I am an avid hiker and an equestrian. Although most cyclists are polite and respectful the few that are NOT make it extremely dangerous for both foot and hoof traffic. I have been nearly knocked off my own feet by cyclists on the Sam Merrill Trail, The El Prieto Trail and even the Mount Wilson Toll Road in Altadena, California. I no longer feel very safe on my own feet, much less on horseback, on my own home trails. I have had to adjust my riding schedule to avoid the cyclists. Mornings on the trail are especially dangerous. I remember the days before the cyclists, when you could walk or ride a horse without fear, without having to constantly strain your ears to pick up the sound of a fast approaching bike. I think we should preserve the last safe places that are left for us.

## Discussion Question 2

***(cont.)***

For those of us that spend a significant portion of our time enjoying our public lands west of the Mississippi, the story is far different than that told by the eastern and far western folks who advocate closures. We live in and among these lands and can explain, as \_\_\_\_\_ did, that the impacts you so fear are overblown propaganda that little resemble the truth. September 2009, the policy regarding public lands is that all roads and trails are CLOSED to public use unless specifically signed open, went into effect. 20 years ago, I had many miles of trail to ride my motorcycle on. Today, in my ranger district, there are only 8 miles of legal trail. There are literally hundreds of miles of trail that were user created by motorcycles due to the need for those trails. They are all but closed, so that an elitist group of trail users can selfishly use those trails on the occasional weekend. Now, on a daily basis, my right to use my public land has been stripped away. \_\_\_\_\_ is right. If it were anywhere near as difficult to close trails as it is to open them, we would be far better off.

Following the Bush admin decision of "closed unless posted open", all roads and trails on Federal lands are now "closed" unless they are specifically posted open. As previous comments indicate, no process is needed to close roads and trails. On the contrary, EIS procedures are necessary to REOPEN roads and trails closed with no public input and by arbitrary decision. We need MORE trails for OHV and motorized use, not less. Exploding population numbers dictate that a more dispersed impact will only be possible by increasing the number of trails available. This is common sense...which unfortunately, is no longer common.

What exactly is wrong with what he's doing? The property was legally acquired (paid for), and he spent money, his or his clients, to construct a residence for investment or habitation purposes. Why should the federal government be allowed to confiscate private property?

I live in Colorado, and I spend a lot of time in Southern Utah camping and hiking. I have seen many beautiful desert plants and biotic soil trampled and destroyed by ORVs going off the dirt roads and driving right across the landscape. In addition, as I have grown older, I have watched the Utah landscapes become more and more degraded due to years of illegal ORV damage. In the Southern Utah wilderness quality lands, there are less plants and less biotic soil than there were 15 years ago. Remember that these are endemic desert plants that I am referring to, which already grow slowly in a harsh environment, so being trampled and crushed only makes it more difficult for them to survive. The overuse of ORVs has already significantly affected the ecosystems of Southern Utah. Shutting down 15% of the dirt roads in Southern Utah will undoubtedly lessen the degree of damage to these fragile desert ecosystems. This is a solution that makes sense for both humans and the ecosystems, as people will still be able to access the land, but the plants and animals will get a small reprieve from the effects of human activity. Considering the high number of ORVs that (illegally) leave their designated roads and destroy wilderness quality lands in Utah, I think that ORVs should have limited access to wilderness quality lands. ORV users have proven themselves to be irresponsible and have already damaged a large portion of land in Utah. I believe that ORVs should only be allowed in designated recreational ORV parks and on certain, carefully selected dirt roads.

## Discussion Question 2

***(cont.)***

Missouri has wonderful state parks - some of the best in the nation. But our parks have suffered from inadequate funding in recent years and they have a backlog of repair and maintenance projects. The states need money from the Land and Conservation Fund. Full funding from the LCF should support the State Assistance Program. States should be able to count on full funding from year to year.

Most of the ecoregions of the United States are not represented or inadequately represented by national parks or wilderness areas. This is true of virtually all ecoregions east of the Rocky Mountains. As a result, most of our nation's ecosystems are not adequately protected from fragmentation, degradation, and the impacts of climate change. With a few notable exceptions (such as Adirondack or Baxter state parks), lands that are not within national park or wilderness areas are not adequately protected. They have little or no permanent protection from resource extraction, roads and motorized uses, and other activities that damage native ecosystems and degrade scenic and recreational values. This includes the vast majority of national forest, BLM, and even national wildlife refuge lands, as well as most state lands. Virtually no private lands have strong or lasting protection. The September 2009 report of the blue-ribbon National Parks Second Century Commission recognized the inadequate representation of existing national park and wilderness areas. The commission recommended a nationwide survey to identify potential new national parks in underrepresented regions of the country. That's a great idea that should be implemented.

***(cont.)***

Oh sure, let's make it easier and easier for gov't to raise "revenues" so it can spend it on its other successful programs like war in Afghanistan and Iraq and otherwise fund its 700 bases in 130 countries. Then there is the war on poverty and the war on drugs each of which ensures poverty and crime at the cost of countless billions more, not to mention that our doors can be broken down and our cars and houses confiscated at the whim of local cops. Let's continue to fund the gov't in its efforts to regulate every inch of our lives. Good job. All the fees that the gov't might receive from users of land owned by its citizens will not go to upkeep of trails and facilities. Nope. Most of it will go to salaries of the keepers of the trails and facilities. Have you not noticed the degradation of all public places, roads, bridges, National Parks in spite of fees, tolls, and taxes? Do you think gov't employees run the Post Office and Amtrak well, or might you know that these institutions have been running in the red from the start? Do you like how you are treated by the FDA, the USDA, the TSA, the BLM, and Timothy Geithner, among others too many to mention? What fools we mortals be to believe that fees collected by gov't at trailheads have anything whatsoever to do with trails and the great outdoors instead of knowing that the kleptocracy knows only too well that it has its useful idiots as evidenced on this very site. And think about this. If you were not taxed as you already are, and this comment is only meant to be read by those fewer and fewer who actually do pay taxes, do you think you would be more generous with your time and treasure with respect to all aspects of your life, not just in support of trails and so on, but in terms of helping those who suffer in your own universe without any middleman and especially not a middleman like the incompetent and corrupt gov't we all know and love? Humans, surprise surprise, are naturally generous. The demigods in office have convinced us that gov't should take over the role of taking care of, well, everyone, and instead of noticing what needs to be done in our own neighborhoods, we erstwhile generous persons can pursue our interests in celebrities who travel to Africa, in Presidents who promise hope and change, in TV where we can live it up vicariously, and in football where our tribal instincts get some harmless exercise. And of course we relative few who love the outdoors can go hug trees whenever we want so long as the money holds out.

## Discussion Question 2

***(cont.)***

If you want government to intervene domestically, you're a liberal. If you want government to intervene overseas, you're a conservative. If you want government to intervene everywhere, you're a moderate. If you don't want government to intervene anywhere, you're an extremist.- Joe Sobran [1946 - 2010] The trouble with socialism is that it takes too many evenings. --Oscar Wilde You want gov't in your lives to protect your interests? You got it. But there is a problem. Since the Federal Reserve was established in 1913 the purchasing power of the dollar has declined by 96%. "So what?" you say, "My standard of living is the highest in the world!" Oh, okay. So when you retire and you need to live on your savings and the interest rate is close to zero on your cash and the bond market looks like it is going to crash and the stock market looks about as safe as putting your money in the fireplace, who ya gonna call? Bernanke? This country of ours is in debt. In fact without debt in this country there would be no "money." Yes, that is correct. The Fed creates money by issuing credit. Voila! And what backs up that debt? Nada, and that may be why gold is going up while we sleep in our arm chairs or discuss how we might pay the gov't a bit more for using lands we own. Is there no end to human folly? Have you noticed on this very thread the tangled web we are weaving upon the revenooer's deceiving? This will not end with civil discussion but in war, as it always has. There is but one solution to the problems of human nature and it is -- nah, I won't get into it here.

The link you provided took me to a blog with a few individual readers' opinions about a newspaper article about a County Commision press release about a District Court advisory provisionally allowing an unspecified width of a road to be maintained for 9/11ths of its length. In every way, this is the \*opposite\* of an official government announcement detailing a road closure. As a concerned citizen, I would like to scrutinize the actions of our government when there are repeated allegations of wrongdoing but this is very difficult when those making the allegations can't present the direct factual evidence...in this case, what seems to be missing is a government document announcing a road closure with justifications that are allegedly insufficient, inadequate, mistaken, or somehow illegal.

You want to encourage young people to start a career in which the rewards for service are structured to diminish as they gain experience and ability, just like their mentors? This is a procrustean solution.

The forests are more than the cheapest available water filter -- behind all the industrial-management talk about "forest health" and "treatments" (which could include logging for private profit in the name of "fire safety") there is no provision in this Idea description for the conservation/restoration of biodiversity in natural habitats.

(per Comment #1): It sounds like you'd like to propose "Oil Spill National Park" as an alternative Idea -- go for it!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Why should domestic, imported sheep have preemptive 'rights' over native species in our wildlands? Wildland ranching has resulted in the invasion and disruption of our natural ecosystems, including interfering with the instinctive feeding patterns of our native wolves, which did not evolve in the presence of docile, foreign farm animals. In many ways, we're doing a better job than our ancestors keeping our ecosystems healthy, but your story illustrates one of the many areas in which there is still room for significant improvement. The incident you describe shows that the sheep didn't belong where the rancher was keeping them.

(per your address to me in Comment #6): It was obviously the DOMESTIC, IMPORTED SHEEP noted in the original Idea, above, that I labeled in my Comment #2 as "invasive" (a technical term, properly applied here). Humans have the ability to learn from written history -- and correct their past mistakes -- if and when they take the opportunity to do so. Please see the Idea: "We will always have more to learn from native species and their natural habitats -- don't sacrifice our teachers for a cheap thrill or a quick buck."

If the Pebble Mine were to extract every ounce of recoverable gold according to the most optimistic estimates of its proponents, then by the end of this century it would add slightly more than 1% to the world's gold supply. This is far, far less gold than we could recover by reducing, reusing, and recycling it and at an astronomically higher environmental price. The Pebble mine is all about privatizing profit for a few and externalizing costs for the rest of us. King Midas tried eating gold and it didn't work out so well. I prefer wild Alaska salmon.

(per Comment #9): The Idea at the top of this discussion is *\*based\** on the many other Ideas, Comments, and Votes on this website concerning various adverse environmental impacts of the Pebble Mine on the Bristol Bay ecosystem as well as the resulting adverse impacts on the existing sustainable economy there if the Pebble Mine is permitted. Searching "Pebble Mine" and/or "Bristol Bay" on this website, you will see that many of us who have commented here have previously contributed the kind of information that you claim we have not. As for your suggestion that the locals should have the loudest voice in this discussion, the same search will show you that many of them have already weighed in against the Pebble Mine on this website and that 79% of Bristol Bay residents are against the Pebble Mine according to a poll cited in the Idea "The people don't want Pebble Mine on Bristol Bay, Alaska."

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

\_\_\_\_\_ 's legal case involved a number of technicalities alluded to in Comment #11 and I think that the court found properly in his favor by applying existing law. Your Comment #17 brings up broader issues which would require changes in existing law -- in the process of such changes, I would hope that the democratic process would bring to the fore various opinions such as those expressed on this website (even those with which I might disagree -- let's "get it all out there"). Your opinion seems to be in favor of user fees, a concept which has been defended on the grounds of fairness by saying that those who impose the costs on the system should help to defray (some or all of) those costs. Others have argued against user fees on the grounds of fairness by saying that our public lands belong to all citizens, regardless of their ability to pay for access more than they already have through their taxes. Another argument that cuts across these two is that resources should be allocated according to the demands placed upon different public lands -- user fees do only a very approximate job of this and there are other means of appropriately allocating funds. Further thoughts?

In my opinion, "recreation" is also a form of "resource extraction" to the extent that it impinges on the natural environment. For example, even "peace and quiet" is a "natural resource" -- noisy and/or fast-moving forms of recreation, in particular, can disturb the survival/reproductive behaviors of wildlife. Tread lightly.

Here are some specifics on just part of what would be at risk if the Pebble Mine is permitted: The Sportsman's Alliance for Alaska ( { Link } ) states that: "no where in Alaska, do so many salmon return as to the Bristol Bay watershed. Just a few of the superlatives in this region include: The Kvichak River is home to the world's largest sockeye salmon run and is also within Alaska's designated trophy wild rainbow trout area. Other species found in the Kvichak include Chinook (king), Coho (silver), pink and chum salmon, Arctic Char, Arctic Grayling, Dolly Varden, northern pike, and whitefish. The Nushagak and Mulchatna Rivers support the largest Chinook (king) salmon runs in Alaska, and perhaps the world. Other species found in these drainages include Sockeye, Coho (silver), pink and chum salmon, Arctic Char, Arctic Grayling, Rainbow Trout, Lake Trout, Dolly Varden, northern pike, and whitefish. Lake Iliamna is Alaska's largest lake and America's last undeveloped "great lake" as it is the same size as Lake Erie. It is home to one of only two freshwater seal populations in the world, as well as all five species of Pacific salmon, Arctic Char, Arctic Grayling, Dolly Varden, Rainbow Trout, northern pike, and whitefish."

Thank you for raising this additional critical issue. While our democracy is equipped to follow the wishes of the people over the long run on broad policy issues (e.g. "Should significant resources be devoted to save species from extinction in their native range in our country?"), it is not equipped to inform all citizens and take a vote on every individual issue every time a decision is required (e.g. "Should OHV traffic be more restricted in the Imperial Sand Dune Recreation Area to save Peirson's Milk Vetch?") At some point, as you suggest, we have to hire/retain qualified professionals and let them do their job/duty, including making decisions on a scientific/rational basis in the face of counterfactual 'information' provided to them by local (or distant) interest groups.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

(per Comment #11): Your Idea "No wilderness should be designated in any state without local congressional support" made the same point and was effectively criticized from several perspectives as well as demoted by a majority. Many people do not trust your local politicians to do what is right for our National Treasures on our Federal Lands.

It sounds like you're suggesting that the federal government exercise eminent domain to make public trails through private property against the owners' wishes. This is problematic on several levels -- please clarify.

Hypothetically, of course, what if the federal government exercises eminent domain to force a trail through my property so that hunters or pagan tree-worshippers can pass through to hunt deer or perform unspeakable acts with vegetation on adjacent public land and I'm morally opposed to hunting or panentheism -- what recourse do I have for the expropriation of my property and violation of my beliefs while the hunters pass back by with carcasses slung on their shoulders or pagans parade around clothed only in leaves?

(per Comment #9): Setting the record straight, I didn't imply that Weyerhaeuser was exploiting natural resources on \*public\* land and I hope that you're not implying that Weyerhaeuser is \*not\* exploiting natural resources on private land (cutting down trees is how they make their money, of course). In any case, none of this addresses the Idea at the top of this discussion, which complains about "groups" owning land and preventing those who would exploit the environment from crossing it. \_\_\_\_\_ seems to have abandoned this discussion immediately after starting it, so I would again suggest that you post some form of your Comment #7 as its own Idea and perhaps he would deign to comment/vote on it.

(per Comment #1): Your caricature of this Idea is completely inaccurate and misleading, not constructive criticism. A "variety of camping alternatives at Wilderness trailheads" was proposed, not "tents, horse corrals, signs and pavement at every trailhead." "Turnarounds and sites large enough for horse trailers, as well as tents" are not "Disneyland style parks" either -- I went to both last summer and can assure you that they bear \*no\* resemblance to one another. Perhaps Priscilla Burton could recommend where/how horse corrals/campsites could be sited to minimize any real or perceived negative impacts to the environment while having even greater positive impacts for "America's Great Outdoors," as she alluded to originally. Also, the collection and disbursement of user fees related to this very valuable service would be worth discussing, as they have been for various other recreational uses of our federal lands proposed/defended on this website.

According to this link ( { <a href="http://www.resourceanalysis.com/trails/trail113/tr113.html" rel="nofollow" target="\_blank">Link</a> } ) the St. Vrain trailhead is not what your Comment #3 nor Priscilla Burton's Idea describes: "The parking area for the [St. Vrain] trailhead is narrow and will accommodate about 12 vehicles. Horse trailers could not be turned around here."

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

(per Comment #11): That's a good start -- others might contribute some amendments (and I don't mean "horse manure") -- but what about user fees for individuals and/or businesses, as noted at the end of Comment #10? Also, if those fees are lower than at operations on nearby private property, will those property owners complain about taxpayers subsidizing operations on public property and undercutting their businesses? On the other hand, if those fees are higher than at operations on nearby private property, will the users complain about the government trying to take advantage of them? \_\_\_\_\_'s original idea is not so simple, it seems.

Implicit in the last two sentences of your Comment #1 is the argument that a few animals must sacrifice their freedom for the sake of others. This is one of the many sad results of human destruction of their native habitats, but we can make it much less sad by holding zoos to the highest standards in how they house and treat their animal guests while they are there (e.g. providing ample room in naturalistic enclosures) and by helping zoos "to restore endangered and threatened species back into the wild" as you say.

We need to encourage our new citizens to connect with the great outdoors, too. If a government function happens on public lands, it usually has to do with public lands policy. What are you imagining being more expensive about this? (Note that I didn't say "all" new citizens would have this privilege/pleasure and remember that they all have to get to their swearing-in ceremony on their own, wherever it's held.) The federal government wouldn't even need to "rent the hall" because it/we already own the National Parks/Monuments! Naturalization ceremonies are shown on national television most every year around the 4th of July and this would remind all of us that the national treasures of our National Parks/Monuments \*and\* of our Citizenship are part of what we love about our land and our values.

(per Comment #5): You would preserve the application of this outdated motto at the expense of the environment. "The land of Many Uses" MEANS "Use This Land" not "Conserve This Land." Your opinion that we must invade nature in order to "save" it is debatable, to say the least.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

(per Comment #18): Thank you for helping to "unpack" your original Idea further. While I agree that human access to the natural world is essential for our spiritual and material well-being, I would also argue that it is in our HIGHEST INTEREST to preserve *some* undisturbed natural areas (particularly with critical habitat for endangered species) from *any* human intrusion that is ecologically unsustainable. I suspect that you would agree with this and that we are only debating the location/extent of such natural areas and the intensity/type of human incursions that should be permitted (i.e. *what* activities are environmentally sustainable *where* and *when*). To put a very fine point on the argument, I would be content if research scientists and documentarians had sole access to the *most* vulnerable ecosystems (but only if they could enter and leave without undue disturbance) -- sharing their findings with us on something like the "Discovery Channel" (to borrow a term of mockery from anti-environmentalists) -- while I had personal access to similar but less pristine examples of those ecosystems which would not be irreparably harmed by my visits. While I prefer to hike, if your OHV riding was according to similar precepts (in separate areas from my hiking trails, by the way) then I'd have no problem with it whatsoever. So, I will agree with the motto "Land of Many Uses" if and only if it some day becomes commonly understood that one of the most important of those "Uses" -- paradoxically -- is not to "Use" the most ecologically-significant land for any human purpose that alters its natural state.

(per Comment #21): Thank you for further clearing the air and continuing this discussion -- I hope/intend to do likewise and I invite others to join us in the same spirit. We do seem to agree on the general principles but disagree on the degree and manner in which they should be applied. For example, I don't think that someone bushwhacking a trail that is then followed/maintained by many others over the years (whether it was legal or not in that particular place and time) should preclude a later closure of that trail if it is found to put an endangered species in that habitat at significant additional risk of extinction. The legal mechanisms through which such a closure is accomplished may be troublesome to both of us (perhaps for different reasons), but existing laws, administrative rules, and administrators are all that we have until we change them. (Perhaps you could recommend some particular changes.) So, I guess that I'm more leery of getting hung up on the technicalities of the definition of "roadless areas" than you are and I'm less deferential to the argument that a particular road should continue to exist, despite demonstrated damage to critical habitat by traffic on that road, simply because it happens to have been there for a long time. Those who came before us sometimes made mistakes and we have the ability to make amends. P.S. I just searched "Discovery Channel" on this website and though your name came up often, I also found it has been used as a term of abuse on both sides of this argument, so perhaps we should just drop it (sorry!).

Wouldn't it be fairer and cheaper to let those who cause climate change make the changes needed to prevent it? Oh, sorry, too late for that!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

(per Comment #7): In reference to global warming, you state: "the only debate is as to the reasons why." Please note that this debate is only a political one at this point, funded and perpetuated by those who profit from dumping excess greenhouse gases into the atmosphere (thereby "externalizing" their costs) while making the politicians dither. Science itself clearly identified the "reasons why" some time ago: industrial disruption of the earth's atmospheric carbon cycle (NOT a "natural cycle").

(per Comment #9): Thank you for helping to continue this discussion. I respect your concentration on finding solutions and your concern about getting caught up in specious debates about causes of global warming, but many of the "global warming skeptics" argue that we can't possibly have the capability to slow, stop, or reverse global warming because we have no control over its causes. That is some of the 'thinking' that climate scientists are up against, armed only with facts (i.e. real, verifiable observations of the natural world) and logic....

(per Comment #4): Giving kids ages 12-15 jobs instead of decent educations (and protecting them with an effective social safety net) is a recipe for expanding the ranks of exploited workers (and all of the problems that come with that exploitation) -- you've convinced me to "Demote" this Idea.

If we sidestep the issue, as you did, and simply accept your definition of wild horses as a "native species" then why in the world would we be in favor of treating them with birth-control chemicals? Are you proposing to "study" wild horses, use them as "teaching/advertising tools" or what? The description of this Idea is too mixed-up and elusive to cast a meaningful vote.

What would the legal protections be for those providing recreational access on/across their land, for example, when someone is injured because of some problem on that land (e.g. an old, rusty barbed wire fence hidden in tall grass catching someone's leg and giving them tetanus)?

It is not part of the Wilderness Act that any and all people have the right to enter any part of any Wilderness Area by any means of transport necessary to get them there. More generally, while access is important, it doesn't trump environmental protection -- we must ensure that there is sufficient natural habitat for people to enjoy when they get there \*and\* for wildlife to enjoy when and where humans give them some space of their own. There is no scientific justification for setting the miles of trails of each type in a particular ratio -- which trails of which types in which areas are sustainable has to be evaluated on a case-by-case basis. To be clear, wherever the environmental impact is minimal and no rare species are imperiled, I'm inclined to favor legally-permissible access trails so that as many people as possible can gain a greater appreciation for the natural wonders that we have succeeded in protecting from 'development.' Finally, if you take the time to read my Ideas and Comments on this website (including the one referenced in Comment #3, above) you will see that I am \*not\* "upset because the ORV Supporters as showing their numbers here" as you assert -- subjecting their opinions to the light of day is a good thing (on this specific point, please see the Idea description for "Participants: Please use this website to learn something and to teach something.").

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Implicit in the original Idea is the fact that off-trail racing in Wilderness Areas is not allowed because of the unacceptable risks of environmental damage there.

It is encouraging to see the USFS working on multi use trails and bringing many users groups together for the benefit of the many rather than the few. I agree that more access is important rather than less as our lands are a treasure to be shared responsibly rather than restricted arbitrarily. Mountain biking is a responsible non-motorized use appropriate for many of the areas currently restricted to it's use. I feel reconsideration of current designations needs to be considered in all of our lands. I agree that many Wilderness areas need to be set aside to hiking only, but many of the previous and upcoming designations are over reaching and excluding Americans and visitors from the outback experience.

Everyone needs space to call their own, but in the case of Mountain Bikers, any space they inhabit on the trail must become their own to the exclusion of others who might enjoy the area. Mountain bikes do not mix safely with either hikers or horses. This has been expressed eloquently above, and if you ask any hiker or horseman to recount a negative experience they've had on the trail with bikes, they will probably give you ten. It's just not safe and the potential for tragedy is too high.

I ride a mountain bike, it's my preferred transportation in town and vicinity, but only where bikes belong. Bikes increase trail erosion, pose a safety hazard to hikers and equestrians, and are not compatible with wilderness values. Exclusion from wilderness areas still leaves millions of acres of lands where other riders and I can ride.

The biggest problem with OHV use on our public lands is that these machines take away any sense of reward you get for working hard to get somewhere--everything, whether a sweet viewpoint, or an archeological site, is just another place to pass by on a machine. If you have to actually strive to achieve a location, then it places an intrinsic value on said place--a value that can never be understood or appreciated by those whose conveyance places them apart from the joys of the natural world. That's why you see so much more vandalism at a site accessible to machines than those with foot-only access. The second biggest problem? there's no way to identify specific OHV riders, so until they have legible identifying tags, folks like me will continue to classify ALL OHV riders as destructive and irresponsible (and I ride a dirt bike and have a vehicle built for desert travel--but I still support balance and Wilderness).

A refreshing idea! I drove 44 miles into the Gila "Wilderness Area" Wednesday to visit the cliff dwellings built by people whose only transportation from their ancestral home hundreds of miles to the northwest was their feet. It was pointed out to visitors that until recently the only way to go see the place was by horseback, off-road vehicle, or helicopter. I have mixed emotions about my access, but if I had been polled about whether to run that crazy road in there I think I would have voted no. Most of us have only infrequent access to quiet places where the noise and smell of fossil fuel combustion does not intrude. I think what we have left should be preserved. Ten thousand years of human evolution adapted us to derive energy from plant combustion; look what the last hundred years of motorheads has done for our environment. Count me out of that party.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

After all the so-credible hype from the NRDC, it's good to hear from a native. Most of us will never see Bristol Bay, but we have seen such places and cherish them as untainted resources. The Pebble Mine project is intended to add a few kilotons of metals to the culture's foundries and a few billion dollars to investors' accounts, then it will play out and be abandoned, leaving -- what? Can such an environment survive the release of that much mine tailings, sulfides, fossil fuel exhaust, noise, and kinetic physical presence? Where will the salmon go from there, or the people who fish them? I agree that this ecosystem deserves the regulatory oversight to prevent mining unless it can be guaranteed not to impact existing flora and fauna.

No matter what you or I do, no matter how much good the OHV's do for the environment, no matter how much money we contribute to the economy, you will never change the minds of some people. All these people can see is death and destruction if everything is not run the way they want. These are the people who are responsible for the continuing downfall of this country and they cannot see the forest for the trees. You will find that those involved with the environmental movement are the most selfish people out there while claiming they are just trying to make the world a better place. We voluntarily vacated an area back when I lived in PA where we used our OHV's. We cleaned the place up, planted trees and grass to stabilize the area that was mined, and in general, made it a nice place with some nice trails. To make a long story short, we left the area after being run out and told them that we would no longer help to maintain it. That it was now their responsibility to keep the area clean as we will no longer be using it. The fit that was thrown was just downright hilarious. Those that wanted us out, cried and complained about who would clean the area up. We told them that they would. The area is now totally trashed and we refuse to clean it up as it was the environment's responsibility.

Take a look at this. Many of these roads that are being closed fall under this. { <a href="http://sxsnews.com/index.php/2010/09/kane-county-wins-its-first-r-s-2477-road-the-skutumpah-road/" rel="nofollow" target="\_blank">Link</a> } I know I have an article or two here where the BLM or the USFS closed a road even after it was proved to be under this. Give me a little bit to find it.

Is this one good enough for you? { <a href="http://www.deseretnews.com/user/comments/700061805/Kane-County-wins-its-first-RS-2477-road-2-the-Skutumpah.html" rel="nofollow" target="\_blank">Link</a> } Guess I could give you the legal right to access your property through mine them take it back anytime I want then, right?

I had thought you would follow the link at the top of the story. I'll give the link to the actual story posted. { <a href="http://www.deseretnews.com/article/700061805/Kane-County-wins-its-first-RS-2477-road-2-the-Skutumpah.html" rel="nofollow" target="\_blank">Link</a> } Pay special attention to the fact that this road was in the Grand Staircase-Escalante National Monument. What was illegal was the fact that the state has jurisdiction over the road under RS 2477 and the federal government decided that they could just do whatever they wanted.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Even though Kane County does indeed own the right of way, I would prefer to see them leave the road a two lane dirt track. We have many here in AZ that would classify as a level 3 road and many that would classify as Level 2. If Kane County decided to maintain it as a level 3 or level 2 road, which would require minimal maintenance, then it would in essence be a high clearance vehicle road. If the federal gov't cannot understand a written law that is only 26 words long, then what recourse are we left with. By the way, the federal gov't is also spending big taxpayer dollars to close these roads even when they do not have the authority to do so.

Under the wilderness act, if those tracks exist then it cannot be declared wilderness. The ultimate result of what Kane County did has yet to be seen. Under RS 2477, there was never a need to record these routes. All that needed to be done was to make a way through. Whether it was a horse trail or a four by four trail. it did not need to be created by a machine either. The Federal Government decided to enter into negotiations because they knew they would lose if they pursued this further. That being said, I have no problem if some of the roads in more sensitive areas were closed, but that option remains up to Kane County. I would like to see Kane County and the Eco's meet halfway on this.

I agree with you that there does need to be laws and regulations. However, EVERYBODY needs to follow them, including the eco's and the federal government. If you take a good honest, hard look at what is being done to the OHV's and a few other groups you will see exactly what we are talking about. No matter where we go with our OHV's, there is always something found. Whether it is an "endangered" species or some water quality issue. The funny part is that one of these "endangered" species are actually an invasive species.

I agree that if you can volunteer that much time, then you could get a free pass not only to your area, but the entire country. This is something that can be used to give people a sense of ownership of our lands. Put in a couple of hundred hours and get a free nationwide pass. Imagine what could get done. Oh, the possibilities.

Be careful what you label as "invasive". Some areas have been closed as a result of those "invasive" species that are now listed as endangered. If you are going to rally against "invasive" species, then rally against them all. Not just what suits your fancy at the time. The eco's tried to use the brook trout in the Tahoe National Forest to close that area to OHV's. Yet those trout ARE NOT native to the area. They were introduced in the late 1800's to provide a sport fish that put up a good fight. Rainbow trout, brown trout, and a few other trout ARE NOT native to North America. Yet they get selectively used to get what the eco's want. Things like that severely hurt your cause.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Whether you realize it or not, there has been a shift in the thinking of alot of OHVer's. We have been trying to and succeeding in rerouting someof the more sensitive sections of trails. Many areashave been "hardened" to protect areas that have a problem with standing water. This was done to keep these areas from turning into giant mud bogs. There where bypasses closed recently at both the Rubicon Trail and at Fordyce in the Tahoe National Forest. The main problem with us getting some ofthe more environmentally sensitive areas either rerouted or having work done to protect them is the USFS, the BLM, and the whole process with the gov't. The OHVer's have been doing alot of work on our trails. There is a massive amount of work currently being done on the Rubicon to meet water quality standards. Some of it needs done and some of it is just plain silly. I have no doubt over the next two years that this will be the model for th rest of the country.

So wht you are saying is that even though you travelled along F.R. 152 ( a forest service road) and parked on FS land you should not have to pay a fee? Didn't your vehicle contribute (No Matter how small) to the harsh condition of the road simply by travelling it? Sounds like you think you do not need to pay a fee because you think your better than everyone else.

Since we are proposing fees in accordance with damage, then let's charge a fees to all hikers to cover the damage they do when they inadvertently start a wild fire. Considering the Rodeo-Chediski fire here in AZ burned nearly 500,000 acres, I would propose a fee of \$10,000 dollars per hiker per year to be oput in a fund to help restore the habitat destroyed by those wildfires. According to some, OHV damage is so prevalent that AZ should look like a virtual wasteland. Yet since we have had a normal amount of rain this year where I live, the once brown desert is once again green.

Tell me something, why should any of us OHVer's support anything you want? especially when your side hasa track record of using it against us. I can see it now. A group of OHVer's helping to conserve an area, close some trails , and do some other environmentally minded things, only to have it turned against them by the enviro's saying, "See even the OHVer's support this," and we get stabbed in the back for trying to be environmentally friendly. YOur side has bred it's own problems. You made your bed, now sleep in it. I alos have an issue with the garbage you hikers leave behind and also the hundreds of thousands of acres that have gotten destroyed by careless hikers who started a fire through sheer carelessness. MAYbe I should start a campaign to ban hiking. After all, it's for the environment and the children.

I really love how the uninformed tree huggers will automatically start spouting off with the usual Sierrs Club rhetoric. Hikers and backpackers have done more damage to the environment than any OHV ever could. Think I'm joking? Start looking into the number of forest fires caused by careless hikers and backpackers. Most of these burn hundreds of thousands of acres before they are contained. As usual, the tree huggers ignore the facts and stick to lies and rhetoric to stir up emotions.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Where the intolerance comes in is shown by just browsing through this site. You have some that don't want OHV's in National parks or forests. You have some who don't want OHV's on public land. You have some here who try to claim you can't have OHV's on your own land as it "might" disturb there peace and quiet. So if you they would all get their way, then where would we have to ride. NOWHERE. We have seen the writing on the wall and we are fighting back. And as far as getting land owner permission, that is becoming less and less, not because of destruction, but because of the bullshit lawsuits being filed bu the enviro wackos.

My OHV's are able to be licensed for road use here in AZ. In fact there are times here where you will see more OHV's on the roads than cars. A lot of the trails I run are actually old rights of that over the years have been washed out by rains and lack of maintenance. I have said before and I will reiterate. I want you to have places where you can go to be away from the hustle and bustle of life to enjoy the simple peace and quiet of nature. I may use OHV's but I do enjoy the simple serenity of sitting beside a high mountain stream here in AZ. But, I should have areas to use my OHV's without having to spend more time cleaning up after stupid people and fighting to keep them open because an enviro wacko gets a bug up there butt. Until that time comes though, I am being forced to take a hard line.

This will help explain some of what I am talking about. { <a href="http://www.propertyrightsresearch.org/2004/articles11/scorched.htm" rel="nofollow" target="\_blank">Link</a> }

Here's the problem with this idea and I've seen it happen too many times. Once the greeners get a small victory they don't stop. They seem to think that their's is the only way and everybody should bow down and kiss their asses. The greeners whine, bitch, moan, and groan about OHV's destroying everything, yet not one word is spoken about irresponsible hikers and backpackers starting wildfires that burn hundreds of thousands of acres. The greeners need to clean their own houses before they have the right to tell me how to run mine. There are places that OHV's shouldn't be allowed but eliminating all access to everything is going to be the biggest mistake in a long line of mistakes the greeners have made. I see a lot on here touting the enjoyment of getting somewhere on foot after a hard hike. Well there is something to be said for the guy who spends all week working on his rig to get up that last pile of rocks. These people have a sense of accomplishment too. Either we find a way to co-exist or we shut it all down and NOBODY has access.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Please don't make me call you out like I did to \_\_\_\_\_. He was caught red handed in more than a few lies. As for closures, take a real good look at what is happening to Johnson Valley. Much of the valley was closed due to the "possibility" of a desert tortoise getting run over by an OHV. Now 29 Palms is looking at expanding into that area. Guess the tortoise will like bombs better. So much for the precious desert tortoise. The only ones to stand up and fight this are the OHV groups. No enviro's are getting involved. As for only getting crumbs, take a really good look. Of course if you consider millions of acres crumbs, then I could see where you are coming from. I have no problem with state forest being off limits. But the problem is, once the enviro's get those closed, all they want to do is close more and more until only there way is left. Unfortunately, there are many more OHV's taking a hard line against closures due to the fact that the enviro's see compromise as weakness so if they raise enough hell then the OHV's will just roll over. As has happened in years past. Now we have been pushed far enough and we are fighting back. So what do the enviro's do? Fall back on lies and rhetoric, as has been proven here many times by many people. If I remember right, some of the anti-OHV evidence was posted here from a place in FL. Too bad the Enviro's forgot to mention that this area was reduced with the OHV's help and reclamation started. They had to destroy that effort by the use of lies and rhetoric. If the enviro's want a "fair" use policy, then they need to back off and come to the table like good little boys and girls. And work towards a reasonable compromise. The alternative is the fact that we vote and we will do so to protect our way of recreating. If that offends some people, well, too bad. We will have our voices heard and we are getting them heard by some pretty high level people.

I'm going to paint you a picture here. Make sure you follow closely. In Florida during 2003, The Picayune Strand State Forest was created by the South Florida Water Management District. In return for the OHV's vacating 287 miles of roads, the District PLEDGED to find 640 acres in return for the VOLUNTARY vacating of the property. In return this Water District tried to pawn off a Superfund dredge disposal site with very high levels of selenium and arsenic contamination in the muck dumped there. Fast forward to 2010 and the Water District has yet to fulfill their end of the bargain. In fact, Collier County is moving forward with a lawsuit to resolve this issue. Collier County and Miami-Dade Parks Commission have found a suitable replacement for the area VOLUNTARILY given up. It rests in the middle of the Everglades where Miami-Dade County had tried to build an airport in the 1960's. The funny part about all of this is the fact that the sticking point about this area is OHV's. Everyone is okay with RV's camping, hiking and the like. The complaints range from the environmental damage to the noise affecting the Florida panther. I find it extremely hilarious that the environmental groups will complain about the 96 decibal level of the OHV exhaust affecting the panther, but the panther was ok with jets doing touch-and-go landings with their engines screaming at well over 140 decibels. This is one of many such occurrences that I can find where OHV's have voluntarily vacated an area for various reasons under the promises of "We will find you another area." Yet it rarely happens. Once the greenies get what they want any and all deals are quickly forgotten.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You might want to check the records again. The enviros are losing more and more cases. I have no problem with the park being created. I really think it was a great thing, especially in Florida. The Everglades are on my list of places to see when I retire in way too many years. The problem I have with what they did is make a promise and then try to pawn off a toxic waste disposal site as the promised area. THAT and that alone makes it look like the liberals want our children to play on toxic waste. You've been outed. At least have the decency to admit it. Many these "roads and trails" were created long before the existence of these agencies. Stop trying to make it look like they were created recently.

Look up the uses of the plantain leaf (sp?). In most places it is considered a weed, but combined with a few other herb and plants, it makes an extremely powerful drawing salve that will pull just about any foreign body from human tissue. There are even cases where it has pulled melanoma tumors from the body with no relapses. I have no problem with conservation. What I do have a problem with is a small group of very vocal people trying to dictate to everyone else on how they should live their lives, raise their children, and even recreate.

So are you going to be the one to decide if I get to have kids or not? How about we do like China and practice infanticide. Maybe we could just line people up and use firing squads. Maybe if you would stand up and be a man and push for immigration enforcement, then we wouldn't have a problem. Some 30 million live here by a lot of estimates. They are here illegally. They broke the law. Round them up and send them home.

Bravo \_\_\_\_\_! Bravo. \_\_\_\_\_ #118, who wrote... "ORV recreation is a consumptive use of the public lands. The vehicles damage (at a minimum) and frequently destroy the ecosystem where they are used." And used that as the basis to state... "given the consumptive and destructive nature of that 'multiple use'; those areas should be limited and carefully selected to minimize the impact." You are drawing conclusions based upon unsubstantiated generalizations and vague accusations. While you may be able to find an irresponsible OHV user who acts in the manner that you've perceived and described, I can tell you, as a matter of FACT, that I, on my OHV have never, ever consumed any public land resource, nor damaged or "frequently destroyed an ecosystem". I will give you the benefit of doubt, and assume that you've actually seen an OHV user behaving in the manner that you describe. But, even then, I will not allow you to cast any such behaviors across an entire Community of people, myself inclusive and use that as substantiation for access-limitations or closures!

I don't know anything about Redrock, Utah, but I'll demote this Idea strictly based on your vague-all-encompassing Title! **\*\*"ORVs Are Inappropriate for Wilderness-Quality Public Lands"\*\*. Really? It's not enough that ORV's are not allowed in Congress Designated Wilderness Areas? Now you want to restrict me from "Wilderness Quality" areas too. Because.... I -Only-Ride-In-Wilderness-Quality-Public-Lands! And, the reason I ride there is because it's Wilderness Quality and I can't ride in the Wilderness Areas! If you want a Wilderness Quality Public Lands without ORV's, visit a Wilderness Area. Demote!**

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

That's exactly what I was afraid of. While I loved riding on your Coral Pink Sand Dunes a few years ago, and I'm somewhat familiar with Little Sahara, I am an outsider here. I came into the discussion as the title of this idea is smearing the entire OHV Community. Then, \_\_\_\_\_ eluded to this with his statements: "There is more area to hike in Eastern UT then to ride a jeep, bike, or ATV so go enjoy that part of UT and leave the rest alone." My thinking was that there was no way you guys were better off in Utah than we were in Calif. That little sliver of accessible sand at Coral Pink had me knowing better than that! Continue the fight, make more people aware. If there isn't one there already Start up a club, work with the USFWS. With 6.6 Million acres, this would be the nail in OHV's coffin. Tread Lightly!

\_\_\_\_\_ is talking Dune Speak to me!! Wow, I can post all day long about the Peirson's Milk Vetch (PMV)! Not only do I know just about everything one can know about this species (try taking THAT to the bank!), its THE ONLY species that I know anything about. :) Tom, the plant is not "Endangered" and it was never classified as such. Rather, in 1999 it was classified as "Threatened" under the 1973 Endangered Species Act (ESA). \_\_\_\_\_, given such, there is no science to show that it's not endangered, as it never was endangered. Now, Since the time that this plant was listed in 1998, 49,000 acres of the Imperial Sand Dune Recreation Area (ISDRA) were "temporarily" closed in 2000, the American Sand Association (ASA, OHV Organization of 37,000 members) employed a Botanist who conducted several in-the-field Plant and Seed Bank studies. The results of these studies was a report which the ASA formally submitted to the Department of Interior (DOI) along with a Petition to get the Plant De-Listed from the 'threatened' status under the ESA. In brief, this study found two major things, 1) the PMV is rain dependant as many more plants / seeds were found in the same study plots, in more recent High Rain Fall Years than in past dryer years and 2) The PMV species is in fact flourishing, in even open OHV areas. This is what \_\_\_\_\_ is referring to as "In the end, it's not 'threatened' at all". This was the OHV communities efforts to get back the 49,000 acres of Dunes that were still 'Temporarily' closed. This petition was rejected by the Bush Administration. The ASA was born in 2000 as a result of these PMV closures in the ISDRA. 10 years later, the 49,000 acres are STILL "Temporarily Closed". Recently, the DOI reviewed the Field Study Report in conjunction with a Economic Impact Report (EIR) and revised the Critical Habitat (CH) Area designations proportionally. The net change was a reduction in CH Area designations. A small victory battle for the OHV community in this big war. I don't know the total amount of money that has been spent on this plant. I know that the ASA spent just over \$150,000 on their studies and that other organizations spent money as well. In addition, I know that there have been several lawsuits filed on behalf of this species under the ESA wherein the prevailing party is awarded their legal fees and thousands of OHV volunteer hours dedicated to the studies. Given such, it's not hard to imagine an accumulated bill of a Million Dollars strictly for the PMV as \_\_\_\_\_ has stated. All on a plant that is flourishing, even in open riding areas!

A lot of people think PMV is listed as "endangered" as there are some Employees of Environmental Orgs who hit the media once in a while and point at OHV's driving around in the sand "devastating the habitat of fragile Endangered species". Referring to the 'threatened' PMV. I was going to link you to video of a Ecological Activist saying this on TV, but I guess it's not on the web anymore.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As an Avid OHV User and "Tread Lightly" advocate, I can't stand this uneducated tone #5, Let me understand: Because OHV has some "bad apples", and because OHV's can "destroy a stream crossing" then "their vehicles deserve to be locked out of wild lands.". WHAT???. #5, who wrote: "The problem with OHV use is that the minority of OHV-ers who are badly behaved can destroy vastly more territory than the same number of badly behaved hikers or equestrians." Ok. The trick is in your statement in "the same number". If you really want to get into a tit-for-tat with Hikers vs OHV, myself and a couple others can provide you with a weeks worth of bathroom reading in articles and references showing the past damages that hikers have done in one foul swoop. But, then both of us recreationalists will walk away with a Black Eye! You already gave us one, so I'm game either way! #5, who wrote: "Three or four of them can destroy a stream crossing or sensitive site in minutes." Do you know that in some areas, riding in streams is not against the law? Refer to my alternate post earlier today. If you would like to constructively address this concern, then you can advocate the construction of access bridges and work with your local governmental agencies. Or do you only care enough to post such concern from the comfort of your keyboard? #5, who wrote: "the fact is that the few bad apples in their bunch are incredibly destructive and, sadly for the others, that's why their vehicles deserve to be locked out of wild lands." IS THAT A FACT???. If that's really a FACT (Cause you said it was), you must have some Science I've never seen. Until you can post said Science, I'll just consider this another unsubstantiated, vague LIE from an Anti OHV advocate! Even with said Science, I'll still question how you go from Bad Apples and Stream Riding to "vehicles deserve to be locked out of wild lands".

If by "protecting and Saving our wilderness " you mean additional "Congressional Designated Wilderness Areas"... then No Thanks!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am an off-road enthusiast and I love the land, my sport is so healthful and I keep losing trails even though I volunteer hour after hour to restore and maintain. There \_\_\_\_\_, is that what you wanted to hear from me? You said: "Trails that are being closed are trails where there has been documented environmental damage." This is not true! And with "forty years in the backcountry, dealings with BLM", I suspect that you know so, OR at least you should! There is presently a 26,000 acres Wilderness Area in Southern California. Prior to this being Wilderness Area, it was OHV accessible Sand Dunes. This area was not closed to OHV use because of documented environmental damage. It was designated by Congress as a Wilderness Area as part of the California Desert Protection Act. The Designation, nor the Closure had anything to do with the previous OHV activity! Near this same area, 49,000 acres of Sand Dunes were 'Temporarily Closed' by the BLM in 2000 to restrict OHV access from the area while a plant was studied. 10 years later, these acres are still closed from OHV Access. Meanwhile, additional studies have been preformed to report that the plant is flourishing, even in open riding areas. This closure had nothing to do with OHV use either. Documented environmental damage does not close trails. Politics closes trails. It doesn't seem that your experience has looked very close at Clubs either. The Club I belong to is "above and beyond" with education and information. Yet, you would say that they "fail to do so"? And you call it self-serving if a group holds a riding terrain "clean up" because they are in their riding terrain???? I can tell you that the Boy Scouts aren't going to clean up the riding terrain! If you think that OHV groups are lobbying for "more a more land", you need to look at the bigger picture! They are lobbying to prevent more and more closures, and to get previously closed lands (like my 49,000 acres) opened up again! And then there's this: " 'We the people' MEANS ALL OF US, not a selective slice of society advocating for a particular special interest." So, why then, are you trying to exclude 'some of us'?

I can copy and Paste too! If any laws are being broken in your 'dust bowl', call your local law enforcement. I don't know where you are located, but In California, it's illegal for kids to ride unsupervised. Unless you are referring to a plot of Federal Land (which I doubt since you say it's "a field that has been allocated for housing") then this forum isnt the correct place to bring it up as the Federal AGO Initiative is applicable only to Lands within their scope. If the owls are listed as "endangered" under the Endangered Species Act, then I doub't if they will be building houses in the Dust Bowl.

#35, who wrote: "As far as I can determine the biggest threat proposed by ORV is the carbon dioxide emissions and energy consumption from getting to a place to ride." I hear you on that Justus! Heck, I used to be able to ride in my own County. Not anymore. Now, to get my family and OHV's to our recreation area, we drive past 3 closed OHV areas that would suffice just fine, and burn 30 gallons of gasoline to get there (one way!).

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

If any laws are being broken in your 'dust bowl', call your local law enforcement. I don't know where you are located, but In California, it's illegal for kids to ride unsupervised. Unless you are referring to a plot of Federal Land (which I doubt since you say it's "a field that has been allocated for housing") then this forum isnt the correct place to bring it up as the Federal AGO Initiative is applicable only to Lands within their scope. If the owls are listed as "endangered" under the Endangered Species Act, then I doub't if they will be building houses in the Dust Bowl. The areas of closure that I refer to are nowhere near any Urban Development. They are in the middle of the desert, closed by environmentalists Orgs.

"Off Road Vehicles Ruin Natural Beauty People who drive off road vehicles have no respect for nature or the rights of others. Please ban or restrict their access to public places. " The Title is a lie, and I can prove it! The first sentece is a vauge generalization throwing an entire community under the bus. The second sentence is asking for limiations to be placed on this community without any valid justification or substantiation. \_\_\_\_\_ didn't take the time to slap up more than 3 sentences in this Idea (the title being one sentence), nor does he care to even answer our questions that are specifically addressed to him (ref my original post in this Idea). Clearly he's one to throw a punch and then run off. And yes, 874 people in this forum want to Promote this idea. Amazing!!!

Preservation of land FROM WHAT?

Wind, Solar and Thermal Industries are moving into California's Desert's Already. Deserts that are OHV Accessbile. The first thing they do is put a fence around the land they've leased from BLM. Until these industries learn to work with the OHV community, I will pass on this thinking every time! Demote.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Your assumptions are incorrect... and so are the things you think I "see". What I said was: "In fiscal year 2004~2005, \$25.4 M was allocated for The Conservation & Enforcement Services (CESA) Account within the OHV Trust Fund, specifically for "restoration of trails". In Jan2005, the OHV Community learned that "restoration of trails" is the act of taking existing trails and restoring them to NEVER be driven on or ridden on again. Here is a case where the money was there, it was even allocated for the use. But it was instead used against the community it was intended to serve while trails needing maintenance were left with no money!!! " In the OP, you stated that I should take "full and absolute responsibility for all the costs associated with maintaining and cleaning up after their group". So, I pointed out an exact case in 2005 where monies were provided by the State of California from the OHV Registration Fund to do just that! For the restoration and maintenance of trails. Money that came from the OHV Community was used to Restrict the OHV Community! Instead of seeing my point, and thinking that maybe our community is trying to take responsibility, you want to point out that "I need some training so I can identify the problems". ARE YOU DEAF??? THE PROBLEM IS, THE MONIES ARE NOT BEING USED PROPERLY! THE FUNDS WERE RAISED. THE MONEY WAS ALLOCATED AND THEN IT WAS HIJACKED. I know, you're probably hi-fiving yourself in the mirror to know that in California moneys were taken from the OHV budget and used to restrict access. But let "train" you on something. IF THE MONIES HAD BEEN USED PROPERLY, WOULD YOU HAVE NEEDED TO POST THIS IDEA, AND CALL PEOPLE NAMES FOR DEMOTING IT??? I maintain that this forum would be a better place without you!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To keep the long discussion from getting longer, I propose that we just talk about the kids. Not adults. I don't see that you've really addressed the questions in my earlier posts. That said, I will address yours as I hope you will of mine. \_\_\_\_\_ wrote: "things like helmets, OHV riding classes, better parental supervision, no night riding, no pavement riding, no doubling up on single rider vehicles are all good things, and if everybody followed these rules it would cut down, but not eliminate, fatalities." If everybody is not following the rules, then this would be an Enforcement issue. Not a "Ban" issue. So why are you trying to "Ban" it?? You wrote: "any people who follow every single rule in the book (a distinct minority) are still killed on ATVs because they are too darn unstable." I would agree that "Some" people don't follow every single Law in the book. That said, I would like to know where you are getting "(a distinct minority)" from??? In the place where I ride (Imperial Sand Dune Recreation Area), there is a lot of Law Enforcement Officers (LEO's) looking around. Everyone must follow all the rules or they will get a ticket for not wearing a Helmet, or riding two people on a ATV or towing a sand board behind them, etc. As a result, I would say from my observations in this Recreation Area that probably 99.5% of ALL users under 16 follow every single Law in the book. Given such, I would disagree with your statement that these laws are "nearly impossible" to enforce. "A safety certificate in a kid's pocket doesn't do him that much good when the machine flips and comes down on him, you know?" You're funny, but you're right, when a ATV is upside-down, it does no good. That stated, I can tell you that the ATV Safety Certification Course does teach kids how to traverse across a slope in a manner to prevent a roll over. How to travel up a slope in a way to keep the ATV from rolling over backwards. How to turn at speed without rolling the ATV over, etc. I have taken the time to read your 3.5 year old article from the The Oregonian and I have to question how long are you going to hang on to this for? Even I can tell you that there are more recent articles of the same ilk out there. Regardless, of all people and accident mentioned in the article, applicable to our '16 and under' discussion it cites the death of Four children at ages 4yrs, 7yrs and two infants all having occurred on ATV's in different parts of the country. While the article goes on and on about what the government hasn't done, should do, etc. It does not give any indication if these children were wearing Personal Protective Equipment (PPE), if the accident was a collision with another vehicle, how the accident occurred, if Alcohol was involved, etc. So, I can't speak much about these deaths. What I can tell you is that there are already laws in place to keep infants off of an ATV (no double riders), so no additional legislation would have saved those lives. The Ban that you propose would not have saved those lives. This is a classic situation where charges should be brought against those Parents or Guardian's. The article goes on to state that 2 million people have been seriously hurt since the commission began counting. In my earlier post, I have already explained that my son is one of these numbers as a result of stitches needed from a 2008 trip and fall in camp. He needed 3 stitches under his chin, and it was counted as a OHV related Emergency Room visit since we were coming from the OHV Recreation Area! Given such, I have great doubt that 2 million people sustained serious injury as the article claims. The article states, "The machines flip over with punishing regularity -- smashing faces, breaking necks, crushing chests." There is presently optional PPE that can be worn to prevent such injuries. Namely Full Face Helmet, Neck Braces and Chest Protectors. My son wears all three. At present this PPE is considered optional, as only a DOT approved Helmet is required and these do come in open face types. My recommendation is to amend your idea to address a revision to the PPE

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

requirements. The article reports that "specific models" are prone to overturn and that the ATV manufacturers point at 'operator error' as being the cause of the safety issues. I would agree that users are responsible for the proper use of their ATV's, but any "Specific Models" that The Oregonian has found to be prone to overturn should be reviewed by the Government. I question The Oregonian's agenda when they fail to mention WHICH MODELS they found!!! Given that this article is outdated, inaccurate and only tells part of a story, I think I've given it more attention that it deserves. After all, it does not very well support the argument to Ban Child OHV use. You are correct, when a family's child is killed in an ATV accident, no charges are brought against adults or parents. This is exactly what needs to change! Regardless of how appropriate it is, a kid dying because he wasn't wearing a helmet is evidence that the supervising parent or guardian was NEGLECTING to put a helmet on him. As the parent owning to Child ATV's, I would much rather find myself Jail than to condemn my entire community of the freedom to ride. "But even if those laws could be enforced (they are not), and people complied with them (they do not)," It sounds like you've convinced yourself of something that isn't true. Something that I've shown you "from my observations" isn't true in my area. I guess I disagree with "America's Medical Community". My child does have the maturity to control an ATV. He started riding when he was very young. At 7 now, his abilities have grown commensurate with his age. My banter here is all in effort to get you to revise your idea. If you have your Agenda and it's not going to change. Just tell me, and I'll start my own idea instead of trying to change yours. I would much prefer that two side come together and work out a balanced solution. To me, this would be much stronger than each of us having conflicting ideas. What say YOU?

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

You seem to be big on statistics, reports and articles. Numbers, Reports and Articles don't always tell the truth. Here are some examples that are not always applicable to your Idea, but they do show that numbers can lie and reports can skew. 1) At this { <a href="http://www.kswt.com/Global/story.asp?S=11388389" rel="nofollow" target="\_blank">Link</a> }, you'll see an article titled "Man Killed In Violent Accident At Sand Dunes". This was a 34 year old man who fell to his death. Devastating Right? Well, later that day, another article is written about the same accident wherein they wrote, "Alcohol is considered to have been a factor in the accident". 2) At this { <a href="http://kxoradio.com/content/view/6319/1/" rel="nofollow" target="\_blank">Link</a> }, you'll read an article titled "62-year-old dies off-roading". At the bottom of the article it says "The Deputy Coroner says it appears to be natural" causes. As if a sensationalized title doesn't hurt enough, This mans death, while determined to be Natural Causes was counted as an OHV related death. 3) While you can find articles about deaths and injuries "on the rise" in the ISDRA, at this { <a href="http://files.americansandassociation.org/Images/ISDRA\_Medicals.JPG" rel="nofollow" target="\_blank">Link</a> }, you can see BLM is actually reporting a steady decline in Emergency Responses over the past 8 years. 4) At this { <a href="http://kxoradio.com/content/view/6977/2/" rel="nofollow" target="\_blank">Link</a> }, is an article titled "55 Year old dies in Sand Dunes". As you read the article, he didn't die in the Dunes. Instead, he had shortness of breath in camp, and was in the process of being transported to the hospital when he died. This was deemed to be an OHV related death as he was camped in the Recreation Area. I can go on forever SP. These are just the articles that I knew of (because the events occurred in my riding area), I didn't even hit google for this stuff.

I am trying to work with you. Case in point, look at all the time I've put into this idea when it would simply be easier to create my own. \_\_\_\_\_ Wrote: "your agenda seems to simply to discredit anyone or any study or article that supports stricter ATV laws when it comes to kids." You clearly aren't listening to me. How can you possibly say this when I've stated the following: 1) I would agree that "Some" people don't follow every single Law in the book. 2) When a ATV is upside-down, (a safety certificate) does no good... 3) When a family's child is killed in an ATV accident, no charges are brought against adults or parents. This is exactly what needs to change! 4) A kid dying because he wasn't wearing a helmet is evidence that the supervising parent or guardian was NEGLECTING to put a helmet on him. In addition, I have asked you questions that you haven't answered yet: 1) If everybody is not following the rules, then this would be an Enforcement issue. Not a "Ban" issue. So why are you trying to "Ban" it?? 2) I would like to know where you are getting "(a distinct minority)" from? 3) Would you consider revising your idea to omit "Ban" and add "accountability"? And, while I've showed you several examples of how numbers get flawed, you continue to throw numbers at me. SP wrote, "six children under the age of 16 killed so far this year. " How did they die? Were they wearing PPE? Were they even on an ATV when it happened? And on top of all this, I provide novels of thoughtful information, and you come back with 5 sentences. Clearly, you don't want to work with me. You have my demote vote, and unless you want to put some energy into this discussion, I'm Done!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Demote. I might be wrong here, but I think by coming on this site and asking for the The BLM to provide interim protection to the lands it has already identified as having wilderness quality, you are seeking the BLM to conduct a task that the BLM can not conduct without the authority to do so.

If the BLM has the authority to provide interim protection to lands it identifies as having wilderness quality and they are not finding it necessary to exercise that Authority, then they must have sufficient grounds for doing so. If you disagree with that position, you would likely be better heard in your efforts by filing suit against the BLM than by appealing (here) to the Obama Administration.

I agree with you. The Idea is missing a lot (a common theme lately). I don't know anything about the significance of the Appalachian National Scenic Trail, but I would like to see some verbiage that your Idea would include some information about Outdoor Recreation. I am concerned about Alternative Energy growth because they are moving into the California Desert without any regard for who is using that land. The first thing they do is put a fence around their land that is leased from the public land managers and then public is blocked out.

More Legislation in the US is not going to "help Earth thrive". Not to mention, the AGO Initiative only goes as far as our shores. Your title states "Stop being an environmental hog" but them your OP doesn't address this. Instead you have "This going back and forth is nonsense" and "it takes every one of us to reach the goal" Yes, these generalities are all true. But HOW will your idea achieve this?

In 2000~2008, Field Research was conducted on a plant species in California. This research was conducted by a Botanist and funded by a OHV Org. It was submitted to the USFWS in the form of "Sound Science" in 2008, and formally acknowledged as such in 2009. In 2010, the USFWS used this data in conjunction with a Economic Impact Report to reduce the Plant Species Critical Habitat Designation. Specific to this case, \_\_\_\_\_ is wrong.

I as the Author of this idea agree to spend my time to address your questions in good faith that you'll return in kind in hopes that my Idea will earn your Promote vote. #1) What is your question? #2) I have not nor do not imply that Environmentalist Orgs are "illicitly receiving funds from the government". To the contrary, under the ESA these Orgs are legally seeking to recover costs of litigation (including reasonable attorney and expert witness fees) in lawsuits that they have originated. #3) I am NOT proposing to disban the ESA. I am all for the ESA with one exception... On Page 46 it states the following: "" (4) The court, in issuing any final order in any suit brought pursuant to paragraph (1) of this subsection, may award costs of litigation (including reasonable attorney and expert witness fees) to any party, whenever the court determines such award is appropriate. "" And this is what allows the ESA to line the pockets of Enviromentalist Organizations.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

The ESA needs to be revised to keep this from happening. { <a href="http://ideas.usda.gov/ago/ideas.nsf/0/CBB02A755EF40A7D8625779D0075435F?OpenDocument" rel="nofollow" target="\_blank">Link</a> } The people, suing the government, with the governments money as currently permitted by the Endangered Species Act of 1973. For that reason, I can not Support and Defend the Endangered Species Act as currently written.

Extra flight time = more jet fuel being burned.

Reading through your strong Anti-Access / Anti-OHV stance, I can get behind your Idea with a couple of revisions. My concern is with access restrictions. If there are 5 streams that run like fingers off your hand through a current OHV Park, and I let you write a law that the rubber cant touch the water, then you've restricted my access to 80% of the park. While I do see the vague and blanketing statement that you're "appalled that people who tend to defend their recreation as responsible act so irresponsibly", I do not see any provisions in your idea for keeping access open to the OHV's for currently open lands on the other side of a stream (i.e. Bridge construction). Nor do I see any provisions in your Idea for the opportunity for this construction to occur without lawsuit, Impact Study, etc, etc, etc. If you can incorporate revisions per my comments, I will revise my vote. Now, what the heck is this all about? "I'm appalled that people who tend to defend their recreation as responsible act so irresponsibly" I am standing here defending my recreation. Which according to you means that I've irresponsibly recreated on my OHV? You would be WRONG sir! I rode through a stream bottom once. I hauled the mail, in 5th gear and it was FUN! It was in the San Felipe Wash in a California State OHV Park. Guess what.... RIDING IN THAT WASH IS LEGAL!!! So, it would seem, in this case, that what you call acting "irresponsibly" is what others like myself, other OHV Users, and LAW ENFORCEMENT OFFICERS call "Legal".

I am an avid bicyclist BUT SORRY, NO way should bikes be allowed on trails such as the Pacific Crest Trail! These trails are for hikers and horseback riders ONLY!

Save Bristol Bay from gold mining. Nature, particularly as glorious as Bristol Bay, is infinitely more valuable than all the gold a mining corporation could extract. Experience has shown that there is no such thing as "minimal disturbance" when it comes to mining. Pebble Mine would be devastating to the beauty and ecological relevance of Bristol Bay. America values its natural treasures. Lets protect them from corporate greed and save them for the health of our communities and the survival of the amazing wildlife that lives there.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The brutalizing aggressive assaults on mustangs have been highly criticized by AZ Congressman Raul Grijalva in a letter of last October, and a letter of CA Senator Barbara Boxer of February 2010. The public is shun out from witnessing ALL operations, under the guise of "safety concerns". I have seen round ups and am one of those appealing to the BLM to include us, an independent humane observer that is, in their apparently covert operations. The transparency that Don Glenn preached about here in Denver remains yet to be seen. The horrific fatal outcome of the Calico/Tuscarora round ups is yet another evidential reason to doubt the whole conduct of BLM outfit. It is time BLM stops its propaganda and becomes more professional in it's program, which has fundamental problems, that have not been corrected. BLM has failed to take a hard look at the findings and recommendations of the GAO's report and is clearly violating not only the managing of horses, but is based on inhumane and fiscally irresponsible practices. The round ups under the current management regime are only another failure to address the effectiveness for the true protection of the horses, whilst other goals such as cattle, mining and drilling - are the true agenda carried out under the guise of "managing excess horses", whilst there are none of those, only excess lies. (How is the loss of 19 million acres range, assigned by federal law to the horses, justified by BLM?) The American people and Congress have been deceived and betrayed. BLM's outstanding problems and it's promise to integrate "transparency" with an allocated budget of \$ 500'000.00 according to Don Glenn, BLM Nat'l Advisory Board Meeting Denver, of summer 2010, have yet to be explored and corrected. It is time the failings in regards to BLM's systematic removals of entire herds, inaccurately determined HMA's/AML's numbers, more horses in holding than in the wild, no long-range plan that is ethically, morally and fiscally appropriate, and the irresponsible use of taxpayer's dollars to finance the current claims to gather, which are in violation with the 1971 WFRHB Act, are fixed. Despite thousands of calls and letters, BLM ignores the public and Congress. Craig Downer, wildlife ecologist, has repeatedly presented effective long-term solutions to BLM, which are conveniently ignored. BLM Board is not balanced with representatives of both sides, only consists of those whose interests are with BLM's and Salazar's main agenda and ulterior motives. It is time BLM agency is stripped of it's abusive powers and reformed.

Here's the story, I am pedaling along on a so called "illegal" trail and there is an elderly man with his presumably two grandsons. As I come closer he starts to tell me I am not supposed to be on the trail. I reply that how is it that a dirt trail has a "law" about it, it is dirt and an "Open Space." As I begin to pull away he actually starts to chase me! I stop and say, "sir, aside from my supposedly not supposed to be here, what have I done to offend you?" He starts to yell and tell me that "that is why, you are not supposed to be here." I ask him who decided that I am not supposed to be here to which he cannot answer but starts to give me ALL the excuses I have read here so far. I then say "why is it so hard for you to just allow me to pass by and enjoy this area just as you are?" to which he again cannot answer. The saddest part of the whole encounter is that his two grandsons are shivering in terror. I have done nothing to this man except "protest" the idea that cycles don't belong on a trail of dirt. I ask you, who is really the belligerent and unruly person in this story??

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Protecting Bristol Bay is good for people, business, salmon and wildlife. The Bristol Bay region is a treasure - both locally and internationally. The tens of millions of salmon that return to the region every year provide food for people and wildlife, pump \$445 million into the local economy each year and provide almost 5,000 full time jobs and as many as 12,000 seasonal jobs.

Thousands of Alaska native people live in this region and depend on clean, healthy rivers for their survival. Hundreds of local Alaskans own small businesses that depend on a healthy watershed to thrive. Thousands of people visit this area for the world class hunting, fishing and recreation opportunities it provides. One excellent program that I've had the privilege of working on that supports a healthy local economy and watershed is the annual Bristol Bay Fly Fishing and Guide Academy. It's a week long conservation and outdoor education course that teaches local Alaska Native youth the ins and outs of fly fishing, owning/operating a fly-fishing business in Bristol Bay, river ecology and much more. In the long term it prepares students for local sustainable jobs based on healthy watersheds. You can learn more about it here: { <a href="http://www.savebristolbay.org/blog/audio-slideshow-of-our-bristol-bay-fly-fishing-and-guide-academy" rel="nofollow" target="\_blank">Link</a> } The proposed Pebble Mine would put all of this at risk. As an Alaskan, I urge the Administration to do whatever is in their power to protect this world-class region and stop the proposed Pebble mine.

Opposing the Pebble Mine. I am opposed to development of the proposed Pebble Mine, which would endanger the pristine beauty of Bristol Bay. This has not been a good year for extractive industries, because something always seems to result in significant damage to the environment. We should not allow greed to trump protection of the planet, even though the proposed mine would be out of sight of most of us in the "lower 48".

Ask any hiker or equestrian who has encountered a fast moving cyclist on any trail/path, much less a wilderness trail where consequences can be deadly, and the common sense answer to this proposal becomes clear. Even if you accept that the majority of cyclists are well intended, their fun factor includes going fast, which puts other trail users at risk. Cyclists should be focused on creating recreational areas where they can do their thing safely. Safe for them and not trying to introduce themselves into an existing successful and historical foot/h hoof trail system. Not to mention the damage/maintenance effects that their equipment causes to trails. The mix is simply untenable.

When anti OHV users complain about noise and air pollution does that mean that they hiked to the trail as well? I just haven't seen many smart cars and "green" vehicles that can make it up the fire roads and such that get you to so many popular hiking areas.

Wilderness areas are set up as safe havens for wildlife and to preserve pristine areas for generations to come. How do you propose to reduce the conflict with wildlife and keep species numbers from dropping now that noisy, polluting machines and human interaction is introduced? Or do you not care?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Do you not care that wildlife numbers are decreasing and more species are listed on the threatened or endangered list than ever before and there are dozens more that should be listed but are not? If you are asking me if I feel so sorry for snowmobile users or ohv users that I would be willing to sacrifice the health of a forest or the survival of a species then the answer would be absolutely NO. I have watched deer, moose, rabbits, etc. run from the noise and presence of motorbikes on trails. What would have happened to that poor cub had it entered your camp? Would someone have shot it or could it have become frightened causing the mother to come to its aid? Most likely and then what would have happened? The mother and the cubs would have been round up and killed even though they did nothing wrong. NOTHING good comes of introducing humans to areas animals live.

Well said. If humans cannot find a way to live with the planet and the planet's species instead of destroying it then we deserve to go extinct.

Ah yes, let's reward the lazy, noisy, polluting, habitat destroying people and punish the nature loving, quiet, habitat protecting people not to mention the wildlife that lives in the areas you want exclusive rights to. That sounds fair to me. Why is it that every ohv idea is me, me, me, I, I, I, give, give, give, take, take, take? Just once I would like to see a ohv user propose an idea that promotes conservation and preservation of wilderness and wildlife habitat. Here is a novel approach Brent, how about you and your community stop harassing hikers, equestrians, skiers and wildlife on the trails and in the forest? How about you and your community actually follow the laws and stay off areas you are not supposed to go on instead of bypassing gates, ignoring signs and going wherever you want? How about you actually apply some of the empty words you like to throw around so much and stop ruining trails and wildlife habitat? Maybe then you would not get hassled so much.

I find it comical that you think sitting on a machine is actually grueling exercise. I think a more appropriate challenge would be for you to keep up with me on a trail WALKING ON TWO LEGS! Either way though thank you for admitting that you ride both recklessly and irresponsibly without any thought on the damage you commit. Pretty much my point on you people to begin with. As far as me losing land open to me I have lost plenty. Over development has taken thousands of acres I once hiked and camped and areas being opened to ohv use has taken 2 of my favorite trails. You are right that the fact you enjoy snowmobiling does not mean you are anti environment but the fact your votes demote all ideas on conservation and preservation says you are indeed anti environmental, anti preservation, anti wildlife and anti wilderness. If you want an explanation on what I mean by hassling you all you need do is see all the whining your community has done on this site since its implementation to now what I mean. That is a good one trying to blame environmentalists on your illegal activities. I believe rapists have tried the same defense...."She looked so hot in those tight clothes she was asking for it." Thank you for admitting though that you do indeed perform illegal activities and do not care. Another of my anti ohv points admitted by you. Please explain to me how my ideas and comments on protecting wildlife and wildlife habitat is somehow selfish. I am gaining nothing from a protected area but wildlife is. If you can do it without sounding moronic I would appreciate it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

For the 100th time yes I rode once about 30 years ago and did not like it, have never done it since and never will again, Thank you too though for admitting you drive irresponsibly and recklessly. That is 2 ohv users that have admitted that. Do I see a third? I still find it laughable though that you people think sitting on a machine is strenuous exercise. Have you ever tried to do something on your feet besides walk from the couch to the fridge or the toilet? Do I think snowmobiles are as damaging as motorbikes, atvs or 4x4s? No, but they do chase wildlife from wintering habitat and away from food sources and in areas of little to no snow cover they are indeed damaging to the area. The trails in my area that were opened to ohv use were basically destroyed quickly after being opened. They became heavily rutted and littered with garbage and broken glass plus the added annoyance of drivers revving their engines as they passed me and having to get off the trail to allow someone on a bike or a truck to pass. The wildlife that once roamed the area were gone and it became too depressing between putting up with the idiots, the noise and seeing the destruction to continue to go there. I go to the forest to relax and enjoy the quiet not put up with jerks and hear more noise than I would on my own town streets. Maybe that is how "people like you" show respect to people who prefer to recreate in a non motorized way? From my experiences it sure is. Just returned from 2 weeks in BC hiking at high elevations with a fairly heavy pack for half of it. I think that is just a bit more strenuous than riding a snowmobile. IF you ever promote an idea about preservation or conservation that does include ohv access then maybe we can discuss what you are and what you are not but until you do I go only go by what I see and read. As I said snowmobiles are not as damaging as some other forms of ohv use but they are still damaging and can be quite a bit damaging if the driver is careless and irresponsible.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Well we can put to rest any notion you are concerned about the environment or are a conservationist like you claim now that you admitted to driving a V8 SUV. I always wondered something about you people..when you saw the news reports of all those poor birds, dolphins, turtles, etc. covered in oil and suffering horrible deaths did you feel any remorse, sadness or feel any type of responsibility? Or did you say they are only animals and jump in your SUV for a joy ride? How much exercise OHV use has nothing to do with this so we can leave it at that. I do not think there could ever be mutual respect or common ground because we both believe 2 totally different things. I believe wilderness and wildlife is something to be cherished and preserved and if that means I have to drive a small car, keep my heat low or give up access as a hiker and backpacker then so be it, I have no problem doing so. You and your community though feels as though wilderness is something to be used regardless of the consequences even if those consequences mean extinction for species of wildlife and plants. You will say this is wrong I am sure but going by the voting and comments on this site not to mention the things I have seen OHV users do with my own two eyes I can come to no other conclusion. To be fair though I have not seen much damage caused by snowmobiles. Maybe that is because I live in an area where there is not much use or maybe it is because they do not do as much damage as other form of OHV use so there may be something to your argument but I have read accounts of riders harassing wildlife and that is something I could never promote. One thing I will agree with you on though \_\_\_\_\_ is that the trails help wildlife move around easier. Still though does that make up for the harassment? Nice try but if I worried about every insult someone from the OHV community has said to me on this site I would have left months ago. Actually your insults are pretty much standard fare and lacking originality. Better luck next time. I don't apologize for mocking you either but tell me since you seem to want me to care, how would you go about protecting wildlife and wilderness?

Way to try to pass blame on environmentalists for what is the fault of ignorant people like you, Rush and Sarah would be proud but if that is what it takes to help you sleep at night then go for it. You obviously do not care about the environment though. As far as me commenting on your idea I am more commenting on the title or your idea since it covers a wide range of OHV use. If you want to change the title to snowmobile areas then fine but since you have tried, unsuccessfully, to deceive people with your title, something the OHV community likes to do, I feel I can comment as I like. Yes I have spent much time in the west hiking and backpacking so I know the areas you speak of and may have even visited some. As for you saying it is "desolate" place I find it not in any way so. I have seen wildlife that very much need those areas to survive, the reason you do not see them is because they run from your noisy machine and because you do not care enough to look for them. As for causing extinction you are not solely to blame but you are not helping in any way and as the saying goes..."if you are not part of the solution you are part of the problem". It would change nothing because you and your community would still be damaging wildlife habitat and killing off wildlife so environmental groups will still be there watching over you.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The reason it is contentious is the author never mentions what happens to the wildlife that lives in these areas he wants access to. Like just about every ohv idea on this site never is there any regard as to the animals that call these areas home and in some cases the last remaining areas of range they have left. To grant further access to vital wildlife habitat just to accommodate a greedy ohv user and to put entire species at risk of extinction is ridiculous and I will fight that every time. If that sounds "radical" to you you like the author suggests in one of his comments then I really have to question your true motives as well. Plus I believe one of your most popular rallying cries is "do not punish one group of users", well isn't this idea punishing one group? Or is it because it is not your group that it does not matter?

" provide the snowmobile with a "cherry stem" into areas not frequented by skiers and close them out of said area. " Obviously we have an interpretation problem here. To me it appears the author wants access currently of limits so he can go to areas where skiers do not go. How does this read to you? Personally I think it is you that is trying to deflect the true meaning of this idea in order to prove a point you are trying to make and because you yourself want more and more access to areas off limits. As an expert on things I say you must know that time and time again I have said (including once on this very thread, comment 15, paragraph 2) I have no problem giving up access if it benefits wildlife. Tell me though since you seem to know everything about me, what is my "real motivation"? As for proof that human interaction with wildlife is bad for wildlife are you really that ignorant and dumb or are you just relying on the same stupid ohv argument that ohv use does no harm?

So protecting the last 3 remaining animals of that species is not good enough reason to close an area? I guess you are suggesting to just let the species go extinct because to try to protect them is inconvenient to you and your fellow snowmobile enthusiast? No I do not know the Timber Wolf is the one predator proven to have a major impact on the species. You forgot the most dangerous predator to ALL animal species....human beings.

Nope, I would say you made you intent clear. The beginning part I could agree with but there is always 2 sides of the story and I would guess the skiers would complain of snowmobile use in areas off limits to your group and damage to trails and the surrounding area which I can totally believe. The second part though pretty much speaks for what you stand for and damages the first part of your argument. Here you feel your own greedy, self centered pleasure trumps the need to protect forest areas, wildlife habitat and wildlife in general. That is pretty much what I figured you were all about so thanks for reinforcing my beliefs. Knowing this, and the many other things you have admitted to in this thread, I could never believe that you are an innocent victim in anything or that your idea is harmless and only a cry for fairness. Normally I would agree that 500,000 acres is a bit much but since this is the LAST 3 remaining animals of that species I would say that any amount of land blocked off, no matter how big, is not big enough to save the species from going extinct. The fact you do not agree is pretty depressing but again pretty much what I expected.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I think there is a lot more than cloud seeding and weather modification going on up there. Lets not forget the grip pharmaceutical companies have on the country. Either way though I agree that it needs to stop.

As usual another ohv user wants to demonize environmental groups and blame them for all the worlds ills. Development, oil and gas drilling, mining, logging, and road building are fine but save a forest or a wildlife species and you are the devil incarnate according to \_\_\_\_\_ and his ohv cronies.

I did read the OP and yes I do realize what the subject matter is. If you had taken a second to check my voting instead of assuming how I voted you would see that I chose no opinion because I thought the idea had both good and bad parts to it so I neither supported it nor demoted it. It is not so much the responsible logging we are opposed to but the infrastructure that is needed to support the logging. Roads must be built through the forest to get to the area that is being logged and heavy machinery is brought in which causes disruptions in wildlife patterns. I strongly suspect though that your concern for the forest is merely a ruse. Everyone knows the ohv community loves roads being built and more access. What better way to get roads built and more access at no cost to you than to promote logging in areas that are currently off limits to you? I find it very hard to believe all of the sudden you have done a 180 and are concerned with the environment, wilderness, wildlife habitat and wildlife when you have not exactly been promoting conservation ideas since you came here.

How about america reduces its consumption of oil? We use nearly twice as much as the closet nation. Are the tens of thousands of wells we already have in this country not enough for you? Most of the oil drilled here is sold on the world market anyway and never even reaches our refineries or pumps. When are idiots like yourself going to realize that no matter how much we drill here it will do NOTHING to reduce our use of foreign oil or the price of that oil unless we reduce our consumption!

You forgot about humans killing elephants for their tusks and rhinos for their horns. Or how we kill grizzlies for their gall bladders and moose, elk and deer so some moron can put their antlers on his wall and prove how (un)manly he is. True facts are humans are the only species to hunt for "sport" and we are by far the most wasteful and destructive animal species there is. Animals have as much right to life as us. We are not better than them.

And as usual the ohv community, lead by lobbyists like \_\_\_\_\_ and \_\_\_\_\_, demote any type of idea that demands responsible usage by the driver. Then they wonder why their community is looked down upon and has a bad name. Look in the mirror guys, the reason is you and your kind.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It amazes me how much the ohv community hates wildlife and wilderness yet they still want people to believe they are somehow respect nature. It is no wonder they could care less about the destruction and death they cause when you read "ideas" like this. You talk about "balance" yet many species are down to 1% of the original territory. How is there any "balance" in that? What you propose is taking away more territory even if it is that last 1%. Check the threatened and endangered species list and tell me there is "balance" going on.

"the average American spends 90% of his or her life indoors," Is this actually true? That is ridiculous. No wonder america is now known as the home of the obese and the land of the lazy.

Your average day of Quality Family OHV Time in the Forest: Driving as fast as you can as destructive as you can. Bypassing gates, boulders and signs to drive where you are not supposed to go. Chasing deer, elk, moose and any other forms of wildlife you come across from their habitat. Running over saplings on sides of trails, flowers in meadows and tearing up small streams. Running over a turtle or 2. Gunning the engine while you pass an equestrian or hiker to see what happens. "gee son wasn't that something the way you could hear her head bounce off the rocks after the horse threw her? HaHaHaHa. " Going deep into the forest to do target practice on unsuspecting birds and wildlife. Going home and telling everyone how you are a "responsible" ohv user.

"Promote ohv use and destroy everything in our path". The ohv users creed. Passed on from generation to generation of ohv users. A wonderful legacy to pass on to our nations youth.

"OHV recreational access to our public lands helps promote and educate on the beauty of the great outdoors. This in turn promotes conservation and good stewardship of our public land." I was always find it pretty odd to read ohv users say this then demote every idea concerning conservation or protection of our forests and wildlife. How exactly is your use promoting or educating you when you demote all ideas of conservation and good stewardship? I guess to you people the beauty of the outdoors is only what you can drive over and if your activity destroys or kills that beauty then so what and to you that is good stewardship?

You should change the title of this to "Sick people CANNOT recreate". I hike as often as I can but as a person who has asthma I have to pay attention to the air pollution alerts and if the warnings are issued I do have to refrain from hiking those days. Sadly this summer was brutally hot and with all the pollution in the air there were more days where I could not recreate than days I could.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Over the weeks and months I have become accustomed to your twisting of peoples words, your accusing people of lying when it is you yourself that is lying, your making fun of peoples fears for the environment, forests and wildlife and your attacks on people who have tried to limit their carbon footprint but making fun of people with disease and trying to belittle their ailments and deny the struggles they go through on a everyday basis is disgusting even for you. How many times have you been rushed to the hospital because of a severe asthma attack, shot full of drugs, hooked up to IV's and breathing machines and kept overnight for observation? Have you ever had your lips and fingers turn blue from lack of oxygen due to a severe attack? How many nights sleep have you lost because you were bent over trying to suck in air all night? Have you ever had to cut a vacation short, go home from work or seen a loved one break down because of your condition? No, well it must be really nice to be healthy and so high and mighty that you can make fun of others that are not so lucky. Tell you what \_\_\_\_\_, go out in the street and run as fast as you can for as far as you can until you drop and while you are laying there sucking for air you can experience what I experience all too often nowadays. Sure I can lead a normal life...if that "normal life" includes having to take 2 types of medicine (more if I am having problems) 3 times a day 7 days a week so I can breathe, medicines whose side effects include things like headaches, dizziness, nausea, cramps, ed or in extreme cases coma and even death. If it having to stay inside and refrain from physical activity when air qualities are rated as dangerous, having to carry a rescue inhaler at all times, being denied access to the military, staying out of smoky places or having to deal with the ignorance of others like yourself then yes I can lead that type of "normal life". On top of it all to lie about others opinions with this affliction is ridiculous. I can tell you are lying because no asthmatic would take objection to what \_\_\_\_\_ says because it is all true. Asthmatics like myself are very much a prisoner to things like air quality and it very much limits what we can and cannot do. I do not take vacations in the summer due to poor air quality fears and have to pick a choose my vacation spots carefully to make sure the activity I enjoy (hiking) is not jeopardized by my disease and the effects bad air has on my breathing. Many times I have had to change my plans or cut hikes short because of my breathing due to poor air quality and on occasions when I ignored the warning I have often ended up with attacks, some pretty severe. Maybe if I were some lazy, uncaring slob whose only access to the outdoors was on a motorbike or sitting my ass inside a 4X4 I could claim asthma was no big deal and not a problem but I am not nor will I ever be. For others who enjoy not only the outdoors but playing sports, walking their dog, serving in the military, going to a bar or even just enjoying what for most people is a "normal life" it very much is a problem and you prove you lack of understanding and caring with your callous statements. Now go ahead and twist that like you always do to make me look like the bad guy you jerk.

Preservation of wildlife and plant species must be considered before human use in all cases. If humans cannot find a way to live with all of earths creatures then we do not deserve to live at all.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

More ignorance and lies from \_\_\_\_\_, no surprise there. Go tell the relatives of the 5000 people that die every year from asthma related deaths how clean the air is. So you would deny the world one of the most incredible discoveries ever if more ohv access is not given to you???

How immature and childish is that? And you wonder why the ohv community has such a bad name? So lets see we either destroy our last remaining forests and kill off our last remaining wildlife with oil and gas drilling and mining or we destroy it and kill it off with increased ohv use. Hmmm, seems like nature losses either way. Frankly I do not believe this story any more than I believe \_\_\_\_\_s relatives help invent hang gliding and set world records.

Sounds like you need to reintroduce predators to the region to return the natural balance of things. Why is the wildlife always blamed for what is really the fault of humans? Maybe if we stopped developing every last inch of land, stopped opening up so much land for oil and gas drilling, mining and ohv use which is driving these species to smaller and smaller areas and less and less food then there would not be this problem.

Leave it to one of the ohv communities largest spokesman to endorse the destruction of wildlife habitat and pristine areas. And he still wants us to believe ohv users care about wildlife, forests and the environment? Sure they do, just as much as the oil, gas and mining industries.

Well said. It is not exactly teaching young children the ways of respecting or enjoying nature either. Ohv use is more about destroying trails, streams, forests and meadows, going wherever you want, whenever you want, as fast as you want and as destructive as you want no matter if it is illegal or immoral. It's about ruining wildlife habitat, killing wildlife, harassing hikers and equestrians because it is fun to see horses rear up and throw riders or see hikers jump off trails before being run down. It's about promoting and furthering our dependence of fossil fuels and polluting the atmosphere and throwing trash all around the forest. It teaches young ones that our public lands are something to be used and abused and that wildlife does not matter because as an american it is your right to drive on, over and destroy every last inch of land even if it means extinction to entire species of animals and plants. It is about taking hiking trails and turning them into "multi use" trails and then running the hikers off the trails so they are no longer around. Basically it promotes the idea that nothing else matters except your own self centered pleasures so screw everyone and everything else and lets have our fun! Some will say this is rubbish but go ahead and check the "ideas" that the ohvers like \_\_\_\_\_ have put forth or the comments of the ohv users in so many posts and if that is not convincing enough go ahead and check the votes of their community and tell me I am wrong.

I live in this area and I totally agree with this mission. What will be left for our children, and our children's children. The same is true of all tribal lands that are shrinking and being polluted. Would the governments like that for their children and the homes they have?

Wolf Introduction is a Criminal Enterprise! By \_\_\_\_\_, Former USFWS Chief, and Whistle Blower of USFWS stealing 60-70 million dollars of Pittman Robertson Funds of Sportsmen Excise Taxes to illegally introduce the larger Northern subspecies *Canis Lupus Occidentalius*. Please watch. { <a href="http://www.youtube.com/watch?v=Uyu8\_X\_F4PM" rel="nofollow" target="\_blank">Link</a> }

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I wish ranchers would get on the computer, but they are too busy working outside for a living to scrape by. Defenders of Wildlife, known in states devastated by wolves as Destroyers of Wildlife which is a more appropriate name, only pay for confirmed livestock deaths. DOW infiltrated the USFWS under the Clinton Administration, when Jamie Rappaport Clark the former Chief of USWS was hired by Clinton to achieve this agenda. She oversaw the theft of 60-70 million dollars of Pittman Robertson Funds, excise taxes stolen to fund without congressional approval the illegal wolf introduction. \_\_\_ testified in front of congress these facts. DOW hired Jamie Rappaport Clark to become their Vice President. DOW under the Clinton Administration, were in charge of overseeing livestock depredations. \_\_\_\_\_ bragged that the real purpose of wolf "re" introduction was to kick 30,000 ranchers off open grazing lands.

DOW only pay for confirmed livestock deaths by wolves. In order for a rancher to prove livestock has been killed, he has to contact the USFWS to investigate the death. In most cases the USFWS doesn't make it out on time, and in many cases "confirmed" is just a method of saying, "prove it!" Only 1 out of 10 livestock deaths by wolves, are "confirmed." That means after USFWS is called. In most cases it can take hours to days. By the time they do come out depending on the condition of the dead animal, and the weather conditions a lot of evidence has been lost. USFWS spends your tax dollars America, performing necropsy investigations on dead livestock killed by an illegal wolves. After filling out paperwork, and jumping through red tape hoops, maybe 1 out of 10 dead livestock killed by wolves might get reimbursed. Most ranchers have quit participating due to the frustration of dealing with a corrupt Federal Government system, and DOW which is an anti-hunting, anti-ranching, radical animal rights group. DOW has no credibility.

What does that have to do with \_\_\_\_\_'s comment? Ranchers have lost livestock, sheep and cattle from wolves. They pay a predator tax for every livestock animal they raise. Many of the sheep and cattle were killed on their private property. If you are going to use that argument...Then we could say neither is your dog, cat, or horse that was killed by wolves. DOW don't reimburse people for their their horses, lamas, goats, and other pets. Henery Fischer of DOW admitted, pre-introduction of the Non-Native *Canis Lupus Occidentalius*, that Wolf "re" introduction would depend on the political climate and tolerance of ranchers. That is the only reason DOW decided to reimburse. I have spoken to many ranchers that said, the reimbursement was such a scam they wouldn't participate. Like the fox guarding the hen house.

I take it you are probably a college graduate in the field of Conservation? I've never ran into anyone in my entire life living in Idaho, or out West for that matter that refers to cattle as "non-native." That is a "term" being used to push the agenda of ending open grazing on our BLM lands, and dismantle the ranching sector of our poverty stricken rural communities under another "scam" of the ESA. So what are you saying Michael, everyone needs to get rid of all cattle, horses, dogs, cats, goats, pigs, sheep, lamas, etc etc, because they are non-native? How extreme do you want to get, can't grow gardens because they are non-native too? Can't grow yards because the rose bush is from Texas and not Idaho? Where are you coming from?

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

Very well said. People like \_\_\_\_\_ are extreme environmentalists, with one agenda to end hunting, and ranching. Just like the Spotted Owl was the surrogate "scam" to end timber management of our forests, the environmentalists would rather see our forests die from bark beetle, blister rust, mistle toe, and other diseases. They would rather let the timber burn instead of be managed. I've never seen our forests so unhealthy as they are right now. I don't believe DOW should reimburse ranchers for wolf killed livestock. I believe the fraudulent people that stole the Pittman Robertsons Funds from the Sportsmen, DOW's own Vice President Jamie Rappaport Clark, and everyone involved with the illegal wolf introduction should be investigated and pay. I would like to see our legislators file FOIA on every NGO, all the plaintiffs especially DOW and Westernwatersheds, to see how much money their Welfare Lawyers are "milking" the American Tax Payers out of Millions-Billions in law suits, aimed at dismantling the hard-working rural American families.

Also Isle Royal is a closed ecosystem. The wolves are all inbred so bad they have congenital bone deformities. The moose would wildly drop, and then pick up after the wolves would starve and kill each other for protein. So it's been an ecosystem full of dips and increases of both predator and prey. Mech didn't go public with the predator pit situation on Isle Royal like he should of. He also kept the facts hidden that the wolves were deformed from inbreeding, weren't pure wolf but had been cross breeding with coyotes as well as inbreeding among themselves. He also hid the fact that the term Alpha female and Alpha male are obsolete. Many of these facts had to be brought out in the public after he was confronted with them. One thing about State Fish and Games they are so penetrated with non-hunters now, that IDFG is in a lot of trouble with the sportsmen of Idaho. Not only that but rural communities like Idaho County are now declaring a State of Disaster!

More Funding for Conservation. In areas with significant population growth and rapid urbanization, land and easement acquisitions are often the only way to achieve conservation and recreation goals. More LWCF funding is needed to fund land acquisition. Furthermore, now is the time to fully fund the Land and Water Conservation Fund. Paul Sanford Director of Stewardship and Public Policy American Canoe Association [www.americancanoe.org](http://www.americancanoe.org)

Change the Paradigm on the Use of Public Lands. Complete the transition away from our historic emphasis on resource extraction (minerals, fossil fuels, trees and water) towards a greater emphasis on protecting the human experiences that occur on our lands and waters. Continue to allow necessary resource extraction where appropriate, but let the human experience drive your management decisions. The experiential value of lands and waters must given greater, or at least equal weight as resource extraction. This shift will contribute to a more sustainable economy. Director of Stewardship and Public Policy American Canoe Association [www.americancanoe.org](http://www.americancanoe.org)

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Poor Water Quality. The Clean Water Act has brought about significant improvements in water quality, but there is a lot of work left to do. Even if we set aside the need for safe sources of drinking water, we still need to improve water quality in order to protect the value of the American outdoor experience. For example, without wildlife, the user experience in places like the Chesapeake Bay and the Florida Everglades would lose their essential character. They would be landscapes without a soul. To protect wildlife, we must improve water quality. Nutrient loading is devastating the waters of our nation, and if this problem is not corrected, they will no longer be the kind of places people want to go. We need to renew our commitment to improving water quality if we intend to preserve the value of the outdoor experience. Director of Stewardship and Public Policy American Canoe Association [www.americancanoe.org](http://www.americancanoe.org)

There you go - stereotyping those who desire to enjoy America's public lands. For your information, my mode of transportation is NOT "over-powered, knobby-tired". It is totally stock. While I agree there are those who do fit your stereotyped definition, the majority of those who enjoy America's public lands do so in a responsible manner. You obviously have ulterior motives. You should be ashamed of yourself in trying to restrict access to America's public lands. Remember, they belong to ALL Americans!

While this sounds like a good thing, it may not be as good as it sounds. Why? For example, Conservation Northwest. Sounds like a good organization, but since they are right here in our backyard (NE Washington state), I am familiar with them. They are proposing to designate an additional 214,000 acres of the Colville National Forest (CNF) to eventually become wilderness area. That may not sound like much, but it would result in one-third of the CNF becoming wilderness. While I'm not against wilderness - there's a place for everyone - I am totally against their way of proposing this. Over the last 5 or so years, there's been numerous attempts by the CNF to get user input on how to manage the CNF. Unfortunately none of the attempts have come to agreement so this fall, Conservation Northwest wants to go directly to Congress and request the wilderness designation. So rather than working through existing channels, since they can't get their way, they are going to do an end run and go straight to the approving authorities (only Congress can designate wilderness areas). I can't vouch for any of the other organizations on the list, but I suspect some of them may also be trying to do the same thing!

Absolutely! I get tired of eastern lawmakers knowing what's right for us westerners! Many of them probably have never visited the lands they want to declare as wilderness!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

"Going for a walk on a national forest without use of specific services remains free." Mr. Crandall, this statement that you made to Ms. Benzar -#2 above- is a flat out lie. At Forest Service contrived "HIRAs" hundreds of thousands of acres of land require the payment of a fee for anyone who dares to stop his car and get out...it matters very little to the Forest Service that the nearest toilet, picnic table, parking lot, campground, etc. etc. is ten, fifteen, or thirty miles away. Ever been to the Los Padres National Forest in central California? "HIRAs" are entrance fees and public land access fees, not use fees. The whole fee program under the Federal Lands Recreation Enhancement Act is a total sham. Right now the Sequoia National Forest is under investigation by the Inspector General's office of the USDA for its "questionable" -to say the least- use of local recreation dollars. As a citizen if I were to present Sequoia National Forest type accounting of my taxes to the IRS I would be thrown in jail. Why is it that the government doesn't have to follow its own laws? What do you and those who you represent have to gain out of all of this? Doubleplusungood...or is it Seig Heil?

Last night I posted a response to \_\_\_\_\_. This morning it is gone. Technical reason, some other reason? \_\_\_\_\_'s statement... "Going for a walk on a national forest without use of specific services remains free." ...is a flat out lie. On millions of acres of land in the western US the Forest Service will cite you for getting out of your car (most often on state and county roads) in the middle of nowhere thirty miles from any sort of "amenity." Possibly could the Interior Secretary and Agricultural Secretary look at this? While you're at it check out how the BLM just got more of these illegal fees approved (via the Forest Service controlled "Advisory Committee") for entrance to the San Joaquin River Gorge in California. Check out the voodoo economics of the Sequoia National Forest's recreation and appropriated fee programs over the last ten years. (It shouldn't be that difficult, per Congressional request the Inspector General is currently doing an audit.) Corrupt Government.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It would seem from some of your comments that you have made an attempt to gather some specific on the ground knowledge of the area and that is very good. I appreciate the positive tone of your approach to land management questions and the opportunity to have this dialogue. It would appear that much of your information is second hand and some is unfortunately inaccurate, your sources likely not being up to date or complete. For the sake of others who might read this I would like to offer some insights as I live in the area, visit frequently (including a hike last Saturday up the Scotchman Peak trail) and participate in many public meetings on land management in the Panhandle. The local snowmobilers do access the Lighting Creek drainage through the Tresle Creek and from Clark Fork. However, topography and geography limit their ability to utilize any of the "Scotchmans". The more often utilize the area you mentioned, Porcupine Lake along with Lunch Peak and Trestle Peak areas. In many conversations with representatives from these clubs and with individuals, there are only a small \who enter the far northeast corner of the Scotchmans IRA (near Lighting Peak). This area is outside of the boundary for wilderness proposed by the forest service and not likely to be designated by congress as wilderness. The area of the scotchmans in Idaho proposed for wilderness is not utilized by the snowmobile community. On the other hand, snowshoers and backcountry skiers do use this area - last winter we had over 80 users on 10 group outings, and that is just the winter hikes organized by the Friends of Scotchman Peaks. The Goat Mountain Trail head is on Lighting Creek road about 200 yards past where the county stops plowing. The Star Peak trailhead is on Highway 200. Ross Creek Cedars trailhead is a plowed parking lot. The Scotchman Peak trail itself is used frequently despite the fact that the last 2.5 miles are closed during "mud season" to vehicles. I mention these simply to provide accurate information regarding winter access for back country skiers and snowshoers. These areas are popular for quiet recreationist because 97% of the Panhandle National Forest open to snowmobile use, reserving only 3% for people who prefer human powered recreation in a quiet setting. Still this is not the principle reason for, or benefit of, Wilderness designation. You asked about the benefit of Wilderness designation (in reference to winter) and the answer to that question is more about protecting habitat rather than providing areas for quiet winter recreationists. Snow mobile use is in direct conflict with providing for critical Mountain Goat Winter Range habitat and Grizzly Bear denning areas. I am not against responsible motorized recreation (winter or summer) and do believe that forest planning and projects should address needs for these user groups. And we need to diffuse the conflict created by extremists on all sides in order to find constructive solutions. There are approximately 12,000 miles of forest service maintained trails on the Idaho Panhandle National forest and the majority of trails maintained by the forest service are open to motorized use. Not all of these are trails, but then a majority of our local trails are open to use by all user groups including ATVs. In the Lighting Creek area, in addition to Porcupine Lake, there are also ATV trails to the lakes systems at the north end of the drainage and over the Strong Creek/Wellington pass, to name just a couple. The trail to Scotchman Peak, since you mention the condition, was cleared of all the downfall on June 12th by a volunteer work group in conjunction with the Forest Service. In fact, the Friends of Scotchman Peaks provided volunteers for 3 trail maintenance projects this last summer, including Star Peak's Big Eddy Trail and Pillick Ridge. Chainsaws were used, as were hand tools including pulaskis. Our volunteers are more than ready to use hand tools in the situations that may require them. Next summer we plan on additional projects in the area.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There are many benefits of Wilderness designation, from protecting habitat for critical species, to preserving big game hunting opportunities, to assuring quiet recreation and providing for the quality of life experiences which are important to economic development, but mostly, I believe, we owe it to our children to leave some places just as we found them. A more complete look at these benefits can be found on our website and in our hiking map and newsletter. If you are interested in joining us for one of our hikes, or trail maintenance projects we would love to have you come! You can go to our website and use the online subscribe button to sign up for our newsletter and / or notices. If you are interested in continuing a one on one dialogue about these large issues, I would also invite you to go to our website and use the "contact us" to access my email. [www.ScotchmanPeaks.org](http://www.ScotchmanPeaks.org)

I meant to write that there are 12,000 miles of FS maintained roads. "Trails" was a slip of the "tongue" as that was also on my mind. Most all of the FS roads provide access for all users. I don't have at my finger tips the total number of trail miles in the district (Sandpoint Ranger district) but seem to recall it's only a bit over 100 miles for all types of trails. A significant portion are open to ATV use, I seem to recall looking at it in detail 5 or 6 years ago, but do not recall the exact mileage. All, or almost all are out and back - due to the nature of our topography. I understand the desire, and usefulness of "loop" trails, particularly for the ATV users and think that this can facilitate reductions in user conflict by establishing some directional usage. I believe there is an effort to create such an experience in the Talache area and south of there through construction and linkage. There are probably other opportunities for adding to this system, both motorized and non-motorized, a need that can be addressed in forest planning, travel planning and perhaps in the Bonner County Trails Advisory group. I have participated in the former two, but not the latter, although I follow the BC Trails group's work. I think all three allow different user groups to come to a better understanding of needs and limits and help reduce conflict over land management decisions. Glad to hear you are involved.

I would rather subsidize park creation than say.....nuclear power plants, but \_\_\_\_\_ does make a point about re-development around parks displacing existing residents.

Protect scenic lands. I write in support of protecting our greatest unprotected scenic areas for future generations. I am inspired by family vacations over the past two summers. The first was a brief visit to Michigan State Parks along the southeastern shore of Lake Michigan. It was wonderful to swim and to hike, but I was overwhelmed by a sense of lost opportunity: due to the history of the region, the lakeshore became private property, and the state parks represent a miniscule share of the lakefront. Such a great treasure, so little of it available to the public---and in a densely populated region, where there is such need for the opportunity to experience unspoiled nature and serenity! Our second trip was farther north, along the Lake Superior shore of the eastern upper peninsula of Michigan. And again, I saw that as soon as the roads are built, development follows, and what we all take for granted is lost. A shocking case is the stretch of Whitefish Bay between the Taquahmenon River outlet and Whitefish Point: nonstop summer homes in the south, an endless stretch of real estate for-sale signs in the north: dozens of miles of gorgeous shoreline, with miniscule areas of unaltered shoreline, public land and public access. And it is clear that dozens of miles of unspoiled shoreline farther west will be developed in the coming years for private enjoyment, if it is not permanently protected. This story is not unique to the small areas I have described. Generations of Americans have taken for granted the greatest landscapes, seashores, and lakefronts of our country, unaware of how much is privately owned and ultimately will be developed. It's urgent to protect the most scenic of these areas for the enjoyment of our children and grandchildren. Some areas are so unique and special, they must be preserved for all. May our sense of the common good prevail!

\_\_\_\_\_, You should indeed get out from behind your desk and see the real world. Fees in general are an abomination. Whether it be in business or government they are simply either another tax or a price increase. You cite toll roads. Toll roads are usually an enhanced travel option that is often implemented by private entities. There is usually an alternative tax funded travel option. Not so with the fee program. It's a government agency money grab with no alternative. Let's not hide behind the names. A Fee is a TAX. And these taxes are being implemented and raised by non-elected officials who have no accountability to the voting public. That is just about as close to "taxation without representation" that you can get. Your facts are incorrect and your statements turn a blind eye to the reality of poor administration by the USFS. This government agency will assess a fee wherever they think they can get away with it. Even on unimproved sites. It is a fact that the USFS spent MORE to administer the test fee program than it brought in. Here is a great example for you. My empty boat trailer was ticketed for being parked in a trail head parking lot. Why would I park an empty boat trailer in a trail head parking lot? Because before the fee program that lot was where we were told by the Forest Service to park the trailers (for 25 years). After Fee implementation, Fee happy rangers conveniently forgot that this was a general purpose lot and that they had done nothing to improve it in over 35 years and ticketed anything that had wheels. Needless to say I refused and the USFS decided not to pursue such an idiotic tactic that would have made them look even more foolish. The fact remains that the Fee program is a deeply flawed piece of legislation. Finally, you propose that "volunteers" get a free pass. I would gladly volunteer to help on forest conservation projects but I have a job and have to work to feed my family and PAY MY TAXES. I don't have time to volunteer. So you want those who have the time but don't pay taxes to get a free walk in the forest? Why not drop the TAX increases masquerading as FEEs and give us all a free walk in the forest??

## Discussion Question 2

***(cont.)***

The rules that exclude mtn bikes from the trails are hardly vestigial. They are there for a reason; though, at the time many of the rules were written, mtn biking as a form of recreation did not exist or was in it's infancy. In general, hiking and horseback travel in the backcountry are the two major forms of getting from "A" to "B". These methods have existed since people started moving away from their birth places. The PCT was created to allow bikers and equestrians to travel from Mexico to Canada. It is a very narrow trail, oftentimes in areas that cling to the sides of cliffs with little opportunity to pass. When I have been on the PCT on horseback, several times, there was difficulty trying to get horse and hiker to pass because there was no way for either to get out of the way of the other. Now, add speeding bike to the mix, who is going to go off the side of the hill? Sure, a bike bell might alert hike, horse and rider but what's to alert the biker? Wilderness areas usually specify that mechanical devices are not allowed. Bikes are about as mechanical as you can get. Real diehard greens even try to outlaw horses claiming that the bridle/bit/reins are a mechanical device (lever) used to control the horse. These rules make trail maintenance a royal pain since chain saws are not allowed to remove fallen trees. If the rules don't allow for mechanical devices for such good things as trail maintenance, why should they be allowed for other reasons. Hiking and horseback riding are about as natural as one can get when being out in nature. These modes of transportation are slow, allowing one to fully experience the surroundings. How much nature is being enjoyed at 30 mph and vision focused maybe 50-100 feet in front? I almost see the PCT as being a test case, allow mtn bikes on one of the most heavily traveled trail systems, then they will try for the Appalachian Tail (on which even horses are banned with as much disdain as mtn bikes are on the PCT). I may be wrong but I just don't see mtn bikers clamoring to be the first to ride from Mexico to Canada on a bike. Their demands for access are more for the chance to ride some exciting downhills in the local area. Angeles National Forest offers many opportunities where a bike ride can be dropped off at the top of the mountain and ride the exciting PCT to the bottom, hikers and horses be damned.

Where I live, users try to show respect for the others. While traveling these trails as a hiker and cyclist, I've met rude cyclists, rude horseback riders and rude hikers. But, these individuals are the exceptions, not representative of their respective "groups." I will note that overwhelmingly it is hikers who leave the most trash and cut switchbacks. But, I view this (and other problems) as educational challenges. As a society we have become more alienated from the outdoors and the Leave No trace ethic is not well ingrained in the typically urban American. Anecdotal stories of the abuses by a particular group make good fodder for those who want to sow discord. But they should have no place in an reasoned discourse over public policy. It has been my experience overall that multi-use trails work well and people can all enjoy them. As a person who has volunteered many hours to trail maintenance, I see a far greater representation from the Mountain Biking community that any other group. This, of course, will vary from region to region (and certainly a wilderness trail that prohibits cyclists is not going to be a magnet for cyclists to do trail work). The point being, no group has a monopoly on good work or misdeeds. Perhaps people should perhaps rethink their opinions rather than look for reasons to become more entrenched in their pre-conceived ideas.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

and it has a direct impact on local economies. Small town near where I live was pretty disappointed when a popular mountain biking area was turned into Wilderness, and they lost their contributions to the community.

I live in NE MN, on the edge of the Boundary Waters Canoe Area Wilderness, an over 1 million acre "wilderness." It is an amazing, beautiful, peaceful place. I have been privileged to paddle its lakes many times. However, there is also beauty to be found in my own back yard. I live one mile outside the city of Grand Marais MN, a small village on Lake Superior. I am fortunate to be outside city limits so I don't have street lights. There are many nights that I step out my backdoor and look up at the stars, so brilliant and so close it feels like I could reach out and touch them. I can hear the leaves rustling in the trees and birds and frogs making their comforting sounds. I can see fireflies flitting about and once in awhile I get buzzed by a bat. We often have backyard barbecues, enjoying the smell of the firewood and sharing S'mores with our grandkids. All of the wonder of nature is in my backyard, in the midst of civilization. The wilderness is precious yes, but it is underused -- the very young, the very old, the busy, the poor-- don't have the time, ability & money to travel to the wilderness and to hike or paddle to enjoy it. But we can all find the wilderness all around us - let's stop fighting & enjoy it!

The process is definitely broken! In Cook County, MN, the Forest Service has invested six years and over \$340,000 (and counting) on a reroute of a 2.2-mile snowmobile trail between 2 lakes. This trail existed in the 50s and when the 1978 Boundary Waters Canoe Area Wilderness Act created the BWCAW, it cut off this trail. Somehow it was overlooked until 2003 and then the Forest Service shut it down. The trail users (cabin owners & icefishermen) have been fighting ever since to try to get the re-route done. These are average citizens, working hard, with no time to decipher the hundreds of pages of environmental studies and file "substantive comments." They are fighting corporate environmental groups such as the Sierra Club & Izak Waltons, who have executive directors and paid staffers to read environmental studies & find a loophole that environmental lawyers can take to court to block anything from happening. Environmental groups might have been helping the forest in the '60s, but now they are eating up precious funding that could be used to educate the public about the forest, to build trails, campgrounds, etc. And yes, these corporate environmental groups get reimbursed for their legal fees if they manage to win, which they do, because judges don't understand what is best for the forest!

We don't need more layers of government to oversee the use of our public lands! It is difficult enough to build a trail or a trail shelter or campground or anything now, with having to go through the bureaucratic processes of the US Fish & Wildlife Service and the US Forest Service. Just let them do their work without adding more redtape.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In NE Minnesota the US Forest Service has spent six years & \$340,000 in environmental studies on a 2.2-mile snowmobile trail because environmental groups (Friends of the Boundary Waters, Sierra Club, Izak Waltons, etc.) are fighting this in court. That \$340K is just environmental work NOT legal expenses! It is disgusting that this amount of money must be spent to appease people who will never be satisfied. In the research of the impact of the sound of this snowmobile trail OUTSIDE the Boundary Waters Canoe Area Wilderness (BWCAW), one "forest user" is quoted as saying they would be bothered whether they went to the BWCAW or not - they would be bothered by the fact that the trail existed! How can the Forest Service deal with someone like that? Let the people who use the forests, respectfully, on trails, use the forest!

Closures and restrictions are out of hand. Cost and regulations likewise. I'd like to see the government butt out and return land use to what it was 50 years ago when I could actually enjoy it instead of be afraid of my government.

OPosser attempts to take over private and state lands should be rebuffed by all Americans who do not believe in Marxist Socialism. How can you even remotely give any credibility to passing title to US lands to China when this maniac bankrupts the country. Not to mention the closing of property that belongs to the people in the mean time. Been a native Oregonian for only 63 years, but what I see today makes me ill.

As a Utah resident, I support and applaud this idea. I've posted some ideas relating to OHV problems and apparently incurred the wrath of some OHV users. However, I've seen the problems first-hand. Anyone paying attention can see the progression over the years of continuing, illegal OHV route proliferation and the resulting soil erosion, expansion of invasive/exotic weeds, visual scarring, and habitat fragmentation. And anyone who spends much time in rural Utah knows that BLM and Forest Service rangers are spread way too thin, and the odds of OHV scofflaws getting caught are very low. In addition, the dominant political culture and most politicians in Utah are so far to the extreme right wing that they make Bush and Cheney look like tree-hugging liberals by comparison. These Utah politicians profess to love the land and be good stewards, while they push OHV recreation virtually everywhere, and appear largely oblivious to the many problems and conflicts those OHV uses can cause. By the way, I'm not averse to OHVs per se, so long as they are used responsibly. I've ridden both dirt bikes and ATVs on primitive routes, but I stay on those routes.

Mountaintop removal coal mining is perhaps the most unsustainable and egregious example of our society's willingness to sacrifice long-term environmental health for short-term fossil fuel energy. It is a continuing national shame that we allow coal companies to blow up mountains and fill in beautiful valleys and streams to access coal. This issue will be a true test for the Obama administration and EPA on Clean Water Act compliance, and for Democrats in Congress on whether they will side with what's right or rather with the coal-state DINO's who are in bed with their coal company campaign contributors.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Actually state and federal levels are engaged in current planning to kill large numbers of wolves regardless of ESA designation. To the wolves one can add America's wild horses, the Yellowstone bison, bears, the rare Florida panther, the even more rare ocelot and so much more. Stewardship is not an option going forward, but rather an imperative. If we can leave no room for other lives and voices, we will ultimately find none for ourselves.

And behind ranching is banking that loans them the money. Without the ESA many species would have already joined the Passenger Pigeon and the Carolina Parakeet. If the majority of people working in agencies are good environmentalists and listen to good science rather than suppressing it, we can do better. There are reasons for words like environment and ecoSYSTEM. When we ignore the whole and interconnected nature of all things we end up destroyers, even when we mean well. In the above case, it is the prairie ecosystem that was essentially wiped out in an earlier era and now suffers abuse even in the effort to bring something back.

Regarding comment 1: One does not usually treat an addiction by feeding it. Wildlife, conservation, etc. were largely absent from the national election debates. Supposedly, the AGO itself is an effort at remedy. True leadership is a valuable and scarce commodity. We could use some more.

Paragraph two sounds a bit closer to what we have already been doing. Without a leap forward in human wisdom, "a more economic, cost-benefit style approach to see which of our options best suits us" would likely lead to our demise, along with the rest of the biosphere.

How did nature ever manage without logging? Much of the revised view of forest science has to do with trying to avoid the effects of past management. Sometimes old growth forest can and should be allowed to get along without the lumber business. Where management is more active, it should not become an excuse to clear cut. Timber interests are not all that excited about thinning diseased and dead trees. The author's idea sounds nice enough, but could as easily serve as speech writing for the head of a timber company. Bottom line is to honestly respect the ecosystem and the resource, something that seems hard to come by.

Actually, animals know and express much more than most humans are willing to listen to. However, even if we have no ears to hear, we could at least use our eyes. Animals (plants too) are the canary in the coal mine for the environment. They are taking a lot of punishment and they illuminate the problems and dangers all too well. They are good teachers for those willing to learn and good mirrors of what we are becoming. The American west contains the oldest known organisms on the planet (some approaching 5000 years) -- the bristlecone pine. They are dying. That should concern us. Each year for decades Americans have killed the numerical equivalent of the Holocaust in our animal control facilities... What happens to other animals ultimately happens to the human animal.

Some things are not a matter just for locals and some things require intervention due to local misdeed.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The uses available need to be determined by what the ecoSYSTEM can actually sustainably support. Too often, multiple use reduces to dividing the spoils. That is not conservation, just a mere shadow of it.

Funny, \_\_\_\_\_ intially attacks my comment and then in the end once everyone has started to black out from his "statistics"...he agrees in general. Snowmobilers have the accountability of use permits and tags that are paid for, certainly in Washington this is the case. I think you would have to have a 1x1ft sign in bright orange to help make any tag on the sled identifiable, let alone something you could read while moving to "nab" the violators. The first half of your "statistics" can also be applied to airplanes flying above. The second half are addressed with the education and peer accountability as I mentioned. There are many areas in WA that are closed when snow depths reach a certain "minimum" level to help protect the areas from the type of degradation you speak of. I just don't think these additional or modified tags will improve the suggestion that was made.

Opinions are just that.....Opinions. Sarcastically falsifying the truth is just ignorant. So here is the challenge for those whom believe the crap they type that is so negative towards OHV Use in the Forest that belongs to the American People.....All of US. A = Give the facts to back up your negative claims 1. I will give the facts to justify OHV People and their actions to preserve trails, take care of trails, care for wildlife and the forest. B = Show pictures of these claims, those of you who wish to continue to show negativity towards OHV People. 2. I also will show more pictures than your computer can handle that verify the volunteers whom take care of more forest trails than most Forest Districts ever have C = Give the facts - not opinions - of those who tear up the trails, pictures would be better, that ride an ATV - OHV - Motorcycle - 4X4 - Jeep - or even family car. 3. I will be able to rebuttal any of these claims the negative ones wish to commit with. I am an Advocate for Saving ATV/OHV Trails..... I do keep well informed - good or bad - and I would be the first to inform the USFS - LEO of those who are endangering our responsible recreation by abusing the forest trails. Also, I Do Not get any financial gain by any means for My Advocating unlike the "Greenies " do. They get their "Money " from any source that will believe the crap and lies that are to make corporations look good to the public. So..... I challenge the negative ones to reply to the questions above. Help USDA - USFS - BLM - Fish and Wildlife kick out the ATV/OHV Recreationist buy showing facts..... not just YOUR typed words and opinions. I would be happy to HELP YOU get rid of those who wish not to follow the rules like most of us do. I await responses!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

120) ..... OHV people are becoming very vocal because the "Silent Ones" have more Corporate Money with lobbyist to back them because they tend to fabricate the information to misleading corporations in to thinking "their ideas" are facts. Hence .....our very own President Obama even received a packet from many of the opposing groups telling the Pres. even much better fabricated information in order to get him to sign the "Monuments Bill" for which.....if one looks at the policies..... a Monument keeps all Americans OFF of it..... for any reason. So I request this..... for all of you out there..... those who support OHV Use for Recreation..... tell all of the corporations that you can about what will be lost forever, and our grandchildren's children will NEVER see, for them selves as to what our forest are like to be able to recreate in them because fabricated information by highly misleading people was propaganda to start with. So back to the point I was making here..... Get corporations to Donate to the protection of our recreation, our family time, our lives, and properly inform them where things are heading if certain groups fabricate any further. The Truth.!

Sorry..... 120) ..... if I made seem to be abrupt but there are too many people that are misinformed do to "gossip" and No Facts what so ever. Our "cities" and "developments" have become so tight with so many people so when a family tries to vacation in the forest..... it has been taken away. Then the family unit continues to break apart..... father's in home offices or watching sports on TV..... mother's may be in home office too or TV..... kids on video games..... and the family pet is considering on moving out due to lack of attention. Recreation is one of the fastest growing activities for families that is bringing them back together. Okay.....I have stopped.....again....I apologize.

Lands "Locked Up"..... Term used from USFS when areas are closed in many forms to public access. Dirt Mounds - Fell trees - Gates - Chains ..... SO if No One has not ever "seen" this "Locked Up" area than maybe you are not out there to actually see it. I am in the forest much more than any city and I come across this problem way too often. Open your eyes - see what is in front of you.....if you are in the forest at all.

## Discussion Question 2

***(cont.)***

New Forest System Land Management Planning Rule. From..... Blue Ribbon Coalition Comment

We are concerned that the NOI strays far from the core purpose for revisiting the agency's planning regulations. In fact, the NOI threatens to create new, undefined goals and criteria which will exacerbate, not resolve, the planning gridlock accelerating through the agency. It is sadly ironic that the agency remains mired in a decades-long effort to promulgate valid rules intended to make more streamlined the content of Forest Plans and more efficient the process by which they are created. At the risk of belaboring the obvious, it should not take a Forest 10, 8 or even 5 years to revise Forest Plans, which are supposedly obsolete in 10 years. The NOI does not attempt to borrow from the best ideas of prior efforts, but instead threatens a new vision fraught with uncertainty. We urge the Forest Service to steer this effort back to its necessary focus- (1) to fill the current regulatory void; and (2) to redouble proper focus on the primary goals of efficiency and expediency in the Forest planning process.

C. Background The National Forests were originally set aside to provide a continuous supply of timber and for the protection of water sources for local communities and agricultural needs. Later, through the adoption of the Multiple-Use Sustained Yield Act of 1960, Congress determined that the forests should be "administered for outdoor recreation, range, timber, watershed, and wildlife and fish purposes," which purposes were declared to be "supplemental to, but not in derogation of" the original purposes. (16 U.S.C. §528) The Forest Service is required to "use a systematic interdisciplinary approach to achieve integrated consideration of physical, biological, economic, and other sciences" in its land and resource plans. The Forest Service must assure that the plans "provide for multiple use and sustained yield of the products and services obtained there from in accordance with the Multiple-Use Sustained-Yield Act of 1960, and, in particular, include coordination of outdoor recreation, range, timber, watershed, wildlife and fish, and wilderness." The plans must "determine forest management systems, harvesting levels [of timber] and procedures" based upon all of the uses mentioned above, the definitions of multiple use and sustained yield as laid out in the law, and the availability of lands and their suitability for resource management. (16 U.S.C. §1604(b) and (e)) The regulations of the Forest Service have defined fundamental principles of planning for the Forest Service's natural resources. (36 C.F.R. §219.3) Land management planning is an adaptive management process that includes social, economic, and ecological evaluation; plan development, plan amendment, and plan revision; and monitoring. The overall aim of planning is to produce responsible land management for the National Forest System based on useful and current information and guidance. Land management planning guides the Forest Service in fulfilling its responsibilities for stewardship of the National Forest System to best meet the needs of the American people. (36 C.F.R. §219.3(a)) The Forest Service is also required, as part of the development and interpretation of information for plans, to consider and incorporate the concept and conditions of sustainability. "Sustainability...has three interrelated and interdependent elements: social, economic, and ecological." (36 C.F.R. §219.10) The overall goal of the social and economic elements of sustainability is to contribute to sustaining social and economic systems within the planning area. To understand the social and economic contributions that National Forest System lands presently make, and may make in the future, the [Forest Service] must evaluate relevant economic and social conditions and trends as appropriate during plan development... (36 C.F.R. §219.10 (a)) Important to interpreting this guidance is a proper understanding of the multi-

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

layered nature of forest planning. There are at least three tiers to this process, which have been described as "existing at the national, regional and local levels." *Citizens for Better Forestry v. U.S. Dept. of Agric.*, 632 F.Supp.2d 968, 970 (N.D. Cal. 2009). The third, project-level of this hierarchy is that which most directly has concrete impacts on specific sites and forest resources, and must necessarily contain adequate site-specific analysis to disclose the range of proposed options and justify the agency's chosen course of action. For the planning process to be even moderately efficient, it is therefore necessary that each level removed from the project level must be more general, less detailed, and less voluminous so that it may be completed more quickly and without inappropriately diverting human, financial and other resources to the planning effort.

D. The Planning Regulations must be efficient and yield timely results. The NOI threatens an excessively broad and unnecessarily complex planning framework. Indeed, a framework more unwieldy than that presented by the 1998/2000 regulations or either of the approaches rejected by the *Citizens for Better Forestry* courts. The planning process must function and advance the agency's mission which requires that management activity actually affect and conserve Forest System resources. We fear we are poised on the brink of creating a fatuously self-indulgent planning process even further removed from the ground. Our planning vision should advance the interests of a broad individual and ideological spectrum. Put differently, it is not tilted toward allocating resources toward one form of use or another. Those decisions are properly made in project level analysis, or at least in the generation of each Forest Plan. There is only one special interest class that benefits from planning gridlock. The ideological extremists, who seek to disown the unavoidable impacts that humans have on the environment. We are often perceived to be (albeit inaccurately) playing a role in an allocation debate such as "Wilderness" vs. "multiple-use", but in the current process the debate should be between "use" vs. "ideological preservation." Planning regulations that prevent timely completion of any plans serve only the perspective of those who would have minimal, if any, on-the-ground human use of the Forest System. We reach out to truly-interested officials, agency employees, organizations and individuals to stand up in this process for active and continuing use of the Forest System. Whatever our differences, we face a common foe who would seize this point in our bureaucratic "evolution" to transform the visions of Pinchot, Roosevelt, and Leopold into a Forest System that excludes meaningful use. The core vision is valid, only its implementation need be improved. We need incremental change to existing planning frameworks, not a dramatic new vision that only threatens continuing judicial skepticism.

E. The importance the USFS has in providing a diverse range of recreation experiences for a wide range of visiting public should be emphasized in the planning regulations. In the materials we reviewed regarding the planning rule revision we noted that the agency may be operating on the assumption that recreation opportunity is being lost because lands are being degraded or used in an unsustainable way. Such a rationale is often cited to support limitations on recreational use and for more land being "protected," or otherwise made off limits for recreation. However, this assumption is not consistent with the facts, at least for USFS-managed lands. The agency's own planning activities results in much more loss of recreation opportunity than any other factor. The overriding reason for loss of recreation opportunities is the yearly additions of the primitive recreation classifications, the thousands of miles of roads and trails that were closed via the agency's travel management rule, and the many miles and areas closed via other site-specific planning.

1. A diverse range of recreational

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

activities should be identified as one of the key "Ecosystem Services" that Land Use Plans should address. According to the National Survey on Recreation and the Environment, the popularity and importance to USFS visitors of off-highway vehicle and snowmobile recreation has drastically increased in recent years. Ditto for mountain bike and equestrian use. Conversely, the amount of USFS lands available for motorized, mountain bike and, on some Forests, even equestrian trails, have been reduced via legislation, implementation of Forest Plans and site-specific recreation plans. Therefore, there is a need to emphasize a diverse range of recreation in the planning regulations.

2. Please identify the need to emphasize a diverse range of trail-based recreation as a formal planning issue and develop at least one alternative where the planning regulations identify motorized and non-motorized recreation as a key ecosystem service and provides direction to enhance and expand opportunities for these popular activities.

3. Loss of recreation opportunity must be properly analyzed in the DEIS/EIS and addressed in the final planning regulations.

4. All of the Alternatives should reflect, and at least one Alternative should enhance the importance given to recreation in the agency's multiple use sustained yield (MUSY) mandate contained in NFMA.

F. The socio-political and economic importance of multiple use sustained yield (MUSY) must be reflected in the planning regulations.

1. All Alternatives should include a complete analysis of the history of the MUSY Act and its socio-political importance to states with large areas of federally managed lands.

2. The issue of "cumulative loss of multiple use sustained yield management" should be identified as a formal planning issue and brought forward for analysis. Each year more and more USFS lands are removed from multiple use management. Past planning activities and litigation have significantly expanded preservation oriented management and significantly reduced areas available for multiple use. The reduction of MUSY lands has been identified by many states and counties as a key problem affecting the health and economic well-being of local communities. MUSY is extremely important to states with large areas of federally managed lands. There is a reason Congress embedded MUSY in the NFMA; it is because management of federal lands directly impacts the lives and livelihoods of nearby residents.

3. At least one alternative should include planning direction to enhance multiple use sustained yield management. Both the Forest Service and the BLM are required to manage the lands under their jurisdiction pursuant to the principles of "multiple use" and "sustained yield." These terms have been defined within the provisions of FLPMA for the BLM and within the provisions of the Multiple-Use Sustained Yield Act of 1960 for the Forest Service. Both definitions are lengthy and worthy of a detailed narrative of the history and the importance of MUSY in the DEIS. The new planning rule should re-emphasize that MUSY management is to be considered in the context of the best combination of land uses that meet the present and future needs of the nation with respect to "recreation, range, timber, minerals, watershed, wildlife and fish, and natural, scenic, scientific, and historical values." The term "sustained yield" is defined to mean the achievement of "a high level annual or regular periodic output of the various renewable resources of the public lands consistent with multiple use." (43 U.S.C. §1702(h)). See also 16 U.S.C. §531 (b)).

G. The agency's stated focus on "Restoration" must be defined and carefully considered.

1. It is vital that the agency clearly define what it means by restoration. The agency must also disclose the effects of this new focus on how the agency will develop and revise land use plans.

2. Restoration, or any other agency initiated planning focus must not override the MUSY mandate. The stated focus on restoration in the Notice of Intent is of great concern to

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

BRC's members. Restoration is not listed as a multiple-use objective in either MUSYA or the NFMA. Other NFMA provisions confirm that MUSY is to be the overriding directive for the management of National Forests. The agency must not substitute its MUSY mandate with any other focus or initiative, including restoration. H. Planning regulations should focus on procedures for developing, amending and revising land management plans, not on policy

1. The agency should reevaluate the "Substantive Principles" and remove any that do not specifically address procedures for developing, amending and revising land management plans. The NOI states that this new rule will "consist of procedures for developing, amending, and revising land management plans" and it lists several "principles" that could be used in the development of a new planning rule. Note that none of the "Substantive Principles" have anything to do with procedures for developing land management plans, and only one of the "Process Principles" directly address the planning process. The agency says its existing planning regulations are costly, complex, and procedurally burdensome. We believe this is because the previous regulations attempted to address policy instead of planning procedures. Congress sets the policies for management of federal lands, and administrative agencies must act within those legislative limits. The new planning regulations should focus exclusively on planning procedures, not policy direction.
2. Planning regulations should avoid setting management direction. The new planning regulations should stress that Congress prohibited national level planning, specifically noting that "there is not to be a national land management prescription" in the NFMA or implementing rule due to the wide range of biological and socio-economic conditions in the national forests. (S. Rep. No. 94-893, at 26 and 35, reprinted in 1976 U.S.C.C.A.N. 6685, 6694.)
3. Regulations should clearly state that Forest Plans should be limited to:
  1. Establishment of forest multiple-use goals and objectives, 36 CFR 219.11(b);
  2. Establishment of forest-wide management requirements (standards and guidelines) to fulfill the requirements of 16 USC 1604 applying to future activities (resource integration requirements, 36 CFR 219.13 to 219.27);
  3. Establishment of management areas and management area direction (management area prescriptions) applying to future activities in that management area (resource integration and minimum specific management requirements), 36 CFR 219.11(c);
  4. Designation of suitable timber land (16 USC 1604(k) and 36 CFR 219.14) and establishment of allowable timber sale quantity (16 USC 1611 and 36 CFR 219.16);
  5. Non-wilderness allocations or wilderness recommendations where 36 CFR 219.17 applies; and
  6. Establishment of monitoring and evaluation requirements, 36 CFR 219.11(d).
4. The planning directives should ensure that planning guidance is based on the 10 key legislative mandates from Congress:
  - \* Forest Service Organic Administration Act (Act of June 4, 1897) (16 U.S.C. §§ 1. 473-478, 479-482 and 551, June 4, 1897, as amended 1905, 1911, 1925, 1962, 1964, 1968, and 1976).
  - \* Multiple-Use Sustained Yield Act of 1960 (Act of June 12, 1960) (P.L. 86-517; 2. 16 U.S.C. §§ 528-531).
  - \* National Forest Management Act of 1976 (Act of October 22, 1976) (P.L. 94- 3. 588; 16 U.S.C. §§ 1600-1614, August 17, 1974, as amended 1976, 1978, 1980, 1981, 1983, 1985, 1988 and 1990).
  - \* Cooperative Forestry Assistance Act of 1978 (Act of July 1, 1978) (P.L. 95-313; 16 4. U.S.C. §§ 2101-2111, July 1, 1978, as amended 1990, 1991, 1992, 1996 and 2008).
  - \* Forest and Rangeland Renewable Resources Research Act of 1978 (Act of June 5. 30, 1978) (P.L. 95-307, as amended by P.L. 100-521, Forest Ecosystems and Atmospheric Pollution Research Act of 1988, Section 3 (c), and as amended by P.L. 101-624, Food Agriculture
  - \* Food Conservation and

Energy Act of 2008 (Farm Bill) (P.L. 110-234) (Title VIII - Forestry and Title IX - Energy) \* Foreign Operation Appropriations Act of 1978 (Act of November 5, 1990) 7. (P.L. 101-513, 104 Stat. 2070; 16 §§ U.S.C. 4501 note, 4501, 4502, 4503, 4503a to 4503d, 4504, 4505, 1641, 1643, 2101, 2109). \* National Environmental Policy Act (Act of January 1, 1970) (P.L. 91-190; 8. 42 U.S.C. §§ 4321-4347). \* Endangered Species Act (Act of December 28, 1973) (16 USC 1531-36, 1538- 9. 40).

I. There is a need to streamline the planning and appeal process We agree with the agency's assessment that current regulations are costly, complex, and procedurally burdensome. There is a need to reduce the agency's costs and delays associated with administrative appeals. However, many of the "Substantive Principles" are likely to exacerbate this problem. It seems reasonable to ask: are we repeating our past mistakes? It was interesting to learn that even back in the 1970s there was a concern that professional foresters, not the federal courts, should manage National Forests. It was surprising to learn that Senator Hubert Humphrey submitted a report to Congress stating that the NFMA is "designed to get the practice of forestry out of the courts and back to the forests." 122 Cong. Rec. 33835 (Sept. 30, 1976). It is unfortunate that the courts are still managing much of our Forests.

1. The new rule should attempt to streamline the planning and appeal process. The analysis should disclose NFMA's legislative intent in this regard, and perhaps seek clarification from Congress regarding what level of environmental analysis is appropriate for both programmatic and site specific planning.
2. The issue of cost and complexity of planning should be brought forward for analysis and incorporated as a formal planning issue.
3. At least one alternative should be formulated that streamlines and simplifies the planning process.
4. The agency may also wish to ask Congress to clarify its intent on both policy and requirements for environmental analysis.

J. There is a need to clarify the distinction between programmatic and site-specific planning as well as what level of environmental analysis is required for both The proper relationship between Forest Planning and project planning is a topic of frequent discussion. In the past, the agency asserted the "programmatic" or "general" nature of Forest Plans. However, recently completed Forest Plans blur the line, viewing subsequent site-specific processes as mere reiteration or "implementation" of the Forest Plan decisions. In addition, the agency seems to suffer from a multiple and often redundant requirements for environmental analysis. Although not perfect, we supported much of the (attempted) flexibility contained in the 2008 planning rule.

1. All alternatives should clarify the distinction between programmatic and site specific planning and at least attempt to describe what level of environmental analysis is required in each.
2. We support Forest Plans that are strategic as opposed to prescriptive.
3. The new rule should address only forest plan-level issues in Part 219, and leave project-level considerations to the Forest Service Directive System. See 67 Fed. Reg. 72773-75, 72791.

K. Comment regarding state and local government coordination during the Forest Planning process

1. New planning regulations should support and enhance close coordination with state and local governments All of the alternatives should include direction to involve local governments in the planning process. Local governments, because they are elected by those who are most directly effected by the agency's land use planning, often adopt plans, programs and policies to directly influence federal natural resource and land planning efforts. Current planning regulations require the agency to coordinate "with the land and resource management planning processes of State and local governments." (16 U.S.C. §1604(a)) Current regulations state that "the Responsible [Forest Service] Official must provide

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

opportunities for the coordination of Forest Service planning efforts...with those of other resource management agencies." Current regulations also provide that "the Responsible Official should seek assistance, where appropriate, from other state and local governments...to help address management issues or opportunities." (36 C.F.R. 219.9) In addition, the agency is required to "discuss any inconsistency" between the proposed plan's provision and "any approved State or local plan and laws." Further, if any inconsistencies exist, the plan must "describe the extent to which the [Forest Service] would reconcile its proposed action with the plan or law." (40 C.F.R. §1506.2(d)) Recently, the Council on Environmental Quality (CEQ) has supported an invitation to state and local governments to become a quasi-cooperating agency in the preparation of federal land and natural resource management plans and associated EISs. The invitation to become a cooperating agency is not based on the fact that state or local government are entities that may be affected by the outcome of the process. Instead, cooperating agency status is specifically based upon state or local government's position as professionals having jurisdiction by law in the planning area or professionals holding special expertise in an issue that will be addressed in the analysis or decision (memo from \_\_\_\_\_, Chairman of the CEQ). Of course, this quasi-cooperating agency status does not relieve the federal agency of the responsibility as the decision-maker, and does not guarantee a decision that the cooperating agency may necessarily favor. Cooperating agency status does allow the cooperators to participate in the scoping process, the inventory of data and analysis of current situation process, the preparation of alternatives, the impact analysis, and in the preparation of the draft and final EISs. This existing guidance should be incorporated in the new planning rule.

L. It is unwise to "proactively address climate change" in the planning regulations. 1. Please remove climate change as a "Substantive Principle" The agency's own Climate Change Considerations in Project Level NEPA Analysis (January 13, 2009) states that the effects of climate change are unknown, will vary regionally and will range the gamut from increased droughts to increased flooding. The document states: "It is not currently feasible to quantify the indirect effects of individual or multiple projects on global climate change and therefore determining significant effects of those projects or project alternatives on global climate change cannot be made at any scale." it also states; "Complete quantifiable information about project effects on global climate change is not currently possible and is not essential to a reasoned choice among alternatives." The only thing that is certain is the climate will change from its current and/or its historical condition. Effects of climate change are unknown. Impacts to the climate from human activities occurring on the forest, as well as the impacts of climate change on the forest cannot be made at any scale. Please remove this issue from consideration as a "Substantive Principle." In addition, incorporating "climate change" into planning will be redundant. For example, the NOI says Responsible officials will also need flexibility to be able to adjust plan objectives and requirements where there are circumstances outside of agency control: For example, where increasing water temperatures resulting from climate change make it impossible to maintain a sensitive fish species in its native habitat. However, such "flexibility" is already embedded in land use planning, and specific management prescriptions, standards and guidelines already address important issues such as "increasing water temperature." Indeed, existing Forest Plans contain very specific guidance regarding the monitoring of and management for sensitive habitats, including aquatic habitat. 2. The agency's planning regulations should discourage utilizing data

## Discussion Question 2

***(cont.)***

provided by the Intergovernmental Panel on Climate Change (IPCC) Current planning directs planners to draw on existing "synthesis and assessments" prepared by the IPCC. As recent media reports indicate, this data contains information that was not properly "peer reviewed" and some countries have even expressed a "vote of no confidence" in IPCC's data. Given the issue of climate change is controversial, and could conceivably affect a wide range of agency planning activities, the new planning regulations should require independent verification of any data from the IPCC.

3. Should the agency ignore our request and include direction to include climate change as a Substantive Principle, the agency should include an alternative that attempts to sequester carbon via aggressive vegetation management. As noted above, climate science is too "young" to be effectively incorporated into the planning regulations at this time. However, should the agency attempt to do so, we recommend an alternative that directs aggressive approach to terrestrial carbon sequestration. The "sink" of carbon sequestration in forests and wood products may help to offset sources of carbon dioxide to the atmosphere, such as deforestation, forest fires, and fossil fuel emissions. Aggressive forest health practices can increase the ability of forests to sequester atmospheric carbon while enhancing other ecosystem services, such as improving soil and water quality by avoiding "fatal" wildfires, insect and disease. Planting new trees and improving forest health through thinning and prescribed burning are some of the ways to increase forest carbon in the long run. Harvesting and regenerating forests can also result in net carbon sequestration in wood products and new forest growth. If the agency insists on incorporating climate change concerns into its planning rule, these activities should be emphasized in at least one alternative

M. We strongly oppose the "all-lands" approach. Please remove this from consideration as a "Substantive Principle."

1. The USFS lacks jurisdiction over state and private forests. It should not waste valuable resources attempting to plan for lands outside its jurisdiction The agency has this exactly 180 degrees backward. Instead of trying to force adjacent landowners to abide by the agency's wishes, it should be mindful not to let the deteriorating condition of its own forest to result in damage to adjacent lands.

2. The "rationale" for the "all-lands" approach lacks the proper perspective On August 14, 2009, USDA Secretary Vilsack outlined his vision for the future of our nation's forests. ( { <a href="http://www.fs.fed.us/video/tidwell/vilsack.pdf" rel="nofollow" target="\_blank">Link</a> } ) As part of his rationale for the "all-lands" approach, the Secretary made this statement: "The Forest Service estimates that over 40 million acres of private forest could be lost to development and fragmentation over the coming three to four decades." The agency's estimate may or may not be accurate. What cannot be denied, however, is that the Secretary's statement is completely out of context. While some private lands are developed, tens of thousands of acres are permanently protected each year. According to the Trust for Public Lands, many millions of acres of private lands have been "saved" from development. { <a href="http://www.conservationmanac.org/secure/" rel="nofollow" target="\_blank">Link</a> }

3. If loss of habitat to development or fragmentation is discussed in the analysis, it must include a accurate accounting of the lands that have been protected. The analysis should incorporate a full accounting of the lands that have been conserved, lands added to the federal estate, lands added to state and local estates, and lands that have otherwise been removed from development (e.g. conservation easements).

N. The agency should develop an alternative that emphasizes a more aggressive approach to achieving the historic range of variability outside

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Roadless Areas and Wilderness No one can deny that a very large percent of the agency's forests are unhealthy. There is agreement that moving to a historic range of variability, at least in as much as we understand it, is probably wise. However, the only tool available to manipulate those variables in designated Wilderness and Inventoried Roadless Areas (IRAs) is prescribed fire. This will be a big problem for the new focus on Restoration. Unlike what the general public believes, IRAs include lands that are highly modified, and not just by decades of fire suppression. Many have been commercially logged in the past and these "plantations" are susceptible to unnatural wildfire, insect and disease. The agency's current Roadless area management severely restrict any attempt to restore these lands to the historic range of variability. Therefore, it is logical to develop an alternative that emphasizes a more aggressive approach to achieving the historic range of variability outside IRAs and Wilderness. This should include commercial logging where appropriate, which achieves the agency's mandates for community health and prosperity, and also protects against so-called "fatal fires," insect and disease outbreak. O. Comment about the distinction between restoration and "adequate protection of roadless areas." On August 14, 2009, USDA Secretary Vilsack outlined his vision for the future of our nation's forests. ( { <a href="http://www.fs.fed.us/video/tidwell/vilsack.pdf" rel="nofollow" target="\_blank">Link</a> } ) In that vision, the Secretary stated: Our shared vision begins with restoration. Restoration means managing forest lands first and foremost to protect our water resources, while making our forests more resilient to climate change. The Secretary also stated: "An integral part of our shared vision must be adequate protection of roadless areas. President Obama was quite clear during the campaign in emphasizing his support for protecting roadless areas." There is an inherent conflict with the Secretary's desire for restoration and the intent to provide "adequate protection" of IRAs. The boundaries of IRAs are determined via the agency's mandate to determine which, if any, of its lands it will recommend to Congress be designated as Wilderness. The single most important criteria is the presence or absence of a certain type of road. That's why they call them Roadless Areas, after all. IRA boundaries are not, as the general public is often told, the last remaining pristine areas in our National Forests. Many IRAs include lands that are highly modified, and not just by decades of fire suppression. Many have been commercially logged in the past and these "plantations" are now in a highly unnatural state and extremely susceptible to unnatural wildfire, insect and disease. The agency's current Roadless area management, which is purportedly focused on "adequate protection," severely restricts any attempt to restore these lands to the historic range of variability. Except for a very few exceptions, the only tool available is prescribed fire. This situation begs the question; what is the agency's definition of protection? If by protection we mean moving the lands to a state that mirrors the natural ecosystem function then there is a conflict with his policy for protecting IRAs.

***(cont.)***

mirrors the natural ecosystem function then there is a conflict with his policy for protecting IRAs. The agency should clarify the distinction between restoration and "adequate protection of roadless areas." P. The environmental analysis should provide accurate information on water quality and related infrastructure We were interested to view the large amount of information on the agency's website devoted to water quality. We agree that USFS lands are an irreplaceable source of water resources and protection of water quality should be a priority. However, our "on the ground" experience with several projects over the years have taught us that water quality for human consumption is much more about big technology than forest management. One of our object lessons in this regard is the "Hayman Fire" on the Pike National Forest in Colorado. A large number of OHV enthusiasts were volunteers in mitigation efforts after that devastating fire, and subsequent rainstorms. Our members saw for themselves how wildfire can destroy water quality for wildlife and fisheries. What was interesting and surprising to our members, is that the human population, which shares the same water sources, was not impacted by same significant drop in water quality. Why? Because water is treated before it is made available for human consumption. Our intent is not to diminish the importance of protecting watersheds. To the contrary. Our request here is that the agency disclose water quality for human use and consumption in the proper context. Q. The environmental analysis should include accurate disclosure and detailed discussion of the social and economic impacts of the proposed rule. 1. The environmental analysis should include accurate disclosure and detailed discussion of the social and economic impacts of the proposed rule. 2. The analysis should include a detailed analysis in the DEIS of how the proposed rulemakings for planning, roadless area protection, and long-term road management policy, fit together so the American people can asses impacts, compare and contrast alternatives and develop informed comments. 3. The analysis should include a Regulatory Flexibility assessment of the proposed rules that discloses the potential impact on small business. R. Special attention should be given to providing clear definitions of all key terms in the agency's planning documents and the DEIS, FEIS and ROD. In our review of materials regarding the planning rule provided on the USFS website we came across two definitions of restoration: A Definition of "Restoration" FSM 2020 defines Ecological Restoration as "the process of assisting the recovery of resilience and adaptive capacity of ecosystems that have been degraded, damaged, or destroyed. Restoration focuses on establishing the composition, structure, pattern, and ecological processes necessary to make terrestrial and aquatic ecosystems sustainable, resilient, and healthy under current and future conditions." The new policy broadens the definition of ecological restoration beyond the traditional approach of reestablishing specific past resource conditions, such as those defined by historical range of variation. Because restoration objectives reflect diverse public values, ecological restoration is based upon collaboration. And Restoration means managing forest lands first and foremost to protect our water resources, while making our forests more resilient to climate change. ( { <a href="http://www.fs.fed.us/video/tidwell/vilsack.pdf" rel="nofollow" target="\_blank">Link</a> } ) This demonstrates the need for the agency to provide clear definitions of all key terms throughout the rulemaking process. S. The agency should review and consider revising the Purpose and Need statement for this important rulemaking. BRC strongly encourages the agency to revise its Purpose and Need statement to focus on the addressing previous planning regulations that were costly, complex, and procedurally burdensome. Discussion: The NOI

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

articulates the Purpose and Need as: The Agency now has an urgent need to establish a planning rule that protects, reconnects, and restores national forests and grasslands for the benefit of human communities and natural resources. A new planning rule must be responsive to the challenges of climate change; the need for forest restoration and conservation, watershed protection, and wildlife conservation; and the sustainable use of public lands to support vibrant communities. It must be clear, efficient, and effective, and must meet requirements under the NFMA, as well as allow the Agency to meet its obligations under the MUSYA, the ESA, and the Wilderness Act, as well as other legal requirements. It also must provide for a transparent, collaborative process that allows for effective public participation. A new rule should also be within the Agency's capability to implement on all NFS units. After admitting that the agency's 1982 planning rule was "very complex; had significant costs, was lengthy, and was cumbersome for public input," and its 2000 planning rule was "costly, complex, and procedurally burdensome" it is very disappointing then to read a Purpose and Need statement with so many undefined terms and potentially conflicting management focus. For example, what does "reconnect" mean in this context? How can a planning rule be "responsive to the challenges of climate change" when the agency's own directives (Considering Climate Change in Land Management and Project Planning) admit that effects of climate change are largely unknown? How can any planning rule be "clear, efficient and effective" when it uses undefined terms like "reconnect" and desires to be "responsive" to effects it admits are unknown? T. Answers to questions posed in the NOI: Substantive Principles for a New Rule 1. Land management plans could address the need for restoration and conservation to enhance the resilience of ecosystems to a variety of threats. Specific questions we would like the public to address include: • What do you see as the biggest threats to forest and grassland health and ecosystem resiliency? The agency's own avoidance of hard questions, wishful thinking regarding the effectiveness and acceptability of prescribed fire, misinterpretation of technical and scientific information, and complete disregard of the legal requirement for timber production and other human benefit objectives. The following is from the Petition for Writ of Mandate and for Preliminary and Permanent Injunction in Quincy Library Group v USFS: On April 22, 1998, twenty-five government employees, all but one from the U.S. Forest Service [USFS], met in Sonora, California as the Sierran Province Assessment and Monitoring [SPAM] Team. They were working on pieces of their "Ecosystem Conceptual Model," a theoretical construct of how literally all the pieces fit together and interact to form the entire Sierra Nevada ecosystem, from geological processes of soil formation from bedrock and the effect of climate change on photosynthetic capture of solar energy, right down to th

Thank You. Following up with Forestry will be a difficult endeavor for sure. What "BRC" (Blue Ribbon Coalition) is basically deriving at here is that USDA/USFS is attempting to take away our recreational rights which will violate polices and closure of trails for many groups use for which is illegal. . . The paragraph above answer your question?.....then attempt to change to Promote.....please..... (21 Sep 2010) , I personally don't have time to read the book you have posted here. Could you please summarize some key points in a paragraph or less? Until then, I am demoting. . We..." Did you mean to create the impression that yours is an official document downloaded from the Blue Ribbon Coalition rather than it just being you speaking for yourself in your own words (and calling yourself "We")? Are you the sole author, editor, and publisher of all content for the Blue Ribbon Coalition? The legal mumbo jumbo also suggests that your posting was vetted by the lead council for that organization -- are you their lawyer, too? Please forgive my confusion. ....apparently YOU did not understand the beginning.....It is BRC's type.....From them to (you read and see) Not Mine....even though I support all of it. Also.....a tid bit info for you here....."Those whom oppose with anger will remember much easier too".....thank you. . . (21 Sep 2010) This is not an "idea." It appears to be a legal brief arguing against something the government is currently doing. ....you are incorrect here in a way.....it is a "Comment" that must be given prior to an "Appeal Process" as per USDA/USFS policy . . So am I to apologize for submitting a "Comment from BRC" to inform many others of the actions being brought forth from our very own inexperienced and un-educated government officials lacking the knowledge of our forest, it's intended use for recreational purposes, and wildlife and even how the forest really came about because of President Theodore Roosevelt...??? Am I? Let me answer before others give extreme negativity here. . . NO . . Recreation in the forest is the right of The People as per documentation stating all the way back to 1934. Now when I see other ideas on here for a good cause, I will support them, even though they may not support what I advocate for - the recreational use of our forest. Thank you all who have supported and promoted this. As for those whom have not, there are those groups also but I thank you just the same.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Public Lands are just that....."PUBLIC". The Lands that are called Forest are the property of The People of this great nation, not that of the government. If YOU have any knowledge of history than you would know our very own President Roosevelt made a pledge about our forest for The People should use it for recreation and enjoy all it's beauty. By means of motorized transportation in order to be deep in the forest to be a part of nature and the wonders of it. That is why Pres. Roosevelt spent so much time himself in the forest he had replenished for all of us to enjoy. Today there are more causes and levels of importance than there are of results of any actions brought up. Recreation is the fastest growth of American use today. Many activities are taking place in our forest like, bird watchers, hikers, plant enthusiasts, All Terrain Vehicle, Off Highway Vehicles, bikers, campers, water activity, and so much more. If one person thinks they can be an Advocate for every activity and have a inch of success than so much more power to them. But.....there is no such person. Most users of trails rarely come across campers. Those that YOU say YOU experienced were fellow campers most likely. I am sure you did NOT confront them to ask them to be considerate of YOUR FAMILY time as well? This info in this blog type is not to promote or to use it for gain to a club or entity for OHV's. It IS for the government to read our concerns and what we believe in for our recreation as to the type of ways the OHV Community is involved in caring as well as taking care of our forest while also using it for recreation. . So I ask YOU, what do YOU do to help OUR Forest? Please say what clubs or associations YOU may belong to for which YOU support OUR Forest. Don't be shy!

AGAIN..... . . I would like to know how many OHV People actually belong to a Club, Association, or National entity to save Trails? Blue Ribbon Coalition is the Nation's Top entity containing all uses of recreation in our forest for Families. How many belong to them? Make a Comment about the Club YOU belong to and just how they are working to Save Our Trails here. This way those who are sitting on their couches and have nothing else to do with their time except make Negative Comments towards Recreation here on this site because they are afraid to leave their homes and really see our Nation at it's best. So load this site up with your Club Names, the good work they do saving Trails and make a point for all to see.

Well a few comments are wrong here. When USFS - BLM - and who ever else that are part of this Nations government, perform "studies" and reports , they MUST fit the criteria of that department. They Do Not perform a non-prejudice report or decision. It has been proven time and time again of this. Private sector has nothing to gain but an income of services and non-prejudice at that. I know of biologist and archaeologist who work for USFS.....it is a job....and a retirement for them.....they don't really have the interest as they once did because of the political side involvement and the Directors criteria they must meet. I do know of several private sector scientist whom have offered their services to perform studies for USFS and they were told" they may do so if they wish but it will not be accepted." That the Public will not be notified of such studies either. Beat that one! . This is our great government at work for sure.

## Discussion Question 2

***(cont.)***

This is truly a underlined way of the government and environmentalist to take anybody's property they want and to keep us out of our God-given right to enjoy the forest in which God created for us to enjoy. What rights are they gonna take next? What are the people inside the borders with homes going to do? More regulations with what we can and can't do with our property. They already have too much control. NO!!!!!! ON SISKIYOU CREST NATIONAL MONUMENT!!!!!!

Quite Majority. All government: Fed., State, and Local have to start lessening to the QUITE MAJORITY not the outspoken 1% minority. I like to do a lot of outdoor activities from surfing to biking, hiking to OHV motorcycle riding, walking the dog in parks and beaches. The 1% minority is making this harder by closing, restricting, or blocking access all in the name of preserve and save. This I have seen in my 57 years. The land should be open for all beings, not closed because of the 1%'ers, there is more than enough for everyone and everyone.

Define damage the land... There has been so many acres ripped flat and paved, and wet lands built upon for houses, or a mall, or a place like Home Depot and that's fine. Where is the land then? I guess money talks. BUT DON'T get caught with an ORV in the power lines!!! Give me a break! Seriously! People are odd, and uptight these days for sure.

Define damage the land... There has been so many acres ripped flat and paved, and wet lands built upon for houses, or a mall, or a place like Home Depot and that's fine. Where is the land then? I guess money talks. BUT DON'T get caught with an ORV in the power lines! Give me a break! Seriously... People are odd, and uptight these days for sure!

Oregon does not have plenty of land already designated as wilderness, we lag woefully behind most of our neighboring states. Wilderness designation does not prevent people from enjoying an area, it guarantees all will continue to enjoy it just the way it is now, and in the ways they are currently able to enjoy it save for tearing it up with OHV vehicles. It is wild land, guaranteed to remain that way, open to all. The Owyhee country is staggeringly beautiful and remote, whether it be rugged canyons or windswept desert plains. It deserves to remain that way.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Perhaps the greatest problem related to advocacy is the fact that the National Wildlife Refuge System (NWRS) has only a part time advocate at the agency head. The Service Director is compelled to represent all Service programs and consequently cannot be a full time advocate for the nation's third largest land base. In fact, the Assistant Director National Wildlife Refuge System (Refuge Chief) is one of eleven Assistant Directors in the Washington Office who report to the Director and Deputy Director. Leadership that is spread between several competing resource management disciplines of the Fish and Wildlife Service can never provide the focused advocacy that the NWRS deserves. A lack of refuge experience in the leadership is a further disadvantage when competing resource interests must be considered. For example, scarce water resources in Western states are allocated according to state laws, and the Fish and Wildlife Service must compete with other interests for water needed to protect fish and wildlife resources. When water needs for Endangered Species protection must also compete, they are usually given the highest priority while the poorly understood needs of migratory bird refuges can get less than fair advocacy and consideration. The same disadvantage of priority is apparent when scarce funds and manpower are allocated. Refuge priorities and needs are too often subordinated to the urgency and legal requirements of other resource management programs.

wow anybody who believes this post must truly be one of the most ignorant people i know. Heres MY question from the OHV side of things, where the heck are all of your Prius's batteries going to go when they go bad? One thing I can't stand is people trying to fight something they know nothing about, as a camper and ATV rider as well as UTV rider I have a HUGE appreciation for wildlife and nature, hence the reason we camp and ride versus going to the track. Why don't you try actually meeting some of these people rather than sitting in Starbucks drinking your iced latte and going on facebook.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Things like helmets, OHV riding classes, better parental supervision, no night riding, no pavement riding, no doubling up on single rider vehicles are all good things, and if everybody followed these rules it would cut down, but not eliminate, fatalities. Many people who follow every single rule in the book (a distinct minority) are still killed on ATVs because they are too darn unstable. See the Oregonian link above. I think the Oregonian found that the percentage of rule followers who get killed is the same as the percentage of reckless riders who get killed. A safety certificate in a kid's pocket doesn't do him that much good when the machine flips and comes down on him, you know? Those type of laws have been tried or are on the books in many states and have proven nearly impossible to enforce. And, generally speaking, when a family's child is killed in an ATV accident, no charges are brought against adults or parents even if some rule hasn't been followed because the family has suffered such a terrible loss. Who wants to prosecute them on top of that loss? I don't think that's appropriate in most situations. But even if those laws could be enforced (they are not), and people complied with them (they do not), that would NOT be good enough, according to America's medical community. Children simply do not have the maturity to ride safely even with helmets, training, and supervision, and the machines are too prone to flipping over. And those type of laws send the very misleading message that kids will be safe on these machines if they wear a helmet, etc. It's not that easy. ATVs are too prone to flipping over, and it is simply not safe for children, who do not have the physical or mental maturity, to drive them. The ATV industry and industry-funded user groups try to spread a different message, but the tragic reality is that machines are dangerous and too many kids are dying or suffering terrible injuries each year. I hope that the Consumer Product Safety Commission steps up to the plate soon and takes a hard look at the safety record of ATVs and children (c'mon, regulators! Do your job!), but in the meantime, at a minimum, children should not be allowed to drive these machines on public land.

Your agenda seems to simply to discredit anyone or any study or article that supports stricter ATV laws when it comes to kids. Why are you so invested in trying to blow smoke about this issue, which is pretty straightforward and clearcut. The safety rules you talk about are on the books in many states. For example, Michigan requires safety certificates, parental supervision, full face helmets, etc. but has already had six children under the age of 16 killed so far this year. Massachusetts is moving in the right direction--it just banned all kids under 14 from riding ATVs anywhere in the state: { <a href="http://commonhealth.wbur.org/2010/09/mass-first-to-ban-atvs-for-kids-under-14/" rel="nofollow" target="\_blank">Link</a> }

My suggestion is to adopt the recommendations of the medical community and ban all children under 16 from driving ATVs on public land. I have no obligation to "work with you" when you are proposing something different that I believe to be the cause of many child deaths. You are saying that better rules or better enforcement will adequately protect children. I fundamentally disagree with you. We don't allow children under the age of 16 to drive motor vehicles on our nation's highways, and I don't think we should allow them to drive ATVs on our public lands. In some states, underage children are allowed to drive them on public roads to the state or federal lands, a very dangerous practice. Also, would you kindly answer this question. Do you have any kind of financial tie whatsoever in any way to the ATV industry? Manufacturers? Dealers? Industry-funded user group?

## Discussion Question 2

***(cont.)***

"The gunning down of wild wolves in the West is beyond appalling" News flash, all wolf hunts have been suspended in the West. You can thank Judge Donald Moly of Misoula MT.

"I have already suggested using highway corridors right of ways for this activity." Why dont hikers and bikers try using highway right of ways instead of trails? A. Because if you wanted to be on or in close proximity to a highway you would just drive in your car. B. It is not safe.

The ESA has actually been used more as a political tool to further an agenda. The agenda is to further restrict federal land use. "They need to hire more biologists and environmentalists who understand these complex systems" Actually I would say that the majority of the people who work in the natural resource agencies could be defined as "environmentalists". The have not been able to do a very good job so far.

I agree with you! But we need to start when kids are in kinder garden, not in high school. One class is not enough, the subject is very broad and it is important that kids understand what is really happening with their environment. In Imperial County there is a very high % of asthma, kids miss school, they need to understand why and what to do about it. The air quality in Imperial County is so bad. There is a lot of pollution, how can kids play outdoor if that is going to trigger an asthma attack?

Restore Our National Mall--Our Front Yard. The National Mall is in terrible disrepair and it is not only our nation's front yard but it is also the centerpiece of democracy in our country. Create a national fundraising campaign to supplement the taxpayer dollars necessary to properly design, rehabilitate and maintain the Mall for its multiple purposes. The design students working with Gary Hilderbrand at Harvard have created tremendous ideas and with Susan Spain's enthusiasm and passion the Mall could once again become our showcase of democracy in action and a role model of sustainable design and maintenance.

***(cont.)***

As a retired U.S. Forest Service Professional in outdoor recreation management I am simply furious with \_\_\_\_\_ for literally hijacking recreation and his blatant attempt to commercialize and privatize the Recreation Resource on our precious National Forests. He has done much damage. The Washington Office of the Forest Service is abjectly culpable starting with Chief Dale Robertson of allowing this to happen. It is the American Taxpayer who is bearing the brunt of this tragic theft of our rights. These are OUR precious National Forests and we the people own the Commons. The Fee SCAM must stop! Fees disenfranchise lower and middle income recreation users and discriminate against ethnic groups. The ham-fisted and oppressive collection (extortion) of fees in inappropriate backcountry and dispersed venues by FS police agents is something the U.S. Forest Service should hang their head in shame over. The problem is they currently have no shame, and continue beating the Recreation Public over the head with a truncheon. Fees are simply a social and economic DISASTER. They are a circular self-defeating dead end. Mr. Crandall is a paid LOBBYIST. His group - the American Recreation Coalition (ARC)-- is an advocacy group for motorized Wreckreation. For goodness sake they previously lobbied Congress to drill ANWR! Their inner motivation is "cheap gas forever" to keep those half million dollar 80 foot long motorhomes tooling around. Anyone heard of global warming and PEAK OIL! The U.S. Forest Service has been in bed with the ARC for a long time. Scream bloody murder to the USFS higher ups to dissolve this unholy and destructive "partnership" with the ARC. Contact Chief Tom Tidwell and national recreation director Jim Bedwell -- ttidwell fs.fed.us jbedwell fs.fed.us -- and tell them loud and clear as a disgruntled taxpayer you demand they serve the recreation general public and CEASE serving corporate America. Do not be fooled one minute by either \_\_\_\_\_'s self-serving propaganda nor the out-of-control U.S. Forest Service. The Forest Service record of dismal financial mismanagement is well documented. Appropriated recreation dollars actually increased 13% between 2002 and 2009. They cry "woe is me--we don't have enough money." That's NONSENSE. They don't use the money they are allocated wisely nor efficiently. They can start by trimming the bloated bureaucracy at the top and getting the allocated Congressional recreation money down to the Ranger District level. I have studied and worked on the FEE MESS for 12 years and I will tell you that the literal future of Outdoor Recreation is at stake. Now is the time to help defeat these onerous fees once and for all! Urge your Senators and Representatives to step up to the plate & REPEAL the Federal Lands Recreation and Enhancement Act (FLREA). It is literally your future in Outdoor Recreation on the table. Please fight like mad for Fee REPEAL. Tell Mr. Crandall to take a hike and write a personal letter to President Obama. Enough is enough!

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

To the Obama Administration and interested citizens, My name is \_\_\_\_\_r and I am the Executive Director of an organization engaged in public land issues for the past twenty years. Since 1997, we have focused attention upon the efforts of certain commercial recreation interests to transform America's Great Outdoors into venues where access is offered for sale to those willing to pay to play. In this forum, has made various statements about recreation fees and claims that we Americans are still free to experience the outdoors as we did before "Pay-to-Play" replaced traditional birthrights. In the paragraphs which follow, I offer some unvarnished history. As \_\_\_\_\_ has pointed out, \_\_\_\_\_ stated in Congressional Testimony: "Recreation fees on public lands were one of the issues which prompted the creation of the American Recreation Coalition in 1979." In 1996, Crandall got what he was seeking when the Recreation Fee Demonstration Program became law. In 1997, the Wild Wilderness website was created, in part, as an effort to provide factual information regarding the still nascent issue of recreation user fees. In that same year, Chief of the US Forest Service \_\_\_\_\_, speaking before a recreation industry gathering announced: "It baffles me that the Department of Agriculture tracks the value of soybeans, corn, or wheat to the penny by the day, yet, rarely is recreation and tourism on federal lands understood as a revenue generator. Instead it has been perceived as an amenity - something extra that we are privileged to enjoy. Fortunately, that's beginning to change." With those momentous words, something very important began to change and I feel strongly that that change should be the over-arching topic of discussion for the entire "America's Great Outdoors Initiative" forum. Quoted below are excerpts of a speech given the following year by \_\_\_\_\_'s boss, the Undersecretary of Agriculture. The speaking venue was the American Recreation Coalition's "Great Outdoors Week." The message was heard loudly and clearly by \_\_\_\_\_'s associates. I suspect it was barely heard by the American Public. I trust the outcry of the American Public on this topic is now being heard by the Obama Administration. More importantly, I pray they are listening. \_\_\_\_\_, Wild Wilderness --- begin quoted --- Outdoor Recreation on the National Forests Remarks of the Hon. James R. Lyons, Under Secretary for Natural Resources and Environment, U.S. Department of Agriculture June 8, 1998 Welcome to USDA and Outdoor Recreation Week.... During my tenure with the Department, we've not only tried to highlight our recreation program, but we've also tried to take a more business-like approach to its management and promotion. We developed a marketing strategy and an icon that we hope will become to outdoor recreation what the Nike swoosh is to sporting goods and that famous Mercedes Benz hood ornament is to automobiles - a sign that connotes high quality outdoor experiences and customer satisfaction... We're working to obtain more resources - through a proposed increase in the recreation budget, through fees collected through the demo program, and, perhaps, through an expanded role for concessions. What about a profit sharing arrangement with concessionaires where the taxpayer and the business benefit from the venue - in cold, hard cash - and the customer benefits from improved recreation opportunities. We're looking toward the private sector to provide more support for national forest recreation - for an expanded partnership with those who realize an economic benefit from recreation on the public lands. In this way, you can help us help you (as Jerry McGuire said) expand your business opportunities while helping us expand recreation opportunities on the national forests. Finally, to accomplish this and more, we need to develop stronger brand and name recognition for national forest recreation. Our challenge, in short, is to help

## Discussion Question 2

***(cont.)***

the public realize that when they're hiking the Pacific Crest Trail, or biking the Hiawatha rail-trail, or running the south fork of the Salmon River, or relaxing at Timberline Lodge, they're not on a national park - they're on a national forest. And we hope to achieve this through better marketing, through better information, and through improved development of our brand of outdoor recreation.... Can you think of any other entity - private or public - that has the breadth and diversity of outdoor recreation experiences that you can find on the national forests? I doubt it! We've got a great product to sell. And, with your help, we can make it even better! The national forests are truly America's Great Outdoors. Thanks for your continued support and partnership. We'll look forward to seeing you at Great Outdoors Week.

The reason we have designated areas is to protect wild lands from encroachment. If you make the public use areas inaccessible you are increasing prohibited use of sacred estuaries, preserves and unmonitored wild lands. To illustrate this: I have to travel 50 miles to the nearest OHV (which was recently in danger of closure) But instead of driving 50 miles, some people will ride and let their kids ride in a field that has been allocated for housing behind our home. This seems like somewhat harmless behavior since the land will be "improved" at a later date. However the field is unmonitored and currently is the home to endangered burrowing owls. The kids chase the owls from their burrows. I can't even begin to tell you the lasting message this is sending to those kids. If accessible areas were more convenient people would be more likely to use them and less likely to destroy non-designated areas. Keep the spaces we have open and create new designated areas to help preserve wild lands.

I've also seen these larger organizations sue under the guise of smaller special interest groups. I've seen lawyers suing and forcing closures of private and non-profits that help kids over technicalities. Again just for the money. It's a sad situation. Our courts should be empowered to take action against attorneys who file predatory and frivolous lawsuits to misuse the public right of access to the courts.

The writer of the article promoting bikes in Wilderness is none other than Jim Hasenauer, past president of IMBA, International Mountain Biking Assoc. He knows how to write as he is an associate professor in communications at CSUN, Cal State University in Northridge. His comments are not supported by scientific studies. His statement that bikes should be allowed wherever horses can go is nonsense. The Wilderness Act should remain in its good stead by not allowing any mechanical devices, and that includes bikes. The primary concern of trail users is safety. Mixing mountain bikers with hikers and horses destroys the trail experience that people seek - to have a relaxed, experience in Nature without the anxiety and worry of meeting a silent, speeding bike along a trail. As to the President's interest in improving the people's recreational opportunities, there are already thousands of places in the nation where people can recreate with their bikes. Bikes are an urban mode of transportation and not a rural way of traveling. The Wilderness areas are our last stand for hikers and equestrians - fight hard to keep them. I hope many people will strongly denounce the idea of allowing bikes in Wilderness areas. It would take a congressional amendment to make the change, I believe, since the Act was created by Congress.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Several people have been curious about what brings hunters to our Place. We have mostly elk, mule deer, antelope, coyote, and sage grouse hunters. Occasionally big horn sheep, sharptail grouse, pheasant, mountain lion, or bobcat hunters show up. People also hunt whitetail deer here. Our area is not whitetail habitat, but they are being forced into this area by overpopulation in their natural ranges. They cross with the indigenous mule deer, threatening to wipe out the species. We always encourage hunters to concentrate on removing any whitetail or crossbreds that they encounter and tell them how to recognize the crosses. Predation is of utmost importance to the survival and health of a species. If you had a pet cat, and she had four kittens twice a year and those kittens matured in 12 months and began to mate and also produce kittens (the averages for cats, according to the veterinary text I consulted), you would have 9 cats the first year, 25 cats the second year, and 73 cats by the end of the third year. At some point, you would no longer be able to provide each cat with fresh water, abundant food, and clean, healthy space. This danger also threatens wild animals if they reproduce faster than members of their population die. If they overpopulate, they must die slowly of hunger and thirst. Some will resort to cannibalism. The mothers will have to watch the weakest members of the population, their young, die of hunger. If one species overpopulates, it can damage the plants so much that many species will suffer. The only ways to protect species from overpopulation is by predation or birth control. Providing birth control to wild populations is complicated, and chemical birth control poisons water sources and kills aquatic life. Predation protects herbivores from overpopulation. However, predators can also overpopulate. Just as herbivores can stress and destroy the plant populations they depend upon, too much predation can destroy a population of birds or animals. If a wild animal predator is overpredating and harming the prey base, it can be very challenging to do anything about it. Human predators are much easier to control. If you have skilled state biologists, who can accurately gauge the number of animals that need to leave the population to keep it healthy, and honest hunters, who will obey the game laws, the well-being of your wildlife is assured. Of course, some people are not honest. In that case, you have ranchers, on the ground every day, who can watch for suspicious activity and abuses and report them to the wardens. No one hunts prairie dogs on this Place. There are none. Mother Nature wiped out four active towns with a disease epidemic. Some studies have shown that shooting encourages healthier prairie dog towns. Maybe if someone had taken the time to hunt a few of them, they would not have fallen prey to a disease that devastated the entire population.

Bristol Bay has crucially important fisheries and wildlife habitat. These are resources, renewable in perpetuity, that are needed for our very survival. Mineral extraction is a temporary producer of wealth which could destroy these vital living resources. Protect the Bristol Bay watershed; don't risk the permanent value for the temporary.

## Discussion Question 2

***(cont.)***

Create master website for US national parks, BLM national parks, US national cemeteries, and World Heritage sites within the US. This list should be sortable by state, category, size, recreation, campsites, etc. so potential visitors can schedule vacations. My wife and I vacation by zigzagging through states trying to visit as many of these sites as possible. We journal all our travels and very much like the current NPS brochures on each park.. Super sized website listing all NPS, BLM, National Cemeteries, and World Heritage Sites in the US. This website would be sortable by state, category, facilities, recreation, etc. so potential visitors can schedule travel and vacations. My wife and I currently vacation by zigzagging through states to see as many of these sites as possible. That list is about 600 sites long. We've seen about 175 so far.

There should be no access fees. I pay taxes each year. Also, what about the poor and unemployed? Do you want to shut them out and make the public lands the playground for the rich only? The fees under FLREA are very unreasonable and excessive. There are no alternatives that I am aware of to the Red Rock Pass in Sedona, AZ. If you park anywhere just to take a photo or sit and meditate, you have to pay the fee. This ture even in areas where there are no facilities or if you choose to not use the facilities. Also, how many hours would I have to volunteer to get a "free" one hour visit. This is just plain crazy talk. What a waste of resources to track these hours and a waste of my time to check the checkers. How many civil servants would be needed to track volunteer hours. Also, I want to volunteer for my favorite causes like the homeless and my church. I just want to visit MY public lands without a big hassle.

First may I say I do now, and have always had a Jeep. That said, I also am handicapped, and cannot hike as much as I used to. I am 64 yrs young, and now use a horse to enjoy the forests, desert where I live, even go to the beach camping with my horses. OHV's DO NOT BELONG in the forests!! No longer can you see wildlife close up from the trails, no longer can you dispersed camp without the loud buzzing of motor vehicles screaming across the desert nearby, or doing "donuts" in the fire roads of the forest. Riding up the sides of the banks of the creeks, and screaming across the forest duff making narrow tracks for natural rain to cause erosion and foul the watershed. This is not to mention the attitude of dirtbag dirtbikers, who trespass on private holdings, break fencing, burn up the line shacks for wood, destroy the grazing, and chase our stock. Nope! IMHO, I say; SHOOT - SHOVEL - AND -SHUT UP, are going to used to all OHV users on our land.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Where we live we are very close to the PCT. The PCT was formed to allow hikers, and equestrians a trail with out motorized traffic, so they could recreate and move from the Mexican border to Canada. When Bicyclists come screaming down hills, and moving at high rate of speed along these quiet corridors, wildlife, and especially equestrians are spooked and driven away from using the areas. In our part of the Angeles Nat. Forest, they have taken to abusing the Pacific Crest Trail and even gone so far as to alter the terrain with berms and wider turns so they can move at high rate of speed. As both a hiker, and an equestrian who also enjoys the opportunity of photographing wildlife, I find them to be almost like "two wheeled Locusts". They destroy the trails, and scare both animals and hikers with their tactics of strong arming the trails. I admit, Equestrians are the LEAST organized group of users of the trails, but NOT the non-users they are depicted. One reason for not using trails near the population centers, is the preponderance of both bicycles, and OHV's which are so intrusive. Thanks for listening;

I have to interject about the biking community NOT doing trail maintenance. In the Montana De Oro State park of Central California, the trail maintenance is ALL done by bicycle clubs. These trails ARE shared by both equestrians and bicyclists, and hikers. That said, the traditional trails thru the trees, and across the narrow canyons have been re configured to accommodate bikes and some have been eliminated altogether. When camping with my horses at MDO, we met some of the most courteous mtn bikers,who were smiling and asked to come pet our horses, talked with us and when we could get off of the trail went by slowly. And some of the "two wheel locust" riders. I asked the rude ones where they came from to use the trails. ALL were from the Los Angeles area! I have ridden in three states and much of California from Oregon to San Diego. The area where I live is quite rural, and the trails are really narrow and ledgy. In fact so narrow and full of drop offs, many are not usable with out repairing the trail before we continue our ride so the horses don't fall or slip. By the way, you can't turn a horse around on a ledge trail with a drop off of several hundred feet. ALL of that maintenance is done by HORSE PEOPLE. In the Wrightwood CA. area, I personally have gone on 6 overnite trips to repair trails, cut snow downed trees and snags from trails, put in logs along washouts and used a pick and shovel to cut out the rocks from slides. The PCT in the Angeles Nat Forest, is very faint in spots due to the fires, and resultant slides. On the "city side" of the PCT, I have had to repair three trails above Altadena where the bikes have built berms and cut outs on the trails. They seem to forget that these trails were ALL BUILT by equestrians. The Doc Larson comes to mind, as does the Fat Grizzly trail, the Golden Moccasin, and the Silver Moccasin. In fact the Golden Moccasin trail has been given over to M/C use. and is no longer usable by bicycles or equestrians, and may get closed because of the ecological damage since the fires. Who do they think trims the overhead trees, puts the rocks back marking the trails in flat areas of little growth. Who transports the markers on mule back to clear the trails and trail camps far away from roads in the forest? And who thinks an equestrian wants to cut across switch backs? If anything you want to stay as easy as possible. It would nearly kill your horse to go jumping across switchbacks going up or down. If you knew what concentration it takes to ride an animal with a flight -or fight instinct, they would stay away from them. Instead we have so many close calls from encounters at high speed, been cursed out, and told WE don't belong on the trails WE BUILT? I have met some of the best and some of the worst...so IMHO, NO, Bicycles DON"t belong on the PCT, or any wilderness area.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I'm not against OHVs and I think there should be places for their use. It seems, though, some think their activity should be allowed everywhere. There are benefits to wilderness for people and animals. It seems there are narrow minded people in all groups that only want their way and don't care about anyone or anything else.

There are areas OHVs should be allowed and areas they are not allowed.

I don't disagree. Although things like hunting, fishing, camping, even OHVs in areas designated for them, are all better than public land being used for drilling and mining. Drilling and mining should be allowed on less of our public land. Wildlife and the health of the environment should always come first.

I would say some need to look past next week. With an exploding population, won't OHV trails become more crowded no matter how many there are. What do we do to "disperse" the impact then? There needs to be areas available to OHVs and areas that are not available, especially as the population grows.

I agree. Here is an example of true wilderness that some want to develop for profit. Can't we find places that have mineral deposits that don't threaten every last wild area, or is it less costly to mine in areas away from development. Some things are more important than profit. I guess we need to drill or mine in every valley. As we develop more in areas that are true wilderness, we can debate how much less wilderness we need in other areas. It has to be clear that wild areas are a diminishing resource. It doesn't make sense to me that after years of developing areas, some are still unable to see the value of areas without development. \_\_\_\_\_, you obviously work for a mining company. Mining is fine in some areas. In some areas it just doesn't make sense. Let's hope the regulations us average citizens grossly underestimate for the mining industry are better than the oil regulations in the Gulf of Mexico.

Not all "back country" should have motorized access. Some should, some should not.

I support the Nature Conservancy and the hunting groups mentioned by \_\_\_\_\_. I think one of the biggest threats to wildlife is habitat destruction. In Michigan, the Nature Conservancy worked with the state to try to purchase land that went for sale from a large lumber company. They were out bid and the land was sold to a private company but the Nature Conservancy was able to get easements to keep the land open to sportsmen.

The Idaho roadless rule allows road construction and re-construction in most areas. Also, OHVs are allowed on most of the areas. I'm not sure the roadless rule is the enemy you assume it is. Idaho has 20 million acres of national forest. I'm sure it is one of the few truly wild areas left.

I ride snowmobiles and have ridden dirt bikes, OHVs, etc. I'm not against this kind of activity but I demoted this idea because I can see the benefit of preserving some of our wild lands. There is room for wilderness and multi use areas. There are extremists on both sides.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I think some people get accustomed to all our modern conveniences, start to feel removed, and have trouble believing we are part of the Earth. If we destroy our environment, we will definitely feel the effects.

I could see a problem with special interest groups (oil, gas, etc). No land would be preserved and everything would go to the highest bidder.

If you noticed I used gas and oil as an example. The "etc" means other interests which could include other things like mining, logging, any other development, private companies that just want land. I don't know of any area that isn't under some kind of pressure for some kind of development. It is in no way a gross exaggeration. What area would preserve land for the good of all the people when money could be made. Money shouldn't always be the most important consideration.

From what I've seen, locals have the largest say. For an example, look at the Roadless Rule. It states use is determined locally. Also, if the land being referred to is BLM land, than it belongs to all Americans and all should have a say. Sometimes the will of the majority and the goals of the nation should take priority. You keep referring to extreme environmentalists. I don't consider myself any kind of extremist, although I believe we should preserve more of our land and some should be wilderness. Most of our land (referring to federal land) is already open to most development. More should be left to wildlife and recreation. To me, there is a much bigger benefit to people and wildlife when we preserve rather than develop it. I'm not against access and local use, as long as it doesn't mean development.

I'm not for the fossil fuels access. I think this is something we need to try to get away from. I know it's probably a long way in the future though. I think oil and gas should not be a primary concern when we are deciding what to do with our wild lands. I don't like it when they drill in Michigan on public land, either. I'm sure most reasonable people can decide on a balance between wilderness and non wilderness. Access is important and the activities you mentioned should have a place. I tend to lean toward more wilderness. I think these areas will be treasured as the population grows into the future.

Preserving our wild lands preserves fishing. Sportsmen have contributed greatly to conservation of our wild lands. The only thing in your idea I don't agree with is the gravel road in wilderness. Maybe we could make it a dirt trail.

Michigan has a huge amount of trails. From what I've seen, there are a great deal of trails in Michigan open to OHVs. The problem in Michigan is it is hard to get away from the noise of development due to the large amount of roads.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I also think we are mostly in agreement. Access and reasonable resource extraction is important. I would say a vast majority of our public land is open to development. My estimate is over 98% of the land in the lower 48 states allows resource extraction. I also agree that well managed logging is ok, especially if they can log and then remove the road used to access the lumber. Drilling is done all over our public land. If they only drilled on 1% of public land, I don't think anyone would have an issue. The percent of public land open to drilling is much higher. There are very few areas access is denied for development. I think wildlife/wild land preservation and recreation should be the focus on more of our public land. Balance is the key. I think if we could reach a balance and protect (or preserve) more of our wild land, alot of these issues would go away.

I don't think anyone wants to preserve anything in some artificial state of suspension, but to have roads and development everywhere would be irresponsible and not what I would like to see passed onto future generations. Roadless areas provide many benefits to wildlife and humans. There is room for both, roadless and roaded areas. Right now there are too many roads in most of our national forests. Because there are some select areas that don't have an excess of roads does not mean we should strive to build into every last region.

I don't think I'm wrong. I consider myself kind of an environmentalist and I don't want things preserved as they are this second, I just want to see areas preserved without human development. I think that is important. Your view of environmental groups is not one that advocates cooperation. You kind of lump all of them together kind of like I've seen others lump people in different groups together. If you are referring to the Roadless Rule, maybe it should be called the Limiting Road Construction Rule. All it does is limit road construction. It's not wilderness designation. In most areas, it allows road construction and re-costruction. As the population grows, these areas you enjoy may become more populated and crisscrossed with roads. As you stated, that's not the experience your looking for. That's why we need to preserve things now. If what you are striving for is limited roads, the roadless rule seems to be just what you described. I believe we need to plan carefully today if we want these wild areas to last into the future. I don't think allowing more and more development in these areas will preserve them in their wild state. Some sort of protection should be encouraged.

Wolves have lived on Isle Royal for years, how about the impact there. The only thing they do is keep the moose population in check. Are you saying wolves in Michigan decimated the deer population? How did you come up with this idea. There is no shortage of deer in the U.P. I might believe in disneyland (it's a real place), but you live in disneyland.

I'm not against hunting or even hunting wolves if it is proven they are no longer endangered in the lower 48 states. It seems there are some who just want wolves eradicated, repeating the same mistakes of the past. That's one good reason why I always advocate we leave enough wild areas preserved, roadless, and undeveloped so unpopular species will also have a place. Paul, I've never seen any information indicating the problems you have described that you state are occurring on Isle Royal. It seems to me you just don't like wolves. The last thing I read indicated wolves are keeping the moose population in check on Isle Royal.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I thought we were past "demonizing" wolves. I guess we should also eliminate other species like sharks, bears, etc., because they don't fit in with our society.

I think the reason some areas don't get the protection they deserve is because there are powerful groups who profit from development of these areas (gas, oil, mining, etc.).

With wilderness designation being 2% of the country in the lower 48 states, I would say a vast majority is open to development. That means mining (to use the author's example) can occur on 98% of the land right now. If there are mining rights in place when wilderness is designated, I believe those rights remain. That means over 98% is available to mining. I think once there is a balance, a lot of the debate would disappear. I don't think anyone wants to do away with any of our modern conveniences or development. Things like mining are important to our economy. We just need to consider if the money we get from developing all our wild areas is worth the price we would pay in the long run. I believe it would be irresponsible to open every area to development. If we can't make it work with, let's say, 90% of our land open to development, what is the chance opening 100% to development would make a difference.

OHV use should be considered as any other recreational use in the forest. There should be places they are allowed and places they are not allowed. Just like there should be areas that are designated wilderness and areas that are not.

I agree that knowing we have preserved wilderness in a specific area, even though I may not visit that specific area, is a comfort to me. I'm not against access, access is important. I'm only against further expansion of roads into our last wild areas. Some areas need to remain roadless.

I ride the PCT from Vasquez Rocks, Agua Dulce to Soledad Canyon, Acton Ca on a regular basis. Allowing Bicycles to ride the same narrow trail would be extremely hazardous. The trail is narrow and has many blind curves. Mountain bikes travel down hill at a high rate of speed and due to the short distances and speed of the bikes there is no opportunity to get out of their path safely.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In these partisan and trying times, Americans can scarcely agree on anything, but I believe that most if not all would agree on the fact that two million is a very large number. Whether it is two million years, two million dollars, or two million people, when discussing millions, it stands as a significant number. Well, in 2009, President Obama added two million acres of land to the federally protected wilderness. With the cloud of the "Great Recession" hanging looming over America's head, we must ask ourselves if our country can possibly afford to let another two million acres of land sit used. Conservationists already complain that current federally declared wilderness areas are underfunded and therefore are not being properly maintained, but you propose that we label even more land as protect wilderness. What is this saying to the world? Do we as Americans only desire these millions of acres of "declared wilderness" as a proverbial feather in our progressive cap, or should we aspire to have fewer acres of land but maintain the quality of these lands better? You say specifically that land expansion will "better represent American great outdoors," but I wonder if we want the global perception of American wilderness to be extensive amounts of poorly preserved land? In the August 24, 2010 edition of USA Today, journalist Shaun McKinnon reported on a followup study conducted by the National Parks Conservation Association presenting the most pressing threats to the continued life of the Grand Canyon Nation Park. Those inside the operation at the Grand Canyon report that a serious budget shortfall poses one of the most pertinent threats to national icon. Cutting back on area maintenance staff, the area is sure to become a shadow of its former greatness. David Nimkin, the regional director of the National Park Service, said, "When you look at all of the challenges, you find out that the Grand Canyon is at risk, at grave risk. We made a deal when we created the national parks, that we would support them, and we need to do that."

As a long distance hiker and a lover of the PCT, I would vote to continue to not have mechanized or wheeled vehicles on the PCT. There are plenty of trails that bikers can travel on. I would like to see this one kept to foot traffic only. Thank you.

The obsidian cliffs in Yellowstone had to be fenced off to keep rock hounds from loving them to death. You are not allowed to bring home animals and plants from our parks and public lands. The same should apply to rocks and minerals. Collection is destructive and permanently alters the nature of a place.

I am 67 years old and unable to access many areas that are only open to foot or horse back access. The number of areas where I can go in my ORV is being reduced and making it harder and harder to access wilderness areas of PUBLIC LAND, that all should have access to. I have no facts to prove my position, but it is my belief that there are far more miles of hiking trails in every state of the union than there are ORV Trails. I will agree there needs to be areas where ORV use of any kind is restricted, but how about you consider an equality between the amount of wilderness trail mileage. I think you would find the ORV groups would be very happy if they had just 1/4 of the miles that hikers and horseback people have. You are just upset because the ORV Supporters as showing their numbers here, just as they show their support in Volunteering to maint the areas they use. Can you say the same for your user groups?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

What kinds of "research, marketing and certain other purposes" are you envisioning with respect to these various industries? How would these benefit the environment, the users and/or the public in general? Thanks.

The most wasteful predators are people. We (people) killed millions of bison for their tongues and hides, often leaving behind even those parts. We still are killing millions of sharks for just their fins. Do you think there should be a season on people, too? Our growing numbers need to be controlled, don't you think?

re comment 6 The "problem with environmentalism" is that there aren't enough of us who recognize that extreme human arrogance like yours, for instance, has led to the destruction of natural processes worldwide. You are a classic utilitarian. re your comment to \_\_\_\_\_ you are not correct about that. Humans used to be part of our "natural ecosystem", but not any longer. Technology has changed the relationship.

This issue is not so much about your "access" as it is about the noisy, over-powered, knobby-tired machines that you bring along with you.

What do we have here? A college class submitting individual essays on the meaning of "wilderness"? At any rate, you've done an especially nice job with your essay. You've illustrated the subtle distinction that seems to be at the heart of many debates that have occurred in this forum. We no longer have any place on Earth that is completely free of human incursions; but we still should protect large areas where Nature is wild and relatively free of our influences and where the full range ecological processes that existed before our arrival can operate.

It's in the public's interest to conserve biodiversity. Did you not want grey whales and bald eagles to survive? The ESA is a visionary piece of legislation. Its shortfall is in the poor way that implementation has been handled.

Yes, conservation is indeed missing from the national debate. We are at least one whole generation into raising young people who have very little connection to nature. We've decided it's our God-given, American right to become anti-intellectuals and to feel proud of our stubborn ignorance. We seem to value no-nothingness in our politicians (think: Palin). We're fooled one election cycle after another by an obstructionist political party that distracts a majority of us with rhetoric about social issues while promoting military adventures and pursuing a pro-business, anti-middle class agenda. These days, it's very hard to get much done in the public-policy arena, especially on back-burner issues like conservation. For our own sanity, it makes sense for conservationists to work mostly through private, non-profit organizations. There are loads of great conservations organizations out there.

People seem to like large homes on small lots these days. Across from where I live, this kind of subdivision has sprouted up on a former soybean field at a rate of about one new house a month. The developer could have saved (but didn't) one or two lots near the center, planted native trees and turned it into a common area for the homeowner's association to control.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As to "when", it may come when enough people are sick of fundamentalist politicians pushing a "reclaiming territory for Christ" approach to the mission of our military services. (Read "C Street", a new book reviewed today on NPR) . I'm asserting that, as a nation, that the U.S. spends more on "defense" than all the rest of the world does put together. Excessive military expenditures are the most avoidable source of our financial woes. Beyond that, I'm personally willing to "kick in", and I do so. As a cyclist, I'd like to see more designated biking lanes. Thanks for your idea.

"Compromise" over mining in wilderness areas? You must be kidding.

There are privately-owned ranch lands and publically-owned (BLM) lands that are often leased to neighboring ranchers. That still makes these publically-owned lands just that: Public Lands. "Split-estate" refers to the subsurface (oil & mineral) rights that were withheld by the government back in the homesteading days. This is a separate issue, one that is troubling to both conservationists and ranchers.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

Some of the equestrian posts remind me of England's defunct aristocracy. "[B]y the High Middle Ages, the necessity of hunting was transformed into a stylized pastime of the aristocracy. More than a pastime, it was an important arena for social interaction . . . and a privilege and measurement of nobility." (Source: Wikipedia.) "For royals and their imitators, forests were from the middle ages onward a 'supreme status symbol and a source of gifts money could not buy.' " (Lohmann 1999.) "Hunting . . . was restricted . . . in 1670 to those with manors or incomes of at least 100 pounds a year from landed property. 'It is not fit that clowns should have these sports,' \_\_\_\_\_ I reminded Parliament in the early 17th century." (Ibid.) Reread the posts above and you'll see not just echoes of these sentiments, but the same lordly mentality in full flower. It's useless to squabble with the equestrians over their insistence that the PCT remain their private preserve and I won't attempt to persuade them to share this trail. I would instead address Forest Service and other agency staffs: a tiny group can't legitimately hold hostage a major public trail that millions of taxpayers maintain, any more than the aristocracy could legitimately keep the nonnobility out of the forests in 1400. No law endorses, let alone compels, continuing to ratify the the reactionary sentiments expressed on this page. Safety concerns are, by contrast, a legitimate issue, at least in theory. Good trail management, however, has worked all over the U.S. to lower trail conflicts to an acceptable level. If all else fails, one simply allows horses and bicycles on alternate days and hikers on all days. (It's worth noting that on trails in the east bay of the San Francisco Bay Area, police statistics show equestrians injuring themselves at an astonishing rate; none of the accidents involve bicycles. This suggests insufficiently skilled riders and indifferently trained horses, deficiencies I suspect give rise to much of the kvetching here.) There is no longer much dispute, even from professional wilderness advocates as far as I've seen recently, that the Wilderness Act of 1964 did not ban human-powered transport. In fact Congress was worried about Soviet achievements and wanted Americans to use public lands to improve their fitness, self-reliance, and ruggedness. The prohibition on "mechanical transport" was a catchall for motorized uses other than the enumerated ones and anything left over that was mechanical but carried people or cargo around, like ore carts, wagons, winches, and the like. Do a bit of research on the Internet and you'll find the evidence of this. Since Mr. Hasenauer brought up the historical background and people here dispute his view, let me quote the following attributions (I have not been able to verify their authenticity as of this date, but I have no reason to doubt them): Lyndon Johnson, 1965: "The forgotten outdoorsmen of today are those who like to walk, hike, ride, horseback, or bicycle. For them, we must have trails as well as highways. Nor should motor vehicles be permitted to tyrannize the more leisurely human traffic." Frank Church, 1976: "As the floor manager of the 1964 Wilderness Act, I recall quite clearly what we were trying to accomplish by setting up the National Wilderness Preservation System. It was never the intent of Congress that wilderness be managed in so 'pure' a fashion as to needlessly restrict customary public use and enjoyment. Quite the contrary, Congress fully intended that wilderness should be managed to allow its use by a wide spectrum of Americans. "I believe . . . that the agencies are applying provisions of the Wilderness Act too strictly and thus misconstruing the intent of Congress as to how these areas should be managed. "Such policies are misguided. If Congress had intended that wilderness be administered in so stringent a manner we would never have written the law as we did. We wouldn't have excluded condemnation as t he means for forcibly acquiring developed ranches within the wilderness

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

areas. We wouldn't have provided for the continuation of nonconforming uses where they were established—including the use of motor boats in the part of the Boundary Waters Canoe Area and the use of airfields in the primitive areas here in Idaho. As these examples clearly demonstrate, it was not the intent of Congress that wilderness be administered in so pure a fashion as to needlessly restrict its customary public use and enjoyment. Quite the contrary, Congress fully intended that wilderness be managed to allow its use by a wide spectrum of Americans."

Another pertinent fact \_\_\_\_\_ ignores is that (more often than not) FLREA access fees charged to REAL taxpayers don't go to support REAL public lands infrastructure or the REAL management agencies responsible for those public lands. Instead they go to private companies contracted to collect those fees. Thus the fees often directly benefit private recreation-based companies rather than public lands. With such a self-serving view of public lands, it is no wonder fee supporters like \_\_\_\_\_ and his corporate-sponsored organization is willing to completely misstate and misrepresent the truth about America's public lands and the vast numbers of citizens who actually both use and treasure them. Such as \_\_\_\_\_'s statement justifying charging fees by claiming only "a relatively small portion of the total US population" uses public lands and facilities and therefore should "pay more." That twisted view of public ownership ignores that all Americans own these lands equally and all Americans pay taxes equally to support those lands. That is the very concept of public lands and why they are "public." The lie that only "a relatively small portion of the total US population" accesses and uses their National Forests, Parks, Wildlife Refuges, etc., is absurd. No one who has actually hiked a local forest trail, visited a National Park, or makes a living from public lands tourism would seriously make or defend that claim. It's ludicrous. In my state alone, public lands account for more than a third of Colorado's land area, and visitation to those public lands supports our number one industry: Tourism. That is no "small" portion, but rather the largest portion of our economy. Those are the real facts, Mr. President. Millions upon millions of Americans annually visit their public lands. Our taxes sustain public lands, and in return visitors to those lands sustain both local economies and state-wide economies. Forcing citizens and taxpayers to pay additional fees to access our own lands (whether a forest trail, picnic table, scenic drive, or parking area) merely causes those visitors to go elsewhere, somewhere they don't have to pay an additional access fee for. Mr. President, my idea is to restore REAL Congressional funding to our public lands and land management agencies, and eliminate FLREA. Fees are an insult to all American taxpayers, and only speaks to the corrupt mismanagement of our national forests, and parks, and economy. Sincerely, \_\_\_\_\_

Wilderness designation and stewardship. Our greed and stupidity, love of OHV and the gasoline engine, cruelty and wastefulness have reduced the wild world to a sliver of its former self. Stewardship is often talked about, but not practiced much (especially west of the Mississippi...) The gunning down of wild wolves in the West is beyond appalling. Maybe some day, when we are going extinct we'll regret our stupidity.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Support historic preservation as part of this initiative. Historic preservation has gotten the short end of the stick in terms of federal support. History is an integral part of the outdoors experience. Historic buildings, particularly those of ordinary people, need to be preserved to teach our children that the world did not begin with Wii.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear President Obama: Please consider that if we want to continue to "conserve outdoor spaces," we must first restore public funding to our public lands and end the fees \_\_\_\_\_ advocates and supports. As someone who has worked with various governmental agencies and stakeholders for more than 30 years to better manage and preserve our public lands (National Forests, Wilderness areas, Parks, and trails), I can think of nothing more important and invigorating to our society in these tough economic times. Funding our public lands and eliminating fees for access (which economically discriminate in favor of those who can afford them) will both conserve those lands and stimulate tourism-based economies around the country. In direct response to \_\_\_\_\_, who states: "It costs real money to maintain our nation's recreation infrastructure and, unfortunately perhaps, use of this infrastructure is actually used and enjoyed by a relatively small portion of the total US population. It is fair that those who derive the benefits pay a bit more toward the costs. The fees under FLREA are very reasonable, and in almost all cases there are alternatives -- including free access for those who volunteer." One needs to ask what real money is being talked about here? What about the REAL people and ALL REAL taxpayers who own these lands equally? Some facts to clear the air: Real people are not paying a "bit more." Federal Lands Recreation Enhancement Act fees are being used as a MAJOR SOURCE OF REVENUE AND PROFIT for private companies while at the same time FLREA is reducing and replacing the adequate congressional appropriations real government agencies need and should be receiving on the taxpayer's behalf. That is the REAL effect of fees and the deliberate strategy of corporate fee supporters like \_\_\_\_\_. So, rather than the "reasonable" scenario \_\_\_\_\_ paints (but cannot support), FLREA, like it's predecessor, Fee Demo, is a Frankenstein Monster in sheep's clothing that is destroying the both traditional equal access to, and historic purpose of, our citizen-owned national public lands. Just who is Derrick Crandall? As a major, supporter and idea man behind charging fees for citizens to access their own public lands, \_\_\_\_\_ represents NO INDIVIDUAL CITIZENS OR CITIZEN ORGANIZATIONS. He represents no one who actually pays the majority of those taxes or fees, but rather represents a conglomerate of private corporate special interests and trade associations (ARC) who, in fact, benefit from charging fees. They include Walt Disney Corp., PriceWaterhouseCoopers, Capital Hotel Management LLC, etc, etc. etc. And none of these companies represent nor manage our public lands. Thus they should NOT be determining or influencing our public lands policies. Taxpayers should, because we pay the REAL bills. Another pertinent fact Mr. Crandall ignores is that (more often than not) FLREA access fees charged to REAL taxpayers don't go to support REAL public lands infrastructure or the REAL management agencies responsible for those public lands. Instead they go to private companies contracted to collect those fees. Thus the fees often directly benefit private recreation-based companies rather than public lands. So, Mr. Crandall is lying. With such a self-serving view of public lands, it is no wonder fee supporters like Mr. Crandall and his corporate-sponsored organization is willing to completely misstate and misrepresent the truth about America's public lands and the vast numbers of citizens who actually both use and treasure them. Such as Mr. Crandall's statement justifying charging fees by claiming only "a relatively small portion of the total US population" uses public lands and facilities and therefore should "pay more." That twisted view of public ownership ignores that all Americans own these lands equally and all Americans pay taxes equally to support those lands. That is the very concept of public lands and why they are "public." The lie that only "a relatively

Somehow about half my comment wasn't posted. So forgive the double post. BTW, WEBMASTER: you should allow posters to edit or delete their comments. Dear President Obama: Please consider that if we want to continue to "conserve outdoor spaces," we must first restore public funding to our public lands and end the fees Mr. Crandall advocates and supports. As someone who has worked with various government agencies and stakeholders for more than 30 years to better manage and preserve our public lands, I can think of nothing more important and reinvigorating to our society in these tough economic times. Funding our public lands and eliminating fees for access (which economically discriminate in favor of those who can afford them) will both conserve those lands and stimulate tourism-based economies around the country. In direct response to \_\_\_\_\_, who states: "It costs real money to maintain our nation's recreation infrastructure and, unfortunately perhaps, use of this infrastructure is actually used and enjoyed by a relatively small portion of the total US population. It is fair that those who derive the benefits pay a bit more toward the costs. The fees under FLREA are very reasonable, and in almost all cases there are alternatives -- including free access for those who volunteer." One needs to ask what real money is being talked about here? What about the REAL people and ALL REAL taxpayers who own these lands equally? Some facts to clear the air: Real people are not paying a "bit more." Federal Lands Recreation Enhancement Act fees are being used as a MAJOR SOURCE OF REVENUE AND PROFIT for private companies while at the same time FLREA is reducing and replacing the adequate congressional appropriations real government agencies need and should be receiving on the taxpayer's behalf. That is the REAL effect of fees and the deliberate strategy of corporate fee supporters like \_\_\_\_\_. So, rather than the "reasonable" scenario \_\_\_\_\_ paints (but cannot support), FLREA, like it's predecessor, Fee Demo, is a Frankenstein Monster in sheep's clothing that is destroying both traditional equal access to, and the historic purpose of, our citizen-owned national public lands. Just who is Derrick Crandall? As a major supporter and idea man behind charging fees for citizens to access their own public lands, \_\_\_\_\_ represents NO INDIVIDUAL CITIZENS OR CITIZEN ORGANIZATIONS. He represents no one who actually pays the majority of those taxes or fees, but rather represents a conglomerate of private corporate special interests and trade associations (ARC) who, in fact, benefit from charging fees. They include Walt Disney Corp., PriceWaterhouseCoopers, Capital Hotel Management LLC, etc, etc. etc. And none of these companies represent nor manage our public lands. Thus they should NOT be determining or influencing our public lands policies. Taxpayers should, because we pay the REAL bills. Another pertinent fact Mr. Crandall ignores is that (more often than not) FLREA access fees charged to REAL taxpayers don't go to support REAL public lands infrastructure or the REAL management agencies responsible for those public lands. Instead they go to private companies contracted to collect those fees. Thus the fees often directly benefit private recreation-based companies rather than public lands. So, Mr. Crandall is lying. With such a self-serving view of public lands, it is no wonder fee supporters like Mr. Crandall and his corporate-sponsored organization is willing to completely misstate and misrepresent the truth about America's public lands and the vast numbers of citizens who actually both use and treasure them. Such as Mr. Crandall's statement justifying charging fees by claiming only "a relatively small portion of the total US population" uses public lands and facilities and therefore should "pay more." That twisted view of public ownership ignores that all Americans own these land s equally and all Americans pay taxes

equally to support those lands. That is the very concept of public lands and why they are "public." The lie that only "a relatively small portion of the total US population" accesses and uses their National Forests, Parks, Wildlife Refuges, etc., is absurd. No one who has actually hiked a local forest trail, visited a National Park, or makes a living from public lands tourism would seriously make or defend that claim. It's ludicrous. In my state alone, public lands account for more than a third of Colorado's land area, and visitation to those public lands supports our number one industry: Tourism. That is no "small" portion, but rather the largest portion of our economy. Those are the real facts, Mr. President. Millions upon millions of Americans annually visit their public lands. Our taxes sustain public lands, and in return visitors to those lands sustain both local economies and state-wide economies. Forcing citizens and taxpayers to pay additional fees to access our own lands (whether a forest trail, picnic table, scenic drive, or parking area) merely causes those visitors to go elsewhere, somewhere they don't have to pay an additional access fee for. Mr. President, my idea is to restore REAL Congressional funding to our public lands and land management agencies, and eliminate FLREA. Fees are an insult to all American taxpayers, and only speaks to the corrupt mismanagement of our national forests, and parks, and economy. Sincerely, Thomas Phillips

(O.K., I guess there are character limits and it would be nice if people were told that before writing and posting. So the rest reads): ...Thus the fees often directly benefit private recreation-based companies rather than public lands. So, \_\_\_\_\_ is lying. With such a self-serving view of public lands, it is no wonder fee supporters like \_\_\_\_\_ and his corporate-sponsored organization is willing to completely misstate and misrepresent the truth about America's public lands and the vast numbers of citizens who actually both use and treasure them. Such as \_\_\_\_\_'s statement justifying charging fees by claiming only "a relatively small portion of the total US population" uses public lands and facilities and therefore should "pay more." OHVs. OHV recreation including that using snowmobiles does not belong on federal land or land which is maintained in a natural or near-natural state anywhere. The pastime is harmful to wildlife and destructive of vegetation and soil. It pollutes waterways and the air. Its noise, exhaust fumes and fast moving vehicles are incompatible with many other activities which have far less adverse impacts on the environment, e.g., hiking, bird watching, and picnicking. Many off-roaders are not law-abiding and many managers of the activity are more interested in promoting it than enforcing the laws and regulations which govern it. The only places where the activity should be allowed are in sound-proof buildings which have purifiers for any air exhausted outside. I am sure that many off-roaders would consider it fun to ride in city parks or in the halls and on the large staircases of many museums. Providing amusement for the off-roaders would not, I hope, be a justification for allowing it in these locations.

Alaska Conservation, esp. Pebble Mine. When I was in my 20's and just graduated from college, I wanted to explore America and the great outdoors; I love to hike and camp and to be out in nature, much like John Muir. When I had an opportunity to visit Alaska around 1994, I will tell you that it was probably the most seminal event in my life, it its sheer beauty and majesty and with the knowledge it imparted that The Natural World held such splendor and beauty beyond what I ever could imagine was possible on Earth! The wild rivers, the salmon jumping out of the water, so big and beautiful you could literally go pick-them-up off their spawning grounds...the king brown bear, the mountains, the quiet, the "God's Country"! And I'll tell you this, there will never, NEVER be another that! This is a beauty and resource that one can never re-create! With every incursion into this Garden of Eden, we spoil for generations the un-told majesty of a world heritage area! I'll never forget the time I went hiking around a pristine glacier, with pure water tricking all-around! The area was so un-spoiled and pure that I literally felt like I was on another planet! I then had the pleasure of swimming in a pristine high mountain lake and I felt like I was on top of the world. The water was so pure and clear that it was un-like anything I ever thought this world was capable of producing! All of this majesty is made lost with man's development! Every single incursion, from the Exxon Valdez spills of the world, to even the much admired pipeline, diminishes "the natural wonder value" for generations to come. There will never be an Alaska like the one I enjoyed, for man's incursion. Please, please, please realize that the greatest resource to be developed in Alaska is man's ability, availability and opportunity to experience, much like I did, the un-spoilt natural beauty self-evident in its natural, un-spoilt state, not man's extraction of its natural resources. There is still time to keep this "heaven" the beauty and love that it is, and that means that we "look but don't touch", admire but don't covet. respect but don't take! Otherwise, others won't be able to experience the totally unique and God-given experience I was able to enjoy in 1994! That time is etched in my mind and heart as an event that seems like "I almost didn't deserve to have", b/c it was so awe-inspiring and "above the fray of mankind's quest to anthropomorphize the land of God! No to Pebble mine! No to developing and destroying Alaska's majesty!

## Discussion Question 2

***(cont.)***

Cancer. Wilderness use to play a large part in this country's history. It set boundaries, created challenges, and held our natural resources. Now that our country is settled for the most part we have lost a little part of ourselves, in the fact that there are very few places that are untouched by human hands. To get people back to wilderness several obstacles have to be overcome. Society has created a new outlook for people in America, one of technology and progression. Wilderness is opposite of this idea, it is natural and timeless. When a person goes to the wilderness there is a completely different time table and set of rules. This can be seen as backwards in the modern society, thus threatening our wilderness. One idea that seems to be prominent in America is to build or mine and not think about future consequence. People do not seem to care for the lack of nature we have left. An elderly man once told me a squirrel used to be able to go from Georgia and make it to Maine without ever having a touch the ground, he would jump from branch to branch, from tree to tree. This is no longer possible due to the amount of construction that happens. If a squirrel could even go several miles like that anymore I would be extremely impressed. David Brower in the book, Encounters with the Archdruid, has a famous "sermon" in which he says, " When rampant growth happens in a person, we call it cancer". Our society has become this cancer, we are constantly building new places, and feel like we must be building. We must overcome our love of expansion as a society. It endangers the security of the wilderness we have now, and the amount we will have in the future. Personally I would like my children to be able to see the "purple mountains majesty".

Mountaintop removal should be outlawed.. Not only is it destroying plant ecologies which have survived past ice ages; it's making people sick! I have a friend in W. Va who's been chronically sick from living a block away from the Monongahela River. That flows into the Ohio, which flows into the Mississippi, which flows into the Gulf. Which is sick enough already.

Stop Pebble Mine. It's bad enough that the Arctic is being put at risk by offshore oil drilling, and runoff from the Canadian tar sands; but now they're willing to do it for GOLD! Of what use is gold but to line somebody's pockets?

The endangered species act has been abused and perverted to lock out public access to non wilderness lands. It needs to be abolished or rewritten with the public's interest in mind.

Stabilize the U.S. Population or Say Good-bye to America's Great Outdoors. Are you finding it harder to have a genuine outdoor experience and not feel crowded? Wonder why? The US population, now at over 310 million, is growing at about 2.75 million people per year. At that rate, in about 7 years, additional growth will be roughly equivalent to the current population of the entire State of New York. Before long, all that will be left of America's Great Outdoors will be a few museum pieces with people on waiting lists to get in. We desperately need a national population policy that aims to stabilize the US population for the sake of the American landscape -- and for a lot of other good reasons as well.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Just google "US Population Growth" and find and crunch the numbers. You can also readily find population estimates for all the States. The US growth rate has varied from about .87% and 1.15% since 2000. I used the 2008 figure of .915% and applied it to our current population of 310 million to come up with a yearly growth rate of over 2.75 million per year. The US Census Bureau seems to be saying the US growth rate is slowing, but I don't see any hard evidence for that. Ours continues to be well ahead of China's. S.Collins -- Yes, the liberal immigrant policies of the U.S. are a huge factor in our rapid population growth. Glen -- Build it (i.e. roads), and more will come. I personally have not found any restrictions to public lands, except for some state lands for which I need a hunting license to access, and some military restricted areas. Thank you all for your comments.

Sure I want families to get away from it all. This includes getting away from vehicles. Not just cell phones and TV (which you see more and more being toted along in vehicles to "get away from it all"). Contrary to popular belief in this country, "these feet were made for walking."

I have an idea.... let's have flamethrower parties in National Parks, Wildlife Refuges, and Wilderness Areas. Once it catches on and flamethrower manufacturers start making some serious money and jobs are created and the economy of an area starts to depend on those who come to town to burn things and the 'Flamthrowers Association of America' lobbies for their 'right' to use their flamethrowers on public lands..... then we'll have the same situation we now have with ohvs.

The idea that horses have to be spooked by a valid trail user, i.e. mountain bikes, is preposterous. It seems to me that horses were used by the military for ages exposed to exploding shells and numerous excitable incursions and yet remained calm and stable. it's merely a matter of training. if you train your animal to deal with what it expects to see on the trail then it will be able to deal with it, otherwise you have brought yourself and others into danger by exposing us to a ticking 1000 lb time bomb. I bring the right equipment to the trail when I show up by having the right tires, brakes and suspension to deal with what I'm about to encounter. If I showed up with a road bicycle or beach cruiser to a technical off road trail system then I probably would have trouble staying in control of my mount also.

I recently visited Yosemite National Park and was both awed by it's beauty and suprised by the numbers of people visiting. I think it is vital to our nation to protect our few wilderness areas, maintain limits on the number of visitors, and budget enough money that these areas can be maintained. Europe may have it's castles, USA has it's wilderness. We must keep wilderness areas as pristene as possible and not allow business and personal or corporate fiscal gain to impinge on what has always been Americas treasure. It is the federal goverments responsibility to maintain our natural treasures while continuing to make it affordable for all to visit.

***(cont.)***

For those who are confused about why off-road vehicles should not be allowed in National Parks, or other areas under the specific protection of the NPS, let me briefly explain: Off-road vehicles make noise, are a source of pollution, and damage terrain. There are plenty of areas under the protection of the USFS and BLM, as well as many state, county and local parks and recreation areas where you can take your motorized vehicles. And, although I am not in favor of off-road vehicles in general, I understand, and can appreciate the enthusiasm people who do enjoy off-road adventures - just keep them out of the parks. When I am in a National Park, Scenic Area, or Recreation Area, I want to hear and smell the natural surroundings, not a snowmobile or four-wheeler - they are an intrusion to the tranquility I seek. If this still does not help you understand, read a little of what John Muir wrote, it would expand your education.

I've tried time and time again to be friendly to mountain bikers while horseback riding on the trail. And I must say, there are some really nice and responsible bikers out there! Unfortunately, there are some very rude, and ignorant ones as well. It's the second of the two that continually make it dangerous for not only equestrians but hikers when on the trails. Perhaps if Mountain bikers could ally to ensure other biker users were respectful, safe, and took the time to help maintain the trails, I would have different feelings. But for now, this topic just opens a door for more accidents waiting to happen.

I just want to add the points that environmental groups have already skillfully articulated: - Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. - Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. - The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. - Relationships between federal and tribal governments should be strengthened. - Standards for mineral development in wetlands should be tighter. - Clean Water Act standards for large-scale metallic sulfide mining should be more stringent. After the oil spill disaster in the gulf, let's learn the lessons and prevent a similar sort disaster in Bristol Bay.

Mile-for-mile is not the way to go for this idea. However as a hiker who disapproves of rampant and aggressive OHV use, I decided a few years ago that if I want OHV cherry stems (dead ends) closed off, or if I want OHV to stick to trails, I must be willing to do the same on foot. Such a rule MUST be for the sake of the lands and air around us. I support revegetating a minimally used OHV trail because where I live in the Four Corners, it is for the good of the community air quality and wildlife. If someone did their research and decided that keeping humans out of a certain area (as they do for Peregrine Falcons) was beneficial, including humans on foot (arguably the smallest impact of the types of recreation, at the very least because foot-travelers can cover the smallest terrain in the same amount of time), I would support this even if it closed off an area for me. There are SO many places to explore, we should be willing to "mother" earth and care for it if that is the most responsible approach for ourselves and our posterity.

## Discussion Question 2

***(cont.)***

Poor hikers and skiers, they only have 140 million acres of their own. Lets see, how many acres are exclusive to snowmobiles, I'm sure there 3 or 4 somewhere. Already had this discussion with the Ranger, number one complaint, skiers with dogs, number two complaint snow shoers stomping on skate ski trails, number three complaint skiers complaining about snowmobilers. Let's recap, #1 skiers complaining, #2 skiers complaining, and #3 skiers complaining. I got an idea on how to cut down on complaints, get rid of the complainers. No really, skiers are some of the nicest, and sometimes some of the most self centered people, much like any group 5% of the group sets destroys it for the rest. There is a concept in law, called reciprocity, you get one acre, I get one acre. You already have 140 million acres, so I want 140 million acres, if my math serves me, that's the entire National Forest, already split between the two of us. You do have to admit, snowmobilers always loose ground. RWA, WSA, Roadless, Y2Y, NREPA, National Monuments, wildlife, user conflict, Wilderness, the list goes on. When your a snowmobiler, your told that compromise is give up half of your land every 20 years. It's just the way it is. Well, things change, and one day, you may look back on these as the golden years. So, suck it up, and go enjoy the forest guys, and leave other people alone. If I where you guys, I'd be more worried about loosing what I have, rather than taking any more.

Daniel Boone National Forest, geeze that makes me laugh. Back when 4x4s roamed the Daniel, a person could hike that place without fear. But, after the 1/2 closure, and another 1/2 closure, and another 1/2 closure, they just closed all motorized in the Daniel. Then the pot growers moved in, and you don't dare walk the Daniel during the summer, unless you want to be killed execution style. Remember the 4 kids? Shared use does benefit everyone. Seen it in the Daniel, and have seen it out west. Usually, it's not realized until it's too late.

109.5 Million Acres of Wilderness isn't enough? 40% of the National Forest, already being designated wilderness isn't enough? We haven't even begun to mine our resources. You probably think the rivers are dirtier than they where in the 70's?

Funding for Multi-use Trail Plans. We need a source of modest funds to encourage states to develop statewide plans for walking/biking trails connecting communities, parks and other destinations. Much trail development now is done on a fragmented basis; it is time to look at the emerging patterns on a state level and identify the opportunities for interconnected trails.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While the Original Poster that created this discussion thread makes some interesting points, the O.P. and the subsequent discussion overlook an extremely important issue, that issue being Volunteer Management. I am a recreational trails volunteer on the 513,000-acre Allegheny National Forest, Pennsylvania's only national forest. For many years, my fellow volunteers and I have done extensive work on the A.N.F., building and maintaining trails and bridges, as well as keeping watch over the condition of said trails. During the 2008 Recreation Facilities Analysis (R.F.A.) on the A.N.F., U.S.D.A. Forest Service personnel proposed decommissioning many developed recreation sites on the A.N.F. Planning reports also revealed proposals to rely more heavily on volunteer work to maintain recreation facilities. I attended R.F.A. events held by the agency. During an R.F.A. workshop on 28 June 2008 at the Bradford Ranger Station, I asked about this proposal to rely more heavily on volunteers. Ranger Scardina told me the proposal was indeed being considered and this was the public's chance to give input and ask questions. I asked Ranger Scardina what the Forest Service's Volunteer Management Policy (V.M.P.), the policy (or policies) that governed how agency personnel recruit, retain, and recognize volunteers, was and if I could see the agency's V.M.P. documentation. Indeed, I made it very clear to Ranger Scardina that V.M.P.'s would require a fourth "R", for "recording", to account for a properly kept record of volunteer donations of time, equipment and material to benefit public recreation facilities. If a volunteer offers to use his chainsaw to clear storm debris out of a trail, and the agency requires a chainsaw-operating trails volunteer to take chainsaw safety and other training in order to work on trail maintenance, and the agency also requires that volunteers keep the agency personnel informed of trail work bees, then it would logically follow that said agency personnel would also be responsible for keeping a record of these donations to the agency as prescribed by the agency V.M.P. Correct? (Also of note: the Forest Service requires volunteers and volunteer-organizations to keep a current, signed volunteer agreement on file with the agency.) Whatever incentives (be they perks, a free "pass", or any other form of benefit) would (or would not) be offered to volunteers for their donations to the public good, one would think the proper procedures would be spelled out in the agency's V.M.P. So, one would think that with the Forest Service's doors open for their "open house" workshop in June of '08, and with the invitation for the public to ask questions about such an obvious issue as volunteer management, that the agency administrators would be right there with the obvious answer to an obvious question. At the very least, one would expect that it would not be hard to get the answer in a timely fashion. It's been over two years. To this day, my V.M.P. question remains unanswered. Nobody ever acknowledged my question. The point I took home: the Forest Service personnel don't want to answer the question. If they do have a V.M.P., they aren't sharing it with the volunteers. If anyone in Washington is watching this discussion, and you want feedback from the volunteers on public lands, here it is: It's time for all United States public land management agencies involved with public recreation facilities and volunteer-donations to review their V.M.P.'s, if they have any. Volunteers who donate so much to our nation's public lands are entitled to know that their donations are being applied properly, and that agency administrators are required to handle volunteer management responsibly. Without accountability and agency transparency, responsible volunteer management will not happen. Without responsible volunteer management, there is no logical reason to expect that any agency will be serious about recruiting, retaining and recognizing volunteers, let alone recording their good deeds.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I noticed that the Original Poster in this discussion thread mentioned a "nationwide pass" concept for volunteers. This stimulated my interest. There was a vaguely similar notion brought up in the "Respect volunteers" discussion thread. I would like to reiterate what I said in the other thread, because it seems to be even more relevant here: I am a recreational trails volunteer on the 513,000-acre Allegheny National Forest, Pennsylvania's only national forest. For many years, my fellow volunteers and I have done extensive work on the A.N.F., building and maintaining trails and bridges, as well as keeping watch over the condition of said trails. During the 2008 Recreation Facilities Analysis (R.F.A.) on the A.N.F., U.S.D.A. Forest Service personnel proposed decommissioning many developed recreation sites on the A.N.F. Planning reports also revealed proposals to rely more heavily on volunteer work to maintain recreation facilities. I attended R.F.A. events held by the agency. During an R.F.A. workshop on 28 June 2008 at the Bradford Ranger Station, I asked about this proposal to rely more heavily on volunteers. Ranger Scardina told me the proposal was indeed being considered and this was the public's chance to give input and ask questions. I asked Ranger Scardina what the Forest Service's Volunteer Management Policy (V.M.P.), the policy (or policies) that governed how agency personnel recruit, retain, and recognize volunteers, was and if I could see the agency's V.M.P. documentation. Indeed, I made it very clear to Ranger Scardina that V.M.P.'s would require a fourth "R", for "recording", to account for a properly kept record of volunteer donations of time, equipment and material to benefit public recreation facilities. If a volunteer offers to use his chainsaw to clear storm debris out of a trail, and the agency requires a chainsaw-operating trails volunteer to take chainsaw safety and other training in order to work on trail maintenance, and the agency also requires that volunteers keep the agency personnel informed of trail work bees, then it would logically follow that said agency personnel would also be responsible for keeping a record of these donations to the agency as prescribed by the agency V.M.P. ***(cont.)***

will be serious about recruiting, retaining and recognizing volunteers, let alone recording their good deeds. In addition, I would like to point out that the public needs greater assurance that these land management agencies are "playing by the rules" when it comes to proposing the application of fee-levying powers on our public lands. Case in point: the Kelly Pines Recreation Area in the Allegheny National Forest. In September of 2009, the Marienville Ranger Station sent out a scoping letter (under the National Environmental Policy Act of 1969) announcing a new project: the Kelly Pines Recreation Area would be converted to a U.S. Fee Area. Here is the N.E.P.A. page: { <a href="http://www.fs.fed.us/r9/forests/allegheny/projects/recreation\_projects/kelly\_pines\_fee\_analysis/index.php" rel="nofollow" target="\_blank">Link</a> } As soon as I received this scoping letter, I started making inquiries. Word of this scoping letter reached Washington in just hours. I less than two weeks, the Kelly Pines project was cancelled. The reason? It was improper of the the Forest Service to propose the conversion to a Fee Area using the N.E.P.A. scoping process. Fee Area proposals are supposed to be announced and decided through the F.L.R.E.A. process. Clearly, the Kelly Pines project was not being handled through the proper channels. How can we, as citizens, taxpayers and public lands users, be assured that this F.L.R.E.A. is a sound policy when the aborted Kelly Pines project underscores how easy it would be for a conversion of an existing Forest Service recreation area from free to a U.S. Fee Area through improper channels? As a private citizen, I exercised my free speech rights to blow the whistle on this obviously improper initiative. But how would you like to be in my shoes and still be involved in a relationship with those same Forest Service administrators afterwards? Would you feel more, or less, comfortable if you did not have access to an agency's V.M.P.?

Stop the FS before they steal again!. The FS is illegally charging money to park and hike in Sedona, Arizona. They were recently found guilty of this in court. So my "challenge", my "obstacle", in recreating in the outdoors is an out of control, rogue agency which continues to extort money from me and everyone else. \_\_\_\_\_, you've got to help us. Stop the FS before they steal again!

I am very favorably impressed by all the intelligent, well thought out comments of all those opposed to having to pay more to access our land but \_\_\_\_\_ said it succinctly and best: "Many generations have contributed to the creation and preservation of our national lands. Access to these lands should be freely available to all Americans. This land is our land." Indeed! This land is our land, and if the Forest Service was not squandering their budget they would not be trying to further nickel and dime us. As for poor \_\_\_\_\_, what a disgrace! "I'll make one more attempt to bring some sensible exchange of ideas -- and ignore the ridiculous emotionalism of some of the commenters here." So Daddy's going to give us children one more chance then take his ball and bat and go home if we aren't "sensible". "Sensible" must mean to agree with him and his variety of "ridiculous emotionalism". By his own words he exposes himself as the typical out of touch elitist. Pity he is in a position of power. Get hip to it, \_\_\_\_\_: The forests are ours, not yours.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I find that I agree with \_\_\_\_\_'s reasoning to an extent. It is certainly true that no extreme is likely to prevail, given that no one really agrees on the subject of wilderness preservation; however, I still think it is necessary to maintain such extreme points of view, even while compromising. To use the example of mining, I am an avid protestor of mountaintop removal. I do not agree with any form of coal mining, but I know that I will only make progress by compromising. I will fight mountaintop removal until it is stopped, and then I will fight another aspect of coal mining until it is stopped. I will do this until all coal mining is stopped, if I can. This may not seem like compromising, but it is. It is unrealistic to expect anyone to immediately conform to such extreme ideas as the abolition of mining. It is, however, not unrealistic to approach it from a less extreme point of view. In other words, I agree with her statement that compromise is key, but I would take it a step further and say that compromise only offers a temporary solution and should be used as a basis for further reformation. I do have to address one statement that \_\_\_\_\_ made which is false. Most people who protest mining do not protest it because it destroys the beauty of the area the mine is in. Most protestors of mountaintop removal (a particularly devastating type of mining) base the vast majority of their arguments on the fact that coal mining is extremely detrimental to society and to the environment; not just how the area looks. Mining is an inherently dangerous practice. In West Virginia alone mountaintop removal has caused multiple communities to completely disappear, and the government issued a warning about fishing in the southern part of the state because many of the fish contain unhealthy amounts of dangerous chemicals due to toxic waste that is dumped into the streams and rivers by coal companies. Ultimately, I like how Tara has chosen to approach some of the issues at hand. Compromise is an excellent way to begin. Not only does it start the process of getting something done, but it also allows people to find more common ground on which to stand. This is extremely important, especially in this country, where public opinion can get a lot more done than in most other countries. However, it would be unwise to consider compromise the solution to all of our problems.

Avoiding having waste to re-use is a lot of what \_\_\_\_\_ is talking about. I'm sure she would agree with the notion of going back and trying to recycle our waste, but her entire argument is based on avoiding something like that being necessary. I don't really agree that it's the answer to our problems, but you can't deny its obvious advantages.

Perhaps you should address your comments to the BLM--or an idea related to horses and burros. The concept of making the National Wildlife Refuge System a separate agency seems a strange place to be making arguments in favor of improving operations under the Wild Horse and Burro Act (the NWRS is not even subject to that law). Our wildlife habitats across America are under stress from many causes--development, highways, extending agriculture, global warming, disastrous wildfires to mention a few--and our refuge system is striving to combat such losses and degradation. They are hampered by lack of support and resources as they have been chronically. They need to get public attention to their needs and to the enormous potential for keeping America's wildlife, plants, and fish--and their habitats--healthy and available to a caring public.

***(cont.)***

Recommendations for Existing Federal Programs and Proposed Strategies and Activities to Achieve the Goals of the Initiative GOAL 1. Support and Invest in the Ecologic, Social, and Economic Resiliency of Rural Communities and Working Landscapes, both Public and Private, in the West (Department: Agriculture, Interior. Agency: Forest Service, Rural Development, Natural Resource Conservation Service, Bureau of Land Management) Actions for existing programs: A. Increase interagency collaboration. The high percentage of public lands in the West creates a unique rural landscape where even private lands are situated in a public lands context. Examples include rural communities surrounded by public land, a checkerboard of private and public land, or private land adjacent to a large swath of public forest or rangeland. In these public lands communities with natural resource-based economies, the land management agencies are often an economic driver. Increased dialogue between the Forest Service, BLM, FWS and Rural Development would leverage scarce government dollars and promote rural communities' efforts to engage in conservation and rural development. Additionally, land owners and stewards often work at the intersection of multiple land management agencies. For example, a rancher might work with the NRCS on private land, graze on both USFS and BLM public land allotments, and intersect with the USFWS and even NMFS for endangered species conservation measures. Increased interagency collaboration has the potential to expand the effectiveness of programs and regulations by integrating agency mandates, practices, and standards promoting the management of whole landscapes for conservation. In addition to potential cost reductions, increased cooperation also reduces transaction costs for communities intersecting with public agencies, and increases trust and understanding between local populations and the federal government. Actions for new strategies: A. Create and fund a Community Capacity and Collaborative Support Grant Program at \$50 million annually to enhance conservation and rural economic resiliency. Investment is needed to retain and build the capacity of community based organizations, collaborative groups, and small rural businesses to participate in landscape level forest and watershed restoration and stewardship activities, utilize the by-products of land management activities for traditional and emerging markets in payments for ecosystem services, and develop mitigation and adaptation strategies for climate change. Investment is essential to economic recovery in rural communities adjacent to public lands. The program will provide funding through competitively awarded grants to directly support and/or provide technical assistance for:

- organizational and staff support, including facilitation;
- travel related to collaborative group activities;
- workshops and training related to current science, management practices, facilitation, contracting, and other topics that will assist groups in building their capacity to meet their project goals;
- natural resource related business support services, including marketing and utilization of products and services resulting from land stewardship, grant writing, bonding access, federal bidding procedures and other technical advice;
- landscape level planning and modeling and watershed assessment;
- design of silvicultural and restoration prescriptions and treatments to enhance forest and watershed resilience, adaptation, and restoration;
- design and coordination of monitoring of ecological, economic, and social impacts of projects and management actions;
- dissemination of best practices and tools to assist collaborative groups and community based organizations in project development, implementation, and monitoring; and
- outreach and engagement of youth and traditionally under-represented populations.

Outcomes: • Ensure community based

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

organizations (CBOs) and collaborative groups have the financial and technical resources to convene, plan, implement, and monitor landscape scale restoration projects. • Strengthen the relationships and partnerships between the land management agencies, collaborative groups, and community-based organizations. • Create peer-to-peer learning networks among CBOs and collaborative groups working on projects across the region and in adjacent regions that will accelerate learning and adoption of best practices. • Provide training and technical assistance related to collaboration, multi-party monitoring, project design, and stewardship contracting for government agency employees, non-profit, and business partners. • Ensure best practices are employed and shared consistently across the region among nonprofits, federal employees, and the business community. • Support and enhance small rural businesses providing quality jobs in land management and restoration. GOAL 2. Support Landscape Scale Restoration and Community Revitalization for Public Lands Communities (Department: Agriculture. Agency: Forest Service) Actions for existing programs: A. Fully fund the Collaborative Forest Landscape Restoration Program (CFLRP) authorized under the Forest Landscape Restoration Act at \$40 million in FY2012. This legislation requires a broad coalition of interests to assess the landscape together, identify priorities, and sketch out a collaborative plan of action. CFLRP should receive full funding for the next ten years and should be used as a template for other programs to invest in restoration and land stewardship across the West. Outcomes: • Appropriations for this legislation in FY12 would continue to fund priority landscapes and allow the creation of new priority landscapes, ensuring adequate funding to support comprehensive forest restoration and rural community benefit. B. Support and expand use of stewardship contracting as a tool for implementing collaborative forest restoration and stewardship. Stewardship contracting has been one successful and critical tool for fostering restoration of our nation's forests and watersheds while creating community benefit. The expansion of stewardship contracting should be should be aggressively pursued. Outcomes: • Increased administrative efficiency, collaboration, revenue for other restoration needs, and community benefit. C. Support and fully fund the Forest Service Integrated Resource Restoration Line Item in FY2011 President's budget. Consolidating funding for restoration and stewardship into one line item will enable land managers to effectively budget for integrated outcomes related to land management goals. The IRR line item proposed in the FY2011 President's budget fixes an outdated structure that stovepipes activities that are better integrated to give land managers more effective budget tools to achieve landscape scale restoration and stewardship objectives on the ground. We support all three components of the IRR line item, with the addition of performance measures and other related guidance. Actions for new strategies: A. The federal government must accommodate, support, and adequately fund collaborative efforts on the landscape. Collaborative community-based efforts present a high area of opportunity to make progress on the gridlock that has surrounded public land management in the West. Land management agencies must support and participate in these efforts. By participating, the land management agencies are not abdicating their authority, but are rather partnering with stakeholders to develop management solutions that have diverse support. Funding for CBOs is integral to support the collaborative structures and institutions that assemble diverse interests and viewpoints, and facilitate them towards common ground. GOAL 3. Promote the Resources and Incentives Needed to Support Private Landowners and Land Managers to Remain Viable and Restore the Land (Department:

## Discussion Question 2

**(cont.)**

Agriculture. Agency: Forest Service and Natural Resource Conservation Service) Actions for existing programs: A. Fully fund the Farm Bill Conservation Programs at the mandated levels for FY 2011, \$4.3 billion. The NRCS conservation programs authorized in the 2008 Farm Bill are critical to enhancing ecosystem health on private lands across the nation. These programs provide technical assistance and financial incentives for conservation of private forest and ranchlands. These include programs such as the Forest Stewardship Program (State and Private Forestry), Farm and Ranch Land Protection Program, Grasslands Reserve Program, and Environmental Quality Incentives Program (Natural Resources Conservation Service). Outcomes: • Private forest and rangeland owners have the ability to achieve long-term, sustainable forest and range management. • Forests continue to be productive, and farm and ranchlands maintain stewardship activities. • Private lands are effectively able to contribute to maintaining public benefits like clean air and water, wildlife and fish habitat, and wildfire risk reduction, and are protected in an economically viable manner. B. Fund the new Community Forest and Open Space Conservation Program at \$10 million annually. This program, established in the Food, Conservation, and Energy Act of 2008, provides an important tool for maintaining working landscapes, managing the pressure to develop green spaces so vital to the character and integrity of many communities, and management of changing land ownership. The program provides matching funds to help county or local governments, nongovernmental organizations, or Native American tribes acquire forest areas that are threatened by conversion to non-forest uses, and are economically, culturally, and environmentally important to local communities. Funds will also be set aside for technical assistance. This assistance will help each grant recipient develop and implement a required forest management plan, crafted with a high level of community input. Outcomes: • Drive conservation activity into areas where federal conservation grants have not traditionally been directed, particularly oriented around rural communities. • Conserve thousands of forested acres and increase carbon sequestration and storage values that would otherwise disappear as a result of development. • Retain and revitalize rural livelihoods through conservation and maintain important positive rural character and culture that is fundamental to America. C. Fully fund and increase the flexible utilization of the Land and Water Conservation Fund (LWCF), while increasing expenditures under Forest Legacy and USFS Land Acquisition. This program is critical to stem development pressure and helps conserve working landscapes, curb future costs to the public, and secure the land base for rural economic activities. Congress should give direction to federal and state agencies to increase utilization of LWCF funding for the purchase of conservation easements on private lands. Outcomes: • Assists states in protecting working forests that ensure water quality, provide habitat, produce forest products, and create opportunities for recreation and other public benefits. • Use of conservation easements on private lands will help prevent conversion and turnover of multi-generational private forest and ranch lands. GOAL 4: Promote Clean Energy Development through Community-scaled Biomass Utilization and Climate Change Adaptation in Rural Communities (Department: Agriculture and Interior. Agency: Forest Service and Department of Energy) Integrated community-scaled biomass utilization strategies can offset the costs of forest restoration and hazardous fuel reduction activities while contributing to rural economies, energy independence, and carbon emission reductions. The following programs represent a comprehensive approach to encouraging efficient, community scaled biomass utilization

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

strategies across the nation. It is critical that Congress fund all of these programs as each fulfills a different need for support, planning, and implementation of broad biomass utilization and climate change planning strategies. Actions for existing programs: A. Fully Fund the Community Wood Energy Program at \$5 million. The Community Wood Energy Program (CWEP) was authorized in the 2008 Farm Bill at \$5 million. The program will provide up to \$50,000 grants to qualifying state or local government entities to prepare “community wood energy plans.” Once a plan has been approved, the qualified applicant may request up to 50 percent matching grants toward the capital cost of installing biomass energy systems. B. Increase funding for the Woody Biomass Utilization Grants program under the Hazardous Fuels line item to \$10 million. The Woody Biomass Utilization Grant Program, funded under the USFS Wildland Fire, Hazardous Fuels Line Item supports the utilization of forest restoration byproducts from National Forest system lands. Outcomes: • The competitive grant program funds projects that demonstrate an increased use of woody biomass from forest restoration and hazardous fuels projects on National Forest System lands where there little or no capacity to use this low value material. • This grant program reduces forest management costs by increasing the value of biomass and other forest products generated from forest restoration activities, generates renewable energy from woody biomass, builds industry infrastructure around national forestlands where limited or no industry infrastructure exists, and expands working relationships between local forest products businesses and Forest Service offices. C. Fully fund the Climate Change Adaptation Initiative in the Department of the Interior at \$17.5 million. The Department of the Interior’s Climate Change Adaptation Initiative is a proactive approach to adapting to and mitigating for climate change impacts to our nation’s public lands. The approach is collaborative and based on integrating science with the broad experiences of partners across regional landscapes. This program will be vital to understanding potential climate change impacts on public lands and reaching social agreement on management actions necessary to address impacts and implement mitigation measures. D. Require the USDA Forest Service and NRCS to join the DOI Climate Change Adaptation Initiative efforts to increase interagency coordination on landscape scale approaches to climate change adaptation. Congress should advise USDA to join the DOI Climate Change Adaptation Initiative to increase interagency collaboration and coordination on climate change strategies. Actions for new strategies: A. Establish a Revolving Loan Fund to support retro-fits of institutional facilities that use petroleum-based fuels to generate thermal energy. B. Ensure every region has a USFS woody biomass utilization specialist. Currently, not every region has them, and in some regions the position is less than 1 FTE. C. Expand the USFS Fuels for Schools and Beyond Program. The Fuels for Schools and Beyond Program, administered by the US Forest Service in Region 1, is a significant resource for communities in the region to explore conversion of boilers at elementary and secondary schools to woody biomass from petroleum-based fuels. D. Establish a new competitive research and development program within the Department of Energy or the USDA Forest Service to encourage the development and implementation of appropriately-scaled dispersed energy generation technologies. GOAL 5: Provide Opportunities for Youth to Engage in Rural Communities and Resource Management, Building their Skills and Paving the Way for Future Employment as Land Stewards (Department: Agriculture, Interior. Agency: Forest Service, BLM) Actions for existing programs: A. Increase funding and strengthen existing programs to retain and encourage the next generation to remain and invest in their

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

family land-based businesses. Increased funding and outreach for participation in programs such as the Beginning Rancher Program (Farm Bill program) helps promote long-term conservation and intergenerational transfer of open space and working lands. Actions for new strategies: A. In addition to the US Forest Service Kids in the Woods program, create programs that support the engagement of young adults in the outdoors through job training and employment. Youth oriented work programs successfully train and employ America's young adults and serve as a critical bridge to long term, stable employment. Agencies can contract with these programs to achieve public land management goals. Employing young adults from rural communities builds community leaders, keeps youth and dollars working locally, and builds natural resource management capacity in public lands communities. Outcomes: • Meaningful and quality career opportunities for young adults. Summer youth programs have their place, but they often lack any capacity to transition into long term employment or careers. • Demand for forest-based work often exceeds available contracting opportunities. Ironically, thousands of acres of projects sit on the shelf due to administrative, financial, and legal barriers. Investment in programs that provide real opportunity for youth can help meet our natural resource management needs. • Youth would gain skills and interest in working in public land management. B. Create a program or re-tool an existing program (AmeriCorps, state Civilian Corps) to direct funding to land management agencies' district offices in rural areas to employ recent college graduates for 1 to 2 years. Recent college graduates are struggling to find jobs in the economic recession and often the land management agencies are understaffed and underfunded. Public land management is diverse work, providing opportunities to grow technical skills (i.e. facilitation, stakeholder outreach, archeological surveys, geology, botany, engineering, etc.), as well as labor-intensive skills (i.e. thinning and fuels reduction, riparian restoration, trail building and maintenance, facility construction, etc.). Outcomes: • Expose recent graduates to rural communities and career opportunities in land management. • Make progress on the backlog of work on public lands. C. Federal agencies should inventory existing youth programs across agency jurisdictions to 1) review programs for redundancy and, 2) create an appendix or report on all existing programs to help streamline program delivery. Funding for youth-related programs exists within numerous federal agencies – Agriculture, Labor, Transportation, and Interior. Thus, identifying and accessing these various programs to support long term youth training and employment programs is a challenge. Outcomes: All information about existing youth programs would be compiled in a single source to allow for greater accessibility. D. Restructure matching requirements and timelines to give organizations adequate time to secure the required financial support to make projects a reality. Match requirements for many federal programs place a significant burden on organizations that provide youth-oriented training, education, and work programs. These organizations are required to invest significant time and resources in identifying and securing private funds to meet match requirements.

## Discussion Question 2

***(cont.)***

Expand Existing Outdoor Education Programs on Public Land. Getting kids outdoors and reconnected with nature is not only essential to maintaining a healthy society; it also provides expansive benefits for students in our nation's schools. Examples of these benefits include better physical and mental well-being, improved science/math performance through hands-on activities, understanding of public land issues, and deeper comprehension of ecosystem functioning. The question asked in the America's Great Outdoors Initiative is how to improve conservation and get people, especially kids, outdoors more often. Many of us experienced summer camps or outdoor schools that laid the foundation of our love for the outdoors. Outdoor classrooms, especially those on public land, are a crucial component of sparking a child's interest and care of the outdoors, though many programs running such classrooms nationwide lack the funding to contribute to mainstream educational systems. Truly, there are countless organizations running outdoor education sites on public land with the materials, ability, and drive to reconnect our younger generations to the land. The only aspect holding many of these organizations back from reaching more students is a lack of public funding and awareness. Our belief is that further expansion and funding of existing outdoor education programs, as opposed to starting from scratch and spending more time and money creating new initiatives, will provide the outdoor opportunities required to reconnect children with the bountiful and beautiful land of the United States.

Better Use of Tax dollars. Radio ads telling us to "go to the forest" is a waste of our money. Since when is it the Federal Government's job to "reconnect people to the outdoors?" Instead of mowed lawns at schools, we could provide outdoor learning labs.

USDA's recent report, Private Forests, Public Benefits, focuses on the particular pressures on private lands. According to this study, as much as 57 million acres of rural forests may experience land use change by 2030 due to the competing economic pressures of other land uses. The resulting fragmentation and forest loss could have significant consequences for the benefits we derive from forests - clean water, forest products, wildlife and recreation. Indeed the report looks specifically at the implications for water quality, at-risk species, timber production, forest fire and forest health and finds that wide-spread land use change will exacerbate each of these issues.

As outlined in the USDA report, the average age of family forest owners, who own the majority of private forests in the U.S., is increasing. This in turn raises the probability that lands will change hands more rapidly, causing greater fragmentation pressures and loss of vital ecological function as owners change. Concurrent with these changes, there have also been significant changes in the ownership of forest lands formerly part of large integrated forest product companies as these companies have transferred ownership of their lands to organizations representing public and private investors from a broad crosssection of the public. Effectively engaging the full suite of today's forest owners in a manner that optimizes both the public and private benefits of the forests they manage will require approaches that build on a history of success while pursuing new and innovative solutions for the future.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Most of America's forests and woodlands are privately owned, with roughly three-fifths of private forest land owned by families. To ensure these forests continue to provide a myriad of benefits - clean water, carbon sequestration, renewable energy supplies, rural jobs, recreation and wildlife habitat - the estate tax burden must be addressed.

Most forest owners are "land rich and cash poor," with the majority of families owning less than 100 acres. The estate tax is one of the biggest impediments to keeping forests land intact.

Each year when the estate tax is collected, an estimated 2.6 million acres of woodlands are harvested and 1.4 million acres are sold to pay the federal estate tax. One-fourth of the wooded acres sold to pay the tax are converted to other, more developed uses.

If Congress does not act, the estate tax will dramatically increase in 2011, applying a 55% tax to all estates valued at over \$1 million. In most cases, even a small forested tract is valued at well over \$1 million. This tax will impact many more family forest owners in 2011, leading to more forest loss - just at the time when we will begin to see an unprecedented intergenerational transfer of property because of aging demographics.

Prior to the Conservancy's ownership, the DLWA included dozens of miles of established traditional foot trails that were etched in place decades or even centuries ago. These trails were often made by the feet of thousands of individuals - but with little benefit of modern trail planning and construction techniques. As a result, trails tended to proceed in a straight line to the destination of interest (often straight up steep slopes or through wet ground) with little accommodation for environmental protection or the comfort of the hiker.

While there are innumerable opportunities to enjoy the great outdoors in Montana and our state is rich in natural wonders and public lands, many children simply do not take the opportunity to explore beyond the city limits. Many of our students are impoverished and never get to know what awaits them when the paved streets end and the trails begin. Our OHV exploratory changed that for a few of the kids. I hope as you develop recommendations as part of the America's Great Outdoors Initiative that you remember that motorized recreation can be a valuable tool to introduce children to the outdoors.

The RTP funding-distribution process is proven, having successfully funded in excess of 13,000 projects across the nation over the past 19 years. Despite this success, however, there is still a backlog of good quality, eligible projects, which exceeds the RTP funding available under SAFETEA-LU, the current transportation legislation, by a ratio of at least 3:1. For this reason, and because past legislation failed to make available all of the funds attributable to nonhighway recreation use of gasoline, we are requesting increased funding for the RTP.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am especially concerned about climate change since it will affect , for the worse , our entire planet.

Every year 3,000,000 acres of American open space are developed. It's a one way street – rarely are lands "undeveloped."

I see farms disappearing by my home. Who is going to feed us - the Chinese? Support real farmers, not agri farms, to protect the land. Preserve our great national parks. It is what makes our country so beautiful. Without this beauty, who will come to see it.

I live in Philadelphia, a very large and bustling city. There are individuals who never get to experience the wonder of nature and the wide open spaces that this country has protected over the years. We are only temporary inhabitants and must ensure that the legacy we leave is a better one than we are given!

Budget cuts are already badly cutting into jobs that we need to care for our outdoors. Children need to receive quality science education in elementary school so that we can have a better future of outdoor conservationists and protectionists.

I live in a rural community that is desperately working hard to preserve our history with very limited funds. Many times we pray that someone will come along and restore or rehabilitate a building simply because they too have a passion to preserve our history.

The Constitution is not all that needs preserving and protecting! Environment shapes human societies, and people, in turn, affect their environments. Our historic and natural sites reflect a wealth of locations, resources, histories and voices whose interpretations help all Americans celebrate our shared earth and heritage. We also need to do a better job of taking care of the ones we already have.

I recently visited George Washington's headquarters at the Brandywine Battlefield in Chadd's Ford, Pa., and was saddened to see it in dire need of grounds maintenance. Funds had been cut and there were no staff and the house was not open. Weeds and grass were tall and the walkway was almost completely hidden under grass and weeds. It was demoralizing to me to see this. Imagine what these conditions say to children and to our foreign visitors, and to all Americans.

MAYBE AUTOMATED EMAIL MESSAGES WON'T CUT THE MUSTARD, BUT JUST IN CASE SOMEONE READS THIS: The health and welfare of human beings is, or should be, the #1 priority. After decent housing and food, I believe conserving natural sites, historic and cultural sites, is next in line. Without access to nature, beauty and a sense of history, (as well as the arts, which I also advocate) our lives would be missing a vital source of inspiration and hope. IF WE DO NOT PRESERVE HISTORIC AMERICA, IT WILL BE LOST. IF WE FAIL TO PROTECT OUR WOODLANDS AND PARKS, THEY WILL DISAPPEAR. I want my grandchildren and all children to experience the majesty that is our home.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Patrick Henry once said that he knew of no other way of judging the future than by the lamp of experience. In this "me" culture world of MySpace and FaceBook and MTV, many Americans know little of their history and even less of their responsibilities as citizens. The lessons of American history are great, indeed: perseverance, entrepreneurship, the struggle for liberty and natural rights, the belief in government of the people, by the people and for the people. When more Americans can identify contestants on shows like American Idol than they can name Presidents or elements of the Bill of Rights, we are in trouble as a nation. This is why preserving--and supporting--historic and cultural sites is paramount to America's future. It is this next generation who must learn the great lessons of America to help keep it a strong nation, one dedicated to fundamental natural rights and liberties. James Madison voiced this so eloquently when he stated "Knowledge will forever govern ignorance; and a people who mean to be their own governors must arm themselves with the power which knowledge gives." Help historic sites around the country continue to provide Americans the knowledge of this great land's unique history so that future generations will be armed with the power to govern themselves and be responsible citizens and champions of American principles.

Please protect our Redrocks!

Please protect what LITTLE we have left!!

No more oil drilling on BLM land, end it now, thanks.

Please do a you can to save our widerness areas.

Action speaks louder than words, save planet Utah!!

I love the wildlands of Utah...please protect them NOW!

I have visited these lands and they are world heritage. Please help protect them.

Utah deserves more wilderness protection. Recind the Bush administration's "No More Wilderness" policy.

Utah is a fantastic and unique place. Please undo the terrible poicices of the Bush administration!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Please protect this sensitive desert environment from destructive off road vehicle use and oil and gas drilling.

Please protect these areas from ORVs and oil companies. Do something positive for the environment.

Please put a stop to the policies the Bush administration has put in place. The policies are ghastly to say the least.

Please take action to protect what little untrammeled, untracked land that is left! We must preserve these delicate areas.

PS: Tar Sands project is also UNACCEPTABLE TO Us here in SE UTAH!! WHY AREN'T YOU MANDATING SOLAR/WIND POWER HERE? PLEASE HELP US!

Now is the time for you to follow-through on your promise and prevent further destruction of this amazingly beautiful region.

Utah's resources deserve careful land use management decisions to protect their wildland and wilderness values for future generations.

The Bush policies regarding wilderness and, in general, other environmental matters, were awful. I had hoped your administration would make sensible changes.

Over development and depletion of wilderness are destroying this country for future generations. Please reverse the Bush administration's positions.

Why is it that after nearly two years of this administration the "No More Wilderness" policy of George Bush is still the guiding policy? We need a more sensible approach.

You could really protect wilderness in Utah by passing "America's Redrock Wilderness Act" We are slowly getting this passed, but it would go much faster if you endorsed this bill..

Mr Obama, if you truly want to preserve "the majesty of our nation's wilderness" as you referred to it, then take immediate action to rescind the disastrous Bush Administration environmental policies now!

A few hours of "pleasure" - decades of damage. The health of nature means nothing to these airheads...OVER RULE them please! These few people shouldn't be allowed to ruin this magnificent country. Thank you,

You said you wanted to preserve canyonlands and other parks and wild open spaces for future generations to see and utilize. Please sunset the No More wilderness policy ASAP so there is some wild land left for future generations to enjoy.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In 2008 I supported you with campaign donations and as a campaign worker in New Hampshire but I have been extremely disappointed that for two years you have continued many of the Bush administration's land use management policies.

These lands are unique and pristine and should be protected as wilderness. While I respect someone's preference for motorized recreation, riparian areas and the very important biotic soil crusts are ecological resources that must be protected. Thank you!

Having just returned from a trip to this area, we've seen the destruction already apparent in some areas. It is unthinkable to imagine what additional destruction would do to one of the few remaining national treasures that we DO have the ability to protect.

Please support those of us who live in Utah. We are Democrats in the most-Republic state in the nation. One of our most significant issue is the environment, and we are particularly dedicated to Utah National Park, Monuments, wilderness, and wild lands.

Although I live in an urban area, I look forward all year to my annual pilgrimage to Utah, to backpack the stunning landscape and follow the streams. These unique areas deserve the highest degree of protection. Keep out the ORV and grazing animals. Celebrate the Wilderness!

The travel trailer group we belong to will be going to Dead Horse Point next week. I must admit to shock when we went there a few years back. We had originally gone there in 1959. The sight of oil wells was unwelcome. Some of our members commented on their trips to this area. We mustn't deface this area more.

Please Mr. President, It is so important to save as much of our wilderness as possible. So much was damaged during the years of republican abuse that it will take all your leadership skills and dedication of the American people to save it. Much has already been lost through climate change and who knows how much more damage will be done.

We voted for this admistration because we believed that as president, you would make decisions that would preserve our Wilderness areas for future generations. Instead it seems as though you are listening to the loud "me now" voices whose only concern is access to all public lands in ways that will permanently alter them in a very negative way.

Please end the Bush policy of no more wilderness and have Secretary Salazar work with the counties in Utah to develop plans to preserve wilderness, use all lands wisely, and Protect forever the beauty and ecology of the southwest. senator Bennett had begun work on a San Juan county land plan in the same vein as the Washington County lands plan. I hope this will continue even though Senator Bennett will not be representing Utah next year.

I am writing you to express my strong concern for threats to natural areas in Southern Utah.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

These special places would easily have National Park status in other parts of the country - but they are currently being destroyed a little bit every day, and a little bit of America's heritage dies every day with them. This is unacceptable. These wild places restore, refresh, and reinvigorate the patriotism of all who are lucky enough to spend time in them. I love my country because of such places - we are so lucky, but sometimes we forget how fragile places like Arch Canyon are.

One of the reasons that I, like many who share common concerns regarding the environment and quality of life issues, supported your candidacy was that Democratic administrations are generally more "environmentally benign" than Republican administrations, Nixon's positive actions notwithstanding. Please do not let us, your supporters, down on these issues. We look forward to continued support but, make no mistake, these issues are far too important to overlook when it comes time for the 2012 elections.

Please act now to insure that future generations can experience the tranquility and grandeur of America's natural places.

As someone who has travelled in not only these lands, but many designated wilderness areas and parks both in our own country and abroad, I can say that the redrock country of Utah is well deserving of more wilderness protection. It has a stunning beauty equal to or greater than any place that I have ever been. It is also critical habitat for declining wildlife populations. Please rescind the "No More Wilderness" policy that imposes an unreasonable restriction for balanced land management policies in Utah (or for anywhere in the US). Thank you.

As an artist of the western landscapes I have witnessed an escalation of scarring due to ORV use in my native Utah to which I return to hike, paint and enjoy what's left of the real wildness of western America. If we are to protect this patrimony I think it is particularly important to reassess the BLM and to some extent the National Forest multi use mandates to update them to confront the chronic degradation of a an area whose principle resource is to uplift and sustain our imaginations and offer quiet beauty in an overcrowded and noisy world.

Last week I witnessed ORV abuse at the San Rafael Swell as inexperienced riders ran off the trails and ripped up the river bank. And this last trip I noticed an open pit strip operation near the Little Grand Canyon that was not there a couple of years ago. Come and see these places, and you will want to protect them. There was a tragic and pitiful face featured on Time magazine a few months ago, the result of deliberate inhumane cruelty. Our collective neglect is allowing the same thing to happen to the face of "Mother Nature." Please, sir, take action.

I have enjoyed a quiet hike into the canyons adjacent to Canyonlands National Park. I hope that trail is not inundated with ORV, they will not only ruin the quiet and solitude, they will destroy the beauty of the landscape and scare the wildlife away. I was shocked at the scars left along much of the area north of Moab left by the placing of pipelines. We must protect the BLM areas from the rush to find and extract every last mineral deposit. We need more wilderness and protected areas in the Canyonlands region of Utah. We need sound land use policies for all of Utha.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It is past time to rescind the last administration's destructive environmental policies, which viewed nature and natural systems as objects to be exploited for profit. Let us not make the same mistake again - we must protect what remains of our wilderness areas and not allow them to become just more degraded areas (which have, of course, made a few people very wealthy). Utah has many of these areas, which are now greatly threatened by oil and gas exploration and drilling. We must also prevent motorized vehicular use of these areas, as this severely damages vegetation and disturbs wildlife.

Several times a year, I vacation in the redrock canyon country of southern Utah. I am concerned that the wilderness aspect of this area is being lost to development and motorized recreation.

This month, Labor Day Weekend, marks my 20th anniversary of my first trip to Southeast Utah, a backpacking trip with my 20 year old daughter. This trip was a life changing event for me. I now travel to Southeast Utah frequently every year and have also purchased a home in Moab, UT with my wife Margie. She will be retiring from the State of California next year and we will be spending much more time in Southeast Utah. In 20 years the landscape has changed dramatically with all the overuse and abuse from off road vehicles. Please help get this matter under control before more permanent damage is done.

Please take steps to contain and limit the use of ORVs in our National Wilderness. The noise pollution alone makes them extremely obnoxious. In an era when people need to lose weight, urge people to walk and enjoy the beauty of the landscape. ORVs degrade the environment in many other ways already mentioned above. Allowing our precious lands to be degraded by gas and oil drilling is even more insidious. Every environmental caution should be taken before consideration is given to such operations. Fracturing for gas is destroying our water. Drilling for oil destroys the land and water. Please take care of our lands, our children's heritage.

Dust created by ORV traffic destroying fragile soil crust has created massive dust storms that travel to other states causing snow melt and other problems. We have new highway signs warning of dust storms. Grasslands have been replaced with drifting mounds of sand.

Edward Abbey must be writhing in his grave. Please do everything you can to reverse those last minute Bush sponsored changes which have such potential to ruin fragile ecosystems on the Colorado Plateau. Thank You

I live in Vermont, but travel to Utah every 12-18 months to hike and to explore the unique wild lands of that state. A significant area of Utah is clearly land of Wilderness Quality, with deeply carved canyons, archaeologically important sites, and forested mountains. This region is, however, threatened by policies from the Bush administration that threaten the pristine natural beauty, quiet and solitude of worthy wilderness-quality lands throughout the West, especially in Utah's redrock country.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As a resident of Utah, and a frequent visitor to Utah's redrock country I ask you to please rescind the Bush administration's "No More Wilderness" policy. Leaving 80% of 11 million acres of BLM land in Utah open to oil and gas drilling and designating an astounding 20,000 miles of ORV routes is simply unacceptable. Those of us who value the beauty and solitude of redrock country vote, WE VOTED FOR YOU, and we expect you to stand up to the special interest ORV groups and protect this land. I mean really - in some portions of the plan EVERY single riparian area has an ORV trail. Have you ever personally seen the absolute catastrophic destruction that an ORV wreaks on stream banks? Its stomach turning and almost impossible to mitigate or repair.

The Bush administration's "No More Wilderness" policy and resulting land use management plans for 11 million acres of BLM land in Utah have left 80% of these lands open to oil and gas drilling and designated an astounding 20,000 miles of ORV routes. Dust is a major problem affecting climate and water in the Colorado snow pack. Reducing traffic in these areas will help to mitigate this problem. In some of the plans, every single riparian area has an ORV trail, leading to pollution, erosion, shrinking water availability and lost wildlife habitat. Climate change, the overriding influence on the health of BLM lands, got just three paragraphs of the same boilerplate language in each of the 1,000-page Environmental Impact Statements instead of any real analysis.

Of all states that I have visited, Utah by far deserves wilderness protection. It contains so much archeological and geological uniqueness!. It stands above every other state in need of immediate protection. The desert environment is just too fragile to endure President GW Bush's "No More Wilderness" policy. It is not too late for Pres. Obama to overturn this nightmare policy. Oil and gas exploration is just one part of Pres. Bush's legacy. Worse yet is the off-road vehicle degradation from motorbike, ATV, and Jeep enthusiasts. The fragile cryptobiotic desert soil takes 50+ years to recuperate after even one set of tracks is left behind. But it cannot heal if continued off-road riding is allowed. And if it doesn't heal, the winds blow sand into huge dust storms; and the environmental disaster worsens.

Dear President Obama and Secretary Ken Salazar, As a Westerner who cherishes America's wild spaces, as an educator who works to impart the values of wilderness to others, as a writer whose voice is too often drowned out by the strident voices of ORV recreationalists and pro-development lobbyists, I urge you, please, to take decisive action to undo some of the damage of the Bush administration in regards to our vanishing wilderness areas. You face many challenges to make our country a humane place to live and grow, and you are doing good work of all kinds that will have a lasting positive impact. Please expand your efforts to create a legacy that preserves some of the remaining wild spaces in our great country for our future generations. Respectfully yours,

Though I live in Illinois, I believe the red rock canyon country of Utah is among our nation's most precious possessions.

Since living in SE Utah during the mid-1980s I have fought to assure that a good portion of it is set aside as wilderness (9 million acres of BLM land in Utah).

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

I have a special fondness for the San Juan-Canyonlands area. My husband and I learned to rely on each other during a challenging hike in Cedar Mesa in 2003. In 2004, we got engaged on a moonlit night overlooking an ethereal crater. Thousands like me have stories to share about peaceful encounters, rugged physical challenges and blissful hours in the redrock country of Utah. My hope is that your administration will ensure that thousands, maybe millions, more will experience the quiet awesomeness of these public lands untouched by strip-mining, drilling and ORV desecraters.

I would beg to add however, that these areas remain more accessible to the young, the elderly and handicapped. This would not allow off road vehicles but would allow access to roads for passenger vehicles. I cannot imagine not being able to take my grandson to a total wilderness designation not accessible anymore to either of us. Further, many of the ranchers in the area are maintaining waterholes that benefit wildlife. Total wilderness designation would restrict access by medical personell in a vast area that has few medical facilities anyway. Serious illness and injuries need to be airlifted to proper facilities. BLM ground belongs to all of us, not to the special interests. It would be tragic to allow further filthy "drilling" for oil and gas. The amounts available are not worth the terrible pollution. Oil shale should not even be considered due to the extreme toxicity of the processing and the destruction of the landscape. America needs to get away from oil, but not with oil shale.

Mr. President, and Secretary Salazar,. Though we live in Washington, My wife and I go to Utah every year to hike and camp in OUR American lands. Many of the sites we visit are on BLM land NOT protected from ORV and grafitti vandals. We are owners of these lands, and we want you to protect them as Wilderness! Please do so! I read over the DEIS documents on each of these plans and wrote letters of comment. But in the final EIS I saw that every one of my comments was dismissed. For example, I wrote that Trachyte Wash stream was incorrectly planned to NOT get Wild and Scenic river designation, and cited specific errors BLM had made in deciding to omit it.. But BLM's final EIS stated that my arguments were irrelevant, since they had already decided that W + S was to be denied!

Why is the egregious Bush Administration policy of not allowing wilderness quality lands be managed for preservation? We are two years into the Obama Administration, and yet this backroom deal that abrogated well considered earlier management protections on valuable Utah wild lands is still in place. WHERE IS THE CHANGE I VOTED FOR? It simply is not acceptable that those plans stand unchanged two years later as well. These were politically and ideologically driven decisions that were not based on science. Yet the Obama Administration has (rightly) proclaimed that science would rule decision making for this president. I want to see that put into action now, on these issues.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Utah's redrock canyon country is especially vulnerable, biologically and scenically, to ORV use. The desert leaves scars bare and visible, not hidden under vegetation. It's hard to describe the sense of desecration that ORV use leaves on the landscape, and the degree to which the noise and impact of the activities of a few offroad enthusiasts degrades the experience of all other users, if you have not experienced it personally. Utah's canyon country is an utterly unique landscape and resource, one that belongs to all Americans. I believe that we also have a duty to protect this singular environment for the rest of the world. Extensive ORV use such as the BLM is proposing will DESTROY this landscape for little-to-no benefit. I would hope that it shouldn't affect your decision, but I would also like to emphasize that this is the single political issue that I follow most closely, and politicians' response to it directly affects my opinions and voting decisions. Please prevent the destruction of the canyonlands, America's most iconic landscape. It is the right thing to do, and future generations will thank you for it.

September is National Wilderness Month, and you did the traditional political thing, re-declaring it and asserting that "we must ensure that future generations can experience the tranquility and grandeur of America's natural places." Thanks. But policies from the Bush administration remain in place which threaten the pristine natural beauty, quiet and solitude of worthy wilderness-quality lands throughout the West, especially in Utah's redrock country, and southern New Mexico's Organ Mountains-Broad Canyon-Portillo Mountains area. The Bush administration's "No More Wilderness" policy and resulting land use management plans for 11 million acres of BLM land in Utah have left 80% of these lands open to oil and gas drilling and designated a criminal 20,000 miles of ORV routes. In some of the plans, every single riparian area has an ORV trail, leading to pollution, erosion, shrinking water availability and lost wildlife habitat. Climate change, the overriding influence on the health of BLM lands, got just three paragraphs of the same boilerplate language in each of the 1,000-page Environmental Impact Statements instead of any real analysis. This is criminally irresponsible and I demand a change!

I know we are busy trying to fix things around the world. but let's take care of some things here too. We need to protect the land: our forests, BLM desert land and land that could be considered wilderness-worthy. Our lands that are under study for wilderness as well as those areas already designated wilderness, make the US so special from countries in Europe. In fact, in Utah, Europeans flock to our National Parks and wilderness areas, because they can't experience nature there, like you can here. But the quality of our lands is eroding and eroding quickly. Please reverse Bush's terrible land policies, especially when it comes to opening up pristine lands in the West to horrible destruction from ORV's, ATV's etc. The damage being done not only kills plant life and degrades our streams and rivers, but the destruction of the land itself will take centuries to repair, if it can be done at all. Please act to protect a very valuable resource, our wilderness. Thank you.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In celebration of that declaration, I took some time in September to go backpacking into one of America's most treasured forests, the Kings Canyon region in the great Sequoia wilderness in California. The spectacular beauty, complete with alpine mountains, meadows and waterfalls, abundance of natural wildlife including deer, bears and fish, and unspoiled views of nature in harmony are enough to reassure the soul and enlighten the spirit. I encourage you to go for yourself. However, there is still work to be done.

The landscapes of Southern Utah are completely unique, and truly a national treasure. Indeed, these unique landscapes provide a positive image of the nation to the world--they signify the spirit of the very spirit of the American West. If you have never visited Southern Utah, I hope you will make some time and space in your schedule to go there because photographs, regardless of how stunning, cannot capture the unique spirit of the place. When you declared September as National Wilderness Month, you stated that "we must ensure that future generations can experience the tranquility and grandeur of America's natural places." I fully agree with this sentiment. However, policies from the Bush administration remain in place which drastically threaten the pristine natural beauty, quiet and solitude of worthy wilderness-quality lands throughout the West, especially in Utah's redrock country.

I was so proud to hear your declaration of September as National Wilderness Month. I thoroughly agree with your statement that "we must ensure that future generations can experience the tranquility and grandeur of America's natural places." I have been quietly roaming the "Redrock" country of Utah for over 40 years and am still in awe of the dramatic landscape which cuts across the millions of geological layers. While walking across this incredible landscape, I have run into evidence (homes, farming and hunting areas, pottery shards) of the ancient Anasazi and Fremont Indians. Utah's Redrock remoteness and the arid weather has uniquely preserved these ancient artifacts for us to untangle the mysteries of people that lived here thousands of years ago. I have passed this "Redrock" appreciation to my children and now my grandchildren. If you have not taken your children to experience this wilderness, I invite you to come and see why so many of us are truly concerned in preserving this area for future generations. I'm so afraid that policies from the Bush administration remain in place which threaten the pristine natural beauty, quiet and solitude of worthy wilderness-quality lands throughout the West, especially in Utah's Redrock country. It would be an honor to have you and your family come and see why this area is a primitive wilderness and should be protected. Please contact me if I can be of any assistance planning a trip here to a place you'll never forget and will never regret knowing you helped save it for your grandchildren to see.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Last week I visited Utah's redrock wilderness on a trip to Capitol Reef National Park. I was once again struck, as I on each trip, by the extraordinary discrepancy in environmental stewardship within and outside of the protected areas of the landscape. There are many areas of the Utah wilderness that are no-go areas for people seeking a peaceful and respectful experience of nature, given the noise, erosion and gaseous pollution which is caused by the appearance of 'off road' vehicles. In other parts of the world where the vast majority of people seek to experience the Earth in it's elemental state (Norway, Sweden, the UK, France, Italy, Switzerland), these anti-social toys are simply banned. It is simply cowardice on the part of the US government, struck as it is with the idea of individual 'freedom', that this ridiculously selfish pursuit is still allowed. But, what 'freedom' does this leaves for the hiker, mountain biker, backpacker or ski tourer, who must remain in National Parks. Personally, any interaction with these people serves as a damning illustration of the selfish and lazy tendencies of the human race, and can turn a charming and pleasant day into one filled with anger and distress. Furthermore, the disturbance of the surface layer caused by offroad vehicles has been directly implicated in the increase in 'red dust' covering the San Juan snowpack, accelerating the spring thaw period, and reducing the capacity of the mountains to store water. This is an outrageous visual and economic impact of this selfish activity. Surely, a time must come when we stop thinking of ourselves as heroic pioneers of hostile lands, and start to think of ourselves as stewards of a delicate and precious resource? That time is surely upon us...

When it's gone it's gone for ever. Increased population pressure means increased need for the grand, unspoiled outdoors. I would hope the Obama Administration will be known for its brilliant record on conservation of our natural legacy, and for adding to the nation's store of preserved natural grandure.

I find "motorized recreation" abhorrent.

If we don't preserve wild places, I feel that it is a tragedy for us all.

When I take a hike in the woods, it is so refreshing to my soul; it would be sad if future generations didn't have that tranquil place to go.

But places like the Wild Rogue River, the wildlands surrounding Crater Lake National Park, the Siskiyou Wild Rivers, and Oregon's portion of the Snake River basin are at risk from dams, logging, mining, and other harmful development.

I have cherished the outdoors all my life, and sadly I have also watched it diminish and degrade during those years. I am grateful for the experiences and opportunities I have had connecting with nature, wildlife, and all that is wilderness.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

One of my primary concerns regarding conservation is the permanent establishment of corridors between wilderness areas in order for the animals to SAFELY travel between their various ecosystems. Corridors are critical to the ability to safely migrate and exchange genomes, thus strengthening the variability of the DNA of species. If you need further information on the importance of this issue, ask your science advisor about the detrimental effects of island isolation.

There is nothing like camping or hiking in outdoor areas that have a sense of solitude, free from the hustle and bustle of today's world with the noise and pollution that follows. These are beautiful treasures that belong not only to the present generations, but for future ones as well. For the wildlife that call our public lands homes and for the millions who enjoy these places for quiet recreation, it is time to correct this Wilderness imbalance before it is too late.

I do not know where you go for peace, but I go outdoors. When thinking about how to contribute, how to make this a better world, I go to quiet, beautiful, majestic places, where I can look up at the giant trees and down at the glistening rivers. If I know there is pollution or destruction going on there, my mind drifts to the controversy instead of being nurtured in its creativity. Those quiet places are vital to humans. If we have nowhere bigger than us, more beautiful than what we can create, how will we rise up above our limitations?

Actually, to me, preserving our National Forests, Grasslands, BLM, Wildernesses, and our remaining undeveloped public lands for future generations to care for is the most important thing I care about. I guess I shouldn't care, because I am due to pass away soon, but I feel there is no greater heritage to have, and nothing says more about a people than leaving things better than I inherited them. I just care about the planet's future, and the attitude of human beings about the world they became in. I care about the above more than the economy, in fact we all know it is the economy that is what is tearing down what I care about most.

Keep America special through protecting a lot more Wilderness and by preserving many many more quiet recreation opportunities. It is critical that we act to preserve more habitat and connectivity for wildlife, and permanently protect our carbon sequestering and beautifying remaining old-growth forests. Oregonians enjoy some of the most beautiful and awe-inspiring public lands in the nation. We in Oregon have protected only 4% of our land as Wilderness. We are lagging far behind our neighbors. Yet we have a huge % who rely upon wilderness for sanity, recreation, and a way of living. We must also preserve the wildlife that calls our public lands home and for the millions who enjoy these places for quiet recreation, it really is now due time to correct this Wilderness imbalance.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Thank you for seeking public input regarding how to manage and preserve the beautiful wonders of nature we are so fortunate to have in our country. This past summer, my husband and I explored several amazing outdoor wonders--Crater Lake, the Three Sisters area, Yellowstone, and the Grand Tetons. Connecting with the towering trees, the wild flowers, the streams and rivers, the canyons and mountains, and the wildlife was an incredible experience. Wherever possible, it is crucial to help keep America special by protecting more Wilderness and quiet recreation opportunities, preserving more habitat and connectivity for wildlife, and permanently protecting the remaining old-growth forests. It is deeply disturbing to me that we are still clear cutting old growth. When I am walking near old growth there is a unique presence and sense of wisdom that I feel. These trees feed the earth, the wildlife, and our souls. They are too precious to destroy.

Do not make them monuments!

. The Indian is still crying..... time to make a change.

. We won't be able to reverse the demise of the wild once it is gone.

. I also want the dolphin and whale slaughtering to be stopped.

heck I even want our current generation to enjoy it! Please stop raping our land!

. In Yucca Valley, our precious spaces surrounding Joshua Tree National Park are being threatened with improper over development. We desperately need a balanced approach.

. We are losing plant and animal species at alarming rates due primarily to habitat loss. It is time to step up and fully fund the protection of our natural resources, which we not only depend upon for our physical survival, but need for our emotional well-being as well.

I have had the great opportunity to visit many of our beautiful National Parks across America, from the Grand Canyon and Zion to Glacier, Rocky Mountain and Hawaii. While these places are breathtaking and serene, I worry that the parks and the rest of our wide open spaces will not remain natural and unscathed for the next generations of Americans to enjoy. Follow Teddy's example and protect our natural resources!

. Having lived in the Seattle region for 30 years, I've seen the expanding encroachment due to population growth of our wild spaces. With unregulated growth, in the not-too-distant future they'll be development up to foothills of the Cascade Mountains. Protection of our natural spaces is the only way to ensure future generations access to this region's and America's natural treasures. Sincerely,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I feel the best way to do this is to get people out in nature. What ever you use the great outdoors to do is what you want to conserve. I know I recently mourned the loss of the perfect tree. On the disc golf course in Willoughby Ohio parks services chose to kill the perfect tree rather than save it. While this tree has no national significance, for all of us it was actually a difficult loss. We need to discourage urban sprawl, and encourage natural landscapes.

Furthermore, please LIMIT and cut-back on the amount of wilderness and outdoor spaces that are open to ATV and other motorized vehicles in order to preserve the wild spaces, increase peace and quite, and reduce pollution and reduce destruction.

. Today, I wish to ask you to think of symbols of America. I think of wilderness, eagles, redwoods... these are the American legacies that bring people from all over the world. Richardson grove, a redwood grove on highway 101, may be disfigured by road widening. I travel this road and know it does not need widening. Why cut down the trees the tourists and locals love just to widen a road? The road is there because of those lovely redwoods, of which less than 4% still stand to carry on the legacy of wild forests and American pioneering spirit. Please Save Richardson Grove on highway 101 in california.

. Conservation easements and through-ways are important to preserve the natural movements of our nations wildlife while our population expands and our economy builds. Natural Gas mining is not the way to a better power system. The ecological damage of the toxic waters released, and the fact that the small size of wells eliminates regulatory requirements even when in a high concentration across the landscape. Congressional leaders who invest in this alternative invest in pollution and continued destruction of our natural resources. Allowing for the grazing of non-native species and drilling in our national forests and federal lands contributes to this trend of destruction and global warming. Please continue to support and protect our planet and stop allowing uninformed opportunists to destroy this great country.

It seems that not many realize how importance of mother nature and her inhabitants; all living things play an important role in the ecosystem. Much of the land we have now that has not yet been touched by man harbors a great deal of history within it. If we let the land become lost to cities and industrial productivity then our history will eventually be only a memory; something that we could only view within the pages of a book. We can't let the efforts of past generations, such as Theodore Roosevelt, go to waste. Therefore, I believe protecting America's great outdoors is essential, not just to preserve our history and the ecosystem, but to allow future generations to be able to appreciate the beauty of nature and create memories of their own by visiting all over the vast majestic land that is America.

## Discussion Question 2

***(cont.)***

I hope you all consider the needless horse killing of more than likely healthy horses near and far - get up off your chair and care just a little more than you are Actors and Actresses and those with the ability to do something about roaming horses that need their natural habitat saved for them - fence the idiots off that bought the land that is near them - cage the dummies that took the land near the loose or roaming deer or horses and other wild life give back that habitat to the horses and maybe consider thinking hard and researching the fact that for many 100's of years they roamed - USA and CANADA so YOU don't just ping them off. Its a shame we have let this get out of control amongst other things. Obama Harper what are you thinking???. Now and not tomorrow get up off your executive chairs or desk for some of you and do some thing to stop this crazy stuff. Why where and when does this happen and who inspects the locations and who benefits from this? YES of I want the next generation to enjoy America's and Canada's great outdoors too. I urge leaders in Washington CANADA to expand and protect our shared outdoor spaces So where are the deer all 6 of them that use to roam the park here across from my building -young and old you would see them there until they started construction and until they put a dog park near the big forest area and yes not anyone has stopped the deer hunt by the deer hunting dogs. So whats to stop the people from hunting in the park at night -that had "let the dog run loose by accident" it got out of the dog park - care someone there and here get real about caring all you big talkers there and here. Disappointing in the horses being shot in the brain after being cornered -disgusted in the message this sends to the people of the USA CANADA shame on you leaders for allowing this and pretending you don't know. Your vote may be affected next time.

WITHOUT PROTECTION, WE ALL LOSE ---FOREVER!

The Art of Nature, can not be repaired by man, once destroyed!

If we do not manage and protect these lands, who will?

PLEASE FOLLOW THRU ON THIS AS OUR BEAUTIFUL PRISTINE AREAS WILL BE RUINED FOREVER IF DESTRUCTIVE DEVELOPMENT IS ALLOWED!!!!!!!!!!!!!!

Worse, the Bureau of Land Management is bound by a directive from the previous administration to cease all wilderness assessments, including the removal of wild horses from these lands.

HOWEVER THERE IS A LOT MORE TO DO AND YOU BETTER STEP UP YOUR EFFORTS BECAUSE I AM NOT OVERLY IMPRESSED WITH YOUR OVERALL RECORD OF PROTECTION FOR ANIMALS RE. THE ENDANGERED SPECIES ACT OR FOR THE HILLS OF APPALACHIA.

When I asked a friend from India what made the greatest impact on her, she said the natural wonders of America were the best part. PLEASE don't let corporations or others destroy the natural world were have preserved.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I THINK THAT PROTECTING OUR REMAINING WILDERNESS AND THE DIVERSITY OF OUR SPECIES, STRONGLY AND COMPLETELY. IS OF THE HIGHEST PRIORITY. THIS IS ESPECIALLY TRUE AS THE EARTH ITSELF IS BEGINNING TO GIVE NOTICE OF THE CONSEQUENCES OF NOT DOING SO.

I treasure the wilderness and yet have visited very little of it, which is the way it should be. We need to preserve even greater areas of pristine lands before they disappear. We need to protect the public lands as well from gas extraction.

Our natural resources are threatened by pressures like expanding population, unguided development, and climate change. I'm asking the President to make wilderness protection a central component of his policy emerging from the America's Great Outdoors Initiative.

I've been fortunate enough to hike, backpack and be inspired by our Wilderness areas. That's the way I spent my vacations for many years, and I feel great sadness at so many of those places being destroyed, and decreased by encroaching development. J

THANKS YOU FOR PROTECTING OUR GREAT PRESERVED LANDS FOR FURTHER DRILLING, MINING, AND/OR DEVELOPMENT!!!!!!!!!! IF WE LOOSE THESE LANDS NOW, FUTURE GENERATIONS WILL NOT BE ABLE TO VIEW AND APPRECIATE OUR GREAT AND WONDERFUL NATURAL PLACES PRESERVED BY OUR PAST LEADERS!!!!

(I do not, however, consider the wild mustangs to be a natural part of our wilderness just because they have been there for a long period of time; it is important to note that they have damaged the wilderness where they have been living and have caused hardship to native plants and animals there.)

My most important priority for wild lands are the WILD LIFE. The fact that killing licenses fund state agencies and federal agencies are biased to killing interests is a crime against the American people. The vast majority of us (95%) are LIVING wildlife appreciators. Yet trophy hunting and cattle ranching have RULED our public lands for trophy thrill killing and cattle grazing, destroying our native wildlife for recreation and profit. This is our COMMONWEALTH. IT should NOT be privatized to killing interests and profiteers. We the people need change to PROTECT OUR WILDLIFE. THAT IS MY TOP PRIORITY. I hope you see the threats to biodiversity and the web of life (even destroying our pollinators) as serious. END THESE SPECIAL INTEREST CONTROLS OF OUR FEDERAL AGENCIES.

I feel that a balance between enjoyment of nature and destruction of nature must be met. I will not accept a single endangered species in America. I want the limited yet existent rights of the wild species of the world to be respected and not abridged in any way. The best way to enjoy nature is to have some. I demand a lot. If nature continues to be infringed upon, I will opt to not re-elect any of those who sat complacently by and watched its destruction.

. Please do not sell public land for logging, ranching, or oil or any other profit scheme.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Take this opportunity to leave a legacy and please remove the four lower Snake River dams. This action would restore 140 miles of whitewater, 70 named rapids, and thousands of additional lands to the public. If you want to get folks outdoors in the Northwest, this is your best opportunity! Please do what you know is right and remove those dams! Sincerely,

Fishing for salmon and steelhead is a age-old family activity at risk for lack fish. Please do everything that you can to change course and put Columbia Basin salmon and steelhead recovery back on track. Follow the best science and do the right thing! Bring people together to craft a recovery plan that removes the four lower Snake River dams and reconnects salmon with their homewaters in Idaho, Washington and Oregon!

especially the Mogollon Plateau national forests described below: Conservationists have proposed a 480,000-acre Mogollon Wildlife Conservation Area is proposed to protect the extensive old growth forest and montane riparian areas of Arizona's southern Coconino and western Apache-Sitgreaves National Forests into a linked conservation system. The Mogollon Plateau forests (Coconino, Kaibab and Apache-Sitgreaves national forests) remain America's largest contiguous expanse of ponderosa pine. These forests contain important habitat for endangered species, including the Little Colorado spinedace, Mexican spotted owl, Mexican wolf, Chiricahua and northern leopard frogs and other important native wildlife such as mountain lion, black bear, elk, mule deer, American pronghorn, Gunnison prairie dog and goshawk. The forests also provide critical linkages for wildlife populations of the Blue Range and Gila wilderness complex of eastern Arizona and western New Mexico across the Mogollon and Coconino plateaus to the Grand Canyon and Arizona's Central Mountains. Since pre-settlement times, Arizona and New Mexico have experienced a 90% loss of riparian ecosystems (Arizona State Parks 1988). Arizona's riparian forests are considered one of America's most endangered ecosystems. The entire forested Mogollon Plateau watershed (i.e. East Clear Creek, West Clear Creek, West Oak Creek, Wet Beaver Creek, Willow Creek and Walnut, Sycamore, and Chevelon canyons) provides relatively intact, biologically significant core and wildlife movement corridors through a landscape otherwise generally fragmented by roads and logging impacts. The southern Coconino and Apache-Sitgreaves national forests' riparian regions including the Black, San Francisco, Verde and upper Little Colorado rivers and their tributaries offer some of the finest and most diverse, as well as threatened natural and cultural resources in the United States. This area remains an incredibly rich, biologically diverse forest and grassland refugia for imperiled and biologically important species described above. Anderson Mesa of the Coconino National Forest provides a relatively intact, biologically significant core and wildlife movement corridor through a landscape generally fragmented by roads and logging impacts. The Mogollon Plateau watershed contains remnant old growth mixed conifer and ponderosa forest. These values are significant, given that more than 200 years are required to develop old growth structure in southwestern ponderosa pine forests. Ecologists have determined that old growth ponderosa pine forests constitute one of America's most endangered ecosystems. They report that old-growth ponderosa pine has suffered an estimated 85-98% area loss due to destruction, conversion to other uses, and significant degradation in structure, function, and composition. Logging is one of the principal causes of this decline.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I consider myself an informed citizen and I care deeply about the preservation of wilderness. I have long been aware of the problems with the U.S. Forest Service, regarding lands that should be designated wilderness, and I have hoped that the current administration would move to correct this. But I am shocked that the BLM directive to cease all wilderness assessments has not been lifted. It is my sincere hope that this administration will move forward and right these grave wrongs done to our nation's wild, natural places.

I've seen first hand the horrific graffiti on Bonita Falls off of the South Fork of Lytle Creek. This points to a need for more rangers.

In the face of growing recreational needs in the urban area of Southern California, the ability of the Angeles National Forest to support visitors is actually declining with only about one dollar per visitor on law enforcement, educational materials, interpretive services, and visitor center management spent annually. Putting an end to youth obesity, a particular interest of Michele and a life-time career focus of mine as a dance and Physical Education teacher, and an end to the diabetes crisis of our youth can be directly attributed to access to our mountains and rivers for local recreation. A San Gabriel Mountains National Recreation Area could tackle this crisis. The America Great Outdoors Initiative that you launched this summer is a wonderful program. It will change many lives by acknowledging the problems of the region and recommending the creation of a San Gabriel Mountains National Recreation Area which would bring in the assistance of the National Park Service as well as more resources and rangers for the area and much needed support for outdoor recreation in our local mountains.

Also, work to provide access to appropriate spaces for recreation including equestrian activities. Thank you.

Without an extension of the tax incentives to potential landowners who are considering land protection under conservation easements, our efforts to preserve land are being severely compromised.

Developers, in the name of progress, continue to destroy land that has much more value undeveloped than turned into concrete. Please stop the destruction of undeveloped land and forests.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am the President of our local land trust and an avid Obama fan. My husband and I retired to the desert from the Chicago area, and are also avid White Sox Fans. I want to take a moment to let you know how much we appreciate your support of tax incentives, farm bill easement programs, LWCF and Forest Legacy. The tax incentives for folks who grant conservation easements is especially important to our work. We are in a struggle to protect fragile desert land that has had cultural heritage since the time before Christ. The petroglyphs are just a small testimony to the importance the riparian areas we are trying to save have been and continue to be important to the survival of fragile desert plants and animals in our area. The state of Arizona owns much of this important land and currently the policy, and law is that all their land must go up for bid for the highest and best use. The people in charge deem the most money from the land as the best use. This makes our work to preserve land in this state especially hard. We have had some success working with private homeowners of especially precious land to get conservation easements. The tax incentives are one of our few tools. Please don't take those away. They are a small investment that can make a huge difference in future Americans seeing the beauty of the desert and visiting important historical sites in our area. Thank you for launching America's Great Outdoors and recognizing the work of America's 1,600 land trusts to keep agricultural lands and protect important wildlife habitat. Sincerely

But places like the Wild Rogue River, the wildlands surrounding Crater Lake National Park, and the Siskiyou Wild Rivers are at risk from logging, mining, and other harmful development.

For example, places in Oregon like the Wild Rogue River, the wildlands surrounding Crater Lake National Park, and the Siskiyou Wild Rivers are at risk from logging, mining, and other harmful development.

Oregon has protected only 4% of its land as Wilderness, lagging far behind its neighbors.

For the wildlife that call our public lands homes and for the millions who enjoy these places for quiet recreation, it is time to correct this Wilderness imbalance.

Our natural resources are threatened by pressures like expanding population, unguided development and climate change.

Currently, the U.S. Forest Service uses overly restrictive criteria in determining their recommendations for lands that should be designated wilderness.

Worse, the Bureau of Land Management is bound by a directive from the previous administration to cease all wilderness assessments.

Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Pebble Mine threatens Bristol Bay's clean waters, the best wild salmon run in the world, wildlife and traditional subsistence ways of life.

It will undoubtedly endanger Bristol Bay's wild lands, salmon runs and wildlife, its clean waters, and traditional ways of life.

Despite growing recreational needs, the ability of the Forest Service to support visitors is actually declining. The Angeles National Forest spends only about one dollar per visitor on law enforcement, educational materials, interpretive services, and visitor center management.

Outside of the forest our region's youth obesity and diabetes crisis is growing, bringing new urgency to connecting our people and communities back to our mountains and rivers.

\_\_\_ said Wilderness designations are not cost effective" The trails maintenance programs for wilderness areas cost almost nothing when compared to road maintenance costs for the non wilderness designated government land. Wilderness designation is the most cost effective management designation. We get clean water and clean air and it costs taxpayers nothing."

I kinda question just how much jet noise you realistically hear when there are overflights at 30-40K feet. Its one matter if the park in question is near an approach route to a major airport, but for high flying jets, I sincerely doubt you can hear much of anything. Another matter to consider is the significant amount of additional fuel airlines would be consuming by running a zig-zag route across the country to avoid overflying parks, etc.

Yosemite and much of the Sierra are certainly an issue, because the major airlines have to cross the Sierra to get to San Francisco, Oakland, San Jose, Sacramento, etc and as they are passing over they are either climbing or descending. Its unfortunately difficult to find a route over the mountains that doesn't pass over parkland or national/state forest. The east-west traffic is the bulk of the issue (north-south traffic usually flies just off shore or up the central valley). I live out here near Yosemite, and I wouldn't call much of any of Yosemite a wilderness" area anymore. Its got way too many people tromping around either on foot or in RVs. So I agree the noise level can suck in the Sierra - just not sure where you'd re-route the traffic to."

Wilderness, Land of NO Uses. Wilderness designations are not cost effective either. It actually costs the USFS more to go into Wilderness areas and do trail maint etc because they can not use motorized conveyances. It is not an effective land management tool, and you fools that think it is clearly have not spent much time in the Wilderness.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Too lazy to hike? Tough luck" Fortunately you only speak for yourself and there are millions of reasonable people with public land ownership rights. That is just plain ignorant nice contribution. This idea presents many issues. The idea that the USFS can not get use plans together in less than a decade now is a substantial problem. I have seen the process in action and it must be incredibly tedious to have to work through. Maybe it would work better if it was done in sections oil and gas one year grazing one year motorized use one year. They need a serious paperwork reduction act too. We do not need thesis writers managing land we need active managers with knowledge first hand knowledge of the lands they are responsible for. Then the apathy of the land managers. Would you want that job though? They have to listen to bleeding heart eco freaks all the time knowing full well from experience that they only bring fabricated problems backed by an agenda. This issue could be cured by making land managers accountable on a local level. We elect the Sherriff we elect county comissioners we elect the school board why not USFS and BLM land managers? In Colorado the Parks board is trying to mis-appropriate some OHV user fees. Shouldn't it just be obvious to people what the funds should be used for? If OHV users pay them they should benefit."

I support the idea of no more new laws, I think we have plenty on the books already. I support enhanced law enforcement for the existing laws. I think there are larger problems at the EPA than enforcement though.

Bar all closed minded keyboard eco-exclusionist. driving past the woods in your outback or volvo does not make you a forest user...

The sustainable" part of the current land requirements is lawyer speak (very subjective) and is being used to keep ORV use out of all the public lands near where I live. Land managers say our existing trails are not "sustainable" and close them and prevent any new areas from being introduced because they are not "sustainable".

This is a comment I wrote on the NEDB forum regarding a public meeting about future use of Myles Standish State Forrest in Plymouth,MA. A publicly owned 16,000 acre forest that was closed to dirtbikes 20 years ago. Other orv use was already prohibatted prior. I spoke at the meeting last night after the woman who founded the Friends of Myles Standish State Forest. She said DCR stands for dept. of conservation and recreation. She ended with conservation should always come before recreation. Realize who we are up against. I reminded everyone that without recreation in our forest, people will not care about conservation. I informed those in attendance that our state only has 130 miles of orv trails,mostly in Berkshire County. Down from last years 155. (-5 Freetown State forset / new highway ramps) (-20 Pittsfield State forest / Maintainance ?/unknown future for us) That puts our current orv footprint in the whole state at 47.27 acres. Do the math. 1 mile= 5,280' times 3' wide trail equals (15,840 sq.ft. / this is the square footage for1 mile of trail) 15,840 sq. ft times 130 miles trail equals 2,059,200 sq.ft of trail in MA offered by DCR 43,560 sq.ft. equals 1 acre 2,059,200sq.ft. divided by 43,560 equals 47.27 acre footprint in MA DCR parks. Myles Standish State Forest is a 16,000 acre park alone? Pathetic!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There is considerable air traffic over Yosemite. I got the figure, over 50% of the time from this interview [ { <a href=http://bit.ly/bqeh7p" rel="nofollow" target="\_blank">Link</a> } ] with the chief acoustical scientist for the National Park Service. While the noise of jet overflights are either unnoticed because they're unremarkable or they're drowned-out by the din of human activity they are much more noticeable in comparatively pristine wilderness environments. In these quiet locations the added background noise reduces the ability of wildlife to find their mates their offspring to be alerted to approaching predators or to detect nearby prey."

Good point. The lastest thing I read indicated the monetary value of clean water from roadless areas dwarfs the monetary value of the timber industry. Also, the government is not able to maintaining the huge amount of roads that are already in our national forests. That is a cost that could be lowered by having fewer roads.

I completely agree as well. There is no more precious resource that natural quiet and we are loosing it at an alarming rate and no one is noticing. This is the only time that we can really address this need. If we wait it will be too late. It is already too late for many of our wilderness" areas."

We need to preserve our land along with the air and water that surrounds us. If we do not then our children have no future! It is very sad that so many people just do not care any more. The time has come to make changes. If nothing is done then all hope is lost. Our children will have to try to survive in a dieing environment where humans have to trod through mountains of trash and polluted waters where nothing can live any longer. We all need to appriciate what nature has to offer and clean it up while we still can. Think back of how much fun the family (and friends too) had in the great open outdoors. The camping, swimming, fishing, sitting around the fire at night. The love and laughter was enjoyed by all! You would get to meet people from all over too. We need our parks. So do the wildlife. Please have some compassion for our future.

Due to my medical conditions, which include severe mobility challenges and the need for supplemental oxygen 24/7, I am no longer able to visit National Parks myself. I do, however, consider them to be part of the birthright of my two granddaughters. Even though I cannot travel with them, I do cherish the idea of them visiting our nation's parks with their parents or their on children one day. I have wonderful memories of visiting these places with my husband and our son, and listening to my husband's tales of visiting the Grand Canyon, the Badlands, Great Sand Dunes, Hot Springs, Joshua Tree, the Petrified Forest, Rocky Mountain, Sequoia, Wind Cave and Mesa Verde with his parents. These places must be preserved for our granddaughters. National parks help to connect people, young and old, to the outdoors, preserve the natural and cultural diversity of our nation, and contribute to the health of our people. They provide some of America's finest outdoor classrooms and serve as a basis for conservation, history, and civics education for millions of people each year.

Please Protect Our National Parks!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We really need to hand down some of the natural beauty that inspired our writers, our pioneers, and our conservationists to our children, and our grandchildren. No one can have much pride in the way things are being destroyed now. Don't let our country become a dump just because there's a profit to be had.

When I think of the great outdoors in the USA, I think primarily of the national parks. National parks play a tremendous role in connecting people, young and old, to the outdoors, preserving the natural and cultural diversity of the nation, and contributing to the health of people and the planet. National parks provide some of the finest outdoor classrooms and serve as a basis for conservation, history, and civics education for millions of people each year. --Heed the advice of the National Parks Second Century Commission, a group of well respected individuals who spent more than a year developing a vision for how to protect the parks and connect people to them in the next century. --Seize the opportunity that the upcoming Park Service centennial provides to renew the national parks. The administration should apply the lessons that were learned from the Centennial Initiative to developing a new public-private partnership to prepare the parks for their next century. We need a new national campaign that will involve people in communities throughout the country in protecting the parks for the next generation. --Do more to use national parks to inspire and educate young people. The national parks are classrooms for discovery and learning for students and teachers. Programs like Teacher to Ranger to Teacher (TRT) allows teachers from low income school districts to spend the summer working as park rangers where they develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. This program should be expanded. And the Department of Education should work with the Park Service to excite children with hands-on learning experiences. --We need more parks for people to enjoy. The park system must also evolve to fully represent the history and culture of the diversifying nation. I yrge you to evaluate and consider new sites to bring into the system that better represent the changing country, and protect remaining natural areas before they are all used up. --Provide wildlife corridors to ensure that the wildlife in the parks can find the food it needs and reproduce successfully outside, as well as within park boundaries. We need cooperative efforts between federal, state and local agencies and private landowners, because wildlife doesn't understand boundaries on a map. A recent study commissioned by the National Parks Conservation Association found that every federal dollar invested in national parks generates at least four dollars of economic value to the public. In 2009, as the recession took its toll on the pocketbooks of USA residents, national park visitation increased on average by nearly four percent, demonstrating the enhanced value of the national parks to people in difficult economic times. USA residents care about the future of these incredible places, so they will be there for future generations to enjoy. Remember the importance of protecting national parks and the many programs managed by the National Park Service that improve communities. National parks are good investments for the future.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Americans care about the future of these incredible places, so they will be there for our children and grandchildren to enjoy. Some of my family's favorite vacations, memories, and history lessons came from visiting national parks. Please remember the importance of protecting national parks and the many programs managed by the National Park Service that improve our communities. National parks are good investments in our future.

Include the Ross Lake boundary adjustment in the final plan that the Park Service adopts.

Not only our National Parks need help, first and foremost, our City Parks, in major states; such as New York, Chicago, Florida, California. What I am saying is simply--I live in the Bronx and there are too many children playing in unsafe parks and recreation areas. What happened to helping people that do not have as much?

OUR NATIONAL PARKS ARE A SOURCE OF PRIDE, PLEASURE, EDUCATION, AND NATURAL BEAUTY -- AND SHOULD BE PRESERVED WITHOUT "SELLING OUT " TO CORPORATE INTERESTS.  
Our

I am 83 years old and many of those 83 summers were spent in our National Parks. In fact my children and grandchildren, with a friend, hiked in Lassen National Park last weekend. We have climbed Lassen Peak several times and skied down the ski trails that used to be there. My son and grandson will visit Yellowstone National Park this week as my grandson returns home from his tours in Afghanistan. Please don't let this wonderful experience diminish in anyway and do everything possible to save these places for my greatgrandchildren. Please heed the advice of the National Parks Second Century Commission, a group of well respected individuals who spent more than a year developing a vision for how to protect the parks and connect Americans two them in the next century. Seize the opportunity that the upcoming Park Service centennial provides to renew our national parks. The administration should apply the lessons that were learned from the Centennial Initiative to developing a new public-private partnership to prepare our parks for their next century. We need a new national campaign that will involve people in communities throughout the country in protecting our parks for the next generation. Provide permanent, mandatory funding for the Land and Water Conservation Fund. Seventeen billion dollars in revenues, primarily from oil and gas leasing, have accumulated during the past several decades in the Land and Water Conservation Fund, unspent for its intended purpose. This money should be spent as originally promised to support parks, seashores, forests, and waterways across the country, rather than just another broken federal promise. What's happening in the Gulf of Mexico reminds us how important it is to keep that promise. We need more parks for people to enjoy. The park system must also evolve to fully represent the history and culture of our diversifying nation. Please evaluate and consider new sites to bring into the system that better represent our changing country, and protect remaining natural areas before we use them all up. Provide wildlife corridors to ensure that the wildlife in our parks can find the food it needs and reproduce successfully outside, as well as within park boundaries. We need cooperative efforts between federal, state and local agencies and private landowners, because wildlife doesn't understand boundaries on a map.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

President Obama, now is the time to redevelop and restore our parks that have suffered neglect from lack of funding over the past 20 plus years. The issue of allowing people to openly carry guns in national parks is terrifying and that policy needs to be revoked and we need to have a new gun policy for national park safety. Your administration needs to do the following: --Stop the carrying of guns in all national parks, except where absolutely necessary to protect oneself from a bear or cougar attack. I cannot stress this issue enough. I used to go to national parks until this year when people are now allowed to carry guns into the parks. It makes camping extremely dangerous since no one knows who has a gun and who doesn't and who does or does not have a history of violence. Too many guns are sold at gun shows without proper identification and registration, making our national parks a refuge for illegal activity. --Stop contracting out park services to large corporations and, instead put it back in the hands of park service personnel. Some consessionares take advantage of students, especially foreign students by encouraging them to come here for the summer on a work visa and then not treating them properly. They are America's parks and should be operated by Americans employing Americans. Crater Lake is a good example of how things are being mishandled. Apparently there are plans to allow this same company to take over the venues at Yellowstone if they haven't already done so. --Limit and restrict the use off off road vehicles which tend to tear up and destroy parkland. --Stop all drilling and mining operations in and near national parks.

## Discussion Question 2

***(cont.)***

Heed the advice of the National Parks Second Century Commission, a group of well respected individuals who developed a vision for how to protect the parks and connect Americans to them in the next century. --Seize the opportunity that the upcoming Park Service centennial provides to renew our national parks. The administration should apply the lessons that were learned from the Centennial Initiative to developing a new public-private partnership to prepare our parks for their next century. We to involve communities throughout the country in protecting our parks for the next generation. --Provide permanent, mandatory funding for the Land and Water Conservation Fund. Seventeen billion dollars in revenues, primarily from oil and gas leasing, have accumulated during the past several decades in the Land and Water Conservation Fund, unspent for its intended purpose. This money should be spent as originally promised to support parks, seashores, forests, and waterways across the country. Don't let it be just another broken federal promise. --Do more to use national parks to inspire and educate young people. Our parks are classrooms for discovery and learning for students and teachers. Programs like Teacher to Ranger to Teacher (TRT) allow teachers from low income school districts to spend the summer working as park rangers where they develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. This program should be expanded. And the Department of Education should work with the Park Service to excite kids with hands-on learning experiences. --Build on programs that work. The National Park Service has tremendous technical expertise and know-how that can help communities preserve their special places and provide recreational and educational opportunities for people. The Park Service's Rivers and Trails Conservation Assistance program has a long history of working with cities, suburbs, and small communities across the country on conservation efforts and providing expertise to help conserve rivers, preserve open space, and develop trails and greenways. You already have a great program, but it's under-resourced. There's no need to reinvent the wheel. Invest in a model that is already working in communities across the country. --Provide wildlife corridors to ensure that the wildlife in our parks can find food and reproduce successfully outside, as well as inside, park boundaries. We need cooperative efforts between federal, state and local agencies, and private landowners, because wildlife doesn't understand boundaries on a map. A recent study commissioned by the National Parks Conservation Association found that every federal dollar invested in national parks generates at least four dollars of economic value to the public. In 2009, as the recession took its toll on Americans' pocketbooks, national park visitation increased on average by nearly 4 percent, demonstrating the enhanced value of our the parks to people in difficult economic times. Please remember the importance of protecting national parks and the many programs managed by the National Park Service that improve our communities. National parks are good investments in our future.

For far too long, the condition of the national parks have been deteriorating, Under Bush and others, budgets have been cut back while visitor numbers have increased. rangers are overtaxed and parks are overwhelmed. This national treasure is the envy of the world, and we force them to make do with less. Shameful. We can rebuild foreign countries at untold billions, but no money for our national treasure. This must be reversed. The parks are the face of national morale, and if they look bad, this country is suffering. Restore and guarantee for the future a healthy park system.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

P.S. We need to keep our National Parks as a place parents can take their children to see our heritage, where loved ones can enjoy nature and see all our own country has to offer.

As a parent of two young children, an scholar in the field of education, a community college administrator, and a lover of the outdoors, I urge you to place priority focus on our National Parks System. Our parks offer something of value to everyone no matter age, ethnicity, or socio-economic background. In direct support of "Race to the Top" and "No Child Left Indoors," National parks provide some of America's finest outdoor classrooms and serve as a basis for conservation, history, and civics education for millions each year. Let's also create jobs through the Park System - WPA style. This will increase our understanding of American History, Conservation, and support active, healthy lifestyles. --Heed the advice of the National Parks Second Century Commission. --Provide permanent, mandatory funding for the Land and Water Conservation Fund- spent as originally promised to support parks, seashores, forests, and waterways across the country, rather than just another broken federal promise. What's happening in the Gulf of Mexico reminds us how important it is to keep that promise. --Do more to use national parks to inspire and educate young people. Experiential learning is well known to be the BEST method for learning in all subject areas but particularly in math and science. Our national parks are classrooms for discovery and learning for students and teachers. Programs like Teacher to Ranger to Teacher (TRT) allows teachers from low income school districts to spend the summer working as park rangers where they develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. This program should be expanded. And the Department of Education should work with the Park Service to excite kids with hands-on learning experiences.

Please stop the trend of privatizing/corporatizing our national parks. We pay taxes for our public lands and then get gouged by people who only care about a profit and nothing about the actual wilderness people are out to experience.

This is a critical time to protect and preserve our Natural Resources. A vital natural resource, our National Parks must be protected and preserved for future generations and their value to educate and enrich the lives of people young more fully valued and put to use.

**OUR NATIONAL TREASURES MUST BE NURTURED AND PROTECTED.**

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I agree with everything written below but I would had this: PLEASE protect our parks, our great outdoors, our public lands, our communal places from the dreadful effects of Hydraulic Fracturing which threatens to pollute America irreparably. Our nation's underground water aquifers as well as our lakes, streams, rivers and waterways are under threat from the unconscionable practices of Gas companies that are able to operate without government interference. Overhead photography of fast areas of Colorado and Texas show a growing appalling wasteland. And now this same landscape of towers, drilling pads, roads and toxic pools threatens to take over vast areas of Pennsylvania and NY State. Please bring reason to bear on what is happening to our country regarding this industry! There is no way that our National Parks can escape being effected by this malignant and degrading solution to our energy needs. This is no solution to anything. This will only create a nightmare we may never recover from. What are we leaving our children if they have this legacy to try to clean up? --Build on programs that work. The National Park Service has tremendous technical expertise and know-how that can help communities preserve their special places and provide recreational and educational opportunities for people. The Park Service's Rivers and Trails Conservation Assistance program has a long history of working with cities, suburbs, and small communities across the country on conservation efforts and providing expertise to help conserve rivers, preserve open space, and develop trails and green-ways. You already have a great program, but it's under resourced. There's no need to reinvent the wheel. Invest in a model that is working in communities across the country.

Let us work to protect and enhance our national parks. I am grateful to have been able to enjoy our national parks throughout my life. Let us insure that others have this opportunity.

I am saddened by the closure of many of our state parks as well, this is where we can go to get away from the daily grind, we need these, they are an inexpensive way for us to "escape" as most of us do not make the large incomes that politicians do, we are a family of four right now and we live on \$26,000 a year, we can't afford much and to have an affordable way to get away is very important to us. The reason I say we are a family of four right now is that only two of my five children live with us, it is important for all of us to come together and share our lives , state parks are so important , it keeps families vacationing together inexpensively. Please help us keep our National and State parks open and working well. It is usually the only vacation we can afford, if at all.

Also I would like to add that being a senior and on SSI and SSD, I would really love to find my National Parks "user friendly". Scooters, walkers, etc... and extremely low fees. I can afford to sit along side the parks, but I can't afford to stay in one and some even enter for one day. THANK YOU FOR LISTENING AND MAKING AN EFFORT.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

When I think of America's Great Outdoors, I think of our national parks and National Forests. National parks and forests play a tremendous role in connecting people, young and old, to the outdoors, preserving the natural and cultural diversity of our nation, and contributing to the health of our people. Our parks provide some of America's finest outdoor classrooms and serve as a basis for conservation, history, and civics education for millions of people each year. Forests allow trained and leashed dogs to accompany their people on leash and I personally find that to be a tremendous draw. I desperately want to save our precious lands that are already in the National Park and Forest classification and hope we can preserve other special areas that cannot be replaced once they are destroyed. If these areas are protected, the wildlife will have a home as well. We cannot afford to lose these necessary areas! They are our connection to our world. They are a place to renew spirits. They are a place for enjoyment. They are OURS and a part of our history and heritage. I do not pretend to know the specific steps your administration needs to take regarding preservation of our lands and wildlife. Perhaps the following steps are somewhat realistic:

I suggest that instead of paying extended unemployment benefits to the unemployed, they should be given the opportunity to work side by side with national and state park employees to better care of this valuable resource. It will not only give purpose to unemployed individuals, it will broaden their experience in a much needed area to maintain our national treasure, our state and national parks.

As more and more of everything is gobbled up by housing, strip malls, development, opportunities for quiet wild space time disappears. When I was a kid, all I had to do was to walk out the door and I was in the woods. That place today is all trailer parks and houses. Access to water, rivers, lakes and the ocean is restricted by private property rights. We need wild, quiet places to keep us sane.

My father was a Volunteer in the Park at Mesa Verde National Park for over 20 years, beginning in 1978. I have visited Mesa Verde on nearly a yearly basis since 1978 and have volunteered myself. I have watched the park struggle for funding, cutting back on valuable education done by the rangers and losing some extremely valuable human resources. At the same time the park administration did a great job of promoting the park in the SW Colorado area, bringing together peoples from diverse cultures, enabling them to work together. Mesa Verde National Park could be an amazing "classroom" if funded properly. It is a sin for our nation to not care for and support a World Heritage Park.

I live in New Mexico, which has both national parks and national monuments, including White Sands National Monument. I am a retiree, and my husband and I voted for you. Please make preservation of the national parks and national monuments a priority. National parks and monuments play a tremendous role in connecting people, young and old, to the outdoors, preserving the natural and cultural diversity of our nation, and contributing to the health of our people.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Living in Michigan, I am truly blessed with an abundance of green and state parks. However, this midwestern state has little to offer in preserving the great history and biodiversity of our nation. It is through parks like Gettysburg, Valley Forge, Ellis Island, and the like that a great historical need is met. But this is not enough. Imagine if we could no longer marvel at Joshua trees or wolf tracks or giant Redwoods or Old Faithful. Parks in all of our states are crucial to keep alive the individual spirit of each area that makes America so great. An American without National Parks is not an America that I want to explore. It is the parks that draw me out of a gorgeous and plentiful Michigan wilderness to see the greatness that is held within each individual nook of our great nation. Keep America Great--support our parks!

Recind all leases for our public lands the Bush Administration handed so freely to Big Oil and mining companies. No drilling in the Arctic ever. Save the polar bears and the many other wildlife there and the native Alaskans who depend on this area for their very lives. Big Oil will destroy all of this by their very existence there. Stop the killing of wolves by Cattlemen after taxpayers spent so much to keep them from extinction only to have them again to be slaughtered by this same group.

Many new jobs could be developed by having the parks cleaned up and the buildings restored. These jobs should go to people who are in need of work, especially the youth of our nation, and not be given to wealthy developers who wish to monopolize everything. The talented people who have smaller construction businesses could oversee the work and guide the staff with the work, developing a great work ethic as well as pride in a job well done. A couple of examples of this are the American Bison and the wolves. If they wander out of the parks, they are subjected to harassment and possibly, being destroyed.

Our National Parks are a much better deal than wars all over the planet. Please spend more on them and less on your military - industrial complex.

I have a special place in my heart for Valley Forge National Historical Park. There are beautiful walking trails and a paved path for walking and biking; many kinds of plant and animal life; and of course the feel of real history from Washington's winter encampment there. (My sister and I were watching some archeologists at a dig there, and the leader let us hold a piece of round shot ammunition that had last been held in Washington's time. So impressive!) I wish the federal government would/could purchase all the private land in the vicinity -- the park is under constant threat from developers who want to put up large hotels with convention centers, justifying this outrage with the lure of a really BIG museum. There is an information center there already, and it covers the needed facts. And most important, the main road through the park, Route 23, has already all the traffic it can manage in an area where pedestrians need to cross the road, and deer also cross it in unpredictable locations. Please protect Valley Forge Park. My sister and I love it so much -- we think that it must be a little like heaven (only heaven would not have so many bugs :-).)

## Discussion Question 2

***(cont.)***

An important part of this effort is to tell Secretary Salazar that he needs to do more to protect Americas wildlife. He seems to be continuing the Bush policies and ignoring the best advice of wildlife experts. His stand on perpetuating the hunting of wolves in Yellowstone and elsewhere is brutal and destructive and his overall action (or lack of) protecting America's endangered species is dismal. Whereas he should be acting as a steward of wildlife he seems bent on removing protections that are already in place.

When I think of America's Great Outdoors, I think of OUR AMERICAN MUSTANGS, our FEDERAL WILD HORSES and how the BLM is stampeding them into pens on Private Lands and hauling them away in trucks! BLM is very bad--they have totally mismanaged the wild horse situation. DON'T EVEN ASK ME ABOUT YOUTH PROGRAMS UNTIL YOU INVESTIGATE BLM--the very same bad people who under the moniker MMS have totally ruined the Gulf of Mexico. FIX THE BLM. BUT WHEN BLM FINISHES THERE WON'T BE ANY WILDLIFE LEFT to look at. BLM IS EVIL. INVESTIGATE THE BLM AND ITS CRUEL HELICOPTER ROUND-UPS OF WILD HORSES. INVESTIGATE WHY BLM WILL NOT ALLOW HORSE ADVOCATES TO WATCH THEM KILL HORSES. INVESTIGATE WHY I AM PAYING TO KEEP 38000 HORSES IN BLM CAPTURE PENS. INVESTIGATE THE BLM CONNECTION TO THE RUBY PIPELINE AND BP.

My husband and I spend most of our weekends in the Congaree National Park. We have always spent most of our recreational time outdoors. With the recession we, like most Americans, experianced a drop in our standard of living. Thankfully the National Parks are either free or of little charge. We still are able to do something we enjoy, and actually get to do it more. Its no longer an option to go to dinner and a movie, but we have a really great time with hot dogs and a campfire. This past weekend we spent some time in NC enjoying the Blue Ridge Parkway. It was very dissapointing that ranger stations were closed, and that there were not any trashcans for us to throw away litter that we picked up on the trail. I understand that we must make hard choices right now about how to spend our money, but I think trashcans are a preventative measure to keep our parks beatiful, and while you may not be able to man every ranger station right now, we should be able to at least leave a stack of maps in a waterproof container outside. I hope you contiune to support our National Parks. Thank you for you time.

When I think of America's Great Outdoors, I think of WOLVES. YOU HAVE SO FAR DONE NOTHING TO PROTECT THESE MAGNIFICENT CREATURES FROM THE PREDATIONS OF HUNTERS AND RANCHERS. WOLVES PLAY AN IMPORTANT ROLE IN MAINTAINING THE BALANCE OF NATURE. IF YOU , OR THAT LOSER SALAZAR KNEW ANYTHING AT ALL ABOUT NATURE YOU'D KNOW THIS. IN ADDITION: --We need more parks for people to enjoy.

Although your family can safely enjoy national parks, I no longer can enjoy national parks because of the few who carry guns. National parks were once somewhat safe but now trigger happy gun owners have me fearing for my and my families' safety. It is sad that a place of beauty and conservation is turned into a place of fear and destruction.

ON A PERSONAL NOTE: I HAVE JUST RETURNED FROM CHINCOTEAGUE NATIONAL WILDLIFE REFUGE and for the second year in a row.to be going downhill. This year over a period of 4 days I could only find the miniature elk (Sika) 1 day, and it was a group of 4 together, and never found a white tailed deer. The other days there was nothing to be found. I complained last year about the missing deer. All these animals used to be plentiful in the late 1990's and early 2000's. This year there were very very few birds which was astounding since that is it's primary purpose a Bird Sanctuary. I found 6 Canadian Geese, but heck, I can go down the block to see them. Many people go to that Refuge go to see the Famous Chincoteague Wild Ponies. I know the horses are not considered to be wild, and they are owned by the Firemen on Chincoteague and they buy rights for the horses to graze on.the land, However the Refuge does nothing whatsoever to facilitate people seeing the ponies in the back areas and at the same time teaching them about the refuge system and the birds in the back portions of the refuge. That is currently being done a few times a week which is so sad as people do not learn about the refuge. It is very clear that the tourist is not wanted in this park. Americans want their wild places and wildlife protected - they do not want to see wild horses corralled but want them to roam wild and free; they do not want their wolves gunned down; they do not want their bison driven off the land they owned hundreds of years ago, for cattle ranchers to profit.

As long as guns are allowed in the National Parks, I am not interested in visiting or contributing.

Like you, National parks provide some of America's finest outdoor classrooms and serve as a basis for conservation, history, and civics education for millions of people each year, as a place for healing for the emotionally wounded with PTSD, the grieving, and the abandoned. Please, -- Heed the wisdom of the National Parks Second Century Commission, a group of well respected individuals who spent more than a year developing a vision for how to protect the parks and connect Americans to them in the next century. --Seize the opportunity that the upcoming Park Service centennial provides to renew our national parks. In similar tough times, Roosevelt would have! The administration should apply the lessons that were learned from the Centennial Initiative to developing a new public-private partnership to prepare our parks for their next century. We need a new national campaign that will involve people in communities throughout the country in protecting our parks for the next generation. You're good at that! --Provide permanent, mandatory funding for the Land and Water Conservation Fund. Seventeen billion dollars in revenues, primarily from oil and gas leasing, have accumulated during the past several decades in the Land and Water Conservation Fund, unspent for its intended purpose. This money should be spent as originally promised: to support parks, seashores, forests, and waterways across the country, rather than just becoming another broken federal promise. What's happening in the Gulf of Mexico reminds us how important it is to keep that promise. The children and the land are our future! --Provide wildlife corridors to ensure that the wildlife in our parks can find the food it needs and reproduce successfully outside, as well as within park boundaries. We need cooperative efforts between federal, state and local agencies and private landowners, because wildlife doesn't understand highways or boundaries on a map. You and I and all love-- "Pastor Mom"

America's Great Outdoors needs to get behind and make use of our national parks. Please consider these steps: --Provide wildlife corridors to ensure that the wildlife in our parks can find the food it needs and reproduce successfully outside, as well as within park boundaries. We need cooperative efforts between federal, state and local agencies and private landowners, because wildlife doesn't understand boundaries on a map. --Seize the opportunity that the upcoming Park Service centennial provides to renew our national parks. We need a new national campaign that will involve people in communities throughout the country in protecting our parks for the next generation. --Provide permanent, mandatory funding for the Land and Water Conservation Fund. Seventeen billion dollars in revenues, primarily from oil and gas leasing, have accumulated during the past several decades in the Land and Water Conservation Fund, unspent for its intended purpose. This money should be spent as originally promised to support parks, seashores, forests, and waterways across the country. --Our national parks are classrooms for discovery and learning for students and teachers. The Department of Education should work with the Park Service to excite kids with hands-on learning experiences. --Build on programs that work. The Park Service's Rivers and Trails Conservation Assistance program has a long history of working with cities, suburbs, and small communities across the country on conservation efforts and providing expertise to help conserve rivers, preserve open space, and develop trails and greenways. --We need more parks for people to enjoy. Please evaluate and consider new sites to bring into the system that protect remaining natural areas before we use them all up. Thank you!

Ban high volume horizontal hydrofracking for natural gas. This unconventional method of gas extraction is dangerous, and incongruous with the mission of the National Parks Service. HVHF should be permanently banned in the entire United States. As it stands right now we have no regulations to protect our environment, health and potable water from the toxic mix of chemicals that are used mixed with millions of fresh water to extract the gas.

Stop the Damn Wars so there will be money to spend on the outdoor infrastructure.

Protect undeveloped places from development or exploitation of any kind. NOT for americans, NOT for people, and MOST CERTAINLY NOT for tourism or the economy, but for the animals, trees, and other creatures of the earth who live there. Let them be the priority for once. -- Heed the advice of the National Parks Second Century Commission, a group of well respected individuals who spent more than a year developing a vision for how to protect the parks in the next century. --Build on programs that work. The National Park Service has tremendous technical expertise and know-how that can help communities preserve their special places. The Park Service's Rivers and Trails Conservation Assistance program has a long history of working with cities, suburbs, and small communities across the country on conservation efforts and providing expertise to help conserve rivers, preserve open space, and develop trails and greenways. You already have a great program, but it's under resourced. There's no need to reinvent the wheel. Invest in a model that is working in communities across the country. --We need more parks. The park system must also evolve to fully represent the history and culture of our diversifying nation. Please evaluate and consider new sites to bring into the system that protect remaining natural areas before we use them all up.

Please don't turn over our forests, parks and wildlife preserves to the oil drillers, mining companies and timber strippers who would turn this whole continent into a desert just to make a few bucks.

I also feel very strongly that the USDA, acting under the auspices of the Atlantic Flyway Council, should no longer be permitted to slaughter our native wildfowl as they are currently doing in so many of our parks. This is untenable.

Inspite of the contents of the last paragraph, Americans, including the government, need to understand that the land in our National Parks is a piece of the continent to be seen and loved for itself, independent of us the people.

My big concern now is what is happening all through Pennsylvania with the drilling for natural gas. Our entire state could be considered one big park with its many state parks, but the gas drilling is taking over . WE NEED TO CLOSE THE LOOPHOLE ON SAFE WATER WHICH WAS GRANTED THROUGH THE EFFORTS OF CHEANYWHO HAS CONNECTIONS WITH THE COMPANIES-- HALIBURTON TO BE SPECIFIC

## Discussion Question 2

***(cont.)***

I believe --Heed the advice of the National Parks Second Century Commission. This group of well respected individuals spent more than a year developing a vision for how to protect the parks and connect Americans to them in the next century. . not merely using them. --Build on programs that work. The National Park Service has tremendous technical expertise and know-how that can help communities preserve their special places and provide recreational and educational opportunities for people. The Park Service's Rivers and Trails Conservation Assistance program has a long history of working with cities, suburbs, and small communities across the country on conservation efforts and providing expertise to help conserve rivers, preserve open space, and develop trails and greenways. You already have a great program, but it's under-resourced. There's no need to reinvent the wheel. Invest in a model that is already working in communities across the country. In particular I think of the buffalo & Yellowstone - where buffalo that wander outside the Park boundaries are slaughtered by stupid ignorant people who maintain that buffalo carry brucellosis - despite the fact that there has never been a verified case of brucellosis in buffalo! This is a huge insult to every IndigenUs Turtle Islander (what you p.c. people call "Native Americans"). More parks will spread the impact of more visitors so that no one park is destroyed by the crush of visitors.

Stop "pimping put" our park lands to ranchers and mining operations, which degrade the lands set aside for all Americans AND our native wildlife. The latter practices practices have contributed greatly to the disappearing of some of our native birds and animals, like the wolf and California condor.

How about upkeep of the National Parks. As far as Rock Creek Park, Washington, MD (MNCPPC) perhaps making sure there are enough Park Police available would be a beginner. People drive through the park shooting off guns. Beach Drive traffic laws need to be enforced for there are trucks, 18wheelers etc using Beach which deteriorates the park. The excess use of autos is destroying the park according to my arborist since my property backs up to Rock Creek Park. There needs to be wildlife signs and Beach Drive needs to be closed at certain hours and closed on the weekends. There is no need for autos to be on Beach, it is now being used as a state road. There are vines and invasives in the park which need removal/control and when trees are destroyed due to weather, they should be replaced.

For me, our national parks have always been a place where the spirit may be renewed, as I stand in awe of the great mountains of the west or enter into the quiet of the forests of east and west, and pause as a wapiti or salamander crosses my path. But even if I never was able to go back, it would be essential for me as a citizen of this nation and the world to know these places remained protected from the relentless onslaught of development that has so damaged our planet and driven so many species and ecosystems into extinction..

Once our parks are gone, we cannot retrieve them, resources like our parks would take years to replace if not centuries, please protect them!!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

When I think of America's Great Outdoors, I think of our national parks and our great state of Colorado. National parks play a tremendous role in connecting people, young and old, rich or poor, disabled or able, sick or healthy to the outdoors, preserving the natural and cultural diversity of our nation, and contributing to the health of our people in multiple ways. Anyone can visit a national park which is part of what makes them so vital, so wonderful, so precious. It's in the bones of humans to need their great outdoors to recuperate from the hectic mechanics of the concrete worlds we inhabit most of our lives. National parks symbolize the essence of freedom and what America truly stands for. How we all love our parks!!! National parks provide some of America's most outstanding outdoor classrooms and serve as a basis for conservation, history, and civics education for millions of people each year. There's hardly a soul in my state who has not visited at least one of our national parks in the course of their lives. In fact most of us visit our parks often. I strongly request that your administration take the following steps: This is an outstanding way to bring people together during difficult times. --Provide permanent, mandatory funding for the Land and Water Conservation Fund. Seventeen billion dollars in revenues, primarily from oil and gas leasing, have accumulated during the past several decades in the Land and Water Conservation Fund, unspent for its intended purpose. It is crucial that this money should be spent as originally promised to support parks, seashores, forests, and waterways across the country, rather than just another broken federal promise. What's happening in the Gulf of Mexico reminds us how important it is to keep that promise. We are all hurt by this tragedy. --Do more to use national parks to inspire and educate young people. We have the grandest of grand theaters available to our people in the form of national parks. A stage from which both our heritage and our future can be visited LIVE any day of the week. I brought my kids to visit our national parks every opportunity we had and they have all benefited immensely from this introduction to the natural world and our environment. Our national parks are classrooms for discovery and learning for students and teachers. Programs like Teacher to Ranger to Teacher (TRT) allows teachers from low income school districts to spend the summer working as park rangers where they develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. This program should be expanded. The Department of Education should work with the Park Service to motivate and inspire kids with hands-on learning experiences. I have seen such programs literally turn lives around. I would especially beseech you to protect these areas from corporate or personal greed so no one can build a house or factory within the borders of places that should belong to the people of this nation and not individuals. --Provide wildlife corridors to ensure that the wildlife in our parks can find the food it needs and reproduce successfully outside, as well as within park boundaries. We desperately need cooperative efforts between federal, state and local agencies and private landowners, because wildlife doesn't understand boundaries on a map. So many creatures have dearly paid for our selfish ends; particularly through the poor planning of fences. Wildlife corridors endure for GENERATIONS over eons. These critters are born with the instinct to use trails provided by their ancestors so it is impossible for them to find other routes without constantly risking their fragile lives. It is our duty to help the most vulnerable in our populations whether animal or human. But it doesn't require an economic downturn for people to visit parks. In Colorado as a whole the population increasingly uses our national parks on a regular basis. Many people are just now discovering the

fantastic gift we have received through the foresight of a few to protect these amazing areas for all of us ~ for each and every American ~ FOREVER. We need you to continue this work; as this is an endeavor of the heart. Americans care about the future of these incredible places, so they will be there for our children and grandchildren to enjoy. I have many friends from around the world who have come to America specifically to visit at least one of our great parks. How proud I feel that for once they weren't berating us for our wars and poor economic choices! Our parks are a great source of national pride for all of us. That's why I'm asking you to please remember the VITAL importance of protecting our national parks and the many programs managed by the National Park Service that improve our communities. National parks are one of the greatest investments in our nation's future. Thank you for your attention and

REINSTATE A PROGRAM similar to the CCC. Take our disadvantaged youth out of the inner cities and allow them to EARN, LEARN and FLOURISH. E L F...

I implore you to not let interests spend this money on anything except our national parks, waterways, seashores and forests. --Build on programs that work. The National Park Service has tremendous technical expertise and know-how that can help communities preserve their special places and provide recreational and educational opportunities for people. The Park Service's Rivers and Trails Conservation Assistance program has a long history of working with cities, suburbs, and small communities across the country on conservation efforts and providing expertise to help conserve rivers, preserve open space, and develop trails and green ways. You already have a great program, but it's under resourced. There's no need to reinvent the wheel. Invest in a model that is working in communities across the country.

Our National Parks are America's National Treasures. I am so eager and happy that the America's Great Outdoors Initiative is on the table right now. I delight in knowing that your administration is choosing to focus its time and focus on such a fantastic part of America. Helping to build a greater connection and a greater accessibility between Americans and nature is so life enhancing and important. Especially in the context of this time. I think we are hungry for a greater connection to the world around us. So, Bravo, for this initiative. I trust that America's National Parks will be a pivotal part of this next step forward. Hopefully our National parks will receive greater care and expansion. America is beautiful, and it is such a treasure that so much of that beauty has been preserved, let's keep it up! Better yet, let's expand on it. The dominant presence of nature heightens the level of happiness and the quality of life for the people around it. Great thinkers, who are the forefathers of America like Transcendentalists Thoreau and Emerson would agree: nature sparks appreciation in mankind.

***(cont.)***

As a Natural Resource major from Colorado State University, I have been lucky enough to have had the opportunity to experience first hand the importance of our environment and recognize just how meaningful it will be for future generations. Whether I was out hiking, biking or camping near Ft. Collins' Red Feather Lakes, snowboarding in the Aspen Mountains, or simply just relaxing with the family in our cabin out by the Spanish Peaks, I have always felt a close connection with nature. What follows are recommendations put forth by the NPCA which I truly believe in. I would like to take just a minute more of your time to address the growing concern of the U.S. government and the attacks being made from many members of our society. It is extremely outrageous that your administration has received so many complaints making it seem like you and your administration are the cause of so much of the political and socio-economical problems we currently face. It is clear that no matter whom had taken over from the previous administration would more likely than not be taking on some of the biggest challenges we have ever come across. And though there are times when I have a crisis of faith in our government (because it is hard to say who is right and who is wrong), I still feel very strongly that those in power at this moment in time really do have the best in mind for all of us living in the United States. Though it might not be worth much, I would like you and all of your staff to know that I have never been more willing to pledge my allegiance to the flag of the United States and will continue to stand by so long as you continue to point this country back in the right direction. In closing, Americans care about the future of these incredible places, so they will be there for our children and grandchildren to enjoy. Please remember the importance of protecting national parks and the many programs managed by the National Park Service that improve our communities. National parks are by far one of the best investments in our future. Thank you for your consideration. Mr.

The --Follow the advice of the National Parks Second Century Commission, a group of well respected individuals who spent more than a year developing a vision for how to protect the parks and connect Americans two them in the next century. --Make better use of the national parks to inspire and educate young people. Our national parks are classrooms for discovery and learning for students and teachers. Programs like Teacher to Ranger to Teacher (TRT) allows teachers from low income school districts to spend the summer working as park rangers where they develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. This program should be expanded. And the Department of Education should work with the Park Service to excite kids with hands-on learning experiences.

America's Great Outdoors is a major part of my life, and I emphasize that I have enjoyed our national parks often as part of that. National parks are critically important in connecting people, young and old, able-bodied and (like me) disabled, to the outdoors, preserving the natural and cultural diversity of our nation, and contributing to the health of our people. National parks belong to all of us, and provide some of America's finest outdoor learning places. These fantastic parks also serve as a basis for conservation, history, and civics education for millions of people each year. Please keep this up. Our parks have been badly underfunded for a long time, and need some support in keeping themselves in decent shape, though.

## Discussion Question 2

*(cont.)*

Rescind the tax cuts for the rich and withdraw from Afghanistan and Iraq. Then, fully fund the national parks, schools, cities, infrastructure and alternate energy/high speed rail.

I firmly support the initiative of America's Great Outdoors and believe that the first step to promoting conservation is by PROTECTING and DEVELOPING our NATIONAL PARKS. If the ultimate goal is to connect our society and especially our children to the natural world we must implement this concept into all aspects of our life. WE MUST SET THE EXAMPLE OF A MORE EARTH CONSCIOUS SOCIETY FOR THE NEXT GENERATION TO BUILD UPON. ULTIMATELY NATIONAL PARKS ARE GOOD INVESTMENTS IN OUR FUTURE. The administration can be more responsible and promote conservation by SUPPORTING AND FUNDING ENVIRONMENTAL PROGRAMS AND CAUSES. Here are a few ways to do so: --Seize the opportunity that the upcoming Park Service centennial provides to renew our national parks. We need a new national campaign that will involve people in communities throughout the country in protecting our parks for the next generation. The administration should apply the lessons that were learned from the Centennial Initiative to developing a new public-private partnership to prepare our parks for their next century. . --UTILIZE NATIONAL PARKS TO INSPIRE AND EDUCATE THE NEXT GENERATION. Our national parks are classrooms for discovery and learning for students and teachers. EDUCATION SHOULD WORK WITH THE PARK SERVICE in order to inspire and excite kids with hands-on learning experiences. Education should work with the Park Service to excite kids with hands-on learning experiences. --Build on programs that work. THE NATIONAL PARK SERVICE has tremendous technical expertise and know-how that can help communities preserve their special places and provide recreational and educational opportunities for people. THE PARK SERVICE'S RIVERS AND TRAILS CONSERVATION ASSISTANCE PROGRAM has a long history of working with cities, suburbs, and small communities across the country on conservation efforts and providing expertise to help conserve rivers, preserve open space, and develop trails and greenways. YOU ALREADY HAVE A GREAT PROGRAM, BUT ITS UNDER RESOUCRED. There's no need to reinvent the wheel. Invest in a model that is working in communities across the country. A recent study commissioned by the National Parks Conservation Association found that EVERY FEDERAL DOLLAR INVESTED IN NATIONAL PARKS GENERATES AT LEAST FOUR DOLLARS OF ECONOMIC VALUE TO THE PUBLIC. every federal dollar invested in national parks generates at least four dollars of economic value to the public. In 2009, as the recession took its toll on Americans' pocketbooks, national park visitation increased on average by nearly 4 percent, demonstrating the enhanced value of our national parks to our people in difficult economic times. Americans care about the future of these incredible places, so they will be there for our children and grandchildren to enjoy. Please remember the importance of protecting national parks and the many programs managed by the National Park Service that improve our communities. WE MUST change our lifestyle to WORK WITH AND FOR THE ENVIRONMENT OR else we continue to STEAL FROM OUR OWN FUTURE. Ms.

Or improve our existing sites to better accommodate the crowds we are getting. If you can consider holding down on the price of tickets to enter our parks because everyone in my state (AZ) is poor now.

***(cont.)***

I just started docenting for California State Parks and can't think of a better way to connect with the out of doors. If you support the National Parks and help states support their State Parks, it will keep this vital resource available to all. Being able to spend time outside shouldn't depend on salary or any other stricture of society.

When I travel to America's Outdoors, I go to our wonderful system of national parks. I am fortunate to live a short distance from three units in south FL. I trust that your administration will take the following steps: --Listen to the advice of the National Parks Second Century Commission, a group of well respected individuals who spent more than a year developing a vision for how to protect the parks and connect Americans two them in the next century.

America's Great Outdoors is not just our national and state parks. It is were we live, breathe, and share our walk upon this planet with all the other life here. Our national parks are a incalculable treasure that we are stewards of. There we can go see, reconnect, and feel raw untouched nature, and preserve some of the last remaining wild lands of our great country. But this should be an educational place as well because nature is also where we live and work. It is not a place we should ever plunder for our selfish geed. We are stewards of all the lands for the generations to come. Your administration should consider the following steps:

I would like to see programs that sponsor trips with inner city/under-funded children to the National Parks -- maybe with some cool folks as part of each group, names that these kids recognize.

I have taken my family to nearly every National Park in our country and implore you to help continue to insure the healthy state of our national park system. It is your administration's job as democrats to protect our national treasures, not destroy them like republicans do.

HOW CAN ANYONE GET EXCITED GOING TO THE OUT DOORS. WHEN BP PLANS TO PUT IN A PIPELINE AND DESTROY THE NATURAL BEAUTY OF OUR STATE OF NEVADA. NOT COUNTING THAT BLM IS REMOVING OUR HERITAGE FROM THE PLANS. WHAT WILL WE BE ABLE TO SEE, NO MUSTANGS, NO WOLVES, OR ANY OTHER ANIMAL BLM OR HUMAN HAS REMOVED AND DESTROYED. A PERSON SAID, IF THE HORSES ARE STARVING AND HAVE TO BE REMOVED. WHY AREN'T ANY OTHER ANIMALS DIEING? THE PRESIDENT DOESN'T REALLY CARE OR HE WOULD OF ANSWER MY 4 ENVELOPES FROM THE KIDS AND PEOPLE FROM PAHRUMP, NEVADA. WE HAVE LOST HORSES ALREADY FROM THE IGNORANCE OF BLM. JUST BECAUSE HE CAN AFFORD TO DO THINGS. WHAT MAKES YOU THINK ANYONE ELSE CAN? THE POOR GET POORER AND THE RICH GET RICHER. BP OIL. 2ND LARGEST CO TO WANT TO GET RID OF OUR HORSES. (BLM AND KEN SALAZAR)..WHEN IS THE PRESIDENT GOING TO STOP LISTENING TO SALAZAR AND START LISTENING TO THE PEOPLE? I VOTED FOR OUR PRESIDENT. I MAY NOT THE NEXT TIME. WE HAVE A BEAUTIFUL COUNTRY. BUT IT IS GOING TO THE HIGHEST BIDDER. WHAT IS GOING TO BE LEFT ONCE THEY KILL OFF ALL THE HORSES, BURROS, WOLVES, BEARS, LIONS AND WHAT EVER ELSE ON 4 LEGS. WHEN HUMANS STARTED TO INTER FER WITH NATURE, ALL IS GONE. NEED TO MAKE THAT CHANGE, LIKE PROMISED. AFTER BUSH, THINGS WERE TO GO FOR THE BETTER. NOTHING HAS CHANGED. THE ROAM ACT IS NOT FOLLOWED BY BLM. THEY MAKE THE LAW AS IT IS NEEDED. LOOK AT WHO GETS THE REWARDS. BLM AND SALAZAR, BP OIL . THE TAX PAYER IS GETTING THE SHAFT, THEY USE MILLIONS OF \$\$\$ TO DO THEIR DIRTY DEED. SELLING THE HORSES FOR \$25.00 A LB. WHILE OUR GOV. IS GETTING PERKS WHAT DOES THE CITIZEN GET? A LOT OF WHAT I HAVE SAID WILL ROLL INTO OUR PARKS. THEIR WILL BE SOME REASONS TO OVER CHARGE TO GET IN. OR BE RESTRICTED, BECAUSE OF WHAT EVER.

Seize the opportunity that the upcoming Civil War Sesquicentennial provides to renew our national battlefield parks like Gettysburg, Antietam, Chickamauga, Shiloh, Chancellorsville, and Vicksburg. The administration should apply the lessons learned from the highly successful Civil War Battlefield Preservation Program, which protects endangered Civil War battlefields outside National Park Service boundaries. These lessons include developing new public-private partnerships to preserve Civil War battlefields for their next century. We need a new national campaign that will involve people in communities throughout the country in protecting our battlefield parks (which are tremendous outdoor classrooms for learning and exercise) for the next generation. --Do more to use national parks, including the Civil War military parks, to inspire and educate young people. Our national parks are classrooms for discovery and learning for students and teachers. Programs like Teacher to Ranger to Teacher (TRT) allows teachers from low income school districts to spend the summer working as park rangers where they develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. This program should be expanded. And the Department of Education should work with the Park Service to excite kids with hands-on learning experiences.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The national parks are for the people not for corporations. We need to stop all oil and gas leasing, cattle grazing, road building, hotel building, and whatever else on national parks. We already have enough hotels, roads, ranches, and oil/gas wells. Parks need to be a place to go to enjoy nature, not from a hotel veranda or car window while speeding by, but from a campsite. And oil and gas wells are not part of a natural landscape. People are taking all available land for themselves as we multiply more and more. Wildlife are animals too and need room to live their life.

As a former Administrative Assistant in the Department of Environmental Protection, FL State Park System, for almost 27 years, I can truthfully say - people of all ages enjoy not only the state parks, but more specifically the National Parks. The National Parks hold more history in them than most state parks do, and provide immense beauty that can't be seen anywhere else on earth. --Provide wildlife corridors to ensure that the wildlife in our parks can find the food it needs and reproduce successfully outside, as well as within park boundaries. We need cooperative efforts between federal, state and local agencies, and private landowners, because wildlife doesn't understand boundaries on a map.

Everglades National Park is slowly being taken for development, and the panther habit is being systematically destroyed. See the St. Petersburg Times article entitled "Florida's Best Managed Extinction" If you would like a copy, I will be glad to send it to you. It's haunting to think that the government and developers are doing, and getting away with, this. Mitigating the land taken for development doesn't happen; there is none left to mitigate. Again, let me know if you would like a copy, if you can't find it on the internet. Ansel Adams said that it is horrifying that we have to fight with the government to save the environment. I think he hit the nail on the head.

I hike at Torrey Pines, a Park Reserve in my area, once a week. It's beautiful, it's a healthy pastime, and it's free. National parks provide a place for people to become healthier and happier, with beauty delivered straight from the Divine. --Heed the advice of the National Parks Second Century Commission to protect the parks and connect Americans to them in the next century. -- Seize the opportunity that the upcoming Park Service centennial provides to renew our national parks. We need a new national campaign that will involve people in communities throughout the country in protecting our parks for the next generation. --Do more to use national parks to inspire and educate young people. Expand programs like Teacher to Ranger to Teacher (TRT) allows teachers from low income school districts to spend the summer working as park rangers where they develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. And the Department of Education could work with the Park Service to excite kids with hands-on learning experiences. -- Build on programs that work. Invest in a model that is working in communities across the country. --We need more parks for people to enjoy. Please evaluate and consider new sites to bring into the system and protect remaining natural areas before we use them all up. --Provide wildlife corridors to ensure that the wildlife in our parks can find the food it needs and reproduce successfully outside, as well as within park boundaries. In 2009, as the recession took its toll on Americans' pocketbooks, national park visitation increased on average by nearly 4 percent, demonstrating the enhanced value of our national parks to our people in difficult economic times.

## Discussion Question 2

***(cont.)***

I live within 125 miles of something like 6 National Parks and Monuments. I have visited all of them at one time or another, and take visitors whenever I can. I am not a back country hiker, so I need these National Parks and Monuments to help me visit Nature as often as possible.

Now is the time - like TR's time - when vision and determination and -vigor(!) is desperately needed. Every day, every hour something goes in our Great Outdoors. We must preserve or it will go.

Ensure that national parks have the funds necessary to safeguard park wildlife and provide park visitors with a safe, clean, and rewarding park experience by the National Park Service's centennial in 2016.

Dear Mr. President, Eastern religious philosophy teaches that all life is interrelated. Commercialize the parks and natural areas and you risk losing life, and future generations. President Teddy Roosevelt understood this. So should this administration. The Republicans only care about business and profit, not life, beauty and national health. Don't fall into their traps.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

National parks also provide some of America's finest outdoor classrooms and serve as a basis for conservation, history, and civics education for millions of people each year. They were established to protect important wilderness areas from destructive ideas and destructive corporate executives. --Seize the opportunity that the upcoming Park Service centennial provides to renew our national parks. The administration should apply the lessons that were learned from the Centennial Initiative toward developing a new public-private partnership that will prepare our vitally-needed parks for their next century. We need a new national campaign, one that will capture individuals' imaginations and that will involve people in communities throughout the country in protecting our parks for the next generation. --Provide permanent, and mandatory, funding for the Land and Water Conservation Fund. Seventeen billion dollars in revenues, primarily from oil and gas leasing, have accumulated during the past several decades in the Land and Water Conservation Fund, as yet unspent for its intended purpose. This money should be spent as originally promised, exclusively to support parks, seashores, forests, and important waterways across the country, rather than just representing yet another neocon broken federal promise. What's happening in the Gulf of Mexico reminds us how important it is for responsible Americans--Democrats and Republicans-- keep that promise. --Do more to use national parks in their role of inspiring and educating young people. Our national parks are classrooms for discovery and learning for students and teachers. Programs such as Teacher to Ranger to Teacher (TRT) allows teachers from low-income school districts to spend the summer working as park rangers helping to develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. This program should be expanded. And the Department of Education should work with the Park Service to excite kids with hands-on learning experiences. --Build upon programs that already work. The National Park Service has tremendous technical expertise and know-how that can help communities preserve their special places and provide recreational and educational opportunities for people. The Park Service's Rivers and Trails Conservation Assistance program has a long history of working with cities, suburbs, and small communities across the country on conservation efforts and providing expertise to help conserve rivers, preserve open space, and develop trails and greenways. You already have a great program, but it's under- resourced. There's no need to reinvent the wheel. Invest in a model that is working in communities across the country. A vastly overpopulated country drowning in pollutants emitted by supply-side economic madmen foisting off unneeded products onto brainwashed overconsuming victims is not capitalism, not Americanism and not even sane conduct. Study the loss of caribou alone; the lesson is clear. This is our most vital asset--people caring about perpetual upkeep of our living heritage, our air, our water and our wildlife. Real Americans, not pseudo-religious neocon reality bashers do in fact care very deeply about the future of these incredible places, so they will be there for our children and grandchildren to enjoy. Only the BLM and EPA and the corporate business lobby apparently hate reality so much they're willing to destroy it in the name of short-term stolen "profiteering". Please remember the importance of protecting state and especially our national parks and the many programs managed by the National Park Service; these are extremely central and vital programs that improve our communities, and generate jobs, income and tourism dollars as well as educating citizens about priorities in realism. National parks are good investments in our future--perhaps the best investment we have.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Reconsider the use of contractors for lodging and food in National Parks because the value offered in national parks is much less than it was in 1977 when parks were completely staffed by Civil Servants and summer helpers. The idea that parks are for private profit is not consistent with the idea that parks are for the good of the people. My family has visited many national parks before and after the use of contractors and have seen the degradation in both quality and value offered by the contractors in the interest of profit. Get rid of the contractors!

I had the privilege of growing up in a family that inspired my love of the outdoors. We spent many summers in our family's RV, camping and hiking. Much of that time was spent in our national parks. As I have become an adult, I still enjoy the outdoors and especially the national parks. I hope that my children will be able to have the same experiences in the national parks that I did. We need to do alot as a country to promote better stewardship of our public lands, keeping our parks in top shape and restoring a healthier environment that protects our national resources, especially improving air quality, preserving our waterways, and protecting endangered species. We need to encourage our children to get outside and learn to enjoy the beauty of the world around them , especially instilling in them the values of conserving these resources for future generations. The national parks can play an enormous role in this endeavor. I realize that this will all take a lot of money that is particularly scarce in the present economy. However, I believe this in a much needed investment in our public lands that will pay off in the long and short term.

Please include our great wild horses. We need to preserve the history of these horses and keep them safe from roundups and shipping them across the boarders for slaughter. PLEASE HELP.

Ensure that national parks have the funds necessary to safeguard park wildlife and provide park visitors with a safe, clean, and rewarding park experience by the National Park Service's centennial in 2016. The national parks were set aside by forward-thinking individuals many years ago. Please provide the parks with the necessary funding to make sure future generations will also have the opportunity to enjoy them. Fully and permanently fund the Land and Water Conservation Fund (LWCF) to enable the Park Service to buy private land within park boundaries from willing sellers. As our nation's population grows, so should our parks grow in order to accommodate greater numbers of visitors. Preserve large areas of public lands and waters to secure the health of our ecosystems, ensure wildlife conservation, maintain public access to parks and open spaces, reduce the impacts of climate change, and protect our cultural heritage. Wildlife deserves enough land to survive. Humans have encroached on their territory for many years. Strengthen the capacity for federal, regional, state, and local agencies and private landowners to work collaboratively in order to protect not only our national parks but the wildlife, plants, and rivers beyond park borders. Improve opportunities to use our national parks to get kids into active, healthy, outdoor activity that will help them lead long, healthy lives. I have found that when people fully understand a problem or situation, they are more likely to come up with solutions to solve the problem in an effective manner. Our children deserve the opportunity to appreciate nature and to be able to protect it for the future.

***(cont.)***

Ensure that the Halliburton loophole gets closed. The loophole in the Safe Drinking Water Act is poisoning one of Americas best feature, free, clean and safe drinking water. Much hydraulic fracturing or "fracking" occurs in our public land. All water sources are connected and steps must be taken to protect ever body of water we can.

sir, i am also concerned about the unemplment also , and i appreciate your fine effort of all you have tried to do for us the working poor, my wife and i live on \$35,000 and my wife will lose her job in january of 2011 so please help and keep up the good work.

All I can say is I would hate to have our beautiful gems become side-notes in our future history book revisions of what America used to look like.

I want the next generation to enjoy America's great outdoors too. That's why I am asking you to seize this opportunity to better protect America's shared outdoors spaces, including parks, forests, (and especially all the wildlife refuges, wilderness, trails, wild and scenic rivers) and historic sites, monuments and especially forrests. National parks play a tremendous role in connecting people, young and old, to the outdoors. I think the wild life must be preserved AND PROTECTED FROM THE POLITICCS AND SO CALLED "DEPARTMENT OF INTERIOR". - The participation of ranchers and other private individuals should be MINIMIZED regarding the managing of federal lands: the federal government has absolute control of all federal lands and should NOT be influenced by anybody else."The Conservation of Wild Life" as mentionned throughout this discusssion of National Parks, etc., has no meaning, since the Department of Interior, the so-called Protector of Wildlife endorses the killing of wolves in federal lands...

Mr. President, I voted for you because I felt strongly that you could see through the complicity that runs rampant in Washington politics. The big-money-backed-projects win over issues that are important to 'We The People'. I am not naive to the tight-rope you must walk and the obstacles that are thrown in your path. This is why I feel that your advising team and Department heads' loyalties to what you stand for must be validated regularly. Our National Parks and the wildlife in this land have no lobbyists other than 'We The People' and what is important to us matters less and less with each passing year. These hallowed places must be strongly protected from their enemies. I worry that your head of the Department of the Interior and the US Department of Agriculture and Wildlife are too much influenced by "the good old boys" aspect of the complicity problem in their realm of control. Please assure yourself that your team is true to who you serve: 'We The People'. I want the next generation to enjoy America's great outdoors too. That's why I am asking you to seize this opportunity to create, expand and better protect America's shared outdoors spaces, including parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments, and to find new ways to support conservation of our farms, ranchlands and forests.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Although this is a form letter from an organization I admire, I live in the State of Florida and have seen Coral Reefs dying caused by pollution. Lots of people in my State of Florida realize that if we do not save our precious Everglades, the River of Grass will be a river of pollution and affect all the natural wildlife in our state. This also affects our drinking water, because we store our water under the coral rock, and we need to stop the pollution before it reaches the natural flow of water. In this economy it will be hard to get started, but if we don't try now, then when. Time is flying by. Thank you for considering my comments and thank you for all the hard work you do as my President.

We would like the next generation to enjoy America's great outdoors too. That's why we are asking you to seize this opportunity to create, expand and better protect America's shared outdoors spaces, including parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments, and to find new ways to support conservation of our farms, rangelands and forests. One way is to end the incursion by utility companies' power towers. Building-integrated solar and wind energy on every rooftop would make these odious Power Links unnecessary. And stop the dump from Los Angeles from destroying Joshua Tree and the desert aquifer. The desert is not a dump. Keep it unblighted by bird killing, fire-hazard inefficient wind farms and Power Links. When we think of America's Great Outdoors, Peace and Quiet, we think of our national parks. --Provide permanent, mandatory funding for the Land and Water Conservation Fund. Seventeen billion dollars in revenues, primarily from oil and gas leasing, have accumulated during the past several decades in the Land and Water Conservation Fund, unspent for its intended purpose. This money should be spent as originally promised to support parks, seashores, forests, and waterways across the country, rather than just another broken federal promise. The growing danger of mass destruction happening in the Gulf of Mexico reminds us how important it is to keep that promise. Keep fouling fossil fuels out of our parks, and collect the understorey for fire safety and biofuels! No Offshore drilling, - specially deepwater drilling that taps the Abiotic Oil that regulates the Tectonic Plates of the planet, and threatening mass extinction! --Provide wildlife corridors to ensure that the wildlife in our parks can find the food it needs and reproduce successfully outside, as well as within park boundaries. NO fences on the border with Mexico to protect endangered American jaguar, and other migratory animals and birds. We need cooperative efforts between federal, state and local agencies and private landowners, because wildlife doesn't understand boundaries on a map. It's worth it. Thank you for considering our comments.

I am a frequent visitor to the many National Parks, so is my family. My children love to visit and partake in activities they offer, wild life viewing and protection, including water born creatures. The only way to protect this is for you to help in clean water, conservation of our parks and animals. Especially the endangered species such as the Gray Wolf, Grizzly Bear. Stop the killing of Wolves in Alaska by airplane. Let's save all the animals and parks for our children and grandchildren.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Among the many disappointments of your Presidency to-date, lack on action on the environmental and climate change fronts tops the list. It seems that you made the political calculation to go after health-care first, and after expending all of your political capital on that ill-fated effort, have none left for any other major initiatives. You have influence but not control over the difficult politics -- but you have more control in the area of the environment through enforcing and expanding regulations than in other areas of your agenda. Please stop granting all permits for mountain top removal, nuclear power plants, and in so many similar ways allowing considerations for the cost of energy to prevent any action on the environmental front. As it stands your Presidency will be viewed as just one among a string of leaders who allowed short-term political concerns to trump long-term survival of our national parks, our food-production capabilities, not to mention the planet. Where is the leadership from your administration to alert Americans to the real risks we face of losing our environmental heritage if action on climate changes doesn't finally begin? Where are the so-called green jobs? The generic message, which I agree with although it's not nearly strident enough, begins:

I would like to start out with a request that you take a look at the BLM policy on wild horses. They are being systematically wiped out with unnecessary round-ups, slaughter and imprisonment. Many are run to death being chased by helicopters, airplanes and ATVs. Many are traumatized and injured so badly they must be put down. Please do not allow this magnificent symbol of our wild America to disappear. Our public lands need wild horses running free.

Thank you for reading this petition: I respect your time and will be very brief. Our parks and nature preserves are a fundamental connection between our identity and our nationality. My landlord once told me: "Everything's for sale". The problem is, "everything" by definition includes the heart and the soul, not to mention loved ones. Our Wilderness is our heart and soul: Two things that should never go on sale. Thank you for your time. Form letter enclosed below: I have left some information below that I believe could be valuable. Your administration may find it wise to take the following steps:

We just returned from a week in RMNP. It was great, but the crowds were greater than even--more visitors would decrease the pleasure of visitors, and put serious stress on areas and facilities. There are other wild areas in the country which could be carefully prepared to make great new national parks. Please support efforts to find and develop these new areas.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

I'm still glad I voted for you to be the current president, even though so far you've let me down by not ending the wars in Iraq and Afghanistan, not appointing progressive judges to balance the courts Bush stacked in favor of reactionism, letting Bush's DEA head sit in her office doing her best to circumvent my state's laws that protect medical marijuana use waaaaaay too far into your presidency, and not, yet, better protecting our environment. How glad am I going to be that you're the current president when I vote in 2012? It's up to you. Our children deserve to enjoy the natural beauty of our country the way we could while growing up. Please seize your best opportunity to create, expand and better protect America's "great outdoors." Surely you realize that an overwhelming majority of American's expect their president to do ALL within the power of that office to protect our environment, including our national parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments, and to find more ways to support conservation of our farms, ranchlands and forests. National Parks are vital to the health of our people. (Sort of like the Arts are vital to the health of our school children, so please work on get them back into our public schools ASAP, please.) Please direct your administration to immediately:

WILDERNESS IS CRITICAL FOR OUR HEALTH - FOR CLEAN AIR AND WATER. TREES HELP WITH OXYGEN AND LAND HELPS WITH WATER. IT IS NOT THE MATTER OF JUST "being pretty" it is the \*\*\* critical \*\*\* matter of SURVIVAL. FOR YOU AND ME EQUALLY. YOU ARE SUBJECT TO IT TOO. AND YOUR CHILDREN. WHERE WILL THEY LIVE? if the Earth gets messed up, where will your children live? I want the next generationS to enjoy America's great outdoors too. That's why I am asking you to seize this opportunity to create, expand and better protect America's shared outdoors spaces, including parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments, and to find new ways to support conservation of our farms, ranchlands and forests.

I am 14 years old.I have been keeping very connected to the disastrous effect on the entire habitat of America by the OIL SPILL. I say this because wintering birds from as far as Alaska and Minnesota will soon be entering a disastrous situation. As I listen to the news I get more and more angry because of the people in charge are unable to protect what has been here longer than we have. I'm sad that the greatest nation in the world cannot protect what makes it great. The things we are destroying are something that is greater, stronger, and older than we can ever comprehend. As Americans we have only been here for 300 years. The only politician I ever liked was Robert C. Byrd because he got things done that needed to be done regardless of were it put him. Because of our carelessness, we have over 950 endangered species in only America! If Washington is to stupid and ignorant to see that we are to dependent on oil to take care of ourselves, I think we should have a sooner election. "Wild beasts and birds are by right not the property merely of people tody, but the property of the unborn generations, whose belongings we have no right to squander.' -Theodore Roosevelt

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We need to take care of our outdoor environment with great care. Perhaps, now with the withdrawal of our troops from warring countries, we can use that money to help ourselves. Our infrastructure has suffered much for over 12 years now and we need to take care of what we have with care. If we could spend billions, to kill people, maybe now we can use that money to maintain our environment safe. We have neglected this issue long enough!!!

Most of us refer to the "simpler times" where we could walk outside, keep our doors unlocked and enjoy our "freedoms" from our own backyards without the tainted worries of pollution, man-made dangers and disrespect. Over the years, our country has struggled intensely to keep the beauty alive within this great country and to watch it go south on a daily basis leaves us with no wonder why our attitudes go south as well. Remembering who gave us these things is crucial as well. God is kind and He provides. We also need industry of educational support as we piece back together the beauty we have destroyed, save the ecosystems and convince the world around us to do the same. Realizing that our needs can be met in other creative ways (food, shelter, clothing) other than robbing our earth's non-renewables or taking simply because we are too lazy to come up with better solutions is robbing our entire world and its heart and existence. Please, President Obama and First Lady Obama, we reach out to you to take care of your own first so that we may build a strong community against all odds. Additionally,

The BLM's current program of eliminating the American Wild Mustang from 11 Western States is the most egregious, outrageously inhumane action now taking place. In 1971 Congress voted to protect and defend this beautiful species of animal and now they are being wiped clean from the landscape. Hundreds of petitions have been sent to you and Ken Salazar requesting a halt to the roundups. Please don't let the American Mustang go the same route of the Buffalo. Protect all wild species of animals including the wild mustang. Do not allow arial hunters from wiping out Mountain Lions, wolves and other species.

The values of this nation are inextricably combined with the existence of its forests and wild places. Unfortunately, this great national treasure is in great danger. I want the next generation to enjoy America's great outdoors too. That's why I am asking you to seize this opportunity to create, and better protect America's shared outdoors spaces, including parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments, and to find new ways to support conservation of our farms, rangelands and forests.

**THE AMERICAN MUSTANGS AND BURROS NEED TO BE SAVED** for future generations. These are our icons of the American west, and our freedom. They need protection.

As our most important natural areas, the parks are barometers for environmental change that affects all of us. We need to focus on the environmental stresses they face and ensure that we satisfactorily address impacts on parks, as well as the impacts on our coastlines, forests, farmlands and urban areas. Degradation may be most visible in parks, but we may also be suffering the negative effects of pollution, land use change, etc.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As the American Indians believed, we do not own this world, we are part of it and are merely caretakers during our stay. This decade has seen some of the worst environmental disasters. We need to reverse this course and set precedents for our future caretakers. I want the next generation to enjoy America's great outdoors too. That's why I demand that you seize this opportunity to create, expand and better protect America's shared outdoors spaces, including parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments, and to find new ways to support conservation of our farms, ranchlands and forests. When I imagine where I'd rather be, often, it is in places like Acadia, Pisgah, Yosemite, or the Florida Keys. When many of us Americans think of America's Great Outdoors, we think of our national parks.

Your "America's Great Outdoors" initiative is welcome. Time is running out to make substantive changes in our land management policies that will ensure that future generations will have the amazingly diverse parks and conservation lands that we Americans enjoy now.

I was so very frustrated with the attitude of Geo Bush when it came to protecting our very special unique lands that we have here in the USA. I am counting on you, President Obama to do the right thing and preserve our lands for the future.

Now is the time to take action. Politics and big money cannot win out over our future. It saddens me to think of America's great treasures sold or destroyed for profit or political gain.

Supporting our national parks and the environment should never be a partisan issue. This is an issue that should unite us all as Americans.

I grew up around national parks. My dad worked in Yellowstone after WW2. I live now on the border of a National Forest. I have always made sure my daughters spent time in the parks and learned to appreciate. With all the acreage lost to development, some day soon these parks will be all we have left.

I grew up enjoying the National Parks system with my family. I am afraid that the joy I found there will not be available for my grandchildren. Please read the letter below and incorporate as many of the suggestions as you can into your action plan.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Do it for your children, grands and greats! Our --We must protect America's parks. Seize the opportunity that the upcoming Park Service centennial provides to renew our national parks. The administration should apply the lessons that were learned from the Centennial Initiative to developing a new public-private partnership to prepare our parks for their next century. We need a new national campaign that will involve people in communities throughout the country in protecting our parks for the next generation. --Provide permanent, mandatory funding for the Land and Water Conservation Fund. Seventeen billion dollars in revenues, primarily from oil and gas leasing, have accumulated during the past several decades in the Land and Water Conservation Fund, unspent for its intended purpose. This money should be spent as **ORIGINALLY PROMISED** to support parks, seashores, forests, and waterways across the country, rather than just another broken federal promise. What's happening in the Gulf of Mexico reminds us how **IMPORTANT** it is to **KEEP OUR TRUST AND RESTORE OUR FAITH IN OUR GOVERNMENT**. Thank you for restoring my faith in your stewardship.

Now is the time to protect our wilderness and the wildlife that depends on it for their existence. If you do not do this during this term of office, it will be lost.

A new ailment has been identified in America's children: nature deficit disorder. A scientific study in Great Britain showed that exposure to nature increases feelings of well-being and raises self-esteem. I would add that it gives life a spiritual dimension that can be lacking in many people's lives. I was lucky to be raised with parents who appreciated the outdoors but I can see that this is by no means easily accessible or sought out by many people anymore. It is essential to the health of our planet and the health of human beings that we live in proximity to nature. That's why I am asking you to seize this opportunity to create, expand and better protect America's shared outdoors spaces, including parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments, and to find new ways to support conservation of our farms, ranchlands and forests.

For too long for-profit corporate interests and inconsiderate users have encroached upon our National Parks. This must stop now. And you are in a position to make that happen. The parks should be available for all Americans to enjoy at minimal cost and without air, water and noise pollution, and desecration of the environment including plant and animal habitats. I want the next generation to enjoy America's great outdoors. Please seize this opportunity to create, expand and better protect America's shared outdoors spaces, including parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments. Corporate farming procedures and encroachments on public lands (factory farms, transection by oil pipelines, genetically engineered crops, timber harvesting, etc) are currently an anathema to environmental protection and controls protecting habitat and the spread of disease must be rigidly enforced.

***(cont.)***

I want the next generation to enjoy America's great outdoors too. I ALSO WANTS US ALL TO HAVE THE OXYGEN NECESSARY TO STAY ALIVE WITHOUT WEARING OXYGEN MASKS! That's why I am asking you to seize this opportunity to create, expand and better protect America's shared outdoors spaces, including parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments, and to find new ways to support conservation of our farms, ranchlands and forests. FOR MY GRANDCHILDREN -- AND YOURS (SOMEDAY),

You must sign an executive order to stop all slick-water horizontal hydraulic-fracturing in all states where now exists. It poisons are water, our land and our air. People are getting cancers or die of methane explosions. The flow-back water poisons streams, rivers and lakes. Most homes that are sitting on Fracked land have their wells poisoned with methane and you can set your kitchen faucet water on fire with a letter. So just as but a moratorium on deep water oil drilling you should totally stop (BAN) hydrofracting in all state.

Please do more to protect our national parks and our environment in general form pollution and destructive forms of energy and development.

I think the above is of prime importance. States like Ohio, where people have made arable land and destruction of forests and wetland their priority, need to be urge to reorient their priorities

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Many selfish politicians do what is good for them, and many democrates and republicans, like the Kennedy's and others were given everything in their lives, and they didn't have to work for anything in their entire lives. Its past time that American's demand their leaders stand up, and contribute, not just "talk about" what needs to happen, but put the wheels in motion, to make things happen. Imagine what if the \$1T that was spent (lost) on America's big losers, that participated in the failure's in the banking business (Washington Mutual), car companies (GM), insurance companies (AIG) and other "bad, poorly run, failing organizations" in America, where the money was spent, and didn't accomplish anything.....except delay these ultimate failures.....of their bad leaders....and that same money would have been invested in successful enterprises like building America's infrastructure (millions of jobs could have been created), and loaned to already successful car companies (Honda, Nissan), and millions of aitiona jobs would have been created, and sucessful technology companies (and millions of additional jobs would have been created), and construction companies (and millions of additionall jobs wold have been created for dozens ofyears into the future)with the stipulation that 100% of this money must be spent in America....and employing American ! I ask 10 six year olds this question...."If you could give away \$1000, and your goal was to do the most good for America...would you give the money to someone who fails at what they do, and doesn't tell the truth, or would you give this money to someone whom is successful, and always tells the truth. Wow ! All 10 six year olds said "they would give the money to successful people, whom told the truth people ! Even 6 year olds understand the economics of... "the better the person we invest with, the better the return". Maybe Mr. President you should have some "logical six year olds on your cabinet"....and in the Senate...and in the House. The six year olds, and the children in America are America's future. I have take my children, Mr. President, to every Natonal Park in America, as my father did for me. I know, and my children know what makes America great. Its the people, but its also the great land we call America. Have you done this for your children Mr. President ? Sometimes when people are give everything, Mr. President (educations to Harvard, homes from the government, and positions you don't earn) its hard to appreciate what others have to do to "earn these things". If you are given things, like Harvardeducations, you tink everyone should be given the same things.....and you don't consider what it is like, or how hard the others have to work for the same things ! I want the next generation to enjoy America's great National Parks and nationally owned outdoors. That's why I am asking you to seize this opportunity to create, expand and better protect America's shared outdoors spaces, including parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments, and to find new ways to support conservation of our farms, ranchlands and forests.

Americans care very much about the animals that are having their home taken away. They do not understand not having food to hunt. We need to be sure that we take care of that problem. You do realize that you cannot make more land! We can make man make lakes and rivers, but we can not make more land. Without land, we have no trees, no protection from the weather, and no animals.

## Discussion Question 2

*(cont.)*

The parks have been a big part of my life and my children's, and I want to ensure they will be around for my grandchildren. They are a unique and irreplaceable resource. Please remember the importance of protecting national parks and the many programs managed by the National Park Service that improve our communities. National parks are good investments in our future. Not only that, research shows that when we become separated from nature, we begin to lose our sensitivity to others, our humanity. This is not a frill but a necessity to protect our culture, our uniquely American way of life. Mrs.

No more oil exploration and no more drilling!

We have altered or destroyed a large percentage of the natural environment on our part of this continent. The outdoors and the wilderness that we say we love are threatened. It is my opinion that spending time outdoors in a natural environment could help or cure many people of depression and other mental instabilities. Protecting our environment also protects our health.

Indeed, these ideas are good. They are much better than stripping these beautiful places of their beauty and their spirit. However, there is an issue which has been ignored for too long. These forests were once the homelands of America's First Peoples. They were stolen from us, resulting in the decline of spiritual life ways which could be beneficial to every person, of every race, color, national origin, etcetera. A judge once ruled that the trees, rivers, lakes, etc., animals, fish, birds, and all beings considered inanimate, have a voice in court, and therefore has a right to be defended by people like me, simple Native man that I am. This point further serves to illustrate the importance of protecting what Great Spirit has made. I do not necessarily speak on behalf of human beings, and their right to enjoy these sacred places. I speak for the eagle, the bear, the wolf, the trees, the plants, the waters - ALL living beings on Mother Earth. And, yes, I speak for the ghosts of my ancestors, their blood and bones buried beneath these sacred stolen lands.

My personal concern comes from the monetary influence from big business. We see many very interested companies and associations contributing money to decisionmakers' campaign funds. I know this is part of American Politics but I ask you to carefully research the Pros and Cons for each issue. The American people voted you into office to hopefully make this a better country. Please make the hard decisions sometimes. Thanks!!

Please do not allow government lands in the Tetons be sold for condos!!!!!!

IF WE DON'T PRESERVE SOME -as much as we can!- OF OUR GREAT U.S. -and planet earth! - IN ITS NATURAL STATE FOR US TO ENJOY THE EARTH'S \*TRUE\* BEAUTY, THERE WILL BE A TIME WHEN OUR CHILDREN WILL NEVER KNOW WHAT THE BEAUTIFUL EARTH LOOKED LIKE! -- PROTECT AS MUCH AS WE CAN! PARKS AND WILDERNESS \*SHOULD\* BE A SPIRITUAL NECESSARY FOR ALL OF US!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Our children's futures are at stake, and our entire planet is at stake. It is time to take the promises of the campaign trail and make them a reality. You have a lot of work on your hands, and you are making some progress. Sometimes, things that don't seem so urgent are precisely the things that are of most importance in the big picture. It is easy to ignore the environment, our incredible parks, our amazing children and pay more attention to easy profits, big business, the squeaky wheels of the economy... But what is at stake is our future. With your creative vision I am sure you can find a way to live up to your promise of hope for the future by taking the needs of our wildlife, our national parks, and all the things that make our country great, including our children into consideration when you make decisions about the economy, about war, about what big oil companies who are only interested in profit can and cannot do. We voted you in to take care of our future. Your responsibility is great.

Stop putting out poisons on public lands. This is barbaric and dangerous. BLM needs to be cleaned up and cleaned out. Salazar has done a terrible job.

GET THE LAND-GRABBING PROFITEERS OUT OF POSITIONS OF POWER. Until you do this, nothing else is going to be effective, and you know it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Do more to use national parks to inspire and educate young people. In my hometown of Lytle Creek, CA in the San Gabriel Mtn. chain we are surrounded by the Angeles National Forest. We work locally with the USFS rangers in many ways. Currently, our students living in the canyon are participating in the Forest Service's "Junior Ranger Program" to gain hands-on knowledge of how our forests work and are managed by rangers to survive within our country's current "protective" status. Also, our national parks are classrooms for discovery and learning for students and teachers. Programs like Teacher to Ranger to Teacher (TRT) allows teachers from low income school districts to spend the summer working as park rangers where they develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. This program should be expanded. And the Department of Education should work with the Park Service to excite kids with hands-on learning experiences. -- Build on programs that are already working. The National Park Service has tremendous technical expertise and know-how that can help communities preserve their special places and provide recreational and educational opportunities for people. The Park Service's Rivers and Trails Conservation Assistance program has a long history of working with cities, suburbs, and small communities across the country on conservation efforts and providing expertise to help conserve rivers, preserve open space, and develop trails and greenways. You already have a great program, but it's under resourced. There's no need to reinvent the wheel. Invest in a model that is working in communities across the country such as the Conservation Assistance Program and Junior Ranger Program. --We need more parks for people to enjoy. We have lost so much of our country's native treasures due to mismanagement and over development on nearby lands. The park system must also evolve to fully represent the history and culture of our diversifying nation. Please evaluate and consider new sites to bring into the system that better represent our changing country, and protect remaining natural areas before we use them all up. --Provide wildlife corridors to ensure that the wildlife in our parks can find the food it needs and reproduce successfully outside, as well as within park boundaries. In the Angeles National Forest, our community participates with Park Service personnel and USFS personnel to perform counts of animals native to our area, e.g., eagle counts and Big Horn Sheep counts. We need cooperative efforts between federal, state and local agencies and private landowners, because wildlife doesn't understand boundaries on a map. A sad state of affairs has evolved in our forest due to resident aliens from the valley coming to park along side of the road to recreate in Lytle Creek. Unfortunately, they bring with them ignorance of the proper and appropriate safe and sane uses of our parks. With the staff reduction of Parks Service, our community has stepped in to supplement oversight with, unfortunately limited, numbers of trained volunteers to assist with education, oversight and monitoring of sites where people tend to congregate outside of proscribed, monitored, safe-camping park service sites. On more than one occasion, these volunteers have been beaten and left for dead by alien nationals visiting the park, fires have been started from picnic cook fires set outside parameters for safe campfires in the forest clearly posted and communicated in English and Spanish, and moreover, trees, brush and rocks are regularly vandalized and, with regard to rocks, are removed from the forest by these uneducated peoples. On my way home two weeks ago I stopped three Hispanics who were chopping deadfall for their campsite fire. I asked them, "Please stop; what you are doing is illegal. That tree belongs where it is for a reason. Please do not remove it." The guy who was chopping the tree with a

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

machete replied in limited English, "The tree is dead" and continued to shop away. I replied, "It is not your dead tree. I am reporting your license plate number to the federal authorities." That got an immediate response; they stopped removing the wood to the back of their new Cadillac SUV but did not remove the wood already placed there and left at high speed down Lytle Creek Road, narrowly missing other recreators along side the road. I reported the license plate but have no idea of the result.

We have successfully managed to squander away our nations financial resources for generations to come. Let us NOT do the same to our nations lands, that Americans have fought so hard to preserve. We must not rob our future generations of their just inheritance. This is OUR responsibility. Your administration, MY GOVERNMENT, needs to take the following steps: --Heed the advice of the National Parks Second Century Commission, --Seize the opportunity that the upcoming Park Service centennial provides. The administration should apply the lessons that were learned from the Centennial Initiative to developing a new public-private partnership to prepare our parks for their next century. --Provide permanent, mandatory funding for the Land and Water Conservation Fund. Seventeen billion dollars in revenues, primarily from oil and gas leasing, have accumulated during the past several decades in the Land and Water Conservation Fund. Do the right thing and follow through. What's happening in the Gulf of Mexico reminds us how important it is to keep that promise. --Build on programs that work. The National Park Service has tremendous technical expertise and know-how that can help communities preserve their special places and provide recreational and educational opportunities for people. You already have a great program, but it's under resourced. There's no need to reinvent the wheel. Invest in a model that is working in communities across the country.

Mr. President, In addition to the following remarks, I would like to add that I am sorely disappointed in your administrations failure to halt the slaughter of wolves. These beings are also a part of the great outdoors and for you to allow the continual eradication of them is shameful. If you care about the outdoors and all that it has to offer, then you must also care for the wildlife that live there.

I also feel very strongly that there are far too many commercial tourism flights in the Grand Canyon. I have hiked the Canyon many times since 1954, and the obtrusive noise of helicopters and winged aircraft is ever increasing. The best part of wilderness hiking is the sounds of nature, not the unending noise of aircraft engines. The trend of increasing flights must be reversed.

## Discussion Question 2

***(cont.)***

I agree with all the statements below, for the most part. I also understand that you have a responsibility to the country to try to get the nations budget under control. If only money grew on trees. Well, in the past it did and we allowed industry to destroy many of our beautiful forests. I have every confidence that your indigence will not allow that to happen. I would appreciate it if you could enact legislation that could prevent other administrations. As for your effort to encourage the children of America to connect with the great outdoors, I truly commend you for seeing the importance of this. I have recently turned 50 and over the past few years have also been trying to reconnect with the outdoors. It is of the utmost importance that today's children embrace the great American outdoors. It is also our responsibility to ensure it is there for them to experience. No better return on investment will be found than educating our children with the importance of the wilderness

Have you ever taken your children to any of these parks? I have been to many of them. And the thought of them not making it gives my stomach knots...It will be ashame that your grandchildren and great grand children wont enjoy every single park.

Thank you for taking your family to Acadia in Maine. I have been there as a child, and spent time at many other national parks as both a child and an adult. I cannot understate the value of national parks for our country and particularly our children. In this day and age, more than ever, we need to preserve these unique spaces and get our children back out to connect with nature.

I want everyone to have access to wildness, a unique resource that provides balm for the soul and ecological benefits.. Unlike most Americans, I am fortunate enough to live across from a National Estuarine Wildlife Refuge where more than 370 species of birds migrate. The open space helps create a quality of life that is extraordinary.

I can't even express what the outdoors meant to me as a child and now as well. I don't believe it is healthty for a person to seldom experience the beauty of our country. Thank you so much for considering my comments.

Please Don't Let Land Delopers And Oil Compaines Destroy Or National Treasures.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As a child, there were few places for my siblings, friends, and me to play besides outdoors. We had two acres of fruit and veggies and some of the best times were helping Dad spray the trees and helping Mom harvest and can the veggies and fruits we raised. Driving the tractor to pull the sprayer was how I learned to drive. One didn't monkey around when Dad was walking behind on the other end of the spray hose. If I wanted to go to my girlfriends house, I walked 10 blocks. We often made the round trip several times a day. Often I'd go to her house and help her get her chores done, then we'd come to my house and do mine. When we were really prosperous on a Sunday afternoon, and had a quarter between us, we would stop at the store and buy a cola. If we were really flush and had fifty cents, we got potato chips to go with it. then we wandered to a little creek that ran through a small rural park and chat about all the important things that were of concern to us. We were'nt obese. We were active and went outdoors to keep out of sight, lest we be put to work because we seemed idle! Today there seems to be so much to fear, even in what seems to be "nice neighborhoods". Children aren't let out of the parents control for a minute. The one safe place, as I see it is the wonderful Great Outdoors of the National Parks and National forests. Please, Mr. President, Help us to guide this generation of children toward the stimulation and exercise and the joy of them

Do not allow guns in National parks!

Very selfish, our kids and all descendants are counting on us to make the right decisions to this situation and our planet! WAKE UP PEOPLE!!!!!!

I love the Parks but, since I'm on a fixed income, I can't visit my favorite Park! They used to sell yearly passes up here in Alaska, which only cost a minimal amount but now it's \$14 a day. Is there something that you can do? Maybe discount passes for people like me?

For example the killing of wolves needs to stop now!!

I am 86 years old. I was born and raised in Montana, and luckily my dad (being a contractor) built many of the motels etc.in Glacier Park This gave me the opportunity to spend quite a bit of my grade school summer there. Now when I get to visit Glacier, I am REALLY upset and discouraged by the lack of Glaciers and how so many people really don't see the beauty around them.

IF THESE BEAUTIFUL PLACES ARE NOT PROTECTED, THEN DEVELOPMENT OF ALL KINDS WILL INVADE AND RUIN THEM FOREVER!!!!!!!!!!!!!!!!!!!!!!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

When I think of America's Great Outdoors, I think of our public lands, including national parks, national forests, national monuments, wildlife sanctuaries and other protected ecosystems such as those under the protection of the Nature Conservancy. These natural lands provide some of America's finest outdoor classrooms and serve as a basis for conservation, history, and civics education for millions of people each year. --Stop the poisoning of wildlife on public lands. Every year, more than 13,000 animals, including coyotes, wolves, bobcats, bears, foxes, and unintended animals such as household pets, are poisoned on our public lands under the Department of Agriculture's Wildlife Services Program. In the name of "predator control" government agents in the Animal and Plant Health Inspection Service (APHIS) routinely place toxic poisons in national forests and other public lands. Two of the worst toxins that they use are Compound 1080 and sodium cyanide. Compound 1080, which is placed in collars around the necks of sheep and goats, is a neurotoxin so hazardous that it has been banned in two states and in many other countries around the world. Sodium cyanide is delivered through spring-loaded M-44 devices that poison any animal who tugs at the bait. Target and non-target animals killed by these toxins suffer unnecessarily painful deaths through convulsions, failure of their central nervous systems, cardiac failure and suffocation. --Increase law enforcement on our public lands to protect innocent citizens from illegal marijuana growing operations and other criminal activities. --Do more to use national parks, forests, and monuments to inspire and educate young people. These natural lands are classrooms for discovery and learning for students and teachers. Programs like Teacher to Ranger to Teacher (TRT) allows teachers from low income school districts to spend the summer working as park rangers where they develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. This program should be expanded. And the Department of Education should work with the Park Service to excite kids with hands-on learning experiences. --We need more natural lands for people to enjoy and connect with nature. Please evaluate and consider new sites to bring into the system, and protect remaining natural areas before we use them all up. --Provide wildlife corridors to ensure that the wildlife in our natural public lands can find the food it needs and reproduce successfully outside, as well as within protective boundaries. We need cooperative efforts between federal, state and local agencies and private landowners, because wildlife doesn't understand boundaries on a map. Americans value their natural public lands for recreation, education, and relaxation. Please make it a priority to increase funding for the many wonderful areas we already have under federal protection, and for acquiring new areas to accommodate our growing population before these unspoiled areas are developed by the private sector and lost forever.

We just returned from a trip through many of the Southwest National Parks and Monuments. It is a real shame that more Americans travel abroad so much and do not avail themselves of visiting the National Parks here in this country.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

This is essential if the parks are to continue to support the large predators that are vital components of maintaining a healthy ecosystem. I moved to this country in 1978 from England. I have been so impressed by the national parks as showcasing everything that is best and most admirable about this country. I now live near Mount Rainier National Park--a beautiful place--and while some rebuilding has occurred, it saddens me to see shabby restrooms, worn out facilities and reduced ranger programs. The parks are an incredible resource that can be used for environmental education, fitness, environmental preservation and a celebration of all that is best about this country.

Many say we have lost our connection to the earth which provides us with stress relief, reduction of inflammation and the ability to look at life more objectively and less emotionally. Having access to the great outdoors in our national parks plays a role in the calming of the minds of many and therefore the betterment of our nation and the world.

National parks and National monuments provide some of America's finest outdoor classrooms and serve as a basis for conservation, history, and civics education for millions of people each year. It greatly disturbs and saddens me that we could lose these valuable parts of our national heritage due to economic factors and lack of financial support to take care of them and to add more. Americans care about the future of these incredible places, so they will be there for our children and grandchildren to enjoy. Please remember the importance of protecting national parks and the many programs managed by the National Park Service that improve our communities. National parks are National treasures and good investments in our future.

I live in the beautiful Shenandoah Valley of VA at the foothills of Shenandoah National Park and the George Washington National Forest, both of which I want protected and preserved. I have seen one of our local mountains, Massanutten, taken over by a resort corporation and developed to the point that the animal and plant wildlife are consistently being destroyed. I certainly don't want that to happen to Shenandoah National Park, George Washington National Forest, or any of our national parks and forests..

My husband and I spent many, many years traveling in an RV and we always made a point to stay in or explore the National Parks. I cannot even express the feeling of joy and contentment it gave us to be in these national parks provided us, acting as a balm to the soul as well as the health of our bodies. Much taxpayer money was collected for the benefit of the national parks that was used by congress for other purposes; leaving less and less money to be able to care for the parks properly.

Show pictures of our beautiful parks. Exploration of natural gas is destructive to large areas and uses too much water.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I live in NYC and eventhough the city parks are spectacular and I appreciate them greatly, nothing compares to heading upstate on the metro north train to Mt Tautus and Little Stony Point State Park. The air is so fresh and crisp, the nature is an unbelievable sight to behold and the various terrains that can change with every footstep make the experience of spending time there very special to me. I wish I more of an opportunity to explore this kind of recreational activity as a kid. I wish that everyone could experience the amazing feeling of being in and around nature.

We need to do more to protect the parks' natural beauty and stop the mining and drilling and four wheelers and airplane flights over, trucks , motor homes etc.destroying the quiet and polluting the air. My family and I have enjoyed the National Parks for years,at least from the Smokies to the Grand Canyon and now our grandchildren are having the privilage of this same enjoyment and appreciation of our nations beauty and cultural history.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

I had hoped to come to the recent meeting in Asheville NC to provide my comments, unfortunately I have two small children and my husband was out of town, so I didn't get to come. I would like to take this opportunity to provide my comments and suggestions. Do I think Americans need to get outdoors? You bet I do! On a recent trip to the Blue Ridge Mountains, my husband and I visited two national parks: Grandfather Mountain and Mount Mitchell in NC. It was quite apparent to both of us that not enough park visitors do much more than visit the main visitor center. Few stray farther than that - in fact, only 20% of national park visitors stray 1/4 mile beyond main roads. We witnessed this in our hikes on trails that were gorgeous and wonderful and full of nature and provided us with some GREAT hiking. But we saw probably only 50 or so other people. Yet at the main center and tourist spots, there were easily several hundred. In one way, I was pleased. I can't imagine the masses walking the trails and how it would impact them and scare away the wonderful bit of wildlife we saw. But on the other hand, I couldn't help but think HOW much these people are missing out on what nature can give you! Another good example is Yosemite National Park where 90% hit Yosemite Valley, which is only 5% of the park! I've not been there yet, but I would imagine the other 95% of the park is immensely beautiful and a wonderful landscape only for those seasoned hikers who will stray beyond and find treasure. Another thing that bothered me...Literature for Grandfather Mtn encourage visitors NOT to explore the trails. For example: "In truth, even if you never leave your car, the summit area is a wonderful place to breathe deeply and rendezvous with nature on a whole different level." I suppose this is good for visitors like us who do venture beyond, because it provides solitude for us. But it makes for overcrowded conditions in the main areas of the park. I find it sad though that so many do not venture out, explore, and reap the benefits of truly experiencing nature. But that quote also brings to subject the TRAFFIC. At both parks, and also Chimney Rock, which we've visited several times, parking is at the top at each park! There are simply TOO MANY CARS within the park, too much traffic and hence too much pollution wreaking havoc on the flora and fauna! Acid rain and pollution destruction was very apparent at Mount Mitchell and Grandfather Mountain. I would think the daily traffic coming to the top of the mountain also contributes to destruction of the trees. A suggestion I would have: reduce effects of car emissions by providing parking at outskirts of parks & energy-efficient transit into areas of park. You should also provide hiking trails to to the top and encourage visitors to HIKE. All these suggestions would eliminate traffic, encourage walking and reduce noise & pollution within park boundaries. Our national parks ARE America's Great Outdoors. Our national parks connect people, young and old, to the outdoors, preserving the natural and cultural diversity of our nation, and contributing to the health of our people. They are nature's outdoor classrooms and serve as a basis for conservation, history, and civics education for millions of people each year. --Create parking at the outskirts of parks & provide energy-efficient transit into areas of park, including hiking trails, to reduce traffic, pollution and encourage WALKING instead of driving into parks. Encourage or MAKE visitors get out of their car.

When I think of America's Great Outdoors, I think of the fact that you and your administration have done NOTHING to preserve wildland and wildlife.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

WE need to get young people working in the Parks as both volunteers for school credit and as paid employees building trails, and all the other essential things needed, not just run the concession stand. Work needs to be done and young people need jobs that pay and teach them to take responsibility and direction. Just like Vista and the Peace Corps, and PWA, this is a job for people awaiting jobs-often with no idea of what direction their lives will take. It will greatly increase interest in the environment, history, economy, and more.

As an avid traveler, camper and hiker in our national parks, monuments, historic sites and recreation areas, I implore you to increase funding to the National Park Service. We must not only protect those units we now have but need to acquire new potential sites for the National Parks system. I am now in my mid-70s and cannot travel or hike as much as I used to, but these treasures must not be lost or degraded. Our children, grandchildren and future generations deserve better. As a resident of Los Angeles, I hope your administration will seriously consider the establishment of a National Recreation area in our San Gabriel Mountains--an underfunded part of the national forest system. These mountains are heavily used but the visitors experience is limited by lack of access, lack of rangers, undeveloped areas for parking, lack of information about the geological and biological significance of the area. The area is now being surveyed for consideration as a national recreation area. In order to connect wildlife corridors in the region, including the San Gabriel River, Rio Hondo and the Puente-Chino Hills in a NRA is important to allow free access of wildlife from the San Gabriel Mountains down the rivers to the Puente-Chino Hills in to the San Ana Mountains. And if financially possible, allow visitors to stay without current fees for parking. This discourages those with limited income from visiting the area. On a broader scale,

Pursuant to the America's Great Outdoors initiative, --Swt up a program for priority purchase of conservation easements from rural landowners threatened with foreclosure, provided such landowners use the funds for paying down their mortgages. and paying arrearages. --Preserve large areas of public lands and waters to secure the health of our ecosystems, ensure wildlife conservation, maintain public access to parks and open spaces, reduce the impacts of climate change, and protect our cultural heritage. --Strengthen the capacity for federal, regional, state, and local agencies and private landowners to work collaboratively in order to protect not only our national parks but the wildlife, plants, and rivers beyond park borders.

Please do not give Pesticide lobbyists and former or current corporate CEOs or those who work for them the legislative freedom to make decisions which go against life on this planet. Pesticides kill. Do not allow pesticides to be used in State Parks and other public land areas.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am asking you to seize this opportunity to better protect America's public outdoors spaces, including parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments., National parks serve as a basis for conservation, history, and civics education for millions of people each year. --Seize the opportunity that the upcoming Park Service centennial provides to renew our national parks. We need a new national campaign that will involve people in communities throughout the country in protecting our parks for future generations. --Provide permanent, mandatory funding for the Land and Water Conservation Fund. Seventeen billion dollars in revenues, primarily from oil and gas leasing, have accumulated during the past several decades in the Land and Water Conservation Fund, unspent for its intended purpose. This money should be spent as originally intended to support parks, seashores, forests, and waterways across the country. --Do more to use national parks to inspire and educate young people. Our national parks are classrooms for discovery and learning for students and teachers. Programs like Teacher to Ranger to Teacher (TRT) allows teachers from low income school districts to spend the summer working as park rangers where they develop and present interpretive programs, staff visitor centers, and develop curriculum-based materials which they bring back to the classroom. This program should be expanded. . --Build on programs that work. The National Park Service has tremendous technical expertise and know-how that can help communities preserve their special places and provide recreational and educational opportunities for people. You already have a great program, but it's under resourced. There's no need to reinvent the wheel. Invest in a model that is working in communities across the country. --We need more parks for people to enjoy. The park system must also evolve to fully represent the history and culture of our diversifying nation. Please evaluate and consider new sites to bring into the system. A recent study commissioned by the National Parks Conservation Association found that every federal dollar invested in national parks generates at least four dollars of economic value to the public. In 2009, as the recession took its toll on Americans' pocketbooks, national park visitation increased on average by nearly 4 percent, demonstrating the value of our national parks to our people in difficult times. National parks are good investments in our future.

From the time I was a small child, growing up, and having a family of my own, who are now grown with families of their own, the national parks have always been places my family has enjoyed and valued. Through the years, our park system has gone through great changes and usually not for the best.

National Parks are truly (one of) America's best idea(s). Unfortunately National Parks are under a variety of threats, from global warming to other kinds of pollution to overuse to an enormous maintenance backlog. the upcoming centennial of the National Park system is an excellent opportunity to focus needed attention on improving our National Parks.

Our open spaces are quickly disappearing thanks to uncontrolled development and the virtually unregulated removal of natural resources (especially logging, coal mining, natural gas "fracking", and oil drilling). It is essential that we maintain green and un manicured outdoor spaces for our health and the health and welfare of the planet and future generations of humans. We are quickly destroying the only home we have!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You have the opportunity to improve our unemployment rate by putting people to work on America's greatest idea (National Parks). I have visited our National Parks for 30 years now, and have personally witnessed their degradation due to insufficient maintenance. The National Parks desperately need workers, and many workers are out of work. It doesn't take a lot of brilliance to realize how to minimize these problems. Fund a program (similar to WPA, CCC) that will restore our National Parks by putting people back to work. I don't want my grandchildren to miss the beauty and mystique that is fading from the parks. Do something, PLEASE.

The Alliance for Responsible Recreation is a coalition of all-volunteer conservation and community groups organized to address the crisis of unmanaged and uncontrolled OHV abuse of our private and public lands in Southern California. We believe that federal land use policy should be based on good science and sustainable management to protect America's Great Outdoors for future generations. The OHV industry is extremely influential in Washington, D.C. as are rider's groups across the nation. We view the unmanaged use of our public lands for OHV recreation as a public subsidy of the industry at the expense of environmental and cultural resources. In surveys, OHV riders have reported that they breach designated routes the majority of the time resulting in widespread damage to soils, plants and animals, and OHV recreation has been identified by the Department of the Interior as one of the major threats to our nation's natural and cultural heritage.

As indicated in the June 2009 Government Accountability Office Report to the Subcommittee on National Parks, Forests and Public Lands, Committee on Natural Resources in the House of Representatives, OHVs represent a clear and present danger to our public lands. Some of the conclusions of the report indicate that our federal land use management agencies cannot manage or control OHV activities that result in the destruction of lands held in common for generations to come. These conclusions reinforce our observations on the ground that OHV activities are a major threat to our public and private lands and that abuse of these lands continue with impunity.

Federal land use managers report an increase of OHV activities with adverse impacts on natural and cultural resources, conflicts with other federal land users and an increase in accidents including fatalities.

The majority of federal field units indicated they cannot manage existing OHV areas in a sustainable manner.

Field units reported that they are hampered from protection of our public lands from OHV activities due to a lack of resources.

Federal land use agencies lack key elements in strategic planning for responsible and sustainable OHV recreation.

Federal land use managers need to improve communication with the public about legal OHV areas and trails.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Current federal OHV enforcement is inadequate to protect public lands.

Fines for illegal OHV activities are not sufficient to curtail damage.

Research in California indicates that OHVs are making a significant adverse impact on climate and public health due to the production of green house gas emissions and dust.

In many parts of the country, public lands are intertwined with private lands. Unmanaged and uncontrolled OHV activities on public lands result in trespass and destruction of private property and at times violent conflicts with private property owners. Local law enforcement and emergency response agencies are overwhelmed with this added burden and the costs of these impacts become the responsibility of local taxpayers. During holiday weekends, OHV recreationists converge on hundreds of thousands of acres of public lands resulting in wholesale damage to those lands. In addition, the lack of signage and public education exacerbates these problems.

Recently, public attention has been focused on the tragic impacts of an unmanaged OHV race on public lands in California that resulted in the deaths of participants. In our view, these large scale races are inappropriate for public lands, constitute a public safety hazard, represent a federal subsidy of the OHV industry and consume federal law enforcement rangers' time and efforts leaving communities and adjacent public lands unprotected.

These large-scale races result in the destruction of large swaths of federal lands impacting endangered, threatened and sensitive species, hydrologic systems, habitat and vegetation. The "collateral damage" from these races includes private property destruction, increased DUI accidents, and conflict with surrounding communities.

Adding to problems with OHV law enforcement is that these vehicles cannot be easily identified since they do not have visible license plates. In addition, unlike other recreational activities on public lands, federal agencies do not have a permit system to control OHVs.

Protection of American Indian cultural resources including sacred sites, petroglyphs and intaglios from illegal OHV activities.

It is tragic to witness the gains of the last few decades to protect America's great outdoors unraveling before our eyes by irresponsible, unmanaged and uncontrolled OHV activity. In many cases, due to a variety of reasons, the federal government has failed to protect this nation's cultural and natural heritage from the adverse impacts of OHVs. This must change with a renewed effort to control the millions of OHVs on our public lands while we encourage the American public to experience our public lands by engaging in more sustainable and responsible recreation.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I would love to see all national parks not destroyed. I would like to take my son to them when he gets older and can appreciate them for their age and beauty. I haven't seen all the national parks but I would like to. I love nature. I would hate to see this whole planet be nothing but one giant city that thinks it can still live without nature. Why would you want to destroy what nature gave us anyway? To make something we can live without? If our forefathers could live without all the high tech stuff we have now then so can we! I love nature, I think it's beautiful, wonderful, relaxing. And isn't nature one of the top "cures" for diseases? If you think you can make a better planet by destroying what was given to us and many before us then think again. Just because it sounds cool and effective doesn't mean it will be. So rethink what you want to do before you destroy and make humans an endangered species.

I implore you to stop the Bristol Bay Pebble Mine from destroying a beautiful wilderness area. I had the pleasure of working at the Wood Tick-Chik State Park in the Bristol Bay area of Alaska and will never forget the incredible beauty of this vast landscape. I would never want that to be lost from this earth. I vividly remember the salmon runs and when I think of the Pebble Mine and the impact it would have on the salmon, I don't know how we will survive if it starts up. Those wild Alaskan Salmon are one of the few fish left with so many health properties that are not loaded with mercury and other harmful chemicals. I pay twice as much for those salmon and will not eat farm-raised salmon due to health concerns. The oil spill has done enough damage to our country's water eco-system for one generation. Please do everything in your power to protect Bristol Bay and the salmon. Stop a few people from profiting from the mining activity and keep the natural wealth for all Americans. Thank you.

Do we really need an excuse to do what's right? People need to slow down the use of fossil fuels. We can not continue to pull on the earth as we do and think that it can go on forever. We need to do all we can NOW to save all of nature, because if the air is completely polluted, the water is contaminated and the balance of nature ceases to exist all by the hands of people abusing it, instead of treasuring it, will anything else really matter? The Bristol Bay is their home not ours to do with it whatever we want. Every corner of this world IS NOT OURS and should be left in its pristine natural environment.

To all concerned with the permitting of Pebble Mine in Bristol Bay: It is with sadness that I hear of yet another attempt to gain profit at the expense of the environment. Is there no end to the unbalanced approach to the use of our natural resources? Is there no end to the lack of respect for our native people and for the wildlife which inhabit the few remaining wild places? Please do not permit this inevitable tragedy. Make greater efforts to insure the protection of such places. This type of activity has no measure of guarantee for the protection of the environment. It only guarantees a disaster in the making.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I write to express my deep concern about the prospect of the Pebble Mine being a destructive force in Pebble Bay. Having travelled recently in Alaska, I had the chance to hear directly the concerns of Native Americans living in villages that would be negatively impacted by this mine. There were concerns that the innocent and collegial social relationships would disappear, especially among the children, as evidenced by the villages already impacted in this way by mining. There were even greater concerns for the wildlife. Salmon will be negatively impacted. I am concerned for these people, for the wildlife, and the environment. I understand that toxins will pollute this pristine watershed. I urge you to stop this mine. I urge you to strictly control and monitor all mining in order to protect the environment and the web of life that depends on it. Substantial fines and legally enforced cease and desist orders cost money, but are necessary tools to protect this precious resource. Please move quickly. Thank you

As Franklin D. Roosevelt once said: "The nation that destroys its soil destroys itself." Nothing more needs to be said!

If there is one thing we are learning about our world, it is that everything is in a finely balanced relationship. The predators that we vilified turned out to be vital to healthy herds of their prey. Bees, while unpleasant in your house, are necessary for agricultural products. This interrelationship exists in everything. Having the effluent from a mine would poison the water in the ground table, and it wouldn't only impact Alaska! The survival of the human race is at stake today. We must cut back, give up, save, if we are to continue living. We can no more let dollars be the primary consideration in our decisions.

Dear Sirs, Please consider the long-term impact of large-scale metallic sulfide mining for short-term gains. In one sense this mine is not needed at all, but if it is to go through it is our duty to make sure it does not have long-term impacts on the area's pristine environment. In Alaska it takes years for the environment to recover from our trespassing. Just look at how much oil still remains from the Exxon Valdez spill 20 years ago. Regards,

Mining does nothing except enrich the mining company. The expense, which not enough people understand, is the destruction of the environment. The US government only receives a nominal amount of money anyway after considering all expenses, so we end up destroying our planet, killing wildlife, including our food supply, and for what? To enrich some company who will then not be in business in 50 years when the environmental problems finally are discovered. Don't do it!!!! Please do all you can to help our dying planet. We don't have another one. Our en

As a taxpayer, I am urging you to support expansion of the federal government's efforts to preserve and protect as much public land as possible. As we search further and farther for more sources of natural resources, we encroach closer and closer to sensitive areas that need protecting in the face of ever-expanding demand for wood, coal, oil, gas, water and mineral resources. Really, only the federal government has the power to keep these demands in check and protect natural areas and the organisms that call them home. We truly need these areas protected, if not for me, for future generations.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I have been asked to send this e-mail to encourage you to protect what is left of our planet. We cannot continue to do with it what we will and need to take steps to correct what damage has already been done. Money is being spent by the ton on war, research on outer space, ocean depths, human life, etc. etc. What if we took proper care of all we have been given so that we can live in peace to enjoy life as it could and should be? We cannot continue what we are doing without dire consequences. The risks are not worth it and common sense needs to prevail once and for all. Yours,

As one who truly appreciates the great outdoors, it troubles me a great deal that the beautiful area around Bristol Bay could possibly be ruined for many generations, perhaps for millennia, by development of the Pebble Mine. I have seen other natural, wilderness areas that have been blighted by mining. It is pathetic! Especially when you consider the consequences to the wildlife of the areas affected. Until we learn to mine without such devastating results we should learn to do without the minerals we think are so important. I, for one, would be willing to put up with any hardship that results from not mining. I feel the Federal should be able to veto any project like the Pebble Mine that could have similar consequences.

To President Obama & Administration Officials: Compromising Bristol Bay is not acceptable. Whatever "practical," or "realistic" rational that might prompt you to do so would be a grave error. Earth does not have an infinite capacity to absorb the indignities we impose on her. Clean water, wild life, wild salmon and a healthy sustainable eco system must be passed on to future generations. It is our duty to preserve some of today for tomorrow. If someday there is no "Wild" left, except the sad, disempowered creatures in our zoos, something in us will know and will grieve. It will be a poorer world we leave our children. Please consider well our connections. When we degrade and pollute the earth, we degrade and pollute our bodies too. We have all expected of you that business-as-usual would not be your mantra. Be the advocate for change we all have expected of you. Thank you for your consideration.

I've seen the devastation that mining has brought about in my home state of West Virginia: mountaintops stripped bare, creeks and rivers polluted, fish and wildlife threatened or wiped out, communities flooded, people sickened by toxins....the list goes on and on. Please don't set the Pebble Mine loose on Alaska. Stop it now, I beg you. Thank you for listening.

We are in a fight to preserve the last remnants of the great american west that have not been settled and roaded. This is not once is not a once in a lifetime opportunity its a once in a civilization opportunity to leave our roadless unprotected wilderness alone for all future generations by protecting them now. These areas are so vital to leaving the western landscape intact as near as it was that it should be the top priority for the administrations conservation efforts. I am a hunter and I value these lands, as do the other hunters. Leaving areas roadless is the best way to protect clean water, preserve habitat, and give all Americans a chance to step back in time to what the pioneers felt and saw. Thank you for considering my comments.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Throughout history the public has had to foot the bill for superfund sites left over by industries unwilling to take care of the earth after plundering it's resources. How can anyone blame people for rallying against these industries looking for future sites. I, for one, ask that this project be suspended indefinitely. Thank you,

I'm a retired commercial fisherman, what you are doing, again and again and again is destroying the small fisherman and the salmon, for a corporation to make big bucks and once again crap on the little guy. Stop this insanity!!!

If this is the moment where a decision can greatly affect the future of our nation's wilderness, wildlife, and water, please let it be one that will be a step in the right direction. So often in the past, decisions were made without any concern for the future of the environment. We now know, environmentally and scientifically, what these decisions did to our nation's outdoor health. We now have the ability to make better decisions, for the present and for the future.

I voted for President Obama. I would vote for him again. I believe he has a solid concept of what we need for the environmental health of this nation. Please let this be a decision in the right direction; one that will keep our biggest state free of more pollution, waste, and irreparable damage from big industry. Sincerely;

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The area under discussion and motivation to change one of the most beautiful areas in our great land are in direct contradiction to each other. To see the earth ripped and destroyed in such a way makes me wonder if we have any qualities left in ourselves, not overpowered by the great wanting to make money. The allowing of this by our past president greatly saddens me as much as other things he left office allowing. What crimes are being committed in this country just because he gave free range and opportunity to people whose main object in this life is to make yet more money - at whatever cost it takes. Although I am over 70 and have seen and experienced many things in this life, my heart is sad and heavy with the thought of all the entries the last president of this land granted secretly during his term of office. I am wondering if the three bodies of the government designed to protect and furnish the people of the United States with possibly the best living can offer equal to anywhere in the world is no longer an effective kind of government, as changed as it has been in the last decade. Now it seems there are people wishing to do nothing but destructive mining and destroying some of the most important species of animals we have in this world. The Pebble Mine would certainly add its deadly pollution materials to the waters of Bristol Bay in such quantities as to finish off the wild salmon who have been coming there for literally thousands of years. In turn, the mammals that eat the toxic salmon would in turn be destroyed and it would go on and on down the food chain, besides harming the waters and their vegetation content. If the human race is going to continue on this earth, it has to have nutritional food free of toxic hazards. We are getting so we wish to overlook these terrible possibilities so we can enjoy the profits from these types of enterprises, but really who wins. Who's grandchildren or great grandchildren will suffer from diseases caused by these toxic chemicals in the waters. What animals will be closer to extinction because they drank and swam in the polluted waters - these are not just harmless thoughts of a liberal person. This is being written by someone who cares a great deal about our marvelous way of life, about our outstandingly beautiful country which must be kept livable for future generations of all beings from the whales to the wolves and include the humans too. I often wonder why human beings think they have the right and own all other animals on this planet. Because we are at present the dominant species - not counting many kinds of insects - we think if we have the money to start a toxic industry which will make more money - all systems are go, except for our human systems, except for all the animal systems, except for all the systems that combine metals and chemicals in non-extreme conditions, and except for all the systems began on this earth before there were any living creatures here. Please please look again at this proposal and see how devastating it would be to allow it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The web page is TOO CLUTTERED - NOT CLEAR AS TO WHAT ONE MAY SAY - or WHERE - - LOOKS LIKE 2 THOUSAND TREE HUGGERS HAVE VOTED 34 THOUSAND TIMES - - REAL REPRESENTATIVE ! Resident Obama and his cronies DO NOT HAVE AN IDIOT'S IDEA ABOUT WHAT IS NEEDED WHERE ! LET EACH STATE DETERMINE ITS NEEDS AND DESIRES FOR ITS OWN PROPERTY !!! NOT LIKE CLINTON STEALING ALL THE UTAH SCHOOLS' FINANCING BY LOCKING UP THE CLEAN BURNING COAL LANDS SO THEY COULDN'T MINE FOR IT OR SELL IT !! WAY TO GO HORNEY BILL !!! Texas has wide open spaces - of desert, mountains, beaches, forests, and WE TEXANS CAN TAKE CARE OF THEM JUST FINE - Thank You! NPS IS SO OVERWHELMED - when Yellow lap dog democrat Chet Edwards tried to get them to take on a local paleontological site - they finally said - after 3 years - THEY COULD HELP "SUPERVISE" IT BUT HAD NO MONEY TO PUT INTO THESITE! AND HERE YOU MONEY GRABBING IDIOTS - ARE ALL TOO HAPPY TO STEAL EVERY SINGLE CENT FROM HARD WORKING AMERICANS - AT LEAST THE ONES WHO CAN FIND JOBS NOT TAKEN BY ILLEGALS !!! SO YOU CAN TAKE OVER MORE LAND - !!!!! WHEN YOU CANNOT TAKE CARE OF WHAT YOU ARE RESPONSIBLE FOR NOW !!!

America's great outdoors are special to us all. We have a great responsibility to protect them for future generations. Oregon has protected only 4% of our land as Wilderness, lagging far behind our neighbors. It is time to correct this Wilderness imbalance. Thank you for considering my comments.

I applaud the Obama Administration's conservation leadership embodied in the America's Great Outdoors Initiative. It is inspiring to see the President make conservation of America's treasured outdoor places a national priority. But if you are so interested in the people enjoying the great outdoors than you need to protect those places. Or is this just a PR opportunity? Walk the walk and stop talking about all the wonderful things we can do and just do it. The American people are tired of talk.

I recently did a river clean up in the Hackensack River in New Jersey. We spent four hours at the clean up site, each of us with a specific task at hand. Some worked along the shore line, others deep in the marshes and a few were out in canoes cleaning up the water itself. At the end of the day, we filled a 40yd truck bed with everything from plastic bottles and styrofoam to such crazy things as toilets and car parts. The lack of concern this country's citizens has for its parks, rivers, and land is a disgrace and needs to be challenged with more heavily fined penalties, educating, and organized clean ups.

People who value gold, a non strategic metal, above wildlife and Earth itself are enemies of humanity. There's no middle ground. Stop the destruction!

To Whom is Listening, Want you to know I have witnessed the exact thing that is being proposed for Bristol Bay. It was heat breaking to see such devastation. Please find it in your heart to reconsider. I can't imagine that doing this feels good. respectfully,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You know all the scientific reasons for not mining at Bristol Bay; you know how it will foul the water and hurt the wildlife so I won't bore you with "the facts." There is another factor not talked about in these discussions - and that is the aesthetic concern. Mining is a dirty business. Companies that mine don't care about the environment or how they leave their mess for the tax payers to clean up. It's an eyesore. We have so few pristine places left in America. Why do you want to spoil yet another one? For a few pennies? When will it end? Why not just dig up the entire Earth and destroy the planet? Will you be happy then? An untouched environment is priceless. If our past President's hadn't stopped the mining in the Grand Canyon - imagine how the most magnificent natural wonder of the world would be spoiled. Now is the time to say "no more." Beautiful places with healthy air and happy animals are far more valuable than anything extracted from the dirt. If you go ahead and foul up Bristol Bay for finite resources - you'll just move onto the next place to ruin. It's never ending. Please, even if you aren't a hiker, artist, poet, musician, scientist, naturalist, tourist or citizen, or animal lover even...aren't you horrified by the wanton destruction? A child would tell you to stop the destruction. Please put the welfare of this beautiful place and it's animals before profit. That's how I see it.

Good morning one and all. As a user of earth's resources, I really wish and pray for my children that you will stop raping our environment. I live green, it can be difficult but it is a must to save earth. I want wild places left for my grand kids to enjoy and appreciate. Please, please leave this area alone. Thank you

I thought we voted in 2008 to change the federal government from one that was operated by and for the big corporations, especially the oil, gas and mining industries. I thought we voted for this change because we want to save ourselves and the planet. The Pebble Mine project at Bristol Bay sounds like a Bush-Cheney idea. We decided those guys were criminals. Can we now change their rape and pillage the Earth policies? Can we stop this project?

Will the rapacious white man not rest until every bay, river, habitat is filled with his excrement? Will greed and lust for power never abate? Leave Bristol Bay alone!

Please stop Pebble Mine!!

I work in the technology field in Silicon Valley and believe that to counterbalance our urban lives we need places of great natural beauty. The site of the pebble mine is one of these. Many decades ago farsighted men and women created our national parks and public lands and while we all embrace the idea of multi-use, this does not mean that anytime something of monetary value is discovered in one of these places that we have to go and destroy everything that surrounds it so a company can profit. Particularly when that profit comes at a cost not only of destroying something of beauty and value to the environment but also threatens an extended ecosystem. The type of mining intended, using metallic sulfide on a large scale, has impacts on recreation and habitat that are not acceptable, and this project should not be allowed. Sincerely

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Sir: The mine would likely pollute the Bristol Bay, leading to a loss of fishing and reducing the chance to live subsistence lifestyles. Public lands in the area's watershed should absolutely be closed to commercial-scale metals mining. Our items of high priority should be recreation and protecting the habitat. The Federal government should exercise severe supervisory authority over the permit issuance process and analysis of the possible impacts on the watershed. The various relations among the tribal governments and the Federal government should be strengthened. Standards for any development in wetland areas should be stricter. This includes applications of the Clean Water Act to mineral mining; these standards should be more stringent. Thank you for your attention.

Bristol Bay and its watershed are extraordinary, largely untouched wilderness in southwest Alaska. The bay is sandwiched between two National Parks and borders a Wilderness Area and a National Wildlife Refuge. The cold, shallow waters here are home to enormous salmon populations -- critical to the survival of whales, seals, brown bears, eagles and other wildlife, and a part of ancient cultural traditions for native peoples. These waters also support one of the world's largest wild salmon fisheries. The economic value of the fishery is incalculable. This wilderness has been closed to commercial mining and drilling for more than three decades! Hard rock mining, such as the proposed Pebble Mine, pollutes water 85 percent of the time. If the waters of Bristol Bay are contaminated by mining the effects could be devastating, transforming the region and affecting the entire food chain. For this reason, public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, traditional subsistence ways of life and recreation resources should be the top priority. Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and cultural traditions. The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. Clean Water Act standards for large-scale metallic sulfide mining should be more stringent, and standards for mineral development in wetlands should be tighter.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We applaud the Obama Administration's conservation leadership embodied in the America's Great Outdoors Initiative. It is inspiring to see the President make conservation of America's treasured outdoor places a national priority. Our natural resources are threatened by pressures like expanding population, unguided development, and climate change. We need presidential leadership now more than ever to protect our wilderness quality lands so that future generations may also enjoy them. We ask the President to please make wilderness protection a central component of his policy emerging from the America's Great Outdoors Initiative. The President has the authority to facilitate better cooperation among the federal public land agencies and Congress to identify eligible landscapes and protect them as wilderness. Currently, the U.S. Forest Service uses overly restrictive criteria in determining their recommendations for lands that should be designated wilderness. Worse, the Bureau of Land Management is bound by a directive from the previous administration to cease all wilderness assessments. Both constraints can be lifted by direction of the President, and we urge that this be done. Expanding America's wilderness preservation system is the best way to protect wildlife, watersheds and recreational opportunities. Again, we want to thank the Obama Administration for taking the initiative to protect America's Great Outdoors. We look forward to seeing the president use this opportunity to establish a new and substantial legacy of wilderness conservation, one that can stand as a visible and enduring accomplishment of his presidency.

The proposed Pebble Mine development in the Bristol Bay, Alaska appears to be a catastrophic disaster if allowed to proceed. Not only will this, if allowed, endanger pristine wildlands and their inhabitants, it will create water pollution that threatens the important salmon resource. We now have a golden opportunity to prevent permanent destruction of valued land and related environmental consequences with appropriate action.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The genie in the bottle of the Pebble Mine proposal is the chemistry and the physics of open pit mining. Once the land is broken and the mine started, no power on earth, no technology, and no litany of corporate promises can halt the destruction of the world-class Bristol Bay ecology. So the question is not “can it be done responsibly?” but rather “is the price of the loss of the Bristol Bay ecosystem worth the economics of the mine?” If there is any doubt of this, see ‘Modern Montana’, from ‘Collapse’, Jared Diamond; also ‘One Round River’, Richard Manning; also the history of the FARO open pit mine in Faro, Yukon Territory, the clean up for which is entirely in the hands of the Canadian public and is expected to run initially in the billions to be followed by a cost of 3 million a year for 500 years. (July 30, 2008, Yukon News “Faro an expensive lesson.. .”) Pebble is a classic in two senses. In the first case it is a classic in the Tragedy- of -the-Commons series of major ecological and societal losses to big development, which includes mountain-top removal and oil sands development. And in the second case it is a classic in the Killing-the-Goose-that-laid-the-Golden-Egg series that includes the loss of salmon-based ecologies all the way from the Sacramento (which had enough salmon to support canneries) to the Yukon River in Alaska which had a run of millions of King Salmon that is now down to a handful of remnant thousands. If the mine is developed, in the end Bristol Bay will be an ecological desert, the minerals and the jobs will be gone, and nothing will be left but a fading memory of unrecoverable bright days, big fish, and healthier times. A word about the nature of the public debate: There is absolutely no accountability built into the system, and no individual and no corporation that is currently making arguments and promises will be in place when the time comes to prove up on the “responsible” and “clean” development promises. They can say anything they want, and ultimately the individuals will be gone and there will be five, ten, or more corporate legal veils between the public interest and the mine ownership when the time comes for accountability. (See FARO mine history; the EXXON Valdez oil spill litigation; the Bhopal chemical industry disaster; the ongoing whitewash in the BP well blowout.) The only protection available to the Bristol Bay commons is the government and the permitting process. Given that corporate behaviors and development pressures have destroyed or massively damaged every single salmon system from the Sacramento to the Yukon, this last reasonably healthy system should have the benefit of a cumulative sense of protection that has not been successful in any other individual case.

I am very concerned about the proposed Pebble Mine project in Bristol Bay. This is a pristine ecosystem, home to wild salmon, rare and beautiful wildlife, and unpolluted (for now) waters. Large-scale metallic sulfide mining will destroy habitat. It is not sustainable. It should not be destroyed forever just for short-term financial gain. Will my children and grandchildren want to visit this wonderful wild place after mining has stripped it of all it once was? Not likely. The government has a responsibility to thoroughly analyze the impact of such an operation and to provide more stringent Clean Water Act standards. The permit process must be reviewed with local and tribal governments in mind, not just big business' interests. Please hear us: our last wild places are priceless. Don't let them be destroyed to line the pockets of mineral developers.

Please cancel this harmful project.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

America's wild places are special to us all and we have a great responsibility to protect them for the wild animals who live there. They were there long, long before humans began to dominate the landscape. We can help keep America special by protecting more Wilderness and quiet recreation opportunities, preserving more habitat and connectivity for wildlife, and permanent protecting remaining old-growth forests. Here in Oregon, we enjoy some of the most beautiful and awe-inspiring public lands in the nation. But places like the Wild Rogue River, the wildlands surrounding Crater Lake National Park, and the Siskiyou Wild Rivers are at risk from logging, mining, and other harmful development. Oregon has protected only 4% of our land as Wilderness, lagging far behind our neighbors. For the wildlife that call our public lands homes and for the millions who enjoy these places for quiet recreation, it is time to correct this Wilderness imbalance. Thank you for considering my comments.

Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife, and traditional subsistence ways of life. The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed, close public lands in the Bristol Bay watershed to large-scale metallic sulfide mining, strengthen its relationship with tribal governments, and tighten standards for mineral development in wetlands and for large-scale metallic sulfide mining. Thank you for your time and consideration.

It is appalling to me that mining pristine Bristol Bay is even under consideration but, I suppose, it should not as we seem to be forever fighting for our few and precious wildlands. Please, PLEASE, stop the Pebble Mine and any other for-profit-only ventures that threaten our natural world. Our entire family voted for Obama but his performance in the area of environmental issues has been disappointing, to say the least. Please restore our faith in this administration and protect Bristol Bay! Thank you for listening,

Hi, I think the pebble mine isn't good for the nature in the Bristol Bay because it's toxic for the animals and for the whole cycle because it's toxic for the fish and so the bears won't have enough to eat. And it destroys the whole nature there. So it has more disadvantages than advantages. I hope that the nature won't be destroyed. Bye

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Ladies/Gentlemen I am writing to express my opposition to allowing the Pebble Mine to operate in the Bristol Bay area. Such a mine will create devastating and unalterable destruction to the waters, land and water wildlife, survival of indigenous populations, indeed to the whole ecosystem. Once gone, that cannot be replaced. The Bristol Bay ecosystem is far more precious than any minerals which might be extracted. Each bit of wilderness we destroy impoverishes all of us. The Pebble Mine would provide a monetary profit to a few and the expense of the many, those whose lives would be forever altered for the worse, and those of us who would then have even less of wilderness area for ourselves and our children to share. It is my opinion that this mine should absolutely not be allowed. At least, do a thorough environmental impact investigation and public statement of that examination. This should be done by independent scientific investigators, not those employed by the government or by the Pebble mine people. The group should include several members of the indigenous populations, who best know the region. I believe that such an investigation, properly done, would reveal the vastness of the destruction the mine would create. Altogether, we need greater commitment to wilderness areas, and greater oversight of activities permitted within them, particularly extractive activities. In this specific case, please disallow the Pebble Mine.

Dear AGO -- Please act decisively to block Pebble Mine. Now of all times, it should be clear that our natural resources must be preserved and that we must be extremely cautious in the way we make use of and impact upon those resources. The effect of Pebble Mine on Bristol Bay would truly be disastrous. Please preserve this and other natural resources for the generations that follow us, and please work to make our existing laws more effective and stringent so that other resources may also be preserved. Sincerely

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Since you have proclaimed this September National Wilderness Month, I want to ask you to protect the Bristol Bay Alaskan Wilderness, whose pure waters and untouched ecosystems are threatened by a vast opencast mine, Pebble Mine. Powerful international mining companies like Anglo-American, Mitsubishi and Rio Tinto, who have no stake in the land, its wildlife or its native inhabitants, are seeking permits to extract low grade gold and copper, minerals whose value in no way equals that of the habitats and natural beauty that their project will irrevocably destroy. These pristine wetlands support millions of migratory waterfowl and land birds, as well as rare freshwater harbor seals, bears, wolves and a huge array of other wildlife in the sea and on land, in a delicately balanced ecosystem which has evolved undisturbed over millennia, and notably includes the biggest run of sockeye salmon in the world. Much wildlife depends on these fish for food, and Bristol Bay's commercial fisheries also generate \$300 million in every year - one third of Alaska's fishing revenues, which are based on sustainable practices. Since even minute increases in copper dust above natural levels have been shown to damage the salmon's ability to find its way back to its spawning stream, the inevitable pollution from the mine would have disastrous consequences on salmon stocks and consequently on the livelihood of native populations, both animal and human. You have said that close attention should be paid to the views of indigenous inhabitants when protecting the Wilderness. Bristol Bay Native Corporations have formed an association, "Caretakers of our Land" to oppose mining in the area where they have lived in harmony with nature for centuries. Please make sure their views are heard, and their ancient way of life protected. Standards for mineral development in wetlands should be tightened by law, every aspect of the permitting process for mining in untouched wilderness should be re-examined, and the cumulative environmental effects over time fully understood and given their due weight. In my view nothing can ever be justified which causes irreversible damage to an untouched wilderness, since these are quite simply irreplaceable, while minerals can be found in many places. It is far better to enjoy their beauty and marvel at their teeming wildlife in ways that respect them, and I applaud your plan to increase the number of national parks - Bristol Bay should become one of them.

I want to know that my leaders in government cherish America's natural spaces as much as I do, and that leaders will go to the mat to preserve our landscape for the next generation and the one after that, too. It is a top priority to preserve what we have already set aside and to expand our shared outdoor spaces including parks, wildlife refuges, wilderness, trails, rivers and monuments and to conserve our farms and forests. Please, please take the long view and put preservation before short-term energy, industry or special interest desires.

We still haven't cleaned up mining messes from a century ago. The Gulf Spill hasn't been cleaned up, and it WON'T be-for years and years. We've got a Midwest ecological disaster with the damned carp-an environment changing problem that will NEVER go away, no matter how much money we throw at it. And now we're gonna do the carp bit AGAIN(oh no, they could NEVER escape-until they do) with engineered salmon. And of course-the middle class gets stuck with the freakin' bills for all this. No Pebble Mine, Thank You! And while we're at it-remove non-functioning dams-they're HAZARDS-and ALL the dams blocking fish migration, please. (unless we can put the tailings and poisons in Limbaugh's backyard-or Cheney's and Rove's-- in THIS, case I support the mine wholeheartedly)!! Just A Citizen, (who's NOT making a profit off this)

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I would like to express my opinion to you about the Pebble Mine in Bristol Bay, Alaska. The Pebble Mine threatens the clean waters, wild salmon, and the traditional ways people make a living in Bristol Bay. Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. If we allow mining or drilling in every pristine place on this planet, what will we have left? It is our responsibility as stewards of this planet, to take care of it. Do you really think the earth was designed to dig up, poke holes in, and strip it of all its minerals. If we continue to destroy the earth, it may end up destroying mankind. I have lived in Alaska and I have seen the majestic wildlife up close and personal. Don't take that away from our children and grandchildren. They have the right to see the land the way it was supposed to be seen. Beautiful, majestic and wonderful. Please put a stop to the Pebble Mine in Bristol Bay. Thank you.

Aren't we losing enough of this planet to pollution? What kind of inheritance are we leaving for our future generations?

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

The CHALLENGE involved in protecting Bristol Bay is that its unspoiled, valuable wilderness lies adjacent to the proposed site of the controversial Pebble Mine which, according to the NRDC, generates over 9 billion tons of waste generated by hard rock mining. The Natural Resources Defense Council states that a survey over 40 years shows that hard rock mining pollutes nearby water resources 85 percent of the time. This pollution, which is a matter of record, would threaten the Bristol Bay watershed, which is one of the world's most productive wild Chinook salmon fisheries, and is critical to the survival of Alaska's eagles, brown bears (Alaska's grizzlies), and seals, as well as native Alaskan communities. Clearly, our world is now a global community. There is not a doubt in my mind that the pressure involved in providing the energy required to sustain modern life is enormous; however, we dare not jeopardize any further the interdependence of ecosystems that are already hugely impacted by global warming, if only because we ourselves are ultimately just as threatened by global warming as are the currently endangered polar bear, beautiful white beluga whale, the brown pelican, etc. Even if one's house were made of gold, its beauty and protection could easily slide into oblivion should it be overtaken by mudslides like those that toppled trees in Japan. Fortunately, we are not without resources. WHAT WORKS regarding effective strategies for conservation, recreation and reconnecting people to the outdoors is applying the wisdom of four-star environmental protection groups, rendering their experience specific to stated environmental challenges. As regards the Bristol Bay Watershed and the Pebble Mine, I am writing this letter at the behest of the Natural Resources defense Council, "the earth's best defense." However, I'd like to quote the words of \_\_\_\_\_, taken from his visit to the America's Great Outdoors website earlier today, that "Both the Nature Conservancy and the World Wildlife Fund are nonpartisan, well-established organizations with a long history of promoting habitat protection and restoration and using funds efficiently [while] working with the local population to find practical ways of achieving environmental protection and helping the local economy." Let's roundtable with these fine organizations. How can the FEDERAL GOVERNMENT be a more effective partner in helping to achieve conservation, recreation or reconnecting people to the outdoors? President Teddy Roosevelt has been quoted as saying "We are not building this country of ours for a day. It is to last through the ages." In our own day, it has been found in the instance of Bristol Bay, that the Bristol Bay's salmon fishery is a GLOBALLY significant resource and a top conservation priority. I believe this is the CRUX of the matter regarding the Bristol Bay. As Peter Lehner of the NRDC observes, the danger is that the region is now at risk of being permanently transformed if hard rock mining resource extraction commences there, with potentially devastating impacts on the fishery. This is NOT good news, particularly coming at a time when traditionally rich fishing regions have been devastated by the Gulf oil spill, additionally coming at a time when it has been found that deep sea fishing is depleting otherwise stable fish populations. MY HOPE AND REQUEST, like that of many others, is simply that you act now to RETAIN THE EXISTING LEGAL PROTECTIONS FOR THE BRISTOL BAY WATERSHED. Please keep them in place so that the health of the public lands, waters, wildlife in and around Bristol Bay, along with the native cultures and industry they sustain, will remain secure and continue to thrive. Best regards,

Please stop the Pebble Mine project. Protecting long term employment from sustainable ways of living like fishing and ecotourism should be a priority on places like Bristol Bay. Thanks

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I'm writing with great concern for Bristol Bay, as it is threatened by the prospect of the Pebble Mine. The bay's now beautiful clean waters, teeming with wild salmon and other wildlife, would be destroyed by large-scale metallic sulfide mining. We won't get another chance, or another bay.

I am writing to urge the government to protect Bristol Bay from the threat of Pebble Mine. Pebble Mine threatens Bristol Bay's water, wildlife and traditions. There should be no large scale mining on public lands in this watershed, where protecting habitat should be the first priority, followed by maintaining strong relationships between federal and tribal governments. The federal government has a responsibility to provide strong oversight of the Pebble Mine permitting process and assess the full impact to the Bristol Bay watershed. The standards for mineral development in wetlands are too weak, and the standards under the Clean Water Act for large-scale metallic sulfide mining need to be tougher as well. The government needs to put more rigor into these oversight processes in order to fulfill its historic responsibility.

Dear decision makers, This is too obvious an environmental disaster to understand how the Obama administration could support it, unless there is some sort of blackmail political trade-offs involved. As a retired Park Ranger I'm naturally opposed.

The great outdoors are such an important part of Wyoming living that the people who live here are willing to accept lower wages to be close to such great public lands, hunting, fishing, hiking, and wildlife viewing. I would ask you, Mr. President, to take a personal interest in protecting the public lands in the Adobe Town potential wilderness from industrial use, and to provide federal funds to purchase or swap checkerboard lands that make up The Haystacks,

Dear Mr, President Although I doubt you will read this or even take into consideration the thoughts of this countries low class public, I still feel obligated to make an attempt at letting you know how I feel about the Bristol Bay Pebble mine. Not only does the mine threaten a beautiful landscape which political officials seem to have no concern over. It is a major pollutant, now lets be honest, all of us (even you) have to deal with the future water problems from pollution and overpopulation and I cannot comprehend any plausible reason for allowing even more pollution to continue. It threatens multiple natural ecosystems and also a large population of salmon. You made multiple environmental promises in you campaign that have thus far been unfulfilled and as much as I hate to do it, environmentally you are another Bush... Protecting these natural habitats needs to be a top priority and if great men in high positions cannot make a stand how do you expect the masses to do it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In response to your invitation for input on protecting our treasured wildlands, I am writing to express my deep concern about the proposed open-pit Pebble mine that threatens Bristol Bay. An accident here would be grievous indeed, jeopardizing a large, valuable ecosystem. Given the environmental disaster that occurred in the Gulf of Mexico this year, in spite of assurances that the deep drilling of oil was safe, it seems to me that the federal government needs to take extra precautions to protect another sensitive habitat before allowing a mine of such huge proportions to be constructed. In addition to providing strong oversight, the federal government needs to strengthen its clean water standards and work more closely with local Alaskans and tribal leaders. This project seems to me to be another tragic environmental disaster waiting to happen.

Hello, Our country is blessed with special places that make living here an honor - Bristol Bay is one of those places. It should be preserved in its natural state, free of mining, road building, and resource extraction. It is essential that we, as Americans, use conservation as a primary tool in protecting our future. It is necessary for our health and well being - it's the reason we live for. Save Bristol Bay for everyone. Make the honorable choice.

Dear Folks: I reside in "nawth" Idaho in a rural area surrounded by low and medium height mountains and forests. I was born in Los Angeles, CA in 1937 and in 1987 CHOSE to move to my present home/ranch. My use of my ATV in and around this area is of critical import. Some winters that use may and can be life saving for folks visiting who may be unfamiliar/unused to rural/remote terrain. Please consider the ENHANCEMENT of off-road use. It is sad to have to beg for reason.

To ye, Overseers of Government Lands, I am writing to urge you to block Pebble Mine's disastrous metallic sulfide mining activities which stand to threaten the pristine waters of Bristol Bay, its wild salmon, wildlife and traditional subsistence ways of life. Indeed, the public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining and protecting habitat, subsistence and recreation resources for posterity should be the top priority of the federal government. In closing, let me say that I see it as incumbent upon you, as Overseers of Government Lands and the Public Trust, to see that standards for mineral development in wetlands as well as Clean Water Act standards for large-scale metallic sulfide mining be more stringent. Many thanks for your time. Yours

The Alaska landscape is part of my heart. My Grandparents lived and raised my Mother, Aunt and Uncle at the remote lighthouse known as Tree Point. The rustic beauty that encompasses the southwest end of the misty fjords along the Inside Passage must be preserved along with Bristol Bay. Please don't destroy what Alaska has to offer future generations. Stop the Pebble Mine.

Oil is not a renewal energy. Please do not drill in Bristol Bay for oil. Thank You,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I'm writing to urge all efforts be made to prevent the hazards posed by permitting Pebble Mine at Bristol Bay. Any threat to the well-being of Bristol Bay's ecosystem must be clearly identified, confronted and eliminated. This defines the purpose of conservation: to preserve & protect our public natural resources from the destructive actions of profiteers. To do any less abdicates the people's authority & trust (through their representative government) over our national heritage causing failure in government's responsibility to ensure the nation's bio-treasures for future generations of Americans. If they want to mine – try Afghanistan – there are plenty of mineral reserves and their economy could use the stimulative effect to defray the cost of incessant war. Faithfully,

Bristol Bay must be saved from the damages of mining! Once the wilderness is gone, it is gone forever! Thank you,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear America's Great Outdoors: The Vermont Traditions Coalition (VTC) is a coalition of over 20 organizations from the forest product, maple syrup, agriculture, sporting, snowmobiling, outdoor guide, and lake association sectors. We have a daily presence in the Vermont Legislature and play a prominent role in all major public lands issues in Vermont due to the depth and breadth of our statewide network and our knowledge of issues involving Vermont's predominantly rural landscape. VTC believes that a healthy economy, healthy communities and a healthy environment are inextricably linked. VTC works with local and state organizations, state agencies and leaders to protect Vermont's rural traditions, identity and ways of life. Below you will find the March 31, 2010 Vermont Traditions Coalition Public Comment on the New England-New York Forest Initiative Concept Paper. This Concept Paper proposed a massive federal and preservationist group land purchase throughout New England and New York. This proposed regional land purchase stood in stark opposition to everything VTC and a huge groundswell of grass roots Vermonters has stood steadfastly against during the Vermont Land Wars of the last 12 years. Rather than reiterate those March 31, 2010 Comments for you in the context of the Great Outdoors Initiative, VTC will simply include them here. VTC strongly suspects that the Great Outdoors Initiative is headed toward the same policy that's advocated by the Concept Paper. VTC therefore asks that you simply extrapolate the comments from the March 31 VTC submission to the Great Outdoors Initiative. If the Great Outdoors Initiative is headed in the direction of restrictions on recreation, timber management, and road access to federal lands or federal lands to be acquired, VTC's opposition and the rationale for it are clear. Based on the experiences of the last 12 years, both in Vermont and nationally, VTC does not trust the federal government as a landowner and strongly opposes land ownership interests being conveyed to private preservationists groups with restriction agendas. The White House Conference on America's Great Outdoors on Friday, April 16, 2010 stated that: "America's outdoors are part of our national identity. They are the farms, ranches and forests that we take great pride in, and the neighborhood parks, trails and fields where we spend memorable time with our families and friends," said Nancy Sutley, Chair of the White House Council on Environmental Quality. "Too many of these places are disappearing. In launching this conversation, we strive to learn about the smart, creative community efforts underway throughout the country to conserve our outdoor spaces, and hear how we can support these efforts." VTC understands the importance of the great outdoors and the need to reconnect the people with nature. More importantly we understand the importance of protecting Vermont's rural identity and traditional land use practices which make Vermont as unique as it is. As more and more lands are being conserved in the name of the public good, the rigid, broad-based federal land restrictions that come with these purchases are taking away our way of life, piece by piece, year by year and in essence disconnecting people from the "great outdoors". These federal land restrictions have worked to displace hunting camps, shut down snowmobile trails, outlaw all motorized use, ban horseback riding and mountain biking, close off road networks, shut down timber harvesting, end fish stocking, and on and on. These federal restrictions and ever changing land plans cater to, in many cases, unnecessarily to only a small user group. VTC believes all forms of recreation are important. Not only to the people who visit, but to those who live there and depend on recreation to fuel the economy. These broad-based restrictions that are filtered down from federal agencies working in conjunction with wealthy, national,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Please consider protecting our wetlands, wildlife and habitat strongly in regard to the proposed mine at Bristol Bay. How much more of our pristine land will mining and construction be allowed to destroy?

We must save our pristine wild lands or we are doomed as a functioning society. Our natural areas are important to our survival for the ecological services they provide like clean air, water, soil, and biodiversity. It's where we came from. It (biodiversity) sustains us. Its gives us peace and quiet. It allows us to see the wonderful birds and other wildlife that give us emotional well being. Bristol Bay is just one of many wild places that must be saved. A society is only as strong as its wild places and with an economy based on recycled and reused materials instead of virgin materials that we have to destroy beautiful wild places to get.

Dear Sirs: I am writing to oppose the Pebble Mine in Bristol Bay. Is there no end to the destruction of ecosystems? Please protect this habitat by saying "no" to this destructive project. Protect the public interest. Thank you.

I prefer that my kids have access to healthy salmon rather than myself having access to cheaper cell phones, etc. Given that nearly all other sources of salmon are ranked low on the FDA's fish consumption safety information, Alaska appears to be the last source for unpolluted salmon in the U.S. if not the world. Please do whatever it takes to keep it that way. Thanks,

I don't know how or why this terrible idea was approved in the first place, except that it reflects the former administration's complete disregard for a pristine environment and the wildlife that dwell in it. The effluent flowing from this disasterous mine would poison nearly everything around it, kill wildlife, and render the local environment a wasteland. Is this what our Federal Goverment does now? Permit mining and drilling for the benefit of a very few and to the detriment of nearly everyone else? Not permitting the Pebble Mine to go forward is not environmental extremism, as so many of the visitors to this site like to say, it is an example of environmental responsibility, and the ability to look forward generations from now to preserve a beautiful thriving habitat from complete devastation. Please do not permit this terrible idea to go forward. Dump the Pebble Mine! Thank you.

I forgot to say that in making a decision, please consider this. . . If Theodore Roosevelt were alive today, what would he do? Best regards Subject: Pebble Mine/Bristol Bay You seem to be one who embraces our natural resources and wants to protect them. It's like those who want to take care of Mother Earth seem to have to fight really hard to do so. Big industry, for more than a century, can only see dollar signs in its eyes. It never cares about the garbage it dumps on our beautiful country and planet. Now, another huge, greedy industry wants to again, destroy one of our last (how horrible), nearly perfect natural resources left on this earth, Bristol Bay in Alaska, home to Wild Salmon, Beluga Whales, pristine, yes pristine waters. I have been to this area in Alaska. I cried when I saw it as I had no idea we had place this beautiful and clean left on earth. I hope and pray with all my heart that you will help stop these greedy and selfish company from ever building a single foot of mine. Put up a huge Stop Sign for Pebble Mine, please Mr. President. Best regards,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Thank you for the opportunity to submit my comments. The proposed Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. Relationships between federal and tribal governments should be strengthened; standards for mineral development in wetlands should be tighter; and Clean Water Act standards for large-scale metallic sulfide mining should be more stringent. The Bristol Bay watershed is one of the world's most productive wild Chinook salmon fisheries, and is critical to the survival of Alaska's eagles, brown bears (Alaska's grizzlies), and seals, as well as native Alaskan communities. For more than 30 years this vital watershed, which is surrounded by protected areas, has been closed to mineral extraction. However, the Bureau of Land Management, under direction of the Bush administration, proposed a Resource Management Plan that would open up 1.1 million acres of this unspoiled wilderness to hard rock mining, putting subsistence and commercial fishing activities, as well as wildlife, at risk. The Management Plan is particularly problematic because the land is adjacent to the proposed site of the controversial Pebble Mine which, as one of the world's largest gold and copper mines generating over 9 billions tons of waste, would pose a risk to the entire Bristol Bay ecosystem. The State of the Salmon conference concluded that Bristol Bay's salmon fishery was a globally significant resource and top conservation priority. Yet the region is now at risk of being permanently transformed if hard rock mining resource extraction commences here with potentially devastating impacts on the fishery. Please do not reverse three decades of sensible protections in favor of an ill-advised, ill-informed Resource Management Plan from the Bush administration, which failed to set aside enough Areas of Critical Environmental Concern and also failed to designate enough Wild and Scenic Rivers. Therefore I urge you to reconsider the Bush plan that favors short-term mineral development over long-term land management and direct BLM to prepare a Supplemental Environmental Impact Statement that reflects the exceptional value of the lands and waters of Bristol Bay. Working to maintain the current withdrawal of public land from federal appropriation until adequate safeguards are put in place, BLM will fulfill its obligation to this public land. Until a better plan is devised, please act now to retain the existing protections for the Bristol Bay watershed. The health of these public lands and waters, and the wildlife, native cultures and industry they sustain depend on it. Thank you for considering my comments.

I live in Kentucky and Tennessee. In eastern Kentucky mountain top removal has caused disastrous and irretrievable damage to the beautiful mountains and caused hardship to local people who live near the affected mountains. The coal-ash spill near Kingston, Tennessee was horrific, devastating. Think of the images from the EXXON Valdes and the Gulf oil spill. We simply must stop desecrating America's natural heritage. I am furious that my government is considering exposing Alaska's Bristol Bay to this kind of desecration. It should be stopped. Pure and simple, stopped. Now.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear sirs, Please ban the mining of Bristol Bay. This is an amazing beauty to be preserved. Please respect this and think of our grandchildren.

Hello, I am writing to express my concern about Pebble Mine. I understand that this project means big business and although I am not opposed to that per se, it seems to me the environmental risks and burden of this mine is not worth the profits. Please work towards legislation that will stop Pebble Mine.

I am against this mine. I live in Alaska. A few jobs aren't worth the risk to a beautiful and sensitive ecological area, one that I have experienced first hand.

All mechanical modes of transportation (save handicapped vehicles) need to be excluded from National Parks. To be mentally healthy, people need a quiet place to contemplate their lives. This no OHV policy will promote a natural peaceful experience for visitors in national parks rather than encourage opportunities for an aggressive and cacophonous competition for space on the trails that will only serve to annoy all who visit. Visiting National Parks should be like visiting a museum. It should be a quiet place to inspire contemplation of the views and not encourage hedonistic antagonism. Would you want OHV's on your land if you had created a garden on it for all to visit? Can you envision skateboarding through the roses?

Greetings, Please save Bristol Bay. I believe we ought to SHARE the earth with the animals.

I applaud the Obama Administration's conservation leadership embodied in the America's Great Outdoors Initiative. Our natural resources are threatened by exploding population, unguided overdevelopment & climate change. Make wilderness protection a central component of policy emerging from the America's Great Outdoors Initiative. The President has the authority to facilitate cooperation among federal public land agencies & Congress to identify eligible landscapes for protection as wilderness. The US Forest Service now uses restrictive criteria in determining their recommendations for lands that should be designated wilderness; BLM remains bound by a directive from the previous administration to cease all wilderness assessments. Both constraints can be lifted by direction of the President; as an emeritus member of the American Institute of Biological Sciences (AIBS), I ask that this be done.

we are writing to submit our comments on the proposed sulfide mine in Bristol Bay... we support : stopping the development of the Pebble Mine. not endangering the ecology of Bristol Bay by such mining strengthening relationships between federal and tribal governments tighter standards for mineral development in wetland - in Bristol Bay and everywhere else! thank you for receiving our comments

It's unfortunate that a mine is going to be established in Bristol Bay. Have traveled quite a bit to Alaska. I am 100% against it. Thank you for your time-

## Discussion Question 2

Thank you for initiating this dialogue. One of us attended the session on the lawn of Lewis & Clark Community College on August 20, but was one of those for whom there was not time to speak publicly. The other was unable to attend because the session occurred during the work week. So we are submitting our joint comments by email. Challenges Reconnecting to our rivers: Missouri is blessed with many opportunities to connect with the outdoors, but more needs to be done to make those opportunities accessible. We could do more to provide connections with our major river systems. The Columbia Bottoms Conservation Area is a good example of effort to provide access to the great confluence of the MO and MS rivers. But at the same time, that Conservation Area is under threat of a major casino development virtually next door and within the floodplain. More thorough analysis by FEMA and the Army Corps of Engineers of all "external" costs of such floodplain developments could help local and state governments to understand the true costs of such developments to taxpayers and society. The MO River from Kansas City to St Louis is highly channelized. That results in a narrow and swift flowing river which limits safe opportunities for visitor enjoyment. Programs such as the Big Muddy Wildlife refuge will provide more varied habitat along the river which will be good for fish and wildlife as well as recreation. More funds and emphasis should be placed on that and similar projects. The topic of reconnecting should also include restoration. We cannot reconnect to what is no longer present. In Missouri many of our grassland, savannah and prairie habitats have been lost. Efforts to restore those habitats on public and private land should be supported. Private Lands: Most of Missouri's grasslands and forests are in private lands. A significant portion of the state is managed for agricultural production. Supporting good conservation practices on private lands is essential for protection of the great outdoors. Initiatives for conservation easements, for example, are a good tool. However, such conservation easements need to be enforced. In Missouri conservation easements have been granted along the Ozark National Scenic Riverway, but not always fully enforced by the National Park Service. Crop Reserve Programs are another way to encourage stewardship on agricultural lands. Our growing population and suburban sprawl constantly put pressure on family farms and forests. We should encourage tax and other policies that enable families to keep their land undeveloped without incurring unnecessary hardship and expense. Public lands: Missouri has many public land ownership levels -- federal, state, county, municipal. All provide levels of access and types of high-quality outdoor experiences. Missouri's outdoors are perhaps best known for our Ozark rivers and streams. We are blessed with the Ozark National Scenic Riverways, which include stretches of the Current and Jacks Fork rivers and is managed by the National Park Service. That linear park is currently undergoing a revision of its management plan. The process has highlighted some glaring management problems which have been a growing concern for years. The NPS has failed to follow the mission of the Scenic and Recreational Riverways designation and has allowed numerous illegal river access points, unauthorized ATV traffic and excessive equestrian use to mar and pollute the rivers. Due to agency analysis and public input, a goal of the management review now is to focus on improving water quality and river habitat and to provide for appropriate, but not destructive, recreation. Carrying through will be a difficult task. The background message to this experience is that proper manage

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I'm writing to urge you to disallow the Pebble Mine in Bristol Bay. It is no place for metallic sulfide mining. It threatens habitat, wildlife, and traditional subsistence ways of life. Public lands in the Bristol Bay watershed should be closed to such an operation. Instead, this beautiful land should be protected for future generations. Furthermore, standards for mineral development in wetlands should be highly stringent. The Pebble Mine would be disastrous environmentally in this region.

You all are intelligent human beings with an understanding and experience of what mining does to the environment. Without a strong environment -- long term -- what is there. Find your integrity and the courage to act in the best interests of the environment which includes the health and well being of humans, including your relatives now and to come. Just do it in the ways you know are correct (Maybe that's not doing it.) and let the lust for money subside. It's your responsibility. Use it wisely and with great care. With intense sincerity and hope,

"In wildness is the preservation of the world." St. Henry of Walden evolution means the creation is the creator, we must have enough respect to leave as many places alone as we can, wilderness should be increasing, and the human stain decreasing.....

Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and the way of life of the residents of the area. Public lands in that watershed should be closed to large-scale metallic sulfide mining so that the habitat and recreation become priority. The federal government ought to be stepping to see that the permitting analysis and process protects the Bristol Bay watershed. The partnership between the federal and tribal governments needs to be kept strong s to insure high standards for mineral development in wetlands. Restrictons need to be tighter and the Clean Water Act respected.

There are few natural wonders left undestroyed by greed for profit. Please prevent Pebble Mining destruction.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Having read about the Pebble Mine proposal in the Bristol Bay area of Alaska I felt I needed to let you know of my concerns. My background was as a Refuge Manager for 34 years with the U.S. Fish and Wildlife Service in the western states and the last four years of my career I served on the 7.5 million acre Koyukuk-Nowitna Refuge Complex, Galena, AK, on the Yukon River. I oppose this horrible Mine proposal and hope it is never permitted to start. It is the worst mining proposal I have seen in my life, and I'm 70 years old. I cannot believe it is seriously being advanced in such a magnificent wild area of Alaska. I have seen what these mines have done to the environment in Nevada, Oregon, California and Utah where I have worked and lived. Uplands are ruined, streams destroyed, primarily never to be able to be used again, or be productive for fisheries and wildlife, plus the vegetation takes many years to ever come back. The present information given out by the Pebble Mine proponents say they will protect the environment and take care to assure fish and wildlife and their habitats will be protected. What a joke. This has ALWAYS been shown to be false with these mining operations that I've seen and read about. These companies always leave their work areas as ecological wastes, with very minimum cleanup and restoration. If the price of gold had not reached such a high rate, I'm certain this plan would not have been made. What will happen to this whole area once the gold price drops, which it will? Will there just be a big hole left in the ground, with the associated pollution? Who will be responsible for the cleanup, the state of Alaska? This proposed mining and associated support areas involve some of the last wild rivers for sockeye and chinook salmon in North America and the pollution and habitat destruction will ruin required river habitats and spawning areas for these fish species. Many studies of similar mining activities show that 85 percent of them pollute nearby waters. These total areas will be destroyed for grizzly bear, killer whales, beluga whales and other associated wildlife use if this mine is built. The entire ecosystem will be ruined for short term economic gains for a few individuals through the hard rock mining operations if the Mine is allowed. After the mining is completed, the companies will just walk away from the area and leave it in ecological ruin as has occurred time and time again by the mining industry, particularly in the western U.S. Records show this is the truth. With the continual ruin of salmon populations up and down the Pacific Coast and in the Bering Sea areas this river degradation would be one more man made destructive project of another magnificent salmon ecosystem. Just look at what is happening to the salmon populations that utilize the Yukon River. Man's destructive activities are slowly eliminating the salmon. The Native Americans cannot set out their nets on the Yukon River, which these subsistence living people need and have done for thousands of years, because of the destructive activities of the commercial fishing activities on the salmon populations. This Mining proposal will have similar effects on the subsistence life-style of the Native American villagers, local fishing industry plus the sport fishery this great area provides for the Bristol Bay area. Based on current and past scientific information, which identifies the destruction of natural resources by hard rock mining, and associated chemical pollution this proposed Mining operation should not be allowed to continue in the Bristol Bay Area. This area needs to be left in its natural condition.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

dear sirs. i have fished in the bristol bay area since 1983, making a total of 16 trips to two different fishing lodges in the region. without question, the bristol bay area is one of the most beautiful places in the united states, but it is also home to the the world's most spectacular rainbow trout, bear, bald eagles, foxes, wolves, and caribou--all living in a delicately intertwined interdependence. any damage to anyone of those species would have a chain reaction that would effect the viability of the others. the potential for environmental destruction by the proposed pebble mine is frightening. to those who say the mine is safe, let me remind the that i have been hearing that for years about offshore drilling in the gulf (i live in louisiana). witness what we have just endured with the BP spill. we can not as a nation take a chance of destroying something so valuable and so beautiful by allowing this mine in such a sensitive ecological area. i implore you to stop this madness. thank you,

To those with a deep love for the Natural Beauty of our Blessed country in preserving that beauty for our children and future generations to come, please look deep into your hearts and minds and do all you can do to STOP the mining in Bristol Bay. President Obama has coined September National Parks month, so let's honor that intention just like our forefather Teddy Roosevelt, who was a supporter of America the Beautiful!!!! Pebble Mine threatens clean water, wildlife, salmon and pristine environments. The federal government should provide strong oversight of the mine permitting process and analysis of cumulative IMPACTS to the Bristol Bay. So, please let's ponder the repercussions and the ripple effect of what this continued mining can do and remember our children, they deserve to see America the Beautiful like we and our forefathers have witnessed it. God Bless America land that I LOVE, stand beside Her and guide Her. Thank you for your time and Consideration

To Whom it may concern. I am writing to express my opinion that I believe the Pebble Mine is an avoidable disaster. In now way should we even consider the option for this project which has the potential to compromise, reduce, or even eliminate the most productive salmon fishery in the world. Thanks for your time,

Sir or Ms, Pebble Mine will almost undoubtedly degrade Bristol Bay, its waters, flora and fauna. Bristol Bay belongs to all of us. These are public lands. As stewards of the public trust, you must not allow this to happen. Thank you, in advance, for your defense of these public lands.  
Respectfully

Mining is so destructive to our environment. Bristol Bay is home to wild salmon, traditional subsistence ways of life, has amazing, beautiful clean water and should stay this way. Opening the area to large-scale metallic sulfide mining would destroy it. It would impact the habitat in a way in which could have lasting damage. This area needs to be left as it is and standards for mineral development in wetlands should be tighter  
Regards

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Sir, I am writing this morning and wish to mention that I don't have a great deal of time to put into my thoughts and I hope you will realize that what follows comes from my heart. I know that through organizations I participate in (NRDC and National Wildlife Federation, to name two) I have probably sent you comments about the Bristol Bay (Alaska) Pebble Mine issue. What comes to my mind this morning follows. First, I live in a state (AZ) where so much of our focus is on immigration (a terribly important issue, by the way) and on the sad ways our state political leaders are choosing to deal with such issues, which includes paring down our government to bare bones, etc. Because of this, it is not easy to see any citizens here caring about our environment and I want to let you know that there are some -- my husband and myself, for sure. Second, just this morning I read an article about how grocery stores are moving in a direction to protect seafood availability. It is so important that we care about the food we have available to buy and eat -- how to stay as healthy as possible. Both of the above make me feel that I just must write and ask that you consider the following: 1. Bristol Bay represents a place where we must protect both the wilderness there and also the relationship with the native people in the area. 2. We desperately need better regulation of the permitting procedures for the mining industry. 3. There must be strong analysis of the effects of mining -- analysis that can only be stronger if it involves the federal government. Alaska is for all Americans, not just political leadership in that state. 4. Wetlands are precious -- and we all see that we have not developed good standards for mining effects there. Thank you for taking time to consider my thoughts on this issue. My husband and I have never visited Alaska, but we still have a real love for that place -- as we do for so many wilderness lands in the world!

Please block Pebble Mine: it threatens Bristol Bay's clean waters and wildlife and subsistence ways of life.

Dear Sir: Please do your part by stopping Pebble Mine in order to save Bristol Bay's clean waters, the wild salmon which are almost gone, wildlife and the environment. Please. Thank you,

Dear Mr. Salazar: Bristol Bay is under attack. At least that is how we, who appreciate the great outdoors and love to eat wild caught fish from Alaska interpret the mining industry's proposed incursion upon this watershed. Policies exist in Alaska to protect the waters and streams there from overfishing. I already have lived this year without U.S. wild caught shrimp from the Gulf of Mexico. That because of improper oversight over the oil industry in those waters. Now it looks as if our wild caught salmon is also in danger of pollution from nearby large scale mining operations. Please ensure that the fishing industry is not compromised so that the Earth can be mined. Frankly, I fail to see a way to protect these waters should mining commence. The Lord has given us dominion over the land. With that control comes responsibility to care for and protect fast disappearing wildlife, wetlands, and Native American ways of life. Have you looked into the sky lately? This season when I looked into the skies, I saw very small groups of birds in V formation. Where have all the birds gone? They have gone to farming, road, home, and infrastructure building. I pray that you require stringent standards for water quality should mining commence and that the Native American community in the Bristol Bay area become participants in the decision making process in a proactive way.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Sirs, Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining and instead the priority should be on protecting the local habitat, subsistence and recreation resources of that area. The Clean Water Act standards for large-scale metallic sulfide mining and the standards for mineral development in wetlands should be required to be more stringent. By allowing the federal government to provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed, a more adequate protection would be ensured. Furthermore, it's important to strengthen the relationship between the federal and tribal governments to create a better understanding between both parties. By allowing mineral development, Pebble Mine ultimately threatens Bristol Bay's clean waters, wild salmon, wildlife, and traditional subsistence ways of life. Lastly, I oppose any decisions that will cause environmental degradation in Bristol Bay by allowing the drilling of minerals at Pebble Mine. Thank you for your time with this matter

Dear Ladies & Gentleman: Here in the United States, we have a long history of preserving special places in which Americans can recreate. Sadly, fewer and fewer of these places exist today either in whole or part because we have allowed greed and mis-management to take priority over enjoyment of our national parks, wilderness areas, national forests, etc. You should not allow the Pebble Mine to move forward because there is no viable way to proceed without destroying the surrounding lands. A study of mines similar to the proposed Pebble Mine, showed that 85% of them polluted nearby waters. Bristol Bay is one of the LAST places you should consider such an open-pit mine as it would ruin the habitat for the people who currently live off the land as well as the wild salmon and wildlife who call this place home. The priority should be to protect this habitat and make its recreation resources a priority. A single accident would be disastrous and as we have seen with the Exxon mobile spill a few years ago and now BP in the gulf, these large corporations can not guarantee that similar catastrophes will not occur. This is MY public land. I do not want it to be used in this manner. I'm a taxpayer and the fact that mining claims/rights are given for a mere pittance, like candy, to greedy corporations is a disgrace. Our elected officials and government need to first change the mining laws so that these corporations like Mitsubishi, Rio Tinto and Anglo pay heavily into the American coffers for mining rights. And why, might I ask, are we letting foreign corporations pollute our waters and land an air on our nickel and in our back yards? It doesn't make sense. I'd like to see much more stringent oversight and legislation applied to any and all types of mining wherever they may take place. I want to see the Clean Water Act standards for all mining strengthened and the permitting process be comprehensive and scientifically based. As to Bristol Bay, the answer is NO. It simply does not make sense. It would disrupt the entire ecosystem in a most egregious manner.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am a lifelong resident of Maine and I oppose the proposed development of the land in the north Maine woods by Plum Creek. This company has proven itself ( in this and other states) to have the barest minimum of regard for the environmental impact its activities have upon the land it is a steward of. The people of Maine were not consulted when Plum Creek was allowed to purchase the land, and now many people are not allowed to have any say in the way the land will be used. The LURC commission paid lip service to opponents by having public discussions, while Plum Creek officials kept their cars running by the doorways with police escorts. Obviously the land cannot remain unused, but the 900 house lots will permanently change the character of the north woods, making it just another development. Money should not always be the bottom line. There would be jobs available for locals with the creation of a national park, but I believe the environmental damage would be minimal compared to the Plum Creek plan. Thank you

To those concerned: When it comes to our environment and now the Pebble Mine proposed in Bristle Bay I would feel there shouldn't be any such thought to impose that area with more of the same. Any or all of our Public Land area does not need blatant disregard for moral responsibility and regulatory lunacy for what has been going on these past eight or ten years what with oil spills and all. We show no regard for this Blue Planet and will probably end up with another moon to live on.

Bad idea - please protect the last remaining Beluga whales!

I love nature and wildlife as very many caring people do. Please stop the Pebble Mine from going forward as it would be devastating to the local environment as well as the area's wildlife. We have a moral obligation to protect both. Please do so. Thank you.

President Obama: Please take the time to remind yourselves of the rare beauty priceless resources of the Bristol Bay area. The most important of these is water, clean clear potable water. It not only supports the wildlife and flora, but in the long run will be ever more important to have areas where we can have clean water, a fast diminishing resource. The true cost of loss of these resources as a result of mining is never paid to the American Public. And in the end we always end up paying to clean up the mess after. It seems a losing proposition to keep giving away something irreplaceable for such short term gains that profit the few. Please, do not allow this mine to go through.

I am heartsick at the possibility of development of large-scale metallic sulfide mining upstream from Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Protecting habitat, subsistence and recreation resources should be the top priority. These lands are treasures. Once they are despoiled they are lost forever and there is no going back. My plea is that the federal government will provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. We need high standards for mineral development in wetlands and Clean Water Act standards to protect waterways from large-scale metallic sulfide mining.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To Whom I have a Concern, My son has fished in Bristol bay for a number of years as a drift netter and I am very concerned about the watershed in this area due to the proposed Pebble mine. As the world's foremost area for returning wild salmon, Pebble or ANY mine in the Bristol Bay area would have a devastating effect not only to the bay, but the river systems, aquifers, biological resources, and communities. We, as a planet, cannot afford the greedy attitude of Alaskans to take money and bite the hand that gave it, as told by an article in the Seattle Times recently. I have heard of two "never fail" tailings levees that have poisoned the rivers, land and peoples lives down stream, the last in Kentucky. Pebble Mine proposes an eight hundred foot tailings levee near a fault line. A lake is below and river systems and Bristol Bay. How many disasters have to happen to stop companies who don't care? Exxon has ruined Prince William Sound with crude oil as has B.P. in the Gulf for how many years? When will this government stop this greed by companies when we have seen their disaster plans don't work! Or in the ones I have cited, don't have them! Please don't let Bristol Bay die.

I am writing again because I'm not sure I had success in sending the last one. My son drift nets in Bristol Bay and that proposed mine would not only ruin his livelihood, it would ruin the largest salmon run in the world. That's a big deal. Think about it. The WORLD. Greed too often wins in this country without thought to the future. That the foreign company that wants to build this mine near a faultline is senseless. The cost of lives in a mine collapse, their proposed tailings wall collapsing into the lake below, the river filled with tailings, the bay filled with toxic outfall for untold centuries is a horrific scenario. Is the money that leaves the state of Alaska worth the pittance the state would receive? Fishing brings in billions of dollars, it 's impact is sustainable, and it has gone on for at least 13 thousand years with minimal impact. Mines can't claim that record. Please don't allow it. Sincerely,

Please stop Pebble Mine. It threatens the clean waters, wild salmon, wildlife and traditional subsistence ways of life. Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Our top priority should be protecting habitat, subsistence and recreation resources. Standards for mineral development in wetlands and Clean Water Act standards Must be more stringent. This is important. Please. Thank you.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I want to urge you to do all you can to stop approval of the proposed Pebble Mine in Bristol Bay Alaska. Bristol Bay is a pristine refuge for endangered salmon and other fisheries, bald eagles, bear and countless other species who live in that ecosystem for all or a portion of the year. I am an avid birdwatcher and I understand the importance of saving intact refuges for wild species, because these wild lands are shrinking profoundly. The number one cause of loss of biodiversity, the storehouse of wealth of species, ecosystems and genetic diversity within species, is habitat loss or habitat degradation and this is especially true of our oceans and coastlines. Mines always generate very toxic waste and our world is littered with toxic sites left behind for the public to foot the enormous bill to clean up the mess, if that is even possible. One example of a species that would be harmed by the mine is the Arctic tern, a species which breeds in Alaska and uses the bay's resources, flying the tremendous distance of 12,000 miles twice a year between high northern and southern latitudes, amazing us with their migratory prowess. This and countless other species call this ecosystem called Bristol Bay their home and a mine may possibly ruin this pristine and important habitat. I urge you to reject this mine and vote for saving wild spaces. Future generations will be profoundly grateful for your foresight and willingness to forgo short term profits reaped by a small group of people for greater environmental good for humans, as well as for the plants and animals found in this ecosystem.

I've known about Bristol Bay for 40 years because my uncle fished for salmon there. I'm delighted to learn that it is still a prime pristine fishery but I am appalled to learn that about the proposed Pebble Mine. I urge you to stop this mine.

I strongly encourage you to protect the Bristol Bay area. I do not believe that mining can be done safely in this area. The native community is very concerned regarding destruction of habitat that supports their livelihood. The planned mining method has shown substantial negative effects on the environment and the effect on wildlife would be devastating. This would no longer be the wilderness that it is supposed to be. I strongly encourage you to prohibit the Pebble Mine from occurring. As a family physician, I am concerned regarding the future of the health of all of us on this planet. Thank you for your consideration. Sincerely yours

To whomever it may concern, The proposed Pebble Mine in the Bristol Bay watershed is an idea that should be extinguished. The uniqueness and the diversity of the Bristol Bay region should not be put at risk. Currently Bristol Bay's clean waters harbor wild salmon and other wildlife providing recreational and subsistence resources that are dependent on the current ecosystem conditions. Prior to even considering future mining projects in this and other areas, regulations should be reviewed and tightened to include more stringent Clean Water Act standards for large-scale metallic sulfide mining and more stringent standards for mineral development in wetlands. Thank you for your consideration,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Dept of the Interior, I understand that the Obama administration has invited input from all Americans regarding how to best protect our nation's cherished wildlands and outdoor spaces. Thank you for this. I would like ask that you work to protect Alaska's Bristol Bay wilderness area from the Pebble Mine project. This area is currently unspoiled, pristine, and important to the health of not only America's wild places, but to that of the earth. The pollution from a metallic sulfide mine would easily destroy the habitat of the salmon in the region, which are a base layer of the ecosystem. Damaging or destroying the central food source of bears, whales, seals and eagles would devastate the ecosystem. Even from a solely human angle, the potential destruction of this habitat would severely harm Native communities that have thrived here for thousands of years. Beyond the pollutive effects, the effects of just building the nearly-half-mile-deep, two-mile-wide mine, with its necessary roads and accoutrements, would be destructive enough to damage the important interconnections of the ecosystem. Please protect the Bristol Bay area -- please keep it wild. Thank you, -

Enough already! stop the Pebble Mine and save Bristol Bay. Block this disastrous mine, which would endanger Bristol Bay's spectacular wild lands, world-class salmon runs and other outstanding wildlife. Our entire planet is under attack in one form or another. Please leave it alone! Let our planet heal. We're damaging our nests. Thanks for listening and hearing me,

Please do not permit the Pebble Mine to threaten pristine Bristol Bay. The Bristol Bay area is "Alaska's Wildlife Eden". The clean waters, wild salmon, wildlife habitat and traditional subsistence way of life would all be threatened if the Pebble Mine is allowed to be built. Alaska is one of America's wildlife sanctuaries and we have a responsibility to our children and grandchildren to protect its natural beauty and bounty. Please abide by the Clean Water Act and protect the pristine waters of Bristol Bay from metallic sulfide mining. Thank You,

I love the America's Great Outdoors Initiative; please use this exciting new opportunity to protect pristine areas like the redwood forests of the northwest coast and Bristol Bay's clean water and salmon. Our way forward MUST be through renewable materials and energy, so that strip mining, clear-cut logging and other industries that rely on the destruction of our beautiful national heritage can be replaced with alternatives that are sustainable and economically viable as well.

Please stop the Pebble Mine and save Bristol Bay. There just isn't a good reason to destroy this natural habitat. Thank you,

Whatever we can do to stop that horrendous pebble mine in Alaska should be done. Why can't people realize that the natural beauty and the salmon have infinitely more value than the metal that could be brought out? One day we will see this point. I only hope it isn't too late on this one.

the gold will do you any good when there is no more clean water to drink, clean air to breath, or safe food to eat.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

The environment is an important part to our everyday lives and fighting to protect and expand it will only better our lives and the lives of our loved ones. There is so much beauty all around us and it would surely cause troubles in the future if it began to shrink. Please help in preserving the wildlife and environment around us. We will need every bit of it!

The risk of the Pebble mine project in Bristol Bay is one we can't afford to take. The ecosystem in the area depends greatly on the salmon run; if the waters are polluted, the salmon population would fall, the predators of the area (including grizzly bears, wolves, and seals) would lose a great deal of their food supply, and when you disrupt one level of the ecosystem, inevitably the entire food chain collapses and struggles to recover. The presence of a single man can disrupt the natural ebb and flow of life in any ecosystem; an entire mining project, especially one so large and devastating as the Pebble Mine, can completely ravage it. Alaskan locals are proud of the wildlife there - they won't stand for such destruction of what they call the true gold of the region. How can we take this risk with the waste proposed to be located so close to an active fault line? One single earthquake is all it would take to send the whole thing tumbling down, in turn releasing over nine billion tons of waste into Bristol Bay. One of reasons the Obama administration was chosen by people such as myself was the promise to defend the natural world. I urge you to follow through on this promise: eliminate the Pebble Mine project from the plans and save Bristol Bay.

Bristol Bay belongs to the AMERICAN PEOPLE, not to oil & gas companies. YOU have no right to lease this land, thereby destroying the bay & killing wild salmon (which we like to eat weekly). Wild salmon feed grizzlies & the orca... kill the bay, kill the salmon & you destroy two of America's greatest APEX PREDATORS. Without apex predators, we are overrun with deer, moose, caribou, rabbits... DO NOT LEASE BRISTOL BAY to oil drillers!

\*\*\*\*\* "Our lives begin to end the day we become silent about things that matter." -- Martin Luther King, Jr.

Dear Sir or Madam: I would hope that you might consider the terrible consequences to Bristol Bay as result of the proposed Pebble Mine. Clean waters, recreation, wild salmon, wildlife and traditional subsistence ways of life are all threatened. The federal government should analyze the environmental impact in detail before permitting any mineral development in the area. Wetlands across North America should have strict standards for mineral development. Large scale metallic sulfide mining should not be permitted in beautiful land created by God to uplift the soul. No amount of money could ever compensate for its loss. Please consider this.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Subject line of my e-mail says it all. I copied it from the your website. But I fear that the Pebble Mine will threaten Bristol Bay's reputation as "An Irreplaceable Ecosystem and National Treasure." The mine threatens the bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. The public lands in the Bristol Bay watershed must be closed to large-scale metallic sulfide mining. The DOI should be protecting habitat, subsistence and recreation resources and not allow private interests to over rule the public interest. The DOI should provide strong oversight of the Pebble Mine permitting process and the analysis of the cumulative impacts to the Bristol Bay watershed. The standards for mineral development in wetlands should be tighter and the Clean Water Act standards for large-scale metallic sulfide mining should be made more stringent. Thank you for your concern for the pristine conditions of Bristol Bay.

Save Bristol Bay—stop the Pebble Mine.

I am not opposed to extractive processes, organized industry, or wise use of natural resources. But the plan for Pebble Mine represents the worst practices of the first two and seriously threatens the integrity of the minesite and its environmental surroundings. It makes no sense to destroy the integrity of our living space and that of species interdependent with us. To do so is to commit species suicide -- a stupid and ultimately fruitless policy. We cannot destroy our future merely for temporary profit. We need instead to develop a truly bounty environmental policy: one that will promote the life-supportive health of our living spaces by preserving its interdependency and using its resources for the future as well as merely for ourselves. We cannot live on the corpses of our children.

Hello, I am writing you to urge you not to allow the proposed Pebble Mine to go forward. The activities of this mine with the resultant toxic slurry would be detrimental to the very important fisheries that abound here. As it stands now, a huge earthen dam would be necessary to contain the sulfuric acid and cyanides that result from such mining operations. Alaska is a seismically active state and this includes the Bristol Bay area. An earthquake would cause the earthen dam to fail releasing all the poisonous liquids into the system. Also, there will always be natural leakage and seepage that will introduce these chemicals. The risks simply are not worth it. It is simply wrong to push this project for a short term gain that only benefits a small handful of people. Bristol Bay is an area rich in bioproductivity. The runs of Sockeye Salmon there are legendary. There is great diversity of wildlife there be it the many species of birds that come here, the bears, other mammals. More importantly, the people who live there depend greatly on the fish for their survival. Pebble mine would take this away from them. This pattern of sacrificing rich ecological areas for short term profit while causing great injury to the local people must stop. Pebble Mine would be another item on this sorry list. As an oceanographer, I have worked in the region and can attest to the richness there and can attest as well to the devastating impacts to the region if this mine were to proceed. Companies can never be trusted to police themselves or spend the money to implement the proper safeguards. We have seen examples of this time and time again. One only need to look at recent events in the Gulf of Mexico. I urge you to not let Pebble Mine proceed. Thank you for considering my comments.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Secretary Ken Salazar, America's "Great Outdoors" are not vanishing by some spontaneous black hole. They are being actively destroyed by for-profit interests, and their protection requires the Administration to confront and stop these interests. You may start by desisting from further permits for the blasting of the Appalachian Mountains by coal companies, one of the Greatest Outdoors our nation enjoys. You can also stop issuing permits for the filling and destruction of wetlands by developers, and stop issuing timber sales and oil leases in our remaining wilderness landscapes. To make a contribution to America's Great Outdoors, the Obama Administration can simply stop doing harm.

Dear Sirs, I'm writing in support of saving Bristol Bay, while the discussion continues about the proposed Pebble Mine. It seems that there will be many negative effects on the environment by a mine being built---I've seen photos of the wilderness there, and read about the many plant and animal species that stand to be impacted, as well as the water-quality, and the quality of life of the people living there. I hope that more research on impacts will be done, and that the government will be stringently trying to protect the animals, plants, people, and water of the area. Thank you for your time,

Absolutely NO: Wilderness -- NO MORE! It should have been finished in 1974. National Monuments -- NO MORE! Far too much power in the Executive Branch. Landscape wide planning -- Absolutely NONE! This is Environmentalist fanaticism carried to extremes. United Nations Wildlands / Wildlands Project -- NO! NO! The United Nations has no business interfering in our affairs. The Wildlands Project, wherever it comes from is antithetical to all Americans, to the way we do things, and to our rights to travel through and use our country as we choose. It is essentially a Communist way of controlling the land and the people. Very bad. Wildlife corridors -- NO MORE! Very little of this is actually needed and the USFS and BLM and NPS are already doing what is based on real need. This false issue. Toss it out. Grants to Environmentalists -- NONE. ABSOLUTELY NONE! Federal and state grants to Enviros amount to taking people's tax money and using it to whip them and deny them opportunity. National Scenic Trails -- Drop support for these. The development of these trails, eg the CDNST, is prejudiced on behalf of the non-motorized recreationists, as if motorized recreationists had no need of such long distance travel opportunities. The whole NST push is basically a payout to the "outdoors" industry, eg, REI, et al. Fish stocking -- Reduce it. Too much time, effort, and money are spent on behalf of fish abusers, especially abusers of trout. Good things to say YES to: Multiple Use. Much enhanced OHV opportunities, since so many have been taken away. Much more single-track riding opportunities for motorcyclists. Back Country Recreation Motorized. More logging; grazing permits. USFS, BLM, and NPS lands open to use of firearms, as has been the case for decades. NO MORE shooting closures.

Please do not decide for me how to enjoy my world. I would like to continue my OHV experience with the same respect I have always had for the environment. OHV users are more respectful and protective of nature than most, realizing it needs to be preserved for all uses.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I believe the natural resources of our country should be protected from development when the activity hurts wild life and will result in issues like metallic sulfide or other toxic byproducts polluting water sheds. Stop the Pebble Mine development. As we can see from the disaster in Louisiana's Gulf Coast, all the money in the world can't replace the loss of wild-life and natural non-toxic habitats.

I implore you NOT to endanger Bristol Bay's spectacular wildlands, world-class salmon runs and other outstanding area wildlife, by stepping up to block the disastrous plan to permit Pebble Mine there. The federal government should take measures to strengthen, make more stringent, the standards contained in the Clean Water Act, which would disallow such large-scale metallic sulfide mining in precious territory like Bristol Bay, and tighten standards for mineral development in all our wetlands. Protecting habitat, subsistence and recreation resources should be the top priority of our interior department.

To Those Who Decide, As one who is concerned about the ever-vanishing habitat for species who depend on it for survival, I urge you NOT to enable the Pebble Mine project in Bristol Bay. The disruption and pollution of the environment caused by a mining operation in this still-pristine area would be unconscionable. What you would gain in profit from allowing the operation of this mine is paltry when compared to the loss of relatively undisturbed, clean habitat needed for survival by species that we all value, mostly because we know that their numbers are steadily declining. As Hemingway once said in a short story, "Once they take it away, you can never get it back." And that applies to the few pristine habitats remaining in our world, along with the valued wildlife species that depend on these places for their very survival. Look what BP's greed for oil has done to the once-viable marshes and other wildlife refuges and other coastal habitats along Louisiana, Mississippi, and parts of Florida! My hope is that you will choose not to live with the guilt of knowing that you have followed BP's greedy path to the desecration of yet another remaining segment of our now-painfully-rare undisturbed wild places. Surely, no amount of profit or wealth can compensate for the feeling that would ensue from that.

Bristol Bay is beyond beautiful and serene. It is home to species with whom we share this planet. Our assigned task is to act responsibly on behalf of all species. Mining in this precarious and vulnerable area will result in degrading and poisoning Bristol Bay habitat. If allowed, this will degrade our own existence and debase the value of the adjacent Public Lands. Intelligent and insightful leaders will recognize the true value and act to protect and preserve Bristol Bay and the surrounding area. Where will you stand? If you care, you will review this situation and act responsibly. Respectfully submitted,

In regards to Bristol Bay and any of OUR treasured natural open spaces, please consider the huge value of its pure BEAUTY. There are plenty of scientific reports which can make an argument either way of whether to exploit or not. May you consider the worthiness of protecting the few remaining places of wildness and beauty for that alone and not attach dollar values to everything we can extract from it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As a lover of Alaska from afar ( we have been there four time and hope to visit again) I have been dismayed at the prospect of the Pebble Mine project ruining the pristine Bristol Bay. I strongly urge your reevaluation of this project using the strictest environmental standards and your closing of all public lands to large scale mining. Thanks you for your consideration/

Hello, I am writing about the proposed Pebble Mine. Because Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life, I ask you to close Public lands in the Bristol Bay watershed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. An important aspect of the Pebble Mine proposal should be that the federal government provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. If standards for mineral development in wetlands need to be tightened, they should be. The same goes for Clean Water Act standards for large-scale metallic sulfide mining. Make them more stringent if needed to protect Bristol Bay. Thank you.

This is no time for compromise or for cutting corners either to bolster corporate coffers or cater to political influence. We are smack up against an environmental catastrophe and preserving havens such as Bristol Bay is of utmost importance for our continued survival on a planet that has nurtured and sustained us; that is until we decided we could play Russian roulette with our living legacy. You can actually do something to ward off an ecological disaster. Please do what is right for me and mine, you and yours.

Hello, Please do not allow any mining at all in Bristol Bay. This area is rich in marine life and mining will ruin it!! Thank you,

Please do all possible to protect Bristol Bay from the Pebble Mine. Thank you.

To whom I hope it concerns: I fear that our priorities are seriously off-kilter when we consider allowing the possible destruction of a wilderness area on public lands like Bristol Bay to be sacrificed for the sake of profit. Consider the impact of a project like this on Bristol Bay: "A study of mines similar to the proposed Pebble mine showed that 85 percent of them polluted nearby waters. At Pebble, a proposed open-pit mine would be 2 miles wide (enough to line up nine of the world's longest cruise ships end-to-end) and 2,000 feet deep (enough to engulf the Empire State Building). As proposed, the mine would generate more than 9 billion tons of waste held behind a series of massive earthen dams -- all of them taller than China's Three Gorges Dam and located just 20 miles from an active fault line." What short-term gains could possibly warrant the likely permanent loss of a resource like this?

my understanding is that the proposed Pebble Mine in Bristol Bay is unwarranted and ill-conceived. please consider closing the Bristol Bay watershed to all large-scale sulfide mining. preservation of habitat should be the prime concern, not short-term financial environment. thank you for your attention to these critical choices,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Please don't allow big mining to ruin this wonderful area. Our waters should be protected against big monied interests. We need to protect our environment against these things to preserve what is left for generations to come. The affect of this mine on the area would be devastating to the indigenious animals and peoples of the area. Do what is right for us - the people - and the environment.

The Cascade-Siskiyou National Monument is unique and beautiful. Please do not let the BLM destroy these valuable areas.

The outdoors are about more than our personal enjoyment--they're about our survival. Outdoor spaces need to be conserved even--actually, especially--if they are being underutilized, because "utilizing" the world is the root of many of our current resource and health problems. I urge leaders in Washington to expand and protect outdoor spaces including parks, wildlife refuges, wilderness, trails, rivers and monuments, with special reference to ecological, rather than traditionally human-based, needs.

Please stop the Pebble Mine.

If you care about air and water quality, please stop the Pebble Mine from proceeding. I realize politically it is difficult with this insane rhetoric, but strong leaders always advance. You can be that leader. Many thanks,

Greed, two foreign mining companies and few already rich American backers get richer. \$270 millions of the Alaskan economy will be gone. Depleted will be the sockeye salmon along with the Chinook, Coho, and Pink Salmon. Trout, Pike Char you name it, gone. Now for the wild life, bears, wolves moose and eagles to name a few, gone. It takes a strong leader to make tough decisions, this decision is easy however, Stop the Pebble Mine.

Dear sir I am discouraged to hear of another attempt to despoil such a beautiful place as Bristol Bay. The Pebble Mine should never be allowed to proceed. It is home to wildlife and native people and its waters will be polluted despite what the corporate chiefs say. Think the Gulf and BP. The clean water and wildlife is more important and valuable than any greedy company's profits. I do hope that the right decision to preserve and protect Bristol Bay is made and that a poorly thought out decision based on the profit motive to destroy and pollute such a natural jewel is seen for the heinous crime against nature that it is.

Please do not go ahead with this project. Pebble Mine threatens Bristol Bay's clean waters, their wild salmon, their incredible wildlife and the very way of life for many of the traditional people there. Instead of destroying this land, it should be protected for generations to come! I am so disheartened by this potentially devastating decision and I implore you to leave the miner's interests by the wayside and protect this special place. Thanks,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear administration officials, I am writing to you concerning the proposed Pebble Mine near Bristol Bay in Alaska. Being a native of California where our state's economy faces many challenges, I sympathize with the people of Alaska not to build the mine. Construction of the mine will contribute to the destruction of the beautiful forests many tourists come to see. In addition, pollution leaking from the mine could leak into the bay and harm the salmon population the fisheries depend on. Being that my own state is facing an economic crisis, I would hate to see the people of Alaska suffer the same fate. Instead I would like to see federal regulations put into place that protects Bristol Bay much like our national parks here in California. Now that we are recovering from the effects of the BP spill, I think everyone can agree that we would hate to see another local economy destroyed. This is why I am urging that the federal government work with the local people, and tribes people, to find an effective way to defend to beautiful land for everyone.

When are we going to stop gouging out the earth, to destroy precious habitat and an irreplaceable environment. There's a lot of talk about not penalizing future generations (e.g the growing deficit). Well it's time we took action to halt the environmental deficit - a deficit condition that can never be fixed, once the destruction has taken place.

Dear Sirs, No fancy words needed. We humans are guests on this planet Earth, and we have yet to treat it as it deserves. It's not all about us! We are leaving behind a nasty, nasty footprint that future generations will be left to deal with. Please don't allow our species to have access to all of our planet, especially not a place as pristine as Bristol Bay. We've yet to learn some things are best left untouched. Thank you,

Bristol Bay is very unique as are all pristine areas. We have destroyed so much flora and fauna in the past, let's start now to preserve what is left. It is time to stop mining and drilling and start using green energy. I can remember when I was a child seeing deer and antelope grazing in the fields along the side of the road in Texas. It was such a memorable experience. My children never saw that. Let's save the wilderness areas so our grandchildren and greatgrandchildren can enjoy them. Please save Bristol Bay. I've lived many years in Texas and Arizona. Both states have lots of wind and sun, as I'm sure do other states. Sure, it costs money to build windmills and solar panels but it also costs money to drill and mine. We are depleting resources and destroying the environment by drilling and mining. Using windmills and/or solar panels doesn't take anything away from the environment. The sun keep shining, the wind keeps blowing. Please save Bristol Bay and all other pristine areas.

Pristine areas like Bristol Bay must be cherished and saved. Too many places of such great value have been spoiled and contaminated by corporate activity with profits the only concern and no consideration for safety and preservation of natural habitats. Just look at the Gulf of Mexico! Don't let these special places be developed and contaminated.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am writing to ask that you stop the disasterous Pebble Mine that is up for approval. Pebble Mine threatens Bristol Bay's clean water, wild salmon, wildlife and the traditional subsistence ways of life. Protecting habitat, subsistence and recreational resources should be your top priority for public lands, which should be closed to large-scale metallic sulfide mining. After the disaster we've seen in the Gulf, it should make even clearer that standards for mineral development in wetlands should be even more stringent. Thank you,

do you hear a voice crying in the wilderness...it's a composite voice. it's telling you that if you allow this it will be devastated forever. when do we as a socieity say we have taken enough? - that now we should make sacrifices so that sacred things are protected and cherished. I am very much ashamed of what future generations will say of our greed, insensitivity, and ignorance. a smart person said "the idea of wilderness needs no defense...it only needs defenders". I am asking you to join us and choose the right course for this irreplaceable gem.

Please stop this proposed pebble mine. The area and its inhabitants does not need to be sacrificed for the enrichment of a few people. Please stop this madness before it begins. Recreation, subsistence fishing and the protection of the waters of Bristol Bay should be given priority.

I am an investor. I have many gold mining investments in many companies around the world. I have been aware of the Pebble Mine project as an investment for many years. When I first learned of the project, I did research regarding its potential resources and its potential environmental impact. I realized at that time that however rich its resources, the price of its potential environmental impact was too high to justify development. The proposed mine is located in a pristine environment that is prone to seismic activity. The proposed environmental impact mitigation and safeguards do not seem nearly strong enough to genuinely protect this delicate habitat and watershed from devastation in the event that there is even the slightest deviation from the expected mitigation conditions. The safeguards need to have far more stringent standards and a far greater safety margin for errors and contingencies before this mine would make sense from either an environmental or investment point of view. We have seen from BP's fiasco in the Gulf the extreme risks of inadequate planning and implementation of envrionmental safeguards for mineral extraction. It may someday be possible to extract Bristol Bay's minerals safely, but the current plan fails to address these issues sufficiently to warrant approval at this time. I urge you to reject the proposed mine until such time as the standards for mineral development truly reflect the needs and conditions of the local environment. Thank you very much,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Sir or Madam, Please stop the Pebble Mine and save Bristol Bay, one of the most pristine areas on this earth. The Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. In my opinion, public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. Further, the federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. Relationships between federal and tribal governments should be strengthened. Standards for mineral development in wetlands should be tighter. And, Clean Water Act standards for large-scale metallic sulfide mining should be more stringent. Thank you

I am writing to you as a protest to the very thought of mining in the delicate environment of Bristol Bay. My daughter lives in Alaska with her family and her whole community is opposed to the Pebble Mine. Gold mining is a dirty poisonous business and should not be allowed in Bristol bay where the far more valuable salmon make their spawning runs. Do we really need more gold at the expense of nature and priceless animals etc.? We have spoiled so much of our planet. Please, it is time to nurture nature instead of exploiting it.

OPEN LETTER TO PRESIDENT OBAMA AND ADMINISTRATION OFFICIALS This is our country. It does not belong to corporate interests which will pay for leasing rights, tear up the environment, vow to reclaim the land, report that it is restored and walk away, heading for the next pristine environment which may hold profits. We have seen the Exxon Valdez disaster, the 2009 TVA coal ash containment pond disaster, the 2010 West Virginia mining explosion which killed many miners, mountain top removal mining scars throughout West Virginia with heavily polluted streams, an estimated \$6 billion clean up of nuclear waste in South Carolina, and most recently the BP Gulf Oil disaster. Space limitations allow mention of only these few examples. In 2009, the EPA had to agree to buy out the people of the town of Treece, Kansas, because the whole town is contaminated due to mining for lead, zinc and iron ore which occurred up to the 1970's. This followed the buy out of Picher, Oklahoma, just across the road from Treece, for the same reasons. These are all instances of man-made disasters. For the most part, these disasters occurred in plain sight. Some occurred due to outright error, some because lax regulations allowed profit-seekers to implement the cheapest methods of extraction, containment, disposal of waste and safety oversight, regardless of the dangers to human health or the environment. Please reconsider any approvals for foreign or national interests to mine the pristine environment of Bristol Bay in Alaska. How will the U.S. government control abuses to the environment -- the land and water, the air and the animal population -- not to mention the human populations. What if there were an earthquake in this fragile area which released contaminated sediments into the wetlands and coastal waters? How will this area ever be fully reclaimed after the intrusion of so many new roads, equipment and infrastructure to sustain such a huge project? You could look to the north in Alberta, Canada, at the environmental disaster created by mining for oil at the Athabasca Tar Sands Pits. Or fly over our own State of West Virginia.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am writing today urging the President to make wilderness protection a central component of his policy emerging from the America's Great Outdoors Initiative. Our natural resources are severely threatened by pressures like expanding population, unguided development and climate change. The President has the authority to facilitate better cooperation among the federal public land agencies and Congress to identify eligible landscapes and protect them as wilderness. Currently, the U.S. Forest Service uses overly restrictive criteria in determining their recommendations for lands that should be designated wilderness. Worse, the Bureau of Land Management is bound by a directive from the previous administration to cease all wilderness assessments. Both constraints can be lifted by direction of the President. Thanks for your consideration of my comments.

Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Pebble Mine is a bad idea. Thank you for your consideration.

For many decades, the good of the earth on which we live (our only place to live), has taken a back seat to every interest in taking and largely squandering it's limited resources. The interests I mean are businesses. un for profits. Profits are in the front seat, driving, always. The US government is just as guilty as our businesses for the overuse of every respource, the polution that rings the entire planet, inseas and in air and the devastation of so many thousands of square miles, that no one has ever bothered to count them, literally. Stop it now. God sees us and what we do. I used to be ashamed of things I'd done or allowed. Now I don't do them and don't allow them if I can help it. You should make such a change. Everyone in any position to stop the degraadation of the planet should make such a change. It's all we have to live on. It's all our grandchildren will have to live on, but they'll be fighting wars over clean water, thanks to us. We already have wars over oil and natural gas, diamonds, land and other minerals and resources. Water wars will come shortly. You can make a difference on this planet. Start now, before it's too late. God bless,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Ladies and Gentlemen: I've been reading about a wondrous place called Bristol Bay. I haven't been there but I sure would like to visit. I've also been reading that some foreign mining companies want to exploit this amazing place for short-term profit. I hope you won't let them destroy Bristol Bay and its watershed -- as their mining surely would -- before I, and my children and grandchildren, get a chance to visit. In fact, I hope you won't let them destroy it at all, because I hear lots of magnificent animals (probably including some humans) would be destroyed in the process. If you let the profiteers have their way, they will wreak destruction on Bristol Bay and all of its present inhabitants. The waters and lands will be irremediably fouled. Untold salmon, sea lions, bears, whales and eagles will be poisoned or starved, or both. The lives of people there will be forever changed -- for the worse. The job of the U.S. Government is to protect its people and their ways of life (the Declaration of Independence says as much). It is not the job of the U.S. Government to maximize the short-term profit of private Japanese and European conglomerates (regardless of their campaign contributions). When the Bush/Cheney/Rove crowd left the White House, I believed, and hoped, the U.S. Government would resume doing its job. So far, I've been disappointed. \* You must not allow our lands and waters to be befouled, even a little bit, with mining chemicals (and I think the Clean Water Act and other laws require that). \* You must protect the natural habitat and subsistence and recreation resources of the Bristol Bay watershed. \* You must assess the cumulative environmental effects of this mining proposal based on on-going, thorough, thoughtful and comprehensive analysis of all independent scientific information, and you must rigorously control every aspect of the permitting process accordingly. \* You must develop and improve the U.S. Government's relationships with the peoples who live there. \* You must create and impose mining standards that prevent the sort of desecration that Anglo American, Rio Tinto and Mitsubishi threaten. (You know those companies don't care about the land or the waters or the people or the wildlife; they care only about their profits.) If you don't get this right, the people of the United States will pay an unimaginable price, far in excess of the petty profits of the foreign mining companies. Sincerely yours,

I believe we have damaged our environment beyond repair. And we continue with business as usual despite the growing accumulation of evidence that our air, soil and waters are massively polluted - most likely beyond repair. The Pebble Mine is an enormous mistake, as our current practices are vastly inadequate to insure proper disposal of waste generated. Money would be better spent on education to hold the current human population in check, as there are too many people worldwide. We can not continue to live at the expense of all other living things. I feel we should stop letting big business call the shots. I am an American, and proud of it, but - with every passing year, I despair of anything actually being accomplished to save ourselves, which can only be done by protecting All living things. We have done enough harm to the very things we need to live well.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Our planet is in such grievous trouble right now that many of the people I talk to are losing hope of saving our natural resources. But I cannot believe that money-driven greed can be allowed when the last and beautiful landscapes of the North are in such danger. A project such as the Pebble Mine is such a travesty and to expect the public to swallow the soothing phrases of "No Danger", "There will be no pollution," etc. etc. is to think that we are ALL totally gullible. Just look at the disaster in the Gulf and lives and creatures destroyed! For all our sakes as well as yours, please put a stop to any further discussions about the Pebble Mine!

I am writing to urge consideration of the following points regarding Bristol Bay: Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. I believe the Clean Water Act standards for large-scale metallic sulfide mining should be more stringent.

Hi, Please stop the disastrous pebble mine, for a chance to a future with hope for all .

Dear Director Abbey, I am writing this letter to ask you to make a different choice. Since the beginning of the industrial age we have allowed the decimation of our planet and resources. We are feeling and seeing the effects this destruction and exploitation has on human lives, in the forms of numerous cancers. Almost everyone has lost someone they love to some form of cancer. The destruction of watersheds and deforestation has led to recognizable shifts in the world's weather patterns. This affects everyone, including big businesses. Natural disasters in the last 20 years have cost governments and businesses hundreds of millions if not billions of dollars. So you have a choice to allow this mine and in doing so please know that you are personally responsible for the loss of all of these species, loss of a way of life and income for countless people, and a contributor to the destruction of this magnificent planet that abundantly supplies you with the air you breath, the water you drink, and the sunshine that grows your food and warms you. You could also have the courage and the vision to make a different choice. To choose life, beauty, and wholeness for yourself and the entire planet that will be affected by this massive project. You can say no to the Pebble Mine. But before you make your decision I ask you one favor. Go and sit in this magnificent wilderness. Witness the living creatures, the water, meet the people living there. Sit and breathe the air and feel the sun on your face. And then decide if you can sleep at night knowing that you were responsible for it's destruction. I wish you all the support in making your decision. I truly hope the Earth and the other living creatures that do not have a voice are honored in this choice. Thank you, - "So for all that we struggle and for all we pretend, you know it don't come down to nothing except Love in the end". David Gray

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Administration Official, I am amazed that the Pebble Mine is still on track for being developed. It poses a dramatic threat to a rare and fragile area that belongs to all Americans - for the benefit of very, very few. Chemical waste in this area - when standards are already too loose - would devastate the place. You have a responsibility to the rest of us, to protect the unique and beautiful Bristol Bay. I urge you to act responsibly.

TO WHOM IT MAY CONCERN, AND IT SHOULD CONCERN US ALL, FUTURE GENERATIONS OF OUR CHILDREN AND GRANDCHILDREN ARE DEPENDING ON US TO PRESERVE AND PROTECT OUR ENVIRONMENT, INCLUDING OF COURSE OUR WATER. PLEASE SAVE BRISTOL BAY. PREVENT PEBBLE MINE. WE COUNT ON YOU

Hello, I've been following the Pebble Mine issue for some time. It makes no sense to endanger one of the last pristine Salmon and wildlife habitats left on earth for the short term gain of 2 foreign owned company's to destroy something as valuable as the Bristol Bay watershed. No amount of money could ever replace what would be lost by this ill conceived project. Please take this issue under serious consideration and put a halt to it. Thanks You,

A huge problem to be caused by the Bristol Bay Pebble mine is endangering the spawning grounds of wild salmon. This a major spawning ground and an accident at the mine, the process of creating the mine and then mining it would cause the pollution to eliminate this fishery. Thank you

Especially with climate change upon us and likely intensifying immensely over the next 100 years, we need presidential leadership now more than ever to protect our wilderness quality lands so that they will be available as crops fail and there are massive population movements to escape devastating changes in regional ecosystems in the South and Southwest. Having places and pathways will be critically important not only for humans whose livelihoods fail, but also for the migration and protection of animal and plant populations in places they can fit ecologically. I'm asking the President to please make wilderness protection a central component of his policy emerging from the America's Great Outdoors Initiative. The President has the authority to facilitate better cooperation among the federal public land agencies and Congress to identify eligible landscapes and protect them as wilderness. Currently, the U.S. Forest Service uses overly restrictive criteria in determining their recommendations for lands that should be designated wilderness. Worst: The Bureau of Land Management is bound by a directive from the previous administration to cease all wilderness assessments. Both constraints can be lifted by direction of the President, and I urge that this be done.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We must cease putting our rare and beautiful wilderness areas and seas in jeopardy because we are too greedy and lazy to invest in alternative energies and resources. Soon, we will not have any more of these places to enjoy and marvel at because we have destroyed every beautiful place that we have tried to preserve. Soon, we will have destroyed ourselves with our selfish, greedy ways and the human population and all other beautiful creatures God has given to us to protect and cherish will be gone from this planet. The short sightedness of these kinds of decisions is far reaching and even if it doesn't happen in our lifetime, it is nonetheless a tragedy and a crime against God. I trust you will have the foresight to see the lack of wisdom in this venture and vote to stop the mining at once

As one who cares about wildlife and the environment, I am writing to encourage you to not let the Pebble Mine project go forward. It is my understanding that if Pebble Mine is built, Bristol Bay's clean waters will be threatened, as will its' wild salmon. The wildlife in the area will undoubtedly experience habitat destruction. There should be no place for large-scale metallic sulfide mining on public lands, or in a watershed area. For all these reasons, I hope the federal government will provide strong oversight of the Pebble Mine permitting process, as well as stringent analysis of the cumulative effects to the watershed. It is also my hope that this project will be denied. Thank you for your consideration.

Bristol Bay is a pristine area with clean waters, wild salmon, wildlife and traditional subsistence ways of life. It is a wonderful place to enjoy and to want to leave for our children. It is not a place that could be re-created. The Bristol Bay watershed should be off limits to mining and development. Unless we protect areas like this now, they will be gone forever and our lives and those of our children and grandchildren will be less rich because of it.

I request that the permitting for the Pebble Mine be denied. Because Alaska is so far removed from the familiar for most Americans, we don't hear or see much about projects like Pebble Mine. But when one considers what is at risk downstream--in Bristol Bay--we have to speak out in order to avoid disastrous consequences. Bristol Bay is the 'breadbasket' of fisheries that provide a remarkable abundance of the very best seafood. The health of the Bay is essential to the continuing stream of seafood from Alaska to our dinner tables, to the continuation of one of the world's best fisheries and the thousands of jobs it supports. FOREVER is the word we must remember when discussing the health of Bristol Bay. One need only look southward down the Pacific Coast to see what can be lost: for example, California, where salmon are now virtually extinct despite the incredible abundance that was found there a mere 100 years ago. There is no way that adding vast mining waste and runoff to the tributaries of Bristol Bay can do anything but harm the Bay fishery. There is no way that the inevitable toxic mineral runoff from the proposed mining can do anything but harm the health of the marine ecosystem. Please make the intelligent choice for all generations to follow us, and reject this mine.

Plain and simple...ANYTHING that may result in the forever destruction of our natural land and seas should be avoided at all cost. There is NO excuse. Our planet will eventually die, but until that time it should remain with enough places that give one pause and sigh as only nature, unspoiled can bring. Please halt any potential mining at Pebble Mine. Protect forever Bristol Bay

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I haven't personally visited Bristol Bay, but from photographs I have seen the beauty and majesty of the lakes, rivers, and mountains, and all the wildlife. Besides being breathtakingly beautiful, this area supports the world's largest sockeye run and Alaska's largest Chinook run, which provide food for bears and seals in the region, as well as an economically potent commercial fishing industry. I hope this pristine wilderness survives the upcoming threat posed by Mitsubishi, Rio Tinto, and Anglo American, who seek to open more than one million acres of public land to mining. This proposed open-pit mine would be two miles wide and 2,000 feet deep, exposing the surrounding lands and wildlife to potentially dangerous and deadly conditions. This mine, once constructed, would generate more than NINE BILLION tons of waste! A study of similar mines showed that 85 percent of them polluted nearby waters. Whatever these companies hope to mine out of the ground cannot be worth more than the clean water, precious landscapes, unspoiled wilderness, and healthy ecosystem of the Bristol Bay area. Please, do what you can to promote awareness of this potentially devastating mine and prevent it from happening!

I am writing to ask you to stop the Pebble Mine and save Bristol Bay. My country has been blessed with vast and beautiful natural resources. We, as Americans, have spent decades slowly eroding these resources. We have polluted our air and water, we create urban sprawl, we destroy vast amounts of wilderness through logging, mining, drilling, and forest fires. Our political landscape is overwhelmed by corporate lobbying in contrast to plain old common sense. It is time for all of us to protect our blessings and look for modern-day energy solutions, not the same old destructive ideas of the 1900's. Please stop Pebble Mine. Thank you for your consideration. Very truly yours,

IT IS ONLY SADLY SURPRISING TO NEED TO EXPLAIN WHY SAVING BRISTOL BAY IS NECESSARY.

Citizens are very aware of the impact of draught years and that they are inevitable and that they will get worse as the decades go by. There is not enough water or power or water sewage treatments or roads available to accommodate for more people and more buildings. We need to take a stand that over-population is ruining our social and wildlife resources. It makes us braced to claim the dismal water and power resources for our own. The reality is that if we take care of open spaces, our wilderness areas, and protect farmland we have a chance to keep our communities and this State alive and sustainable. Local governments are misguided to encourage more building in order to get more money for their coffers. It is an act of desperation but the ethical considerations are being ignored. Saying 'no' to more homes and buildings would help create an ethical decision to take care of what we have and stop over-crowding, more traffic jams, more water scarcity. We must stop local politicians from bringing in more people to balance their budgets. They did not rebuild the infrastructure and plan for the inevitable draught years when the budgets were in the red, they just increased their own salaries. Now must come a time of correcting this mistake and returning to sanity. More over-population will not solve our problems. Please put the long-term view first and give our children a land that we leave for them that is sustainable, that promotes agriculture, and that protects as much open space and sanctuaries for wildlife as possible. These decisions are difficult but they are ethical. thank you.

I am very distressed to think of harm coming to Bristol Bay. We are given this gem, this gift from God and we would carelessly trash it for dollars. How sad and what a disappointment we humans are.

## Discussion Question 2

***(cont.)***

To: President Obama, On the Preservation of America's Natural Wonders "If you ignore beauty, you will soon find yourself without it...But if you invest in beauty, it will remain with you all the days of your life." ~Frank Lloyd Wright I LOVE Beauty – beauty in all its intricate and splendid forms – be it, a spectacular sunset descending into the pink hue sky, a school of dolphins charming us with their spins and flips, a tiny hummingbird hovering before our very eyes, a beaver building a dam, horses running in freedom and ecstasy through a meadow of lilies and daffodils, a rugged mountain challenging us to climb, or simply a quiet walk through a dense forest – the list is endless. As you have admired works of art in the finest of museums, I invite you to imagine this magnificent planet as a canvas upon which a higher power has created and manifested the most stunning, staggering and breathtaking beauty of all. One need only be conscious of this remarkable beauty – the rugged mountains, pristine lakes, roaring seas, remarkable wildlife and rich forests – to understand the magnitude and critical level of importance in its preservation. "In all things of nature there is something marvelous."~Aristotle The great outdoors is "Free" medicine for the mind, body and soul. · The great outdoors "connects the spirit to nature" – it nourishes and feeds the soul with its intoxicating beauty. The oxygen we inhale in the great outdoors has reviving qualities, is healthy and pure, and keeps our spirits youthful. · The great outdoors clears the mind of everyday stresses, while giving us the ability to view life in its true perspective. · The great outdoors strengthens and tones the physical body, helping to keep disease at bay. · The great outdoors brings families closer together as they rally in joy at the prospect of hiking together, with pets in tow, on a glorious Saturday afternoon. · The great outdoors offers the outdoor participant the rare opportunity to be an observer of our precious wildlife in their natural habitat and hopefully instilling a newfound understanding and appreciation. · The great outdoors may even save a marriage or two as the couple reconnects through laughter or admiring the beauty of nature as it unfolds before them. · The great outdoors may help to instill values and respect in children, and get them off the computers every now and then. "Our task must be to free ourselves...by widening our circle of compassion to embrace all living creatures and the whole of nature and its beauty."~Albert Einstein Now, it is up to us, to live up to the task as responsible stewards of the earth to protect our natural treasures, our natural heritage, and magnificent wildlife. Our public lands are continually challenged and stressed with increasing development and pollution pressures, and climate change posing the gravest risk of all. It is time to take bold and urgent action to protect our land, water and history for generations to come. As scientist estimate that 20-30% of species could become extinct by 2050 as a result of climate change, it is time to take the critical steps needed to protect habitat and help species in peril by making this a top priority. Dedicating long-term funding for natural resources adaptation strategies is one important step the Administration can take and the development of a national adaptation strategy that clearly delineates how natural resource agencies should practice climate-smart conservation. Seize the opportunity for a stronger and more united America by creating, expanding and better protecting America's shared outdoor spaces – protect wildlife habitat, clean up our rivers, expand our parks, conserve working farms and forests, create more trails and places for kids and adults alike to simply enjoy the great outdoors in this great country. As well as our wildlife, our prec

please dont ruin what natural beauty we have left, think of another way

I work for one of the government's largest land management agencies, but we are rapidly losing our ability to protect what's inside designated protected areas, due to losing habitat and connectivity outside of our boundaries. Increasing protection in these neighboring lands in these boundary areas, and/or in tact ecosystems will provide additional areas for wildlife and flora to continue to flourish. We can not allow our protected areas to become islands. When the research has already been accomplished, and we can articulate why an area is important, we need a support system to acquire or protect these lands.

It is vital that we all work together to protect and save the many important and beautiful ecosystems that we are so lucky to have here in the USA. They are important in so many ways, and it's pretty darn impossible to restore a natural landscape once it is degraded. Yes, development will continue as it must, but let's do it in a sensible way and not let greed and wrong intention guide us.

Dear America's Great Outdoors Initiative: The Administration needs to seriously take on the issue of protecting our "nation's lifelines" -- our rivers -- for this and future generations. In many communities, like my own, the publicly accessible portions of rivers are linear parks, open to all regardless of age, ability or income. Our local river, the Mokelumne, is used by hikers, swimmers, birders, wildflower watchers, young people courting, families picnicking, anglers, rock climbers, artists, parents teaching their kids about nature, cyclists and more. It provides a place of inspiration, re-creation, enjoyment and solace for our local public. And in this, it is not alone. One cannot know America without knowing rivers. One cannot understand our history, our literature or our culture without knowing what a river is. Yet our river, like so many others in the U.S., is threatened by yet another unneeded and poorly planned dam. The Administration needs to embrace the goals of the National Wild and Scenic Rivers Act, to balance the development of rivers with the protection of others for this and future generations. Supporting the grassroots effort to designate California's Mokelumne a National Wild and Scenic River would be an excellent place to start. See [www.savethemoke.com](http://www.savethemoke.com) Thank you for this opportunity to comment.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Bristol Bay is a wetland home for bears, wolves, seals and whales, all drawn by salmon runs which support valuable commercial fisheries and indigenous people. Yet our American public lands and our rich heritage of wildlife, sustainable fishing and native peoples are about to be sold out to foreign mining companies, including Mitsubishi, Rio Tinto and Anglo American. After watching British Petroleum trash our Gulf, why are we so eager to let another batch of foreign multinationals trash sustainable fishing, pristine coastlines and public lands in Alaska? I grew up in Arizona, where the evidence left by hundred year old hard rock mining abounds. It was hard to take a hike in the woods around my home without stumbling across abandoned mine shafts. In some areas, slag heaps from old gold and copper mines covered acres of land, and were still leaching poisons into the watershed. In Jerome, where my cousins had a ranch, smelters spread pollution to such an extent, that the mine was forced to buy out local ranchers, because sustainable grazing land was now toxic. My cousins literally loaded their home onto trucks, and left the land their family had homesteaded more than a hundred years earlier, forced out by the cumulative impacts of mining. Miners came and extracted gold, silver and copper. After the mines closed, the damage remained. More than 100 years after the Arizona gold rush, the native people I knew, many of whose relatives had worked in the mines, still looked at gold with dread. They said it made non-Indians crazy. According to the Constitution, native tribes are sovereign people under the jurisdiction of the US government. Tribes which are stakeholders in Bristol Bay should be included in the oversight process for any possible mining permits, with full rights to raise questions and have their concerns addressed. According to NRDC, "a study of mines similar to the proposed Pebble mine showed that 85 percent of them polluted nearby waters. At Pebble, a proposed open-pit mine would be 2 miles wide (enough to line up nine of the world's longest cruise ships end-to-end) and 2,000 feet deep (enough to engulf the Empire State Building). As proposed, the mine would generate more than 9 billion tons of waste held behind a series of massive earthen dams -- all of them taller than China's Three Gorges Dam and located just 20 miles from an active fault line. A single accident here would be disastrous. But even the construction and operation of the mine could disrupt salmon migration and jeopardize the larger ecosystem. It's a risk most local Alaskans are not willing to take. The true gold of this region, they say, is its fish and wildlife." The hundred year old mine tailings I grew up around were in desert country, where pollutants were relatively stable. Pebble Mine is proposed for a wetland. Mining in a wetland makes pollution instantly waterbourne. Why let foreign multinationals trash more American coastlines, wildlife habitat and sustainable industries? Congress needs to tighten all mining standards, and particularly Clean Water standards for sulfide mining. Yours,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The greed of the big foreign mining companies should be stopped. Pebble Mine is planned for and located at the headwaters of Bristol Bay, Alaska. All the rivers and streams in the area are salmon runs. They provide one-third of the world's wild salmon. It would take only 2% of copper tailings in the water to prevent the salmon from laying fertile eggs. More, and the salmon become contaminated. Picture a small child eating the toxic salmon. The toxicity effects the brain. By the time she is in the 6th grade she would not be able to read. She would not be able to do the math. Is this what the Federal Government wants? The big mining companies say they will not spill, the big oil companies have said the same, but they have daily or weekly spills. Luckily not all are like BP's Gulf spill, but they are toxic spills nevertheless. How can the big mining companies not spill? The area is in the Tundra. Water will continually go into the hole, become toxic and have to be pumped out again in order for them to work in there. Pumped out to where?? These greedy guys need to think again. The Alaskans living in the area are fisherman. They provide the Wild caught Alaskan Salmon to us. They can lose their livelihood! That one third of the world's wild salmon can be wiped out, or at least contaminated enough that the bears and eagles and humans who feed on them can become sick, is so strong a possibility you folks need to say NO to the pebble mine. It could wipe out a whole ecosystem. Have you looked into their past diggings in Africa? In Ireland? In Nevada? Take a look and talk to the people who have had to put up with the results. Please put a stop to Pebble Mine in Alaska. It's greed. Nothing else.

Dear Sir or Madam: Please stop the Pebble Mine from happening in Bristol Bay. This mine would bring terrible pollutants into this area that would destroy wildlife in a beautiful area that should be protected. Don't sacrifice this beauty of nature for the profit of a few. We need to protect these resources for our children's children. Don't be influenced by the needs of corporate greed. Thanks for your help.

I speak for my grandchildren...please protect the pristine parts of our world so that future generations can enjoy and be proud of our efforts to keep the earth from exploitation and despoiling for quick and easy profit. There will be no going back once we have destroyed the natural balance of nature. And regrets at that time will accomplish too little too late.

Please stop the Pebble Mine to save Bristol Bay. The public lands in the Bristol Bay watershed should be closed to metallic sulfide mining. The government should provide strong oversight of the Pebble Mine permitting processes. There should be stricter standards for lage -scale metallic sulfide mining to protect water and wildlife. The two things human cannot live without are water and oxygen. Please protect the water of Bristol Bay and all those animals, plants and humans who live there.

I grew up in Alaska and have been able to enjoy it's wild beauty throughout my life. The proposed Pebble Mine is a horrible threat to the pristine wilderness of Alaska, especially the Bristol Bay area. Please don't let this catastrophic change take place--we don't want a "Gulf Oil Spill" in Alaska. Thank you

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As a future Meteorologist, I would like to see a big change in air pollution and climate change. There should be laws made so that is mandatory. Keeping this planet healthy should be top priority. Our oceans and wildlife should be protected. Factories and other big companies should not be allowed to dispose of waste into the air. Nor should they run off waste into our oceans. It is killing our ocean and wildlife population and its harming our air; causing climate change. If we continue the way we are, future generations will not be able to fix what we have done. They also won't experience the beauty of Earth like past generations have. It is time to start now. AND MAKE IT MANDATORY. Everyone must help.

Dear Department of the Interior/relevant Obama administration official(s), I'm writing to voice my strong opposition to permitting Pebble Mine to go forward in Alaska. I am sure that proponents of this proposed mine will attempt to play down or dismiss the torrent of opposition to it as an ephemeral reaction to the BP disaster in the Gulf of Mexico. I assure you that, for me and everyone I know who feels similarly, that couldn't be farther from the truth. The idea that the clean water and extraordinary wildlife of Bristol Bay, and the indigenous people who depend on that wildlife to live, could be decimated for large-scale metallic sulfide mining of low-grade mineral deposits on public lands, made me physically sick even before we learned what can happen when exploitation of resources at any human or environmental cost is the prevailing ethos (or absence thereof). I, and millions like me, are horrified and angry that such a venal act can even be under review by this Administration. We veered between rage and resignation at the systematic dismemberment of hard-won environmental regulations in place prior to the Bush administration, thinking we just had to hold on until this President took office. Now, we ask you to live up to our expectations that you will do a cost-benefit analysis of this situation that is moral, adult, farsighted. Is the nation's need for hard-won, deep-dug copper and gold so dire that it justifies pollution, disfigurement and possible destruction of extraordinarily beautiful wildlife habitat? Are these low-grade minerals worth the havoc wreaked on the indigenous people who have made their living from this land for 11,000 years? Will this be so much as a blip on the national economy's radar? And even if the economic gain were significant, at what point do we draw the line on the devastation of fast-disappearing, near-pristine wilderness? Please -- however jejune it may sound to you -- please think of our children. Ask them whether they'd rather have a gold bracelet or another circuit board, and maybe a .000001% improvement in the GDP, or know that the salmon, the grizzlies and seals that depend on them, the whales who need so much clean water to survive and reproduce, will still be there in large and healthy numbers when your kids' own children arrive on this planet. Be wise. Thank you for your thoughtful attention.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As one who has visited the great wilderness of Alaska many times and the Bristol Bay area, I implore you to reconsider the Pebble Mine development or at the very least, provide strong oversight into this mining. I think all citizens of the US would agree, that Alaska is the last of this country's great wildernesses and any threat to this wilderness is a great concern to me. We cannot afford for the habitat to be endangered in this area. This area needs to be preserved for the citizens today and for the generations to come. Even though precautions may be taken, things go wrong and the effects are devastating. A single accident here would be disastrous. But even the construction and operation of the mine could disrupt salmon migration and jeopardize the larger ecosystem. It's a risk most local Alaskans are not willing to take -- the true gold of this region, they say, is its fish and wildlife. Thank you for your time,

African American youths are deprived of outdoor physical activity. Waterparks and recreational centers in Saint Louis inner city and St. Louis north county parks have will benefit all. Usage of waterparks will bring the community together, it will introduce young and old the vital skill of laughter and fun, survival and physical fitness. Please help us....Swimming programs is a vital and necessary skill. Upgrade the small recreational centers and programs. Eliminate charges to low income to participate in a swim program. Make mandatory in the schools as a curriculum.

Dear America's Great Outdoors, As a naturalized US citizen, I ask you humbly to carefully consider the consequences of the Pebble Mine to the Bristol Bay watershed. I am deeply grateful for the opportunities that the United States has afforded me and it pains me to see the complacency of my government and its current administration in the face of wealthy business interests. Once lost, the ecosystem in the Bristol Bay watershed can never be recovered and it is one of those beautiful places that make the United States special. Please do not bend to business interests and sell away something that is not yours to give. Please stop the Pebble Mine proposal once and for all. Protect that region for the benefit of future generations of Americans - not to mention this current generation! Thank you for your time.

Coming from south central Texas, you might wonder who I am concerned about a place as far away as Bristol Bay. It's because I live close to nature here on my ranch in a beautiful part of the country and wish to keep the heritage of natural beauty and unspoiled land and water for future generations. I have seen too much "sprawl" in my own state and as I have flown over this huge country of ours. With every trip, it becomes more painfully clear to me that there is very little that is still unspoiled. Bristol Bay is a fragile environment, and no mine can ever produce enough wealth to cover the cost to the environment there. Thank you for letting American speak out on environmental concerns. I stand with the Obama administration in protecting the environment.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I urge you to rethink the Pebble Mine situation. It threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Our public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources for future generations should be the top priority, not Corporate Profits! The Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed should have strong government oversight. The relationships between federal and tribal governments should be nurtured and strengthened. The standards for mineral development in wetlands and the Clean Water Act should be tighter. Our Public lands should be managed in a way that demonstrates good stewardship of these valuable resources. Thank you for your consideration. Respectfully

America's great outdoors are incredibly valuable to us all for a variety of reasons and we have a great responsibility to be wise stewards of them for future generations. Locking up ever more land in wilderness should be carefully weighed with other uses. Wilderness designation immediately limits the uses allowed and therefore limits the number of people who can enjoy the area to those who have the leisure time, the monetary resources, and the physical ability to enjoy them. Here in Oregon, we enjoy some of the most beautiful and awe-inspiring public lands in the nation. There are a few places that can be good candidates for additional protection from multiple uses, but there are a lot of places that single focus groups like Oregon Wild want to throw a wide loop around that do not really contribute to the experience of people who enjoy places like the Wild Rogue River, the wildlands surrounding Crater Lake National Park, and the Siskiyou Wild Rivers. While Oregon has protected only 4% of our land as Wilderness, vast additional lands are functionally dedicated to limited human uses by other designations at many levels from Congressional action to USFS and BLM Resource Management Plans. Much of the wildlife that call our public lands homes coexist quite well with a variety of other uses of the land. Oregon Wild claims that millions of people enjoy these places for quiet recreation, but that is logically inconsistent. If anywhere near that number of people invaded wilderness areas, it would no longer be "quiet" recreation and the impacts of that many people concentrated on the trails and other limited locations suitable for foot or horse travel (including compaction and bodily waste) would be astronomical. Their greatly exaggerated numbers and consistent with their normal pattern of exaggeration and hyperbole on most issues related to natural resource management. Thank you for considering my comments.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I would like to express my deep concern over creating inappropriate Wilderness and Monument designations. Locking the public out of public lands would actually disconnect people from the great outdoors. OHV recreation is the best way to get out deep into a wildlife area and away from the city. It is a family-oriented activity that parents can share with their children and teach them about wildlife. Learning about it in books and videos just isn't the same thing. Many citizens can't hike for very long. They might have a bad knee or back, might be out of shape, might have asthma, etc. OHV recreation lets these people still enjoy the wildlife areas. They can still share the experience with their families and don't get left behind. Wilderness access trails must remain open for these people in particular. Most people involved in OHV activities are often very responsible citizens and treat the areas with the utmost respect. As with any activity, you do get the occasional "idiot" that makes the rest look bad, but that is a rarity. The reality is, many members of the OHV community volunteer their time, money, and vehicles to maintain and preserve wilderness areas. After all, they go to the wilderness to enjoy it and want it to remain that way. Time and time again, I have witnessed fellow OHV members pulling together to repair fire-damaged areas (from lightning, etc.), remove fallen trees that block fire trails, repair washed-out trails, help with fuel reduction, remove trash, etc. They are a valuable asset to groups such as the Bureau of Land Management and Forest Service. These government-run groups are over-burdened, under-funded, and under-staffed. They need the help of the OHV community. Without it, the areas would not be properly maintained. Fire roads would be overgrown or blocked, and that certainly doesn't help the wildlife when the next fire comes along. You must keep access to the wilderness open for the public. It is actually better for both the citizens and the wildlife. Thank you for your valuable time,

hi Ago As we know from the BP disaster in the Gulf, we shouldn't trust corporations to monitor their own environmental quality. Basically they lie. To us, to the government, and to themselves. This is understandable. They are in business to make money, not to preserve ecosystems and such. The laws that allow and encourage this behavior are unfortunate but until they change, the last line of defense against bad ideas and bad corporate behavior is government agencies like yours. Please do whatever you can to stop development of large scale problems in the making like the proposed Pebble Mine. This includes stopping the opening up of more offshore oil drilling, drilling in the ANWR and other gems of nature (e.g. Yellowstone Park). Once these places are f'ed up, they are gone. Corporations can find other ways to make money. They have the ability to be clever and imaginative, but often have no incentive to behave that way. It is up to citizens like you, in your governmental role, to try to assure that the corporations innovate new and less destructive activities while promoting their business goals. good luck, have a good weekend too.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Will we ever learn? Mining operations are notorious toxic waste sites. All the economic benefits of the mining activity go to the mining company and all the economic burdens go to the taxpayer. The company wins; the public loses. This ignores the fact that an environmental village is raped, pillaged, and burned. On planet earth, everything is food for somebody else, be it plant or animal. When any living thing on the planet becomes extinct, whoever or whatever depended upon that for food is going to die out. And it is a chain reaction. No mother ship is coming to replenish planet earth. We need to stop consuming at such an irrational rate what is not going to be replaced. And we need to reign in our activities that cause death, damage, and destruction to all the plants and animals in the neighborhood of the activity. The Gulf of Mexico oil spillage disaster is a prime example of the callous attitude of large corporations in carrying out their mission to get theirs, and everybody else be damned. If the nuclear power industry had to pay the true cost of taking care of the nuclear waste they generate instead of off loading that responsibility to the government, ie., you and me, they would be bankrupt now. If you measure the activity in terms of dollars in and dollars out there is no positive generation of energy. America needs to lead the way in figuring out how to live in a sustainable way on this spaceship we call planet earth. Stop the Insanity; say no to the Pebble Mine, at least until they can demonstrate how they can do their operation without damaging our habitat. And that, they will not be able to do.

The proposed Bristol Bay pebble mine is another example of why the wild salmon are going extinct. Right when we discover their nutritional benefits, we are overfishing and killing them. Farmed fish has a lot less nutrition no doubt due to the Franken diet and even possibly the lack of time for the tissues to accumulate it the GE Franken fish are approved that grow twice as fast. Our food resources are not limitless and until people get that, we are headed towards major trouble in the future.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Decision Maker: Construction of the proposed Pebble Mine can't be allowed! If constructed, it would generate more than 10 billion tons of toxic waste, to be stored in the Bristol Bay area just 20 miles from an active fault line. And if constructed, it would irrevocably alter for worse Bristol Bay's clean waters. The wild salmon, wildlife and traditional subsistence ways of life there would be 100% threatened. My greatest personal concern is that America's (and the world's) largest sockeye salmon run, and Alaska's largest Chinook run, could disappear if this proposed mega-mine is built. Currently, Bristol Bay generates between 10 and 30 million sockeye fish caught each year, with an average of 23 million, according to Greenpeace online. That's a lot of extremely healthy, wild fish! Numerous medical doctors of high reputation such as Dr. Andrew Weil, Dr. Nicholas Perricone, Dr. Christiane Northrup, and Dr. Joseph Hibbeln, recommend eating wild-caught salmon as part of a healthy diet and in order to prevent or treat a wide variety of diseases. And the American Heart Association recommends two 6-ounce servings of fatty fish per week to prevent heart disease! (Wild-caught salmon is, of course, an iconic "fatty" fish, with upwards of 1,000 mg of omega-3 fatty acids per serving and low in environmental contaminants.) I am a voter, and I voted for the Green Party in the last presidential election. Protecting Bristol Bay, however, is so important to me that I would gladly throw my vote, and urge others to do likewise, to now-president Obama in the 2012 presidential election IF he would only press the Environmental Protection Agency to use their authority to stop the Pebble Mine from being built. And the EPA has that authority under the Clean Water Act. What needs to happen is for the public lands in the Bristol Bay watershed to be closed to large-scale metallic sulfide mining. We need affordable, sustainable wild fish to nourish America's citizenry--not dirt-cheap gold rings and copper bullet casings, with nothing but frankenfish for dinner! The federal government should closely oversee the permitting process and impact analysis for the Pebble Mine. The federal government should strengthen its relationship with relevant tribal governments. Standards for mineral development need to be tightened for wetlands. Thank you for taking my concerns into consideration!

I want my children and future generations to be able to enjoy and appreciate the wildlife as I have been able to, lets make this happen!

I walk to work using one of Nashville's green-ways. I've seen quite a bit of wild life there, and as Nashville becomes more crowded with malls, there is increasingly less open space for these animals to live. While Rand Paul may not miss a "hill or two," I will. Preserve what we have and add to it; don't continue the Bush practice of letting corporations loot our vanishing. wilderness

I am writing to urge you to protect Bristol Bay, Alaska by halting the deleterious effects of the Pebble Mine. It is imperative to our national security and well-being that we protect this biologically rich area. It provides jobs for local fishermen; it provides nutrition and medicine to citizens throughout America. Thank you,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I urge you to stop the owners of Pebble Mine from proceeding with their plan to engage in metallic sulfide mining in Alaska's Bristol Bay. Their mining activities would have irrevocable consequences to the salmon, wildlife, and subsistence way of life of people in the area. In addition, the Clean Water Act needs to be strengthened to insure greater protection from this type of mining. Thank you for consideration of my urgent appeal. --

Dear Mr. President, I have two young kids with whom my husband and I share our passion for the great outdoors. We surf, climb, hike, fish, like to travel to remote areas, and these are all things we want our kids to be able to teach and enjoy sharing with their kids. Because of this I am asking you to seize this opportunity to create, expand and better protect America's shared outdoors spaces. This includes parks, forests, wildlife refuges, wilderness trails, wild and scenic rivers, and historic sites and monuments. Equally as important is to find new ways to support conservation of our farms, ranch lands and forests. Before the world is private and paved, before the only way to view "wild" animals is in a zoo-like setting, set some limits and better the world for our future and for the future of our children.

President Obama, Please SRIO the PEBBLE MINE and SAVE BRISTOL BAY. You have the power to do this and I'm counting on you.

As a committed conservationist, I am opposed to the Pebble Mine because of the damage that would be done to the pristine Bristol Bay and the multitudes of wildlife that depends on the Bay for survival. As time goes by, the human race is destroying anything and everything in its path for industry, economy, development, etc. There are certain places that must be saved from destructive projects like Pebble Mine and Bristol Bay is one of those places. I live in California, but I care about the planet as a whole. That is why I am writing to ask you to please save Bristol Bay from this destructive project.

No Pebble Mine. Thank you.

Everywhere I go, everywhere I look, people are telling me about all the natural resources we are wasting, how many polluted lakes, rivers and overrun wilderness areas they've seen. DOI oversees ALL of this destruction. The new world order folks are talking kill 30-80% of humanity, and YOU want to sell off more pristine nature? Make more species extinct? Foul our world further? A lot of folks who must not believe are going to be in retraining for a long time. You certainly aren't setting any kind of example of what humanity is. May your children and Grandchildren need Social Security and Medicaid.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The number of pristine places in our country continue to dwindle. Now the big corporations are working to reduce the number further. It is the usual profit is better than beauty. They want to dispoil Bristol Bay to further enrich their coffers. Is a bigger balance on the profit page better than wild salmon, our beautiful wildlife, and clean waters? Certainly not. Yet these people will fill the rivers with tailings. The forest will be destroyed to add get at the mimerals to enhance their profit. Of course, the corporate spokesmen say that they will take measures to protect the environment. Don't believe them. It never works. They say one thing and when they open their mines, they do something else. All you have to do is look at the oil shale mining in Alberta. The mining corporation has already contanimated the area and little is being done to stop it. Please do not let them even enter Bristol Bay.

Dear Decision-Makers: PLEASE stop the Pebble Mine and save Bristol Bay. STOP this disastrous mine, which would endanger Bristol Bay's spectacular wildlands, world-class salmon runs and other outstanding wildlife. Please act as stewards for our children and the planet. Sincerely--  
Kjersten Gmeiner, MD

Hi, I am an Australian citizen and I want you to stop the Pebble Mine. You would be endangering Bristol Bay's spectacular wildlands, world-class salmon runs and other outstanding wildlife. You have an absolute treasure in your hands. Please protect it, don't destroy it. All of this destruction of Mother Nature affects every single one of us globally!!!!!!!!!!!!!!!!!!!!!!

Please do all that you can to save Bristol Bay from the Pebble Mine. Mining anywhere, and especially in such a pristine place as Bristol Bay, is an assault on our precious land. Bristol Bay must be left as it is to protect the wildlife there and to keep Alaska the wild and beautiful place that it is. Help keep what remains of our. Beautiful country beautiful and untouched. Thank you,

As a concerned American citizen, I am writing to express my strong feelings regarding the Pebble Mine development. This project endangers so much of what makes America great: clean waters, wildlife, forests - all of which are irreplaceable. This mine would endanger Bristol Bay and the surrounding habitat - an irreplaceable piece of America. I urge you to strengthen the federal government's oversight of the permitting process and to strengthen the restrictions around mining near wetlands, including restrictions in the Clean Water Act. Protect this beautiful and fragile public area from being lost to short-sighted private profiteering! The federal government should protect the interests of its citizens, not corporations! -- The only thing we have to fear, is fear itself. (and spiders....)

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I urge federal government agencies to do their utmost to preserve America's beauty and natural resources from greedy developers. We will never be able to turn back the clock if we are foolish enough to allow voracious politicians to destroy our heritage for pennies on the dollar, as they have done in the past. We must preserve our clean air and water to preserve life in any form. The West, Alaska, Hawaii, the Mississippi Gulf Valley, our mountaintops, and the New Orleans wetlands with their abilities to rejuvenate nature and human nature can never be returned to their pristine conditions after despoiling or giving away our natural treasures for horrific corporate short-term profits. Jobs that wreck Nature aren't worth the sacrifice to the country and its future; human ingenuity can and should create jobs that enervate and energize people to live lightly with Nature. No corporation or its profits is worth their tremendous rapaciousness to America or the world. Man has so ruined our climate and the planet, we may never be able to reclaim it. Let's not continue down our current path to natural and human devastation.

To Whomever Is Making Decisions In Regards To Alaska's Bristol Bay: I hope this letter will inspire to reconsider pebble mining in the precious wild lands of Bristol Bay. It would harmfully effect the ecosystem there in multiple & reactive ways. As we have witnessed the disaster in the Gulf of Mexico & the deaths & losses with coal mining; it is evident that more thought needs to be put into how & why we are still draining Earth's natural resources. Digging needs to stop while preserving & respecting nature needs to be a priority. There must be alternative materials that can be used rather than digging up our beautiful rocks & minerals. We as humans have evolved into such a sophisticated species; why can't we think of other sources with our advanced technologies & intelligence? We must compromise & stop greedily taking from our Earth. She is obviously growing weak from us taking so much from her. We need to find balance with kindness, compassion, & respect towards all living things on this planet. We humans are not the only inhabitants. Thank you for taking the time to read my message & I hope you can find it in your heart to reconsider how we do business. Kindest regards & much love,

The proposed Pebble Mine in the Bristol Bay region threatens the Bay's clean waters, it's salmon fishery, and the wildlife and native cultures that depend on those waters and fishery. Please ensure that the public lands in the region remain closed to large-scale metallic sulfide mining. The low-grade ore there can hardly be more valuable than a pristine environment, which provides a livliehood to the locate inhabitants and tremendous recreational opportunities to the rest of us. And be sure to consult with the local tribal governments, they are the people on the ground who would have to deal with the effects of toxic run-off from such mines. Tighten standards for mineral development in wetlands, and make sure that Clean Water Act standards are enforced. This can all be obviated if the mines are never approved in the first place.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I attended the July 17th Albuquerque, NM Listening Session on the President's America's Great Outdoors, but did not at that time leave my comments. Below please find my concerns and suggestions. Thank you so very much for hosting this session and listening to the public! The MEXICAN GRAY WOLVES, the most incredible part of the awe inspiring wild Nature, need: \* FULL Endangered Species protection (only 42 remaining in the wild) \* A permanent trapping ban on Public Lands in New Mexico (to keep the few wolves we have in the wild out of harms way; Arizona has the ban already!) \* A thorough FBI investigation on the recent systematic killings of the Mexican gray wolves (Trial and Prosecution of the criminal/s) I live in Albuquerque, but spend on average a weekend a month in the Gila & Apache National Forest, in the wolf country. This summer's wolf killings made me very concerned about the completely inadequate survival plan of the most endangered mammal in North America. And, the killings made me nervous about the safety of the citizens who like to spend time in the wilderness where such killings continue to take place. Here are my concerns: 1. What message are we--as a society--sending to our future generations, when the Mexican gray wolf is being gunned down by some derailed individual/s, and nothing is being done about it? In total contradiction with our attempt to get more youth reconnected with Nature (Nature Deficit Disorder conversation). 2. Human safety when this/these individuals are running free and able to get away with crime.

I am a physician and public health researcher with a focus on natural areas and green spaces. The scientific literature is very clear that access to nature is essential for health and well-being. On every measure, from childhood development to elderly functioning and longevity, access to nature is a fundamental human need. It provides the opportunity to create, maintain and restore positive physical and mental health. Please support the protection of our outdoor green spaces, so that future generations can continue to prosper in good health.

Absolutely NO to Pebble Mine or any mining or clear cutting in the watershed of Bristol Bay. It should be a top priority to put in place some kind of permanent land protection for this area to protect the pristine views, watershed, and clean waters of the bay that harbor wild salmon and other wildlife. The impact of large scale strip mining and leaching of run-off toxins into the waters would be very destructive to the environment of the area. The impacts would effect tribal communities, recreation, fishing jobs, food supply and wildlife habitat. A pristine ecosystem would be lost forever. Not only should this area be protected, but standards for mineral development in wetlands and large-scale metallic sulfide surface mining should be strenghtened under the clean water act to safeguard the environment.

I am writing to express my opposition to the Pebble Mine. This hard-rock, open-pit mine would be a disaster waiting to happen. The construction itself could adversely affect the nearly pristine ecosystem. A study of similar mines showed that 85 percent of them polluted nearby waters. The protection and preservation Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life should be our top priority.

As an American, I urge you to protect Bristol Bay, which serves as the habitat of innumerable wild animals. Pebble Mine threatens the Bay's waters and the wildlife who depend on them. Public lands should be closed to large-scale metallic sulfide mining. Thank you for your consideration.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I'd like to express my concerns surrounding the proposed Pebble Mine near Bristol Bay in Alaska. It is high time that we began to see our roles as stewards of the environment rather than exploiters of the environment. We cannot continue with business as usual with the growing awareness of the decimation of increasing numbers of species on the planet. While a corporation could reap huge monetary benefits from the building and operation of the proposed mine, the resulting environmental degradation - and there will be if it's allowed to be operated - cannot be expressed in dollars. We must begin now to evaluate human activity not in terms of the benefit to a small number of people, but to the effect it will have on the planet we share with all living things. I say NO to Pebble Mine.

We come to Alaska every spring, and we do it to get away from the HELL that is clear cutting of trees, and digging of Sand Pits along our San Jacinto river. Please stop this Pebble Mine, because things will never be the same again!!! Thank you,

It is my understanding that the Obama administration finally wants to work to protect our nation's wild spaces (as opposed to the administration's quite disastrous environmental record to date). So I am writing to ask that you do the right thing to protect Bristol Bay by closing the public lands in this area to all large-scale metallic sulfide mining, and working to protect the (so far) clean waters of the Bay, the fish that live there, the wildlife that reside in these wild lands, the traditional subsistence ways of life of the native people here, and the recreation resources in this area. Needless to say, the Pebble Mine would threaten all of these, and the federal government should start NOW (1) to analyze the long-term impacts that this mine could have on the Bristol Bay watershed, (2) to create much better and more environmentally protective standards for mineral development in the wetlands, (3) to create more stringent Clean Water Act standards for this type of mining, and (4) to oversee the entire mine permitting process to be sure nothing is allowed that would have adverse environmental impacts. As a Native person, I would also ask that you work honorably with the tribal governments in this area, honoring native values and working to prevent any harm to traditional subsistence ways of life here. Thank you for your consideration of my comments.

For your consideration, I recently spent ten days traveling in Alaska and was impressed by how much the Alaskan people rely upon tourism and wildlife endeavors for their lively hoods. From Anchorage to Fairbanks and down to Homer and Prince William Sound I was glad to see that the environment was still vigorous and healthy enough to support many different small business interests. I had been in Alaska in 1973 and was overwhelmed by the beauty, but this time I could appreciate how this pristine environment supports so many peoples businesses and personal livelihoods. I think any concession towards a mine should weigh in the balance all of the effects that will impact on the Alaskans themselves as they will be there years after any mine is closed and deserve to have their interests protected.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I urge you to stop the Pebble Mine which would threaten Bristol Bay's clean water & fish & wildlife. Habitat needs protection as many species are endangered. Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. The standards for mineral development in wetlands should be more strict. More public input should be accepted before any decisions are made. We only have one earth & it needs are help if we want future generations to be able to enjoy it with its pristine lands & wildlife. Thank you.

Seems like the oil industry just wants to cover the globe with false starts which permanently disturb the areas they drill. Let them use their astronomic profits to develop alternatives to drilling into the earth for petroleum. We have to face it and move on - oil is no longer the way ahead

Alaska's pristine wildlife environment of Bristol Bay must remain clean and undisturbed from toxic wastes that mining would surely bring if Pebble Mine is allowed to mine in and around this area. As an environmental artist, I am asking that you please do not support Pebble Mine or any mining in this important ecosystem which needs to remain free of toxic chemicals that mining would soon over take in it's dirty toxic path threatening this important wildlife ecosystem! Thank you,

Dear Sir, I urge you to please consider the impact that the Pebble Mine will have on the wild salmon, wildlife and the residents of the Bristol Bay area. The large scale of this endeavor, and the toxic waste byproducts of this mine that will harm this ecologically important area warrant a strenuous investigation and a further review of the permitting processes involved. In a year that has brought such evidence of man's impact on our environment with the Gulf disaster, I implore your department to put a halt to the destruction, before it's allowed to happen. We need more oversight, and less hindsight. Please do the right thing for this pristine area, and don't allow the Pebble Mine project to continue.

Think about the future and where we will be without the world of wildlife. We need preserves that are not polluted by humans. It is very short term thinking that money is the most important consideration in this world. Humans are better off in every aspect to have some natural wild areas and this Pebble Mine would be so detrimental to everyone. Please think about this and ask yourselves how you can best preserve life into the future. It is clear to me that the Pebble mine is a menace to all life.

Just wanted to voice my opposition to the proposed pebble mine that will threaten Bristol Bay. It is a fact that this kind of mining will pollute the water and harm the ecosystem in many ways. There is not adequate regulation in this industry - like many. It is time to build our economy and future jobs within the new greener industries - of which mining is not one. Will be following the discussion of this issue. Thanks for your consideration.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Sir, I am writing to say I am opposed to the Pebble Mine. This is too important an area to have it ruined by mining. In spite of the corporate line that keeps coming out, there is no guarantee that everything down stream won't be damaged. The truth is, that the mining company executives don't really care what happens as long as they make money and get bonuses and promotions. I was a stock broker for 18 years, so I know how the system works.

Dear Sirs, I know you are wrestling with the complicated issue of Pebble Mine in Alaska. I know you are pulled in two directions. I would urge you to look about you, to think what is becoming scarce, what is irreplaceable. I would urge you to protect the clean waters of Bristol Bay, the wild salmon, the wildlife and the traditional ways of life of the people who live there. If we lose those things, precious as they are, they will be gone. No amount of development is worth it at this point. We have developed as far as we can without ruining our planet. Please help protect this small bit of nature. Thank you,

These are my comments in connection with the proposed Pebble Mine 1. Grizzlies, wolves, seals and whales roam the area and depend on the healthy population of salmon. 2. Everything in the ecosystem is connected and damaging one part damages the other parts. 3. A study of mines similar to the proposed Pebble mine showed that 85 percent of them polluted nearby waters. 4. If Bristol Bay is so special that the former Governor of Alaska named her daughter after it, then it should be special enough for us to guard, preserve and treasure.

Please stop this distructive mine send a message to America that you are willing to make the tough choices and set America on a sustainable future Thank You

Pebble Mine threatens Bristol Bay's clean water, wild salmon, and the wildlife of the area. The Bristol Bay ecosystem supports valuable commercial fishing, indigenous people and a large wildlife population. The mine would destroy habitat, polute the waters, jeopardize the wild salmon and irreparably damage the ecosystem. The company is proposing to store the toxic waste generated by this mine just 20 miles from an active fault line. An earthquake would be a huge disaster. This mine is a mistake. The only people to benefit from it would be the foreign mining companies. Our top priorities should be the protection of habitat, the ecosystem, and the indigenous population.

Dear President Obama and Staff: I am asking you to do all that is in your power to stop the advancement of the Pebble Mine on Bristol Bay. Pristine wild areas are so rare--mines are not. It is known that one third of useable recyclable copper lies in our land fills, as do many other precious, useful metals. Please find a creative way to recycle these products and bypass the need for yet another ruinous mine to despoil the beautiful Earth we are so fortunate to live with. To build Pebble Mine is to ignore the rights of myriad wildlife and plants, for the poisonous run-off from tailings and processing will kill many small rivers, and all the creatures and plants that depend on them, and potentially ruin the eco-system of Briston Bay. It is a delicate web of life that sustains us, and every time we poison another place, we poison our thread in that web. Take care of it, do not sanction destruction. Be who you say you are: stand up against the interests of the corporate developers and protect the land for your children and your children's children.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The debate over this mine and its impact on the Bristol Bay setting has many elements which are too complicated for the layman to effectively measure. So I have to leave it to you in the federal government, you who are there to safeguard our environmental as well as our economic interests, to look after my citizen/consumer interests. I hope I can safely leave it to you to ensure that corporate profits don't drown your decisions

As stewards for future generations, we owe a duty to preserve the gift of our natural resources- allowing the mining operation would damage Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Again as stewards, public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting natural habitats and recreation resources for the use of current and future generations should be important goals for the government. Also, protecting this area could strengthen the not always strong relationship the federal government has with tribal governments. Given the recent BP issue, the federal government should provide stronger oversight of companies that could cause devastation to our natural resources and communities. Thank you for your consideration

Dear Sir: As a resident of Colorado Springs, I know first hand what mining can do to the landscape. When the miners have gone the land is too polluted to use for centuries and the landscape even when 'remediated" never is the same. We have an opportunity to prevent this from happening again. Please resist the effort to open this area up to mining.

I want the nation's children and their families to enjoy America's great outdoors. Please choose this moment to grow and better protect America's natural bounty: parks, forests, wildlife refuges, wilderness, trails, wild and scenic rivers and historic sites and monuments are all legacy matters that require attention. The dramatic loss of farms, ranchlands and forests is dramatic and we must redress a process that will leave no heritage if left unchecked.

The Pebble Mine is another Gulf oil spill times 10. Mining companies are famous for their disregard of the environment...look at the Mesabi Range, the UP in Michigan, the Appalachian Mountain, the abandoned mine fields of the Sierra Nevada, and others. Pristine waters, the North Pacific fishery (especially wild salmon), wildlife, the topography, Native communities' cherished way of life...these are all imperiled by a mine at the head of Bristol Bay. Please...do not allow foreign interests with problematic reputations with regard to the environment to endanger a unique and precious piece of our world. Thank you for your consideration .

Dear Caretakers of the American Great Outdoors, I have never been to Bristol Bay. I have never been to Alaska. My idea of what these areas represent may be romanticized. I do hope to go there someday. I hope to see the complete beauty of our natural wilderness that still exists...a wilderness that we, as Americans, can be proud of...that we, as Americans, can share amongst ourselves, and with the rest of the world when they come to visit. In the meantime, I am concerned about the destruction that may be caused by the anticipated Pebble Mine. I am concerned about the damage to the delicate ecosystem that may be caused in that area, and ultimately, the effect this destruction may have on the rest of our world. Please help protect and maintain this beautiful wilderness, this invaluable ecosystem, by preventing the construction of the Pebble Mine which would cause destruction to the area. Thank you.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It does not take much thought to realize that destroying our environment will destroy us. Please take steps to strengthen regulations on mining and drilling and be sure they are enforced. Protect particularly fragile natural settings from any commercial exploitation. Access to clean air, a safe water supply and soil free from contaminants should be considered a fundamental right of all citizens.

We are writing you to ask that you please stop the Pebble mine and protect Bristol Bay. Thank you!

The shallow and cool waters of Bristol Bay are home to seals, whales and millions of salmon. The salmon runs support commercial fisheries, native Americans and wildlife such as grizzlies that depend on the salmon runs to fatten up for the winter. Protecting wildlife and the traditional lifestyle of the indigenous people should come before the gains to foreign mining companies. To reach the low-grade copper and gold deposits thousands and thousands of acres of pristine land will be demolished to get to the ore and tons of pollutants will be released in an area only twenty miles from an active fault line. This is a disaster waiting to happen. Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. Tribal governments should be deeply involved in the decision-making and permitting processes. Standards for mineral development in wetlands should be tightened and stringent standards for large-scale sulfide mining must be implemented. Please don't let large business interests outweigh the pristine region of Bristol Bay and the fish and wildlife that are so important to the Alaskans in the region

That the word "art" should sit right in the middle of the word "earth" fascinates me. Human interference with Nature's original plan is sadly questionable at best. It will be important to have preserved it, fully stocked! Every single little link will be significant when we collectively realize the Earth requires some respect in order to provide us with a place to live. The more painting teaches me, the more evident this becomes." Bristol Bay is a unique environment with an ecosystem that can't be replaced or duplicated. I don't see what this mine has to offer that is worth more than having this earth to live on. It's pristine beauty is so quickly fading for no logical or beneficial reasons other than money to pay for more destruction. Please rethink the benefits of this project and for whom, certainly not the whole. Thank you for your time.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Hello, I am writing to urge you to protect and save Bristol Bay from the disastrous Pebble Mine. America's beautiful public lands should be EXEMPT (and kept that way) from any commercial mining, or other commercial interests, that threaten to diminish its beauty, threaten its wildlife, and scar the earth forever. Public lands were put into a trust for all of us in this country and for all generations to come. We cannot allow such indiscriminate use of mining to destroy what we cherish and hold dear. And the actions of mining companies always do. They threaten wildlife, wetlands, watersheds, and the very being of what is a public land trust. No matter how many promises or written agreements are signed by mining companies, the result is always the same. You do not have to look too far into the recent news headlines to find horrible consequences from mining company disasters and the companies total lack of responsibilities for their actions. It is we, the people, who pay the price, often for generations to come. And it is the land, our environment, that pays the price in devastating effects from these senseless attempts to ravage the earth for more fossil fuels. We have the ability for so much green energy use and yet so little is done to harness it. How much longer do you think the earth will survive if we do not take control now and stop mining companies, such as Pebble Mine, from destroying land and habitat. Enough. I urge you to stop the Pebble Mine; in no part should it ever be allowed. And I would urge you to do the same for other mining interests that think they can over take public land and public opinion, and put, not just the land itself, but wildlife, the oceans, and all of us at risk. Thank you.

Dear Sirs, As a concerned citizen, I would like to voice my objection to the Pebble Mine project in the Bristol Bay area. I could explain my objections with a long e-mail but hopefully logic and care of our great outdoors in America will be enough to stop all the erosion of one of our most treasured assets. PLEASE SAVE BRISTOL BAY Regards

Dear Representatives of the great natural lands of our nation: please read W. S. Merwin's poem, "The Last One". Merwin is the present Poet Laureate of the U. S. and this allegorical poem is terrifying in its portrayal of our voracious appetite to eat up all our blessed territory and all its beings: Well they'd made up their minds to be everywhere because why not. Everywhere was theirs because they thought so. When will we give "standing" to the other life on this planet? When will we stop our disingenuous language about just how safe and environmentally benign all our mining, drilling, chopping, paving over is? I am writing to ask that those of you who decide, think about the destruction of the beautiful life--those creatures who have no "standing", no meaning past the tag of "resources". Think less about going along with those with the money, the power. It won't be long until we have destroyed so much that power and money will not feed our bodies and we will have lost our souls. If you go ahead and allow the Pebble Mine at Bristol Bay, each of you will be complicit in destroying the habitat and lives of wild salmon, the life of the clean waters, the trees, the other creatures who live there. Please stop Pebble Mine at Bristol Bay. With regards for your integrity.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

Preservation means different things to different people. I came to Dillingham, Alaska, on the north shore of Nushagak Bay, in 1987, for a seasonal volunteer position with the US Fish and Wildlife Service. I never left. It was clear to me I was in an environment with natural animal populations that were abundant and healthy enough to support the people that lived here, and then some. Historically, indigenous peoples followed animal populations to survive, and some still do. The commercial demand for wild salmon, in particular, has led to, combined with Kvichak Bay to the east, the world's largest wild salmon fishery. Intense management has insured all five species of salmon have not only survived subsistence and commercial harvest levels, but in some cases have thrived. There is nothing here that doesn't have roots in salmon. They are the major player in ecosystem balance, and critical to the health of other fauna and even flora. Even introduced inhabitants like myself depend on them for food. Some of them spawn in the fresh water systems that the proposed Pebble Mine would destroy. I say the word "destroy" bluntly, as people as a whole know how some industries cannot help but destroy the environment. Mining is one of those industries. I choose to believe that most people do not want to see the planet systematically destroyed so they can enjoy luxury items (for example, I commute to my job via bicycle). Our motto should be sustainability, living within our means, sharing our planet, and policies and practices should reflect preservation, not destruction. Southwest Alaska, and all that depend on the salmon that are born and return to spawn and die here, must be preserved. There should not be a Pebble Mine. Sincerely (and looking forward to grilling salmon steaks this weekend)

The Pebble Mine in Bristol Bay would be TERRIBLE. Destroying the environment for living animals would be a tragedy. As Americans, we take for granted our pleasant living conditions and set our expectations high. At the same time, we often turn the other cheek when something like this occurs. The pebble mine would make animals suffer, lose their homes, die, and for what? A mine? Humanity needs to step up and speak for those without a voice. **DO NOT ALLOW THE CONSTRUCTION OF PEBBLE MINE TO GO FORWARD.**

Bristol Bay is one the few pristine wild spaces left in our increasingly populated and polluted world, in which environmental degradation is out pacing preservation and renewal of the environment. The Pebble Mine will threaten the clean water of Bristol Bay, including the salmon runs and other wildlife. Our very lives depend on a diverse and healthy ecosystem. In a world with so few healthy, diverse ecosystems left, it is unspeakably important to protect Bristol Bay from the damage the Pebble Mine will wreak. We need greater government oversight of mining projects, and more stringent regulations. I am a 25-year-old who loves the natural beauty and wild spaces of the United States. I am honestly skeptical that if I have children, they will never be able to experience the beauty and splendor places like Bristol Bay, if the government does not step in now to protect it.

Please give serious thought to ending mining in the Bristol Bay area. There is too much at stake on both large and small scales, too much damage already, too much ignorance of future damage. I am sickened by the endless destruction of the natural world for the economic gain of the few. Exploitation of local cultures, local resources and local wildlife has been policy for too long. Turn it around. Turn it to good for all who will follow. Thank you for your consideration,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

, I write to ask you to protect Bristol Bay and it's wildlife and all the environment. Please stop any mining projects and in particular the Pebble mine projects. Too many species are at stake along with the pristine beauty of this landscape. Please protect Bristol Bay!

To Whom it Concerns: I would like to see the Bristol Bay's water remain clean for the sake of the wildlife, the wild salmon and other fish, and for the sake of the economic value this area provides simply for its beauty as a natural area. Such awesome beauty should be closed to the damning and damaging processes which come with large scale mining operations. Accordingly, please protect this area for the habitat and natural resources. Additionally, I wish the government would provide stronger oversight regarding the Pebble mine permitting process as well as with the analysis of the cumulative impacts associated with such mining processes to the Bristol Bay area. Due to the impact such large scale mining operations can have, I would also like to see more stringent Clean Water Act standards for all similar operations. Thank you for your consideration,

Salmon are being threatened in far too many ways, from water diversion in California rivers, to possible escape of genetically engineered double growth hormone fish. Public lands should provide a refuge for them, not yet another threat. The world needs salmon far more than it needs the Pebble Mine.

The Pebble Mine would endanger the entire Bristol Bay ecosystem. Please do not allow it.

Why do people have to destroy what God built? This bay is home to salmon and many other God made creatures. I'm not a fanatic but these places WERE made for a purpose. Is money more important than leaving areas like this bay alone? Sit down and think hard about it. I think you will come to realize the destruction it will cause. I thank you for listening to me and I'm sure MANY MANY more like me.

My wife and I were privileged to visit Bristol Bay in 2007 on a self- guided tour that included kayaking, hiking and wildlife viewing. We were so deeply touched by the incredible and unique beauty of the Bristol Bay area. We feel strongly that the proposed Pebble Mine will threaten the clean water and the salmon and the whales that depend on the area. Please see that Bristol Bay receives the protection that it deserves so that all of our children and grandchildren will be able to enjoy the area. Thank you.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Sir, I am very dismayed over the possibility of Pebble Mine. The clean waters of Bristol Bay provide habitat for wild salmon and other species, which in turn provides livelihood for fishing communities. Salmon spawn in the Bristol Bay watershed, and metallic sulfide mining would be disastrous to their future. If the streams and brooks encoded into the salmon's DNA are destroyed or polluted by development, the salmon will die out. The federal government should oversee the Pebble Mine permitting process and analysis of environmental impact on the watershed. Standards for mineral development in wetlands should be much higher. The need for dialogue and relationship between the federal and tribal governments seems very great. One hopes the discussion will proceed with deep sensitivity to habitat, wildlife, and human beings. Bristol Bay is one of the earth's great treasures. Please save it for generations to come. Sincerely yours

To whom it may concern, I'm opposed to the proposed Pebble Mine development. This type of large scale mining would have an adverse effect on the immediate and surrounding environment for generations to come. Do we really want to leave this legacy. We need to strengthen your "clean water act" so this type of outrageous plundering of the land should never be an issue again. Please consider what ramifications this project will have for the future and I feel confident you will see the negatives far exceed any possible benefit that might result. Please pass on my thoughts and all other NRDC comments to the President and his Interior Secretary, as well as the appropriate committees. Thank you for your time. Regards

Dears Sirs, Day by day I see and read about more progress in resources to move our country forward in providing needed fuels and other things to enrich our lives. Along with this I also see the destruction that is happening to get to the goal of "progress" and "more money" for a select few. To rape our land, trees, animals, air, etc. is not always necessary but those that have no respect for natural resources and a stake in the profits don't seem to care. I feel that there are many people that would love to know what they can do to help stop the ravages. Please consider your families long after you are gone. Also consider what exactly you are going to say to the powers that be that are not of this Earth. Just an idea.

It's highly inappropriate to destroy/toxic pollute this spectacular unique wilderness area & violate Indigenous rights. Do your job-Protect Our Public lands, waters, wildlife, economy & health! You work for citizens, not industry! Your attention to this most urgent matter would be much appreciated by all present & future generations of all species. Thank you

Without air to breathe, water to drink and food to eat, we are all dead. Jobs, economy, civil rights, nothing will matter without a sustainable land base. Please do everything in your power to protect our and our fellow species' abilities to survive. Conservation is the ultimate health care action.

I am writing to urge in the strongest terms to put an immediate end to plans for the Pebble Mine that threatens Bristol Bay. Our poor planet is losing more and more habitat in the goal of exploiting the resources for economic gain. I have grandchildren, and I want for there to be a verdant and diversified world for them to grow up in. Public lands should provide habitat, subsistence for indigenous people and non-invasive recreation. Thank you,

## Discussion Question 2

***(cont.)***

Save Bristol Bay Block the Pebble mine If I have to explain why, I need to vote for someone else  
Thank you,

Please stop Pebble Mine in Bristol Bay. Most Americans are in favor of preserving life. Killing or even endangering salmon and other wildlife contradicts our support of life. Allowing Pebble Mine to advance puts more stock in minerals than life.

I am writing asking you to desist on the Pebble Mine in Bristol Bay. Have you been there? If you had, as I have been, you would think more about the beauty, and how few places exist in our world that stir our hearts and imagination, where a deep breath is of clean air. And of course you know that fresh water will be a major concern for the people on our planet. And how about being nice for a change to Americans other than rich stockholders? I'm discouraged but there is always some hope that you will hear me. Thanks,

#### STOP TAKING OUR LAND

Bristol Bay's public lands represent critical habitat for salmon and other important wildlife, as well as provide traditional subsistence living inhabitants a home. It also offers world class fishing which brings tourist dollars to the local inhabitants. Altogether, the salmon and trout fisheries represent 75% of the jobs in this area of Alaska. It is too important of a natural resource to risk having it essentially destroyed by money-hungry mining interests. The majority of Alaskans oppose the destructive mine. This area should be closed to large-scale mining, especially metallic sulfide mining. The top priority here should be protecting the irreplaceable habitat, and subsistence and recreational resources. If our federal government does not provide strong oversight of the Pebble Mine permitting process and analysis of the impacts to the Bristol Bay watershed, no one will. Allowing this mine to be constructed will further divide federal and tribal governments, something that should never be allowed to happen. This is a perfect example of a situation where the needs of the many (those that live off of or otherwise make wise use of the land and water here) vastly outnumber the needs of the few rich and greedy (the mining interests). The existing standards for mineral development in wetlands, which shouldn't be allowed in the first place, should be tightened as a result of this planned assault on the environment. To prevent future situations where large-scale mining threatens to destroy public lands of this type, the Clean Water Act standards for large-scale mining should be tightened. There is too much at risk in Bristol Bay to allow this mine to go forward.

As a citizen of this beautiful country, I am writing to express my strongly held opinion that Bristol Bay is an environmental gem that in its natural state provides benefits to our nation far-exceeding any mineral resources it contains. We have exploited our environment in unsustainable ways too long--certainly long enough to see the error of our ways. Please make the protection of the public lands in Bristol Bay your highest priority. And please change the paradigm and maintain the highest standards of the Clean Water Act in that area. Thank you for your attention.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Please halt the Pebble Mine project. I am 63 years old. The best memories of my life are trips across the U.S. with my parents visiting our National Parks and viewing the wildlife on pristine lands. My hope is that my grandchildren will have the opportunities that I had as a child. It is truly sad that we are destroying so many of the natural resources that the good Lord gave to us. Thanks for your consideration of my plea

I am writing as a concerned citizen to stop the proposed mine from being constructed at Bristol Bay. We have seen the destruction to the US Gulf of Mexico eco-system brought about by a once considered safe system of oil removal. Let us consider our other fragile eco-systems. The arctic wildlife that thrives near Bristol Bay would be endangered if a mine was to be constructed there. We need to protect what natural resources we have and not exploit animals' habitats for the simple purpose of extracting desirable minerals from the earth. Not only does this scheme endanger wild animals, but people as well. Let us be cautious in any plan that knowingly creates tons of toxic waste, and could even remotely effect the life surrounding it. If the mine does go forward, which I sincerely hope it does not, we need to consider tightening the standards in the Clean Water Act, and for mineral development in general. We cannot afford another large, or even small scale environmental disaster in our world. Let us instead, make headlines about putting the interests of our tender lands and the animals that inhabit them, above those of the corporate and commercial.

Please stop the Pebble Mine! The Bristol Bay is priceless and will sustain life indefinitely. Short-term riches, however great, must not take precedence over the resources that sustain lives over the long term-watershed, wild, sustainable salmon runs, other wildlife, the livelihoods of the native population, the irreplaceable beauty of this place. Allowing greed to supplant these values is unconscionable, one more manifestation of our tendency to put immediate self-interest ahead of every other value. Future generations will thank you for stopping this attempted devastation.

In the scheme of things the USA hasn't been around that long but we still act like we can do anything we want and clean up the after-effects sometime in the future. We aren't discovering new land and there's only so much we can do to the earth before we all pay the price of our lack of stewardship. There are some disasters that simply won't go away with time. We know that eco-systems are fragile. That the people, animals and fauna that depend on the watershed provided by Bristol Bay and tributaries are linked. We also know that no company willingly polices it's pollution levels if it means foregoing one penny of profit. Strict regulation by local and federal agencies has to be the rule of law. Additionally any company wanting water rights for any product with the word 'metallic' in it doesn't need to be drilling in an area as clean as Bristol Bay. The way I see it best of intentions hasn't worked so well with the oil industry why would it be any different for this operation? Must we continually be behind the curve on environmental damage? Shouldn't the safety of the American people, it's cultures and our natural resources be the overriding concern of any business wanting to work in our wilderness areas? Shouldn't it be the overriding concern of the government? If not, why?

I was upset to hear about Pebble Mine's selfish plan, which would ruin our precious water and wildlife. Bristol Bay needs to be protected, not threatened by Pebble Mine.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I have crisscrossed the world and learned quite a bit about the disastrous impact mines make everywhere. They are detrimental to the rivers, lakes, watersheds and bays and have a huge negative impact on wildlife and humans who live near-by when their ground water is being poisoned and their health ruined. The only winners are the corporations who benefit financially. We should be more mindful of our environment and do everything possible to protect it and if that can't be done adequately projects like these shouldn't be allowed to move ahead. thank you,

No ecosystem should be lost to a mine. Stop this project.

The Gulf of Mexico has already been defiled. We don't need to add Bristol Bay to the list of polluted waters. Please do not permit the Pebblemine to operate.

Dear Department of the Interior, I am writing to support the preservation of all natural habitat in the United States, and specifically Bristol Bay. I support the prevention of extractive industries from having access for conducting any business operations on these public lands. There is one exception: to open and operate a museum that describes the habitat destruction and public health dangers of the extraction techniques. Otherwise, these businesses should not be approved for any other purpose. The Pebble Mine directly threatens the health of the watershed in the Bristol Bay area. It is time the federal government, and that includes you, the DOI, stop allowing profiteering corporations from irresponsibly taking resources from the environment. In place of that behavior the DOI, and all related agencies, should begin giving more protection to the Clean Air and Clean Water Acts. I support increased funding for enforcement of these standards, as well as reviewing and strengthening them to take into account new technologies, and a NEW attitude supporting public safety. It is time to lock arms with the EPA, and present a unified federal approach that is more sensitive to the needs of the local tribal people. If this means higher federal taxes, then so be it. We must all pay our fair share, but it must also come with having the ethical courage to SAY NO to corporate motives and interests. Your personal behavior on this issue will reveal what legacy you leave our children. I thank you for taking my opinion into consideration as you seek to turn public opinion into policy. So many other countries squandered their opportunity to preserve due to lack of foresight and ethical responsibility towards future generations. I hope my elected and appointed official's policy will preserve the United States' natural and cultural treasures.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We have the opportunity right now to stop the Pebble Mine and save Bristol Bay. Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. Relationships between federal and tribal governments should be strengthened. Standards for mineral development in wetlands should be tighter. Clean Water Act standards for large-scale metallic sulfide mining should be more stringent. Thank you for your help in preventing the environmental disaster that Pebble Mine would be.

There are few places left on earth that are as untouched as Alaska's wilderness. Don't let it become a strip mine. We only have one earth. Not only would I like my grand kids to be able to experience nature as God made it, but once we have raped the entire earth... what will we do for energy then. There IS a better way... Please don't be "penny wise and pound foolish" with our earth!! Thank you

Dear Administration, We are all entrusted to care for our generous planet. It is not being faithful to strip her of her blessings and create destruction like pollution. Please hold our planet dearly. Protect the waters of Bristol Bay from companies like Pebble Mine Yours,

Dear Friends, Now is the time to save Bristol Bay. As you well know, it's easier to stop pollution from happening than it is to clean up a destroyed area. What happened in the Gulf should bring this truth home forcefully. The Pebble Mine is a clear and present danger to Bristol Bay, a beautiful, clean wildlife habitat. There should be no large scale metallic sulfide mining there at all, and the government should keep Pebble Mine on a very short leash, providing frequent inspections. Standards for large-scale metallic sulfide mining should be more stringent. And the government needs to work with tribal governments more closely as it regulates the industrial presence in the area. America, the Beautiful will not remain so unless we are all mindful of what we need to do to maintain pristine areas.

Please do not allow the poisoning of any more watersheds! Veto the Pebble Mine and protect Bristol Bay.

Wherever there are clean waters, wild salmon, wildlife, and traditional subsistence ways of life, it is essential we keep this goodness and not destroy it. We humans must be good stewards of our Mother Earth for now and for the future. 46 years ago, I had one of my most special life experiences when I worked in Yellowstone National Park for two summers. What incredible foresight it was and still is to save this precious area for mankind to study, have, and enjoy, and how many millions of people and animals have benefitted from this incredible act of preservation. I beg you to keep this area pristine. I think it is as important to our future as you, President Obama, asking the minister in Florida not to burn the Koran.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I would like to bring that mining this area will destroy the area as you can see at Bisbee AZ where the mining tailing have cause no end of problems and eye sore. I don't know how bad the water table in the area based on all the leaching of chemicals into the underground aquifer which can cause problem to the people in the future. This is one of the problems you must face if it is worth the destroying of the area for the mine or the natural resource that can come from farming and fishing is more worthwhile then a one time resource and after it is finished then there is nothing for the future. This decision you must make and I believe you should deny the permit to do mining as it really wouldn't help the economy in the long rung but to destroy it. You have to do a long term economic analysis of what the effect of this mining and also if you do how are going bring back the area the way it is before. So with all the problems you should turn down the permit as it will not accomplish anything in the long time in the area.

Dear Sir or Madam, I understand that the Administration has invited public comment on the preservation of America's wildest places in connection with National Wilderness Month. I would like to take this opportunity to commend the President and the Department of the Interior for all you have done to preserve wilderness and non-wilderness public lands for the enjoyment and benefit of all citizens. I would also like to register my opposition to permitting a large mining operation, like the Pebble Mine, to operate in an environmentally sensitive place like Bristol Bay. Public lands in the Bristol Bay watershed should be strictly protected to preserve natural habitat, subsistence fishing, and public recreation. It is entirely inappropriate to use such lands for mining -- unless the mined materials are essential to the national welfare -- and it is especially inappropriate to use the land to generate corporate profits. If such use cannot be prevented under existing laws, we need stronger laws to protect public lands from exploitation for profit. Meanwhile, the federal government must, at a minimum, provide strong oversight of the Pebble Mine permitting process and careful analysis of the cumulative effects of mining on the Bristol Bay watershed. Thank you for your consideration of my views.

Save Bristol Bay from mining and keep Alaska gloriously beautiful!

Wildlife in Arizona is threatened by AZ ballot Proposition 109. This proposition seeks an AZ Constitution amendment which would permit lawful public hunting and fishing as a preferred means of managing and controlling wildlife. If this proposition passes, the AZ State Legislature will control all recreational hunting. The National Rifle Association participated in crafting the wording of this proposition. In order to conserve our wildlife and respect the rational process of balancing the land used by people and wildlife, this proposition needs serious revision before it is voted on. We need national attention and help to block this proposition and revise it for further review.

Please protect the natural habitat of Bristol Bay and stop mining from threatening clean water and wildlife!! Concerned citizen,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Protect the Kvichak and Nushagak watersheds and save Bristol Bay because there is no place like it in the world. Because there are people who depend on this river and its resources for their livelihood. Because gold mining is a dirty and unsustainable practice, Because it's the right thing to do for future generations to come. And if your still not convinced, see the film Red Gold. Thank you,

Planned mines like Pebble Mine caused substantial damage to ecosystems that never recover from them. Bristol Bay represents an important ecosystem for both native people, wildlife, fisheries and recreational industries, which could be significantly harmed by the mine, given the inadequate federal standards for wetland development and mining under the Clean Water Act. Arctic and subarctic ecosystems are especially vulnerable to damage, given the stress they are under due to the accelerated rate of climate change in polar regions. They need our protection more than ever.

Please save the Bristol Bay and stop the Pebble mine

I'm writing to express my great concern regarding the irreversible harm that could be caused to the natural splendor of Bristol Bay due to the proposed Pebble Mine. Alaska is our last wilderness frontier. It has already been damaged by the actions of our fossil fuel addictive ways. The Pebble Mine will devastate the surrounding wilderness, the magnificent wildlife, and Bristol Bay, itself. We need you as our leader and the overseer of our country's resources to stop the destructive practices of greedy corporations that choose not to look beyond the almighty profit. As Americans, we all need to change our thinking and actions regarding energy sources. Please be proactive in this matter. Be America's voice in protecting our last frontier. Lead us in the development of clean energy sources to preserve the natural wonders of our country for generations to come. Thank you,

The pristine watershed of Bristol Bay deserves our reverence, not a rape two miles long and two thousand feet deep. The Bush administration pursued a headlong rush to devastate the environment for the sake of corporate profits. At the moment, we see the end results of such policies most dramatically in the Gulf of Mexico, but wild lands all over our country have suffered. Let us reverse those environmentally disastrous policies, not continue them. Do not approve the Pebble Mine. All of my life my family has enjoyed respites of hiking, boating and camping on federal lands. Their deterioration has been sad. Let us not risk one of the remaining great tracts of wilderness for the sake of a mine that will do little for the vast majority of Americans.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Good afternoon, We are not experts on mining, nor do we understand all the intricacies of big business, but what we do know is that we love Alaska! We have been to Alaska four times and are always amazed at its wildness and beauty. The frontier that it represents in today's crowded, complicated world is exhilarating. What we are afraid of is that Bristol Bay – which is a place most Americans haven't even heard of – will become known only after some environmental disaster. Who had ever heard of Bligh Reef in Prince William Sound before the Exxon Valdez oil spill?! We were fortunate enough to visit Katmai National Park this past summer and got to watch the brown bears eating salmon in the Funnel River. It was awesome, and there are scenes like that all over the Alaska Peninsula. Can we really be promised that there won't be an accidental spill, leaching of toxic chemicals into the soil and rivers, or any other man-made ruinous accident? We need to be caretakers of our earth, not complete users. Please don't allow the Pebble Mine in Bristol Bay, or anywhere else in Alaska. Let's not even take the chance.

Bristol Bay is worth protecting for many reasons, saving fishing grounds for future generations being at the top. Where does our insatiable greed for nonrenewable resources end? Please stop the Pebble Mine for my and other people's grandchildren.

Dear Administrator, As a lover of nature, I implore you to preserve pristine Alaska and stop the construction of Pebble Mine. It is not necessary to destroy nature--this mine is completely disastrous.

Why Save Bristol Bay? Close to 7 billion people live on planet earth. Each day thousands of square miles of natural, wild places throughout the world disappear forever. Satellite images allow us to see the clear cut forests, mountain tops removed, entire eco systems destroyed for tar sands, polluted water and stripped, dead land. The list goes on and on. Rarely do we see or read about all the wildlife that disappears along with these natural places. Mistakenly, many people assume that displaced wildlife can simply move to a new location, but that's not the case. Most displaced wildlife simply die off, disappearing forever from the face of the earth. Bristol Bay is one of our last, pristine wild places. Home of wild salmon and a multitude of wildlife. It's waters are pure and skies crystal blue. To jeopardize this heavenly place is short sighted and just plain wrong in every way. Public lands are everyone's land and should be preserved in their natural state for current and future generations, both to enjoy and improve quality of life. No man-made castle, tower or sky scraper could ever come close to nature's magnificence in it's natural state. We have all seen how the human footprint changes and destroys nature. Our footprint soon becomes a path, then a road, and then a city -- displacing and killing all God's creatures that live there. For these reasons and too many more to discuss in this letter, Bristol Bay must be preserved from mining of any kind. It's as simple as that. Very soon, our nation is going to have to get serious about clean energy like wind and solar or it will be too late. We only have one earth--and we better take care of it now by standing up for what's right one project at a time.

Please protect the public lands in the Bristol Bay watershed. We don't know what the cumulative effects will be, of this toxic mining. Protecting habitat should be a priority. Thanks,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

If I asked you to name a kind of meat that is natural, healthy, uncontaminated, tasty, sustainable, essentially wild, and (why not?) tasty, what would come to your mind? For me, nothing meets these specs as well as Wild Alaskan Salmon. Anything that threatens the waters of Alaska threatens to spoil this unique resource. How can you possibly allow the Pebble Mine to introduce toxic chemicals in the name of extracting yet another NON-RENEWABLE resource, when that would threaten a unique and important RENEWABLE resource? And this is above and beyond the dangers this mine poses to the rest of this precious ecosystem... Please stop the Pebble Mine!

America's great outdoors have been fast disappearing across my lifetime. Once lost, this land is lost for immense lifetimes at best. So little is left to protect, and so much of it is distant from those of us who most need the getaway from noise, machines, development, erosion, pollution that characterizes what has been done to America. I feel that you have an uncompromizable responsibility to protect them for future generations. Along with wilderness protection comes the absolute necessity to cease fragmenting habitats of our remaining large animals, and the vital native pollinators. We must protect more Wilderness and quiet recreation opportunities, preserving more habitat and connectivity for wildlife, and permanent protecting remaining old-growth forests. In nearby Oregon, places like the Wild Rogue River, the wildlands surrounding Crater Lake National Park, and the Siskiyou Wild Rivers are at risk from logging, mining, and other harmful development. Oregon has protected only 4% of our land as Wilderness, lagging far behind nearby states. California has vast population pressure on our wilderness here. The amount of wilderness is far insufficient to handle the heavy use. We need more. Because of the vital need to reverse global warming, we need to protect America's public lands from logging, and change course to healthy foot recreation and conservation of wildlife. It is past time we considered actualities - the need to preserve and live in harmony with the natural world. Political maneuvering has avoided this necessity, and brought great danger of extinction and global catastrophe. It is time for such compromise to end, and to take a stand for what remains, and to try unceasingly to restore our lands, seas, waters. We need far more wilderness sequestered from "harvest", development, or private gain at the expense of our future. We need to restore damaged areas, by establishing resorted wilderness protections to even lands that have been used and abused. Thank you for considering my comments.

Dear Sirs: We have not much time left to turn around our destructive ways. We are at the crossroads. Species are being eliminated at a brutal pace. Our turn will come soon, very soon, unless we change. You're up to bat. Regards,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear America's Great Outdoors, The first thing that I want to note, is that I am pleased we now have a month to celebrate Wilderness, perhaps America's greatest legacy and heritage. What I found sad, however, is that with over half of the federally designated wilderness being in Alaska, not one of your listening sessions will be held here. This is an especially important time to listen to the issues facing the outdoors in Alaska. The state and federal government continue to battle on divisive issues, rather than settling for what is important for all Americans. Alaska must recognize that when it became a state that it joined a union and that it cannot continue to make decisions only for its own best interest. We saw this with the State Board of Game's decision regarding the trapping of wolves outside of Denali National Park. I hope that the federal government will now become more involved with the Pebble Mine that threatens Bristol Bay's clean waters, wild salmon, wildlife, fishing industry and the jobs it provides, and traditional subsistence ways of life. We need stronger federal oversight of the permitting process and analysis of potential impacts. Our public lands in the Bristol Bay watershed need protection and should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority to truly honor our heritage over the short term gains of mining in the area. I understand that as a nation, we need to extract resources. However, we also need to think in the longterm. History and ecology has taught us how fragile wetland communities are. The standards for mineral development in wetlands should be more stringent, especially for large-scale metallic sulfide mining. Let's make sure we celebrate one of the most amazing things that makes America unique. People from all over the world come to our wild areas, our national parks, and specifically Alaska to see, feel, and experience the vast, unotuched wild areas that are disappearing from so many other places. Let's hope that America continues to be the leader in preserving these places. That can only happen with sound decisions. Smiles,

The US has a lot of resources already at it's disposal. I hate to see us overdevelop our natural heritage when there are plainly other solutions. We are one of the few highly globalized nations who seem to simply not give a damn about who or what we interfere with. The federal government should be held accountable by the indiginous peoples to uphold certain standards of action involving their livelyhood. Deny the corporates!

Please help keep America special by protecting more Wilderness and quiet recreation opportunities, preserving more habitat and connectivity for wildlife, and permanently protecting remaining old-growth forests. Here in Oregon, we enjoy some of the most beautiful and awe-inspiring public lands in the nation. But places like the Wild Rogue River, the wildlands surrounding Crater Lake National Park, and the Siskiyou Wild Rivers are at risk from logging, mining, and other harmful development. Oregon has protected only 4% of our land as Wilderness, lagging far behind our neighbors. For the wildlife that call our public lands homes and for the millions who enjoy these places for quiet recreation, it is time to correct this Wilderness imbalance. Thank you for considering my comments.

Stop destrucing the pebble mines. Its so sad to see just majectc beauty be destroyed by man.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Official, I urge you to do all that you can to save and protect Bristol Bay and the waters, wildlife, lands and habitat that would be threatened and damaged by Pebble Mine. Metallic sulfide mining should be prohibited in an area such as this. Thank you for your work and efforts in this important matter .

Bristol Bay and the remaining wilderness is too precious to dig up! Mankind does not need another mine. The sole purpose of this endeavor is for wealth - we have to learn money and the environment aren't in the same plane, i.e. air we breathe and coins we buy things with. Leave whats left of the environment - to future generations!!

Please consider what is best for our environment and its future and the future of our children. Please do not continue with the mining plans. Thank you,

I appreciate the Obama Administration's conservation leadership embodied in the America's Great Outdoors Initiative. It is inspiring to see the President make conservation of America's treasured outdoor places a national priority. Our natural resources are threatened by pressures like expanding population, unguided development and climate change. We need presidential leadership now more than ever to protect our wilderness quality lands so that future generations may also enjoy them. Please make wilderness protection a central component of the President's policy emerging from the America's Great Outdoors Initiative. The President has the authority to facilitate better cooperation among the federal public land agencies and Congress to identify eligible landscapes and protect them as wilderness. Currently, the U.S. Forest Service uses overly restrictive criteria in determining their recommendations for lands that should be designated wilderness. Worse, the Bureau of Land Management is bound by a directive from the previous administration to cease all wilderness assessments. Both constraints can be lifted by direction of the President, and I urge that this be done. Expanding America's wilderness preservation system is the best way to protect wildlife, watersheds and recreational opportunities.

Dear Obama Administration officials: As you consider ways to preserve America's open spaces and natural beauties, I respectfully ask that you provide strong oversight of the Pebble Mine permitting process near Alaska's Bristol Bay. Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life, and so the area should be closed to large-scale metallic sulfide mining. Instead, the government's priority for this area should be protection of habitat, subsistence resources, and recreational opportunities. More generally, we can preserve our open spaces and natural wonders by improving relationships between federal and tribal governments, tightening the standards for mineral development in wetlands, and increasing the requirements under the Clean Water Act for allowing large-scale metallic sulfide mining. Regards-

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As a former resident of Alaska, I would like to express my opposition to the Pebble Mine in Alaska. The mine threatens Bristol Bay's clean waters, salmon, wildlife and traditional subsistence ways of life. The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. The standards for mineral development in wetlands should be tighter and the Clean Water Act standards for large-scale metallic sulfide mining should be more stringent. I believe public lands in the Bristol Bay watershed should be closed to large scale mining. Protecting habitat, subsistence and recreation resources should be the top priority. Additionally relationships between federal and tribal governments should be strengthened. Best Regards,

Hi, I am writing to request that everything possible be done to protect this wild place. Remember, irreparable damage has been done all over this earth to capture a few "pebbles". The rewards are fleeting and the final results are devastating. In the end I'm afraid man-kind will find, too late, that obtaining "the pebbles" wasn't worth the sacrifice. Ask the people and the pelicans in the Gulf! Respectfully yours,

Please do not destroy the incredible resources of Bristol Bay for a stupid mine that will destroy something that cannot be replaced. It is difficult to think that this is even an issue in the 21st century. No Mine period. There is no way to make it safe for the environment and the mine itself is not important enough to justify it. Save Bristol Bay not just for today but forever. Thank you,

Hello, To be concise- DO NOT PERMIT IT. It will, as we know from long history, become an unrecoverable disaster. And, for what- more fast money for the owners. As always, at the end they will declare bankruptcy and walk away from their promises leaving devastation and ruin of this part of magnificent America and nature. So many of our values rest upon this kind of action to NOT do the easy expedient thing and think only short term. Please have some greater integrity and not bow to the temptations of the influence of the corporate money that so sways those of our government so frequently these days. Think BIG and LONG term, not the reverse and not about the money. Do the right thing- start a new trend by doing so. Thank you.

Alaska's Bristol Bay is an important pristine wildlife sanctuary. It provides a clean refuge for threatened western salmon while protecting the native Alaskan's subsistence lifestyle. These features make Bristol Bay incompatible with the proposed large-scale pebble mine using large-scale sulfide mining techniques. The Bay should be closed to these mining activities and be preserved as a protected wildlife habitat and native Alaskan sanctuary. The Federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed with a bias towards wilderness preservation.

Greetings, I am writing to plead with you to help preserve the natural beauty and resources of Bristol Bay. The bay is home to wild salmon and other irreplaceable wildlife which we must learn to sustain, not poison. Mining is an extremely dirty and harmful business and it has no place in delicate ecosystems. Please do what you can to work with tribal authorities to investigate the environmental impact of Pebble Mine on Bristol Bay and the traditional ways of the native peoples, and determine the most earth-friendly methods of preserving the bay's treasures for the present and the future. Best Regards,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

stop the Pebble Mine and save Bristol Bay.

Dear Obama Administration: Please do not let Bristol Bay be ruined by allowing the Pebble Mine. The Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. The federal government must provide strong oversight of the Pebble Mine permitting process, and analysis of cumulative impacts to the Bristol Bay watershed. Relationships between federal and tribal governments would benefit greatly from being strengthened. Standards for mineral development in wetlands must be tighter, and Clean Water Act standards for large-scale metallic sulfide mining must be more stringent. Please consider these facts and this logic in deciding to save and protect our few remaining natural places. Thank you.

I am submitting my comments ahead of your September 30 deadline with regard to mining in Bristol Bay watershed. Bristol Bay must be saved from the ravages of the disastrous mining operation known as Pebble Mine. The mine would effectively destroy, for all time, the beauty of Bristol Bay's wildlands, clean waters, life of the salmon runs, natural habitat of wildlife native to the area, subsistence living traditions, and the serenity offered by natural areas which should not be systematically destroyed one by one. The public lands in the Bristol Bay watershed should be off limits to large-scale metallic sulfide mining, and priority must be given to protecting habitat, subsistence and recreation resources. The government should provide strong oversight of the Pebble Mine, the first step being a thorough analysis of cumulative impacts to this pristine area known as Bristol Bay watershed. Going forward with the plan would undermine tribal and government relationships, wetlands development standards, and current laws and standards for permitting or excluding mineral and other development in wetlands. Once destroyed, this beautiful area could never recover. Thank you for your time and attention.

Department of the Interior I would like to be counted as a voice against allowing the Pebble Mine to use its destructive mining practices in the environs of Bristol Bay. The indigenous people and the wildlife of the bay, not to mention the beauty of the area, must NOT be left at the mercy of this heavy-polluting process. Whatever it was, we can do without it more easily than we can recreate habitat, a broken subsistence economy, and the recreational value that are all under threat if this mining project goes forward. Thank you for your attention.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I grew up in the Bronx- so my experience with the great outdoors didn't extend much past a playground near my apartment building, and my experience with wildlife was limited to the Bronx Zoo. But, after living for four years in upstate New York and spending every summer in Ithaca, I really became the person I am today. Whether it was walking along a path in one of the many gorge trails nearby, swimming in a stream fed by a waterfall, picking blueberries in my friend's backyard or even going out onto Cayuga lake to do research- I really fell in love with our natural world. I can't imagine living in a world where you don't get to have those experiences. In our society we spend so much time indoors and on concrete- it's even more important to protect our last natural stands. The AGO initiative is our opportunity to make sure our National Parks don't fall into disrepair; that they have the resources to be as vibrant in fifty years as they were fifty years ago; that even kids growing up in the Bronx have the opportunity to spend a long weekend outside. This fall, our leaders in Washington should fulfill the promise of our national parks and fully fund the National Park Service budget and the Land and Water Conservation Fund.

The Department of the Interior has an opportunity to do something heroic for the planet. The Department of the Interior can stop mineral mining that will undoubtedly be destructive to the ecology of Bristol Bay with its clean waters, wild salmon, wildlife, and traditional subsistence life of its native peoples. A study of mines similar to the proposed Pebble mine shows that 85% of them pollute nearby waters. As proposed, the mine would generate more than 9 billion tons of waste held behind a series of massive earthen dams, waste that could pollute and poison pristine water. Please prove to the American people that the Department of Interior can provide strong and objective oversight of the Pebble Mine permitting process and careful analysis of the cumulative impacts to the Bristol Bay watershed. When you have done so, I believe you will decide not to allow this mine. The possibility of an accident there would be disastrous. But even the construction and operation of the mine could disrupt salmon migration and jeopardize the larger ecosystem. It's a risk environmentalists like me are not willing to take. I hope the Department of Interior is also not willing to take such a fool-hardy risk.

please permanently protect bristol bay, our wildlife & world matter! thank you,

To America's Great Outdoors: Please record my opposition to the Pebble Mine proposal. Bristol Bay would be despoiled if the mine proposal is activated. It is too valuable an outdoor resource to undergo that fate. The watersheds that contribute to the bay should be closed to mining. Furthermore, the government must provide strict criteria for any kind of large-scale mining, and there must be vigorous monitoring for any projects which might be approved. Any other approach is an invitation to abuse of the criteria and destruction of the resources involved. For example, the Clean Water Act provides for the possibility of imposing strict standards for large-scale metallic sulfide mining. Such standards can, and should, be imposed and should involve broad public input. Thank you for considering my views.

## Discussion Question 2

***(cont.)***

For the past 25 years I have experience the beauty of the lakes, rivers , mountains and fishing in the Bristol Bay area. Three generations of my family have traveled to King Salmon to fish ever year. I cannot believe anyone would allow an open pit mine in an area that has the world's largest sockeye run. The major problem with the proposed open-pit mines is how they will contain the tons of waste to find gold. Stop and think about the problem with storing tons of waste forever. They will never be able to contain the ground water pollution which will expose the surrounding land, and wildlife to deadly conditions. Please think again, when they are gone we will have large toxic lakes that cannot be used. The area will have a 2 mile wide and 2,000 feet deep pit without life. And forever we will live in fear that the Billions of tons of waste will not harm our land and water. Common sense should tell us that this is wrong. The only reason for this posed mine is money. If we look at the past, mining companies come and go, they leave toxic waste behind and NEVER clean-up before they leave. How can anyone tell us that they will remove tons of toxic waste. They can't , they only tell us they will store it there forever. Please do not allow any open-pit mining in this area. Thank you

Pebble Mine should not be allowed because of the damage it will do to the wilflife and environment. Pebble Mine threatens Bristo Bay's clean waters, wild salmon, wilflife and traditional subsistence ways of life. Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. Please consider what is important to us citizens. There has already been too much distruction of our environment through mining and we must preserve our pristine habitat in the Bristol Bay area. Thank you,

I'm writing to ask the US government to have to good sense to put a halt on plans to open Bristol Bay in Alaska to mining. Though the financial temptation might be great, we cannot risk polluting some of America's last true wilderness. The proposed mine is projected to generate billions of tons of waste and would pollute the pristine waters nearby, killing off native species and forever altering our relationship with the land and those who live and make their living there. We have a duty not just to our environment and its habitats, but to our fellow humans as well, to prevent this land from being destroyed in this way. The mine might last a few years, but the destruction it would leave behind would be irreparable. Thank you. -- "Today's problems cannot be solved if we still think the way we thought when we created them." - Albert Einstein

I am strongly opposed to the proposed Bristol Bay Pebble Mine. Please do not allow this mine to begin operations ever! The location of the mine is in sensitive wildlife habitat and would do great damage even under the best of circumstances. The bounty from the natural habitat as it is today is much more valuable than any revenue or profit obtained from the proposed mine. Do not permit the proposed mine! Thank you. Respectfully Submitted,

## Discussion Question 2

HEY WEBMASTER -- I NEED TECHNICAL ASSISTANCE. HOW LONG DOES IT TAKE SOMEONE THERE TO ANSWER MY EMAILS AND HELP ME? DO YOU ANSWER CITIZEN'S EMAIL, OR JUST TAKE MY TAX DOLLARS AND SIT ON YOUR BUTT? DO I HAVE TO CALL KEN SALAZAR'S OFFICE TO COMPLAIN ABOUT YOU? FYI, HE'S MY FORMER SENATOR AND HIS OFFICE \*\*\*WILL\*\*\* TAKE MY COMPLAINT SERIOUSLY AS TO THE HORRIBLE AND LAZY JOB SOMEONE AT <http://ideas.usda.gov> IS DOING WITH THIS WEB SITE. Dear Webmaster, I CANNOT post my comment to the forum at <http://ideas.usda.gov/> (the full URL below.) I've tried three times and yet only half (or less) of my comment gets posted. In addition NO OPTION IS PROVIDED TO EDIT OR DELETE COMMENTS AFTER POSTING. YOU ALSO HAVE NO INSTRUCTIONS OR INFO (ZERO, ZIP, NADA) ON POSTING COMMENTS, TROUBLESHOOTING, POSTING REQUIREMENTS, CHARACTER LIMITS, ETC. This is extremely frustrating and has been a total waste of my time and efforts. Mine is both a comment and an open letter to the PRESIDENT, and it is meaningless if your stupid forum truncates, misrepresents, or otherwise mangles my attempt to make an educated comment and contribution. Now I have two (or maybe three) partially completed comments posted that do not say what I intended to fully say. PLEASE FIX THIS AND IMPROVE THE INTERFACE TO ALLOW POST-COMMENT EDITING. (How's that for an idea?)  
<http://ideas.usda.gov/ago/ideas.nsf/0/F5B7C870571DC680862577AD00498B6F?OpenDocument>

Hello, My sister and brother in law make their living fishing off Bristol Bay in the village of Ekuk. My wife and I went to visit them at their fish site and help fish for 6 tides. The experience was eye-opening, and fantastic. We met Alaskans of all stripes, natives, old-timers, and newcomers. All benefited from the bounty of the Bristol Bay fishery. The fish are phenomenal. It is beyond comprehension that anyone would consider placing this priceless fishery at risk, but clearly those who shortsightedly favor developing the Pebble Mine are doing just that. Once an ecosystem like Bristol Bay is compromised it can never return to its pristine, bountiful state. Please tighten wetlands protections in the regulation of mineral development. Please ensure that oversight of the Pebble Mine licensing process takes into account cumulative impacts on the Bristol Bay watershed. Please strengthen the Clean Water Act for large-scale metallic sulfide mining. Please stop the Pebble Mine and preserve the Bristol Bay fishery for generations to come.

I am writing to let you know that I believe there should be no mining at Bristol Bay. The proposed mine threatens the purity of water and land, and destroys the well being of native people as well as animal and plant species. The degradation of the planet through reckless extraction of resources needs to be halted, now. Public lands should be used for the well being of all, not the profit of a corporation at the expense of activities like outdoor recreation and preservation of habitat and native ways of life. I urge you to support strong clean water policies, strict evaluation of the impact of this mine, and to strengthen policies which protect wetlands from the effects of mining. Thank you,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I applaud the Obama Administration's conservation leadership embodied in the America's Great Outdoors Initiative. It is inspiring to see the President make conservation of America's treasured outdoor places a national priority. Our natural resources are threatened by pressures like expanding population, unguided development and climate change. We need presidential leadership now more than ever to protect our wilderness quality lands so that future generations may also enjoy them. I'm asking the President to please make wilderness protection a central component of his policy emerging from the America's Great Outdoors Initiative. The President has the authority to facilitate better cooperation among the federal public land agencies and Congress to identify eligible landscapes and protect them as wilderness. Currently, the U.S. Forest Service uses overly restrictive criteria in determining their recommendations for lands that should be designated wilderness. Worse, the Bureau of Land Management is bound by a directive from the previous administration to cease all wilderness assessments. Both constraints can be lifted by direction of the President, and I urge that this be done. Expanding America's wilderness preservation system is the best way to protect wildlife, watersheds and recreational opportunities. Again, I want to thank the Obama Administration for taking the initiative to protect America's Great Outdoors. I look forward to seeing the president use this opportunity to establish a new and substantial legacy of wilderness conservation, one that can stand as a visible and enduring accomplishment of his presidency.

America's Great Outdoors, I have been visiting Alaska since 1983. In my view, it is one of the most beautiful places on earth, deserving of our protection for future generations. The Pebble Mine at Bristol Bay is a really bad idea. I went to college with a gold miner who is now notorious for poisoning Canadian wilderness with toxic mining practices. Once pristine lands like these are contaminated, their legacy lives on in misery and blight. Let's stop this disaster before it happens, and keep Bristol Bay clean and safe for wild salmon, wildlife, and traditional subsistence ways of life. Say no to the pebble mine.

To Whom it may concern, Years from now, when the last of God's greatest gifts to this planet and the humans who inhabit it, has been destroyed by pollution and construction, and disrespect for it's fragility, we will know who could have stopped it! PLEASE, for the Love of God, put sanity over greed this one time at least! Thank You,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Sir/Madam The future of our wonderful wilderness looks terribly grim with all of the mining and oil companies being given carte blanche to lay waste, pollute and destroy nature's fragile balances. We deserve better of an administration than to have it sell off what few of the wilderness areas are remaining. This administration has become gluttonous in its desire to destroy the wildlife and its habitat. It is a no-win situation if it continues in this manner. All the areas now about to be destroyed will not allow much additional time before resources run dry. Leave these refuges of beauty with the wildlife that God created and think laterally about the situation. Limit population increase, make it more expensive for people to waste rather than save resources, stop all the building in the cities from leaving on the lights 24 hours a day, limit packaging of food, cut back on air conditioning, make more public transport available and make it more difficult and expensive to run a private car. These are the ways to provide for a future. Shooting wolves in the national parks, destroying the habitats and food sources of wildlife and other ghastly policies will do nothing except enrich shareholders and corrupt politicians. Pebble Mine is a perfect example of this misguided policy and will doom yet more of the wilderness without any lasting gains. Yours,

As an American citizen I have been very concerned about the onslaught against wetlands and other wild areas which support wildlife and are important natural places for Americans to appreciate. The mining at Pebble Bay would be disastrous for these values and would be one more misjudgment regarding preserving critical natural resources. Let's not ruin everything in the pursuit of resources. Our children have a future and we must preserve vital and special planetary wonders.

Sirs, There is quite a bit of media coverage about the Pebble Mine Project in Alaska. Since this would affect Bristol Bay I would just like to add my own thoughts to the governmental review procedures. There are several streams in Alaska that were blocked around 1900 during the gold rush. They were subsequently reopened during the 1950's. The salmon have never come back. The wildlife biologists have discovered that once these fish are interrupted for a certain number of years they cannot recover. The Pebble project would undoubtedly affect the acidity or PH of the entire bay. This is all it takes to ruin salmon spawning. Secondly this mine is proposed for its copper content. There is a vast quantity of copper in our landfills. Copper generally does not rust and it can be recovered with no environmental effects and it is shallower and far more easily refined. Instead of mining it from Bristol Bay it could be taken from Freshkills New York City at a far lower cost. We have ruined many runs of salmon in this country and there are still 38 species on the verge of extinction. I recommend that we protect all remaining runs.

It isn't just that Pebble Mine will Destroy Bristol Bay no matter how careful they are, it is that every little bit of the ecosystem that we destroy effects the rest of the ecosystem and each day we destroy a little bit more and one day we are going to look up and say, "Whoops there isn't any more". It is all attached. The chemicals that go into Bristol Bay will end up in our back yards and the chemicals we put on our backyards will end up in Bristol Bay some day. We have to quit saying, "Well just one more time. It will be ok."

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In Washington state we have seen the results of being careless with salmon runs and clean water. Let's all learn from this and not make a tragic mistake again.

I am writing to strongly urge you to reject Pebble Mine and protect Bristol Bay with its clean waters, wild salmon, and other wildlife. The mine threatens all of these along with traditional, sustainable ways of life. In fact, the federal government should strengthen its relationship with tribal governments rather than ignore their interests. Overall, public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Instead, the top priority should be protecting habitat, subsistence living, and sustainable recreation. The federal government needs to provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. You must also tighten standards for mineral development in wetlands and make Clean Water Act standards for large-scale metallic sulfide mining more stringent. Again, please protect Bristol Bay and all the life it supports from the devastation of Pebble Mine.

It is vital that the Pebble Mine project not go forward as planned. Pebble Mine seriously threatens Bristol Bays waters, wildlife, and salmon. Clear Water Act standards are not stringent enough for metallic sulfide mining. There needs to be a much closer working relationship between the federal government and the tribal government. Please do not allow this project to go forward. A very concerned citizen

To Whom It May Concern There should be no mining in Pebble Mine. It is in the Bristol Bay watershed. Protection of Bristol Bay is much more important than short term gain from mining. Please do the right thing

Folks, I am writing this email in response to the disastrous possibility of the Pebble Creek Mine in Alaska's Bristol Bay region. I visit this area each year in search of the monster rainbows this area sports. Yes, I am a consumptive user of the outdoors and wish to voice my opinion on this proposal. I think there are places to mine, and this is not one of them. This mine will affect so much of our national heritage, that it has to be stopped, right now! I am not normal against this sort of thing, but I think this is a bad idea all the way around. Thanks for your time,

We applaud the Obama Administration's conservation leadership embodied in the America's Great Outdoors Initiative. It is inspiring to see the President make conservation of America's treasured outdoor places a national priority. Our natural resources are threatened by pressures like expanding population, unguided development and climate change. We need presidential leadership now more than ever to protect our wilderness quality lands so that future generations may also enjoy them. We're asking the President to please make wilderness protection a central component of his policy emerging from the America's Great Outdoors Initiative. The President has the authority to facilitate better cooperation among the federal public land agencies and Congress to identify eligible landscapes and protect them as wilderness. Currently, the U.S. Forest Service uses overly restrictive criteria in determining their recommendations for lands that should be designated wilderness. Worse, the Bureau of Land Management is bound by a directive from the previous administration to cease all wilderness assessments. Both constraints can be lifted by direction of the President, and I urge that this be done. Expanding America's wilderness preservation system is the best way to protect wildlife, watersheds and recreational opportunities. Again, thanks to the Obama Administration for taking the initiative to protect America's Great Outdoors. We look forward to seeing the president use this opportunity to establish a new and substantial legacy of wilderness conservation, one that can stand as a visible and enduring accomplishment of his presidency. Peace!

I am very concerned about the America's treatment of our outdoors. In particular, I worry about our wetlands in South Louisiana, and the damage being done by policies and actions along the entire Mississippi River watershed. I want the next generation to be able to enjoy my part of the country and the fruits of our wetlands -- the nurseries to the Gulf of Mexico. I urge leaders in Washington to expand protection and conserve America's wetlands and outdoor spaces. Thank you

The Pebble Mine project in Bristol Bay, Alaska must never be approved. Pebble Mine threatens Bristol Bay's clean waters, wild salmon, and wildlife. This pristine environment must not be sacrificed for greed! Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority! Do not approve this project under any circumstances! Too much of our Alaskan heritage is already under threat.

Dear Obama Administration Officials, What we don't have in the USA is enough protected, unspoiled wilderness areas. We are a large country but only protect roughly 4% of it as wilderness. That is not only short-sighted, but a reflection of a mentality that views nature as only as a commodity. Some of greatest poets--Emerson, Thoreau, etc--regarded nature as the embodiment of God. I don't view carving up some of the last of our unspoiled wilderness and replacing it with a mining operation as an improvement. I'm tired of seeing what man can do to a wilderness and somehow viewing it as an "improvement" and would like to see more of what nature can do on her own in creating beautiful wilderness areas like Bristol Bay. I strongly oppose this mining operation. Please let Bristol Bay continue to remain pristine. Our future generations will thank you. I would also like to say that I am against strip mining of any kind. We can't lose beautiful mountains like those in West Virginia and other areas to strip mining.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Sir/madam, The proposed Pebble Mine in Bristol Bay would threaten the environmental stability of the region, devastate the wildlife there, and the livelihood of the native population. Man's greed for natural resources should not make us short-sighted, and destroy the very environment we live in and which sustains us. I hope your administration will take steps to ensure the stability and security of this environment and its flora and fauna.

Dear America's Great Outdoors and the Obama administration, Please do not allow metal mining in Alaska's Bristol Bay. The Pebble Mine is dangerous to wildlife, and we don't have much of wildlife left. The mining would pollute the water and make life untenable for the helpless creatures there, the bears, whales, salmon, birds. This would happen even if the mine operated normally. With an accident, the damage would be unthinkable. There are few places that we have not damaged. Let's keep this one the way it should be. Let's do the right thing this time. Please stop Pebble Mine and the actions of the Bush administration.

the government needs to protect the natural areas including the animals, birds etc that inhabit these areas. once a species is extinct it cannot be brought back. greed, big business have been in control to long. we destroy precious creatures, plants, trees and even insects in the name of progress and in the long run in danger our own survival ( ie: global warming ). one of my biggest concerns are the wild mustangs, cougars and polar bears. there is still way to much poverty and people being paid to much ( politicians, sports and ceo's ). not all of these can be solved by government but it would be nice to see a start made. bickering between the elected officials of this country should be lowered all so.

Why is it that you folks WE THE STUPID PEOPLE elect do things most of us think is just plain stupid? This Pebble Mine business for instance. Here we have a perfectly clean environs,net, Bristol Bay, and big business is going to run you dunderheads in another big chase and circle, all for the sake of of risking metallic sulfides if and when this mine operation goes into effect. Oh, don't get me wrong. I know how you're going to vote on this matter, just like you folks always vote - weak, though with a diluted compromise. So, why not grow a pair and do the right thing for a change: close down that operation and open up your minds for a change. Otherwise, you know damn well you're going to create another environ,entail hazard and shrug your shoulders saying words to the effect, "Gee, never thought that would happen. Those mine officials even told me everything would work out just fine." Come on people in power - wake up and listen to the wisdom that says "What harm do to this planet, its environment, you also end up doing to yourself."

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Sirs: I have major concerns with the proposed Pebble Mine project. Let me start by saying that I am generally for a cooperative private enterprise/public interest policy. In most cases I would prefer that the federal government stay out of the private sector, unless there is a compelling public interest at stake. For example, I generally support most oil drilling project unless it can be clearly shown that there is likely damage to the environment. I greatly appreciate the natural environment and have enjoyed outdoor recreation most of my life - I believe we must be good steward of the creation with which we have been entrusted. The Pebble Mine project appears to be a clear and imminent catastrophe just waiting to happen. The rare treasure of western Alaska is a jewel to be protected. There appears to be so little benefit from this project compared to the great peril it presents to the environment and the economic welfare of the whole region. I would encourage the federal government to do all that it can to halt the project. Thank you.

Ladies and Gentlemen of the Obama Administration and relevant agencies: Alaska's Bristol Bay is another spectacular example of treasured wilderness that should be protected from large scale degradation. The natural beauty and teeming wildlife of this great region would be forever impacted by the destruction brought by a project such as the Pebble Mine. The traditional fishing patterns of Alaskan native peoples in this area would also be severely affected. Doubtlessly, the area also contains non-renewable archaeological and other historical sites. While impacts to these resources might be somewhat mitigated through careful pre-construction measures, the loss of timeless landscape, old growth forests, and marine environments are not. These effects will last for generations, as they are likely to in the Gulf of Mexico and elsewhere. The need for another ugly and massively destructive project such as the Pebble Mine is difficult to understand. The beauty of the Bristol Bay ecosystem is far more valuable, and the entire watershed should be closed to metallic sulfide mining. We need to protect Bristol Bay and other places like it by prohibiting permits for needless, destructive developments of all types. We also need to strengthen the standards represented in the Clean Water Act, and to enhance the relationship between the federal government and native councils, particularly in matters as damaging to the environment as the proposed Pebble Mine. Please keep the Pebble Mine out of treasured wilderness such as Bristol Bay, and direct them instead to areas that have already been irrevocably marred.

Please save the Bristol Bay area from becoming another cesspool of toxic waste. I visited this area about 10 years ago, and it still leaves a strong impression on my mind when I think back to the natural beauty of the area, and the friendly, easy-going ways of its inhabitants. This is a place where many different types of people and animals depend on. From the whales to the salmon, to the fishermen to the native cultures who fish the sea and the rivers. There are too many issues at stake here, way more than just drilling and mining and ravaging a pristine area for some precious minerals. This needs to be rethought, and the Pebble Mining corp. needs to find another area to do their mining. Where so many people and animals aren't dependent on this environment, and so many livelihoods aren't at stake. Mining is not renewable, and once that hole has been dug, it will be very difficult to ever recover what once was... Thanks for listening

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Pebble Mine clearly threatens Bristol Bay's clean waters, wild salmon, wildlife, and traditional ways of life of the people living along its shores. Please prevent the opening of this mine. Thank you,

There are many environmental problems associated with mining, particularly mining sulfide ores. Most of the material mined is not processed for the ore, it is treated as waste and placed in piles that are more than double the volume of the space they occupied prior to mining. This "waste" material contains sulfide ore, just not in high enough concentrations to profitably extract the targeted metal(s). Sulfide ores exposed to the atmosphere, and moisture, rapidly break down giving rise to toxic pollutants that leach into the groundwaters and/or run off into the streams. When those water resources are contaminated by mine wastes, their ability to provide habitat for food fish is reduced or destroyed. Bristol Bay and its tributary streams are critically important for food fish (both for sustenance and commercial purposes), and contamination of them from mining would be disastrous for all who depend on the fish. For that reason, any mining development in the Bristol Bay watershed should be rigorous in protecting the environment from the detrimental effects of mining. Note that even the most carefully planned measures to protect the environment are entirely dependent on the mining personnel to ensure that all measures are scrupulously followed. However, the mining company is in the business to make as much money as possible, which is another way of saying that they will tend to put resources into activities that have the highest rate of metal production per dollar invested, and spend as little as possible on activities which don't. Unfortunately, environmental protection is something that costs money, and doesn't produce any metallic benefit. So, unless you leave the fox to guard the hen house, any environmental protection plan needs effective oversight by another party. This oversight should be paid by the permitting agency, using funds supplied by the mine. I think, if the true cost of effectively protecting the Bristol Bay and its tributaries from environmental damage resulting from mining is considered, the owners of the Pebble Mine claims will find it in their best financial interest to seek minerals in other areas where environmental values are considerably less than they are in Bristol Bay. I appreciate the opportunity to comment.

I am writing this note this evening to express how concerned I am over the proposed Pebble Creek Gold mine. I want our Government to take the long view, of the environmental damage, impact to the economy through the destruction of salmon stocks and the fouling of our waters. The history of mining in this country is very clear...the companies make huge profits, and the citizens are left with what remains...generally a damaged environment and an unpaid bill. Government should take the lead to look for sustainable growth, without unpaid environmental bills as the result. Please stop the Pebble Mine project. very respectfully,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear Sirs, I am writing to you in reference to the proposed Pebble Mine on Bristol Bay, Alaska. As you may know, Trout Unlimited is a nationwide, non-profit organization and the individual chapters are completely volunteer. T.U.'s mission is to conserve, protect and restore our natural cold-water resources. Areas such as Bristol Bay and its eco-system are constantly being threatened by development and big business across our nation. It is important that we preserve unique natural resources such as Bristol Bay and instill stringent legislation to protect these fragile areas. All considered, once this is allowed to happen, there will be no turning back, no restoration. In Connecticut, we once had some of the largest Salmon runs in the world, now we have none. Restoration efforts have been taking place for over thirty years and we still have no return runs of salmon. If the Pebble Mine is allowed, the last large consistent salmon run in the world will be decimated forever. Please do not allow this to occur. I implore you to stop this while it is still stoppable and to instill strong legislation to protect this and other similar unique, fragile eco-systems from destruction due to greed and certainly not by necessity.

Mr. President and Mr. Secretary, After reading hundreds of the comments on America's Great Outdoors, it is clear that there is great diversity of opinion and high emotion on both sides of the environment issue. It is also clear to me that if the health of our public lands and wildlife habitat is up to credulous and ill-informed public opinion, there is no hope for our once great natural endowment. As a prime example... who, in possession of his mental faculties, authorized the open pit Pebble Gold Mine in Bristol Bay, Alaska?! The Guns and OHV Crowd is fired up at the "threat of Left Wing radical Environmentalists taking over their country." They are furious at the notion of introducing Environmental Sustainability studies into public education, asserting that it is THEIR job to teach their children environmental values, as if Sustainability were a Belief. And they have been conditioned to accept as gospel that America's greatness is synonymous with our aggressive ethnocentrism, and our unregulated freedom to exploit natural resources, whether on U.S. soil or that of other nations, regardless of the harmful cost to living species and their habitat. The Responsibility to Preserve and Protect the Commonwealth is delegated by The People to elected and appointed government officials, who have taken an oath to do so. Their mandate is to sustainably manage the Commonwealth for the benefit of All Americans, not to give equal weight to the demands of All Claimants, nor to Average the results of public polls, such as America's Great Outdoors, and let that Average dictate public policy. No, to Preserve and Protect the Resources held in Common by the People of this country will necessarily require moderating and regulating those uses that devalue and contravene the quality of the Commonwealth, or restrict responsible and respectful access to it by The People. This responsibility is the mandate of the Secretary of the Interior. And he and the President, and the Congress will be held accountable, at the Polls and in the Courts, for proper implementation of wholesome, sustainable regulatory policies.

Bristol Bay and also other Alaskan wilderness area, including the arctic ocean, are far too important for the environment, climate and as habitat for endangered species and should not be destroyed by any mining and drilling activities. Besides that, mining activities will destroy livelihood of native Alaskans who depend on salmon fishing. please do what is right for us now and later!

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

Bristol Bay, one of our last great wild ecological areas, is too valuable to destroy by commercial mining! How far do we go in the name of the all mighty dollar?! We have forfeited far too many of our lands and waterways already. Enough is enough!! NO MORE WILDERNESS DEVELOPMENT!

There is nothing I am more passionate about than preserving our natural resources and protecting the environment. I feel strongly about being nature's advocate and voice and am therefore speaking out against the Pebble Mine which threatens Bristol Bay. Large-scale metallic sulfide mining will impact public lands in the Bristol Bay negatively and needs to be offset with tighter Clean Water Act standards and stricter federal government oversight of the Pebble Mine permitting process. We, as responsible earth stewards, need to respect Bristol Bay's amazing wildlands and wildlife and contribute to their protection. I urge you to make stopping the Pebble Mine and saving Bristol Bay a priority and, as a result, leave a lasting legacy for future generations so that they might enjoy nature's beauty and inspiration. Sincerely yours

Allowing mining in Bristol Bay makes about as much sense as giving a logging company the rights to cut down the Giant Redwoods in California. The damage to the wildlife and the environment of this area would be so extreme that no dollar amount could ever repair the loss to this world. Our natural resources are being depleted for the GREED of these mining, logging and oil companies...IT HAS TO STOP and BRISTOL BAY and PEBBLE MINE is an excellent place to say NO.....NO MINING...NO LOGGING....NO OIL DRILLING !!!!!!!!!!!!!!! KEEP OUR NATURAL ENVIRONMENT AND WILD LIFE SAFE AND PROTECTED....ITS HERE FOR FUTURE GENERATIONS AND ITS OUR OBLIGATION TO KEEP THIS PROTECTED AND SAFE FROM THE GREED OF THIS WORLD !!!!!

Dear sirs/madams: One of our nation's most precious assets are the natural wonders that we have set aside for present and future generations. One of those precious wonders is the Bristol Bay watershed which is now being threatened by the proposal of large-scale mining, notably the Pebble Mine project. The permanent and uncorrectable damage that such a mine would wreak on this resource is incalculable. Not only would it poison the water supplies of the whole area, it would also damage the enormous watershed that is so critical to the health, welfare and survival of the wildlife, trees, and plant life of that area. It would also change forever the traditional subsistence ways of life that are still practiced in that part of our nation. Please do all in your power to stop the Pebble Mine project NOW. At the same time, every effort should be made to strengthen and tighten the standards for mineral development, especially in wetlands such as Bristol Bay. The Clean Water Act also needs to be strengthened, especially its standards related to large-scale metallic sulfide mining. Thank you for your time. And Please Help stop the Pebble Mine Project.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Hello!! I would like to be able to take a moment to express my concern on the possibility of a mining adventure to take place near the Bristol Bay in our beautiful state of Alaska. Today with the changing needs of the world. We must start to see that we can preserve the unspoiled areas of nature in the raw (the way it was designed to be forever). We can but all safe guards in place to protect it, but we have seen lately and in the past, that safe guards can fail, with the loss of the area that was to be protected. Once lost it can never be replaced or brought back to the way it was meant to be. Therefore I'am asking that this mining project be omitted in the sake of unspoiled nature. Thanking you for your time.

We need clean water and safe fish & wildlife to eat. It doesn't get any more simple than that, does it? Polution has already cost us dearly when others have not thought ahead. Do not make another mistake that will not only cost us the environment, but the taxpayers will have to pay again when we have to clean up the mess later. Millions of taxpayer dollars are being spent currently in Oregon to clean up old mine areas that are still polluting our rivers. Do the right thing now. Thanks in advance

I am tired of hearing of our great, beautiful country being over-ran and destroyed for our own personal comforts, it's time we as human beings step up and realize we are directly affecting millions of life forms everywhere, and we are directly responsible for millions of deaths. If these animals were human, we would all be on trial for genocide, but it is human nature to put ourselves above everything else, all I am asking is for respect. Respect for the world around us that gives us sustenance, without it, there would be...nothing. Pebble Mine is nothing but a nuisance, all the recent global issues involving mines should be all that is needed to show why another mine should not be created, it's time we move on, find less destructive ways to keep our comforts and harvest what we think we need in life, not for us now, but for future generations; no one knows how much time we have before our destruction is irreversible, and I don't think anybody wants to wait until that point. 30 years ago when we realized our Ozone was rapidly depleting, the laws were erected to stop it, but with our current environmental issues, no one is in a hurry to jump, when these issues could be substantially more devastating than any we have ever faced before. I plead for some consideration that all us "green freaks" might have a leg to stand on, that we might be on to something, I am not asking for things to change overnight, I am just asking you to ponder the idea that our world is taking a turn for the worst unless everyone, not just America, steps up to the plate and starts refining the ways we all live. We are all connected more than anyone realizes, we are all neighbors in the grand spectrum of things, please do not add to our problems by creating yet another one, please leave Alaska beautiful, it's the least urbanized area I know of in this country, and it deserves to stay that way! Thanks for hearing me out on this matter,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Hello. I am writing to you to urge you to oppose Pebble Mine in Bristol Bay. The cool, shallow waters of Bristol Bay are surrounded by a verdant cushion of tundra, crisscrossed by swift rivers and dotted with lakes large and small. Grizzlies, wolves, seals and whales roam this nearly untouched ecosystem, all drawn by the same lure: tens of millions of thrashing salmon, charging upstream to spawn. Huge salmon runs are the linchpin of this glorious wilderness, supporting valuable commercial fisheries, indigenous people and a vast array of wildlife. Yet the whole system could come crashing down if giant mining interests get their way. A study of mines similar to the proposed Pebble mine showed that 85 percent of them polluted nearby waters. At Pebble, a proposed open-pit mine would be 2 miles wide (enough to line up nine of the world's longest cruise ships end-to-end) and 2,000 feet deep (enough to engulf the Empire State Building). As proposed, the mine would generate more than 9 billion tons of waste held behind a series of massive earthen dams -- all of them taller than China's Three Gorges Dam and located just 20 miles from an active fault line. A single accident here would be disastrous. But even the construction and operation of the mine could disrupt salmon migration and jeopardize the larger ecosystem. It's a risk most local Alaskans are not willing to take -- the true gold of this region, they say, is its fish and wildlife. Please oppose Pebble Mine. Thank you for your time.

Dear Important People, Americans have so stupidly allowed our waterways to be contaminated. Please do not allow Pebble Mine to contaminate Bristol Bay. Thank you.

I'm doing all I can to try to save this vast planet, being only one person. I need your help! I'm most concerned about the mining that threatens our Alaskan wilderness and the waters of Bristol Bay. Please consider what destruction to public lands, water and wildlife can be caused by mining. Our federal government needs to step in to protect Bristol Bay by providing strong monitoring of Pebble Mine, as well as strengthen our relationship between the tribal and federal governments. Please, please take my concerns into consideration. OUR PLANET DEPENDS ON US.

Our National Parks are a gift from wise Americans who went before us who had foresight and wisdom. Please continue that legacy. There are environmental issues, esthetic points, and just plain common sense that are involved when considering the protection and upkeep of our National Parks. I am sure that others will remark on these very poignantly. I would like to say this. These parks spiritual places for our national family. They are places of wilderness, openness, quiet, and inspiration. These are challenging times. There are so many problems that seem too big to solve--that we have no answers to and/or do not have the resources to meet. I believe it is vital to our national psyche to know that our government can at least preserve this legacy. If our government can not come together on this issue and move forward rightly, successfully, immediately...I believe it will lose the last shred of hope Americans have that democracy works...that our government is capable...that America can't even preserve its own natural resources. Please show us you can keep our National Parks in tact. Thank you for considering my comments.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Having traveled through Yellowstone National Park and the surrounding area for over 30 years we know it is an ecosystem to both enjoy and protect. Having a vacation home 15 miles from the west entrance to the Park we feel privileged to spend several months in the area, including winters. Use of low emission snowmobiles by responsible individual drivers should be allowed. Before the requirement of having to go with a guided group, friends, my wife, and I enjoyed touring the Park three times; staying overnight at the Snow Lodge at Old Faithful. We can not do this under the current regulations unless we pay for the guide to stay overnight. Please do not allow a few careless riders deprive others of enjoying the Park in the winter. While we are supporters of several environmental groups in the area, we are NOT in agreement with banning snowmobiles from Yellowstone. Please, allow responsible visitors to enjoy the wonders and beauty of Yellowstone in the winter without the requirement of being with a guide. Alternate Plan: Individual snowmobilers would complete training workshops, up to four hours, and successfully pass a test. In addition, the individuals would understand and agree to severe penalties and/or fines for violations.

Dear Secretary Salazar and Department of the Interior: I recently spent 3 weeks traveling in Alaska and was overwhelmed by the beauty of the small amount of the state I was able to visit. I was also struck by how fragile the environment in Alaska is. I've lived in Colorado all my life and am aware of how fragile environment is, especially in our mountains. There are scars all over our mountains from metal mining in our past, although it did not threaten wildlife species. Knowing its destruction of fragile environment, I cannot imagine the destruction mining heavy metals and risking contamination by the chemicals involved in mining might cause in Bristol Bay, Alaska, threatening wildlife and Salmon and the traditional Native Subsistence Fishing. Every place I traveled in Alaska I saw bumper stickers on various vehicles to Stop the Pebble Mine. I absolutely agree with that sentiment. I know that Climate Change is causing destruction of habitat, and I don't know how much impact we can truly have on that although we must try. Not mining in Bristol Bay is a positive action that we know can protect vital wildlife habitat. Do we truly need to be mining Gold there and risking destruction? Please give every consideration to blocking Mining in Bristol Bay. Thank you for your consideration.

Everytime I hear about plans to start a new copper or gold mine I literally cringe. These mines are toxic to the area where they are and often to a wider area due to the chemicals used in dissolving the minerals. The mining companies always claim that they can do this while protecting the environment but so far I don't think that they have been able to....usually effluent leaks into underground acquifers and spreads across the land and into the surrounding lakes and bays etc. AND like the oil mine in the Gulf of Mexico there isn't any proven method of clean up afterwards.....Then the Federal government and the taxpayers end up paying for some kind of remediation....after the fish, birds and mammals have been killed off. This area is an important recreation and tourist area in Alaska where not only can you go fishing for trophy salmon but you can also fly in and watch the brown bears catch the salmon for themselves. This to me is a very rare opportunity...not found in more than one or two other places in Alaska and nowhere else in the world. Why would we want to destroy this unique place for any amount of gold-- which after all is not in short supply or necessary to maintain our lives.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

If we don't protect what we have now we'll go down in the history books for all the wrong reasons. Our grandchildren will never forgive us.

Dear decision maker, I have traveled to Alaska on four separate occasions and am a practicing field biologist, I would like to submit comments on the proposed mining in the Bristol Bay watershed. As a Colorado resident I am all too aware of mining's impacts on native species and natural communities. In the case of Bristol Bay, the Pebble Mine has the potential to wreak havoc on one of the richest habitats in our nation. In addition, the mine would seriously threaten the viability of subsistence peoples whose livelihood depend upon healthy lands and waters. I have been closely watching the specter of this plan develop over the years and am horrified at its momentum and potential for harm. Whatever riches may be gleaned from the relatively short lifetime of this development is not worth the damage that will remain behind in perpetuity. The pristine nature of the Bristol Bay watershed will never be the same if the mine is approved. The federal government must honor its responsibilities and provide strong oversight of the process, closely regulate air and water standards, keep a special eye on wetlands, and honor the rights of traditional people. Thank you for the opportunity to offer these comments ...

Hello, When all of the true costs and benefits are tallied, there can be no doubt that we must do everything possible to protect, preserve and restore as many of the few remaining wild places as possible. Industry and individuals have been stealing from the environment by not paying the true costs as long as they have been able to do so. Any valid scientific study would support this. Thank you for focusing attention on this most important issue. Regards,

Sorry, but we should be doing much much more to get solar and wind and geothermal and ocean energy, whatever, but we need to keep our wild areas free.....and untouched by human hands.....it's about time we realize they are almost all gone.....but we need people in power who understand how fragile our ecosystem really is...instead of just plowing ahead (see oil rigs offshore.....no real protection for us, the ocean, the inhabitants of said ocean) and destroying what you can never recover in your lifetime....and when you are gone, no one else will pick it up to try and restore it..you know that. please keep these big monster projects away from our pristine lands.... look at brazil..as the weather changes due the forests being ripped down hundreds of acres a day..... oops..... on your watch you need to keep our fabulous green areas green. period. thanks for listening,

Why would we not save this beautiful place, haven't we destroyed enough of our planet IT IS TIME TO CHANGE the old ways of thinking has got to end, look were it has got us global warming ,extinction of animals. Destroying this place should not even be an option .please help make a change

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

Perhaps I fail to understand what the term "Public Lands" designates, but I have always believed that it meant lands set aside for the public good. Since when have these lands become available to the obscenely wealthy few, who exploit them for their own personal gain? Why must we allow these huge corporations to destroy our national birthright? Since when did it become acceptable for our governments (federal and state) to "pimp" these territories for the personal profit of the few, with no regard for the ecological after effects of this exploitation? This has to stop! We are destroying our own environment

We have a lot of questions for the Interior Department. Okay, haven't we learned that we can't blindly trust "Industry's" reassurances that they can prevent devastation from occurring because of the latest, greatest technologies?? Worked well for B.P., Transocean, and Halibuton, didn't it?? I mean, really!! An open-pit mine at the headwaters of the largest salmon fishery left in the U.S.A.?? You do know there was a regime change in D.C. in '08, don't you?? Are you really considering granting permits for the largest open-pit mine in North America?? To companies that have already had 45+ water-use violations, IN JUST THEIR EXPLORATORY PHASE?!? When the fish are gone, they're gone-- do you remember assurances from the power companies how fish ladders were going to save the salmon on the Columbia River?? Lot's of questions....here's one more: Besides writing you, is there anything else we can do to prevent this from happening??

It is pretty simple.....Public lands mean just that, PUBLIC, as in the land belongs to the American people. For some reason that is always overlooked. In speaking for myself I am speaking for others. We don't want polluters from large corporations defiling our PUBLIC lands. For far to long that has been "business as usual" and the Obama administration needs to step up to the plate and do what is right. Did you know the "NO" is a complete sentence???? Use it..... Thank you,

Please stop the proposed Pebble Mine in Bristol Bay. Our marine life suffers throughout the seven seas. Whales and dolphins are under attack for frivolous entertainment and cheap food sources. We are the last generation that will regularly eat a wild caught food. AND NOW another threat to our marine life: Pebble Mine in pristine Bristol Bay. Shame on you for killing off more animals and fish in the name of GREED. Penalties for violating the Clean Water Act should be devastatingly high.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I would like to comment on the proposed Pebble Mine in Alaska's Bristol Bay. My step-son is a fly fishing guide in the Bristol Bay area, so I have seen and heard much about this area. It is truly one of the finest places on earth, home to many thriving species of fish and wildlife. Its pristine landscapes are not only stunning, but a national treasure. The natural landscape and incredible wildlife habitat are also the basis for a local industry based on fishing and recreation. The damage from a mining operation like that proposed by the Pebble Mine would be too horrible to imagine. I work for a natural resources consulting company and have seen the damage that even minor disturbances to wetlands can cause. Also, I want this mine proposal to be taken off the table. Because I don't think that is a likely outcome politically, then I want to urge the federal government to provide strong oversight of the Pebble Mine permitting process and the most stringent analysis possible of cumulative impacts to the Bristol Bay watershed. Anything less is unacceptable. As we have seen in the Gulf of Mexico, assurances by large corporations that nothing will go wrong and that measures are in place to prevent damage are clearly unfounded and an insult to all the citizens of the United States who care about the environment. For the opportunity to comment. Please protect Bristol Bay!

Although my family hikes, camps and fishes in wilderness areas of the nearby Rockies, I would like to draw attention to a place I've never visited. In Alaska, where my children were born, a proposed mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Hard rock mining has a terrible record. Water resources are polluted 85 percent of the time. I'm lucky to live near beautiful places that are protected, and hope to help protect more in the future. Please help draw attention to the threat to the wonderful Bristol Bay. E.

I am against this disastrous mine, which would endanger Bristol Bay's spectacular wildlands, world-class salmon runs and other outstanding wildlife.

Decision Maker: This This Pebble Mine is not needed and will hurt the local economy. This area has always been dependent upon its pristine natural environment.

I have serious concerns about the Pebble Mine: Please - don't ruin this great natural resource! .

The human population is very high, and our activities have major consequences. We cannot afford to make more poor decisions which lead to catastrophic consequences. Pebble Mine threatens Bristol Bay's clean waters, the wild salmon, wildlife and traditional subsistence ways of life. Therefore, . Protecting habitat and traditional subsistence should be the top priority. The federal government needs to provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. With this in mind, for considering my comments,

One clear way we can do this is to protect the Bristol Bay watershed. To me it is vital that Pebble Mine is not allowed to proceed in Bristol Bay because it will threaten Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To Whom This May Concern: As I look at our country's natural resources that not only feed our mouths but also our souls, I zero in on Bristol Bay as number one. Now there is talk of opening the area to mining. This is a terrible idea which we will come to endlessly regret if implemented. This mine would threaten the Bay's clean waters, wild salmon, wildlife and traditional ways of life. Other points are that public lands in the Bristol Bay watershed should be closed to large scale metallic sulfide mining. Opening this mine would be a great disaster. The United States need to be the leader in reevaluating its policies concerning the environment and be the leader it is meant to be in this respect.

! One suggestion I have is to protect the Bristol Bay, in Alaska. The Pebble Mine project threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life.. Doing so ensures protection for the habitat, subsistence and recreation resources there. It's unconscionable that Native American well fare is still largely unconsidered in this day and age. There are times it is not worth the long-term impact. Corporations focus on short-term monetary goals and care little to nothing for long-term impacts of their greed.

. : Each action that Humanity takes for has consequences. We are a Chain of Life and Consciousness. The Human Being is the eldest brother to the sub-human kingdoms. We should be responsible for what happens in the environment for they are the environment. We will not survive as a species if we do not take care of them. Air, Water, Earth, is shared by all. Even if you do wrong in one part of the Planet as we are One Life, one Humanity, one World, it affects the whole. The individualistic man that is greedy because he has not group consciousness yet is wanting to make money by buying and selling what is common to all. As top priority, we need to protect the habitat, this is our responsibility, and public lands in the Bristol Bay watershed should be closed to large scale metallic sulfide mining. We will run out of species very soon if we continue with this poisoning process that is affecting worldwide for we share all the elements. Poisons run throughout all water, air, and earth. Correct clean Water Act standards should be fixed thinking in next generations to come. Correct Human Relations should be strengthened between Federal and Tribal Governments. Tribes know this Earth is one Life. We cannot stand loose standards in the greedy mineral development. We should share all natural resources, they do not belong to one rich company. We are attempting to the health of the Planet and it is not reversible.

i am writing to express my deep concern about the proposed Pebble Mine in Bristol Bay.

I am writing to express my concern over the Pebble Mine and the preservation of Bristol Bay. The Federal Government should give priority to the protection of the environment that each one of us needs in order to live a healthy life. Large-scale metallic sulfide mining permitting and Clean Water Act standards should be more stringent in order to help accomplish this goal. If we do not protect our most precious asset, our natural environment, not only are we hurting ourselves, but future generations as well. Please consider carefully what you will leave to your grandchildren and theirs as well.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I'm writing you about the Pebble Mine project. I am deeply concerned about this project threatening Bristol Bay's clean waters, salmon and wildlife as well as traditional ways of life held by tribe of those who already live in the area. I ask that public lands in the Bristol Bay watershed be closed to large-scale metallic sulfide mining. Protecting habitat subsistence and recreation resources should be the top priority. It's very imperative to strengthen the relationships between federal and tribal governments as well so that all work together harmoniously. We need to have greater standards for mineral development in wetland areas and standards for a Clean Water Act for large-scale metallic sulfide mining should be stronger as well.

The American people will welcome strong and inspired leadership towards solid long term goals, one of which should be the preservation of our environment. The permitting process for the Pebble Mine offers an excellent opportunity to demonstrate that our government has a clear view of the likely project impacts, will provide definitive oversight of the process and the analysis of cumulative impacts on the Bristol Bay watershed, and will not allow the mine to proceed without sufficient safeguards and restrictions. This project clearly poses major long term threats to water quality, fisheries, and wildlife as well as traditional ways of life, in what is currently a relatively pristine environment. Large scale metallic sulfide mining should not be allowed on our public lands in the Bristol Bay watershed. Standards for mineral development in wetlands and Clean Water must be made as stringent as possible. The pressures to facilitate short term profits must be resisted. As in all of these cases, "Once gone, gone forever" We need to do better, particularly on projects as significant as the Pebble Mine.

Pebble Mine is a great threat to Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. We need to preserve all of wild America that remains!

Do we really need another pebble mine! Is this Sulfide mine so important, that the waters at Bristol Bay are polluted, the wild life poisoned from debris. Our "Clean Water Act" standards for large-scale metallic sulfide mining should be more stringent! Public lands in this Bristol Bay watershed should be closed to large-scale metallic sulfide mining. We need to protect this habitat, subsistence and recreation resources should be the top priority. The federal government should provide strong oversight of the Pebble Mine permit process and analysis of cumulative impacts to the Bristol Bay watershed.

,I have taken previous action online to try to block the creation of Pebble Mine because of the ways in which it will negatively affect Bristol Bay. It is now time to personally address an email to help stop the passing of any bill or law that would permit this disastrous mine to become a reality. Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. It is also urgent that Clean Water Act standards for large-scale metallic sulfide mining be more stringent. I feel very strongly about this and other developments that endanger our lands, water and food sources, and the conservation of our wild-lands. I hope you will take the time to read this message and note my vote.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

U. S. Department of the Interior Officer: Your comment deadline is Sept. 30 for submitting a rationale for eradicating Pebble Mine. We submit our comment below. Please take note of it and count it. We are writing to demand immediate action to stop the proposed Pebble Mine in Bristol Bay in Alaska at the urging of executive director of the NRDC in an email earlier today. This mine cannot go through. We are former residents of the state of Alaska and we have lived in San Jose, California since 1997. Prior to that in Fairbanks, Alaska where we were working residents for the Fairbanks Daily News-Miner. The salmon fishing industry is of paramount importance to Alaska fisherman and its industry at large. The largest salmon runs in the world - and the best fished environmentally - are in Alaska and within Bristol Bay. What are you doing approving Pebble Mine in this place at headwaters? It is a very crazy idea. We don't want farmed salmon if that is what you are thinking would replace this. As far as the American people, some are unaware of the real risk. Take this mine out. It is a bad idea. For these reasons - that are also those of Lehman's of the NRDC today - we ask you to reconsider: 1.) Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. 2.) Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. 3.) The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. 4.) Relationships between federal and tribal governments should be strengthened. 5.)6.) Clean Water Act standards for large-scale metallic sulfide mining should be more stringent for your interest.

It is the function of the federal government to provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. Such impacts, in their entirety, should never accumulate to the point that they alter or compromise the current level of life in Bristol Bay. In addition, , as well as the standards for mineral development in wetlands.I would ask that their advance for your thoughtful consideration of this matter.

, When I visited Alaska in 2005 I was absolutely floored by its beauty, grandeur, and stunning landscapes. It hurts me to think that the Pebble Mine project will actually happen. This will DEVASTATE the ecosystems of Bristol Bay.

I am writing to add my comments concerning America's Great Outdoors program. I want to strongly state that the Pebble Mine in Alaska threatens Bristol Bay and its clean waters, wild salmon, wildlife and traditional subsistence ways of life. If we are going to protect we must start with this mine which threatens a whole ecosystem..for government agencies in this area.If this project goes ahead, and it shouldn't, the federal government should provide strong oversight of the Pebble Mine permitting process and analyze the cumulative impacts to the Bristol Bay watershed. From what I understand, standards for mineral development in wetlands are weak and should be tighter and Please add my comments to the official record.

Here are my comments about the Pebble Mine proposal and permitting request: I urge you to NOT grant a permit for the proposed Pebble Mine in Alaska unless a full analysis of the cumulative impacts to the Bristol Bay watershed has been completed and shows benign impact.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Greetings Government Official- Some places on earth need our protection as they are exceptionally beautiful, are important habitat for declining wilderness species, and provide incredible recreational opportunities; Bristol Bay is one of these locations. Here are some important considerations in addition to keeping this place protected as a important natural asset to this nation. These lands belong to us for our long term use, not for the short term gain of mineral extraction, as the damage done can never be mitigated.

I am writing to ask that you stop the Pebble Mine. Proceeding with this project threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. If not, the region will never recover from the effects of toxic mining. It's time to prioritize the environment over profits. Loopholes and "free passes" should be eliminated and oversight strengthened so that future disasters like the BP oil spill don't happen again. with the emphasis placed on preservation of fragile areas rather than maximum extraction for maximum profits. The Clean Water Act standards for large-scale metallic sulfide mining should also be more stringent. and native peoples given a say in how the land is protected and used. A renewed focus should be given to alternatives to some of the materials we have come to depend on in order to replace slash and burn tactics with sustainable practices.

: I hope you will consider protecting Bristol Bay from mining by mega-corporations. It will destroy the clean waters, wild salmon, wildlife and traditional subsistence ways of life that exist there. I believe that.

We should strengthen standards for mineral development in wetlands

the us govt and politicians are non responsive to what the american public wants. You can also refer to our SaveBioGems web page about  
<<http://www.nrdconline.org/site/R?i=R5DyUVGpI2WMOhoxmg6cNA..>> Bristol Bay if you want more information.

We are writing to express our concern about the Pebble Mine in Bristol Bay.

I spent 6 years of my life at the university of montana with my major thesis advisor, former chief of the forest service under clinton ... I am appalled at the lack of science being applied in general to our nations land management practices ... this is yet another example of the wrong extraction in the wrong environment ...I have grave concerns about the Pebble mine for the following reasons and I have added some ancillary thoughts as well. Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Public lands in the Bristol Bay watershed should be closed to large- scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. Relationships between federal and tribal governments should be strengthened. Clean Water Act standards for large-scale metallic sulfide mining should be more stringent. -

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

This disastrous mine would endanger Bristol Bay's spectacular wildlands, world-class salmon runs and other outstanding wildlife and it must be stopped.

The waters of Bristol Bay are surrounded by tundra, crisscrossed by swift rivers and dotted with lakes large and small. Grizzlies, wolves, seals and whales roam this nearly untouched ecosystem. Huge salmon runs are the linchpin of this glorious wilderness, supporting valuable commercial fisheries, indigenous people and a vast array of wildlife. It is my understanding that mining companies are eyeing low-grade gold and copper deposits on pristine land in the Bristol Bay watershed in an area known as Pebble and that the only way to extract this ore is through destructive and pollution-producing hard-rock mining. A study of mines similar to the proposed Pebble mine showed that 85 percent of them polluted nearby waters. At Pebble, a proposed open-pit mine would be 2 miles wide. As proposed, the mine would generate more than 9 billion tons of waste held behind a series of massive earthen dams and located just 20 miles from an active fault line. A single accident here would be disastrous. But even the construction and operation of the mine could disrupt salmon migration and jeopardize the larger ecosystem. A Pebble Mine would threaten Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. from mining activities that would endanger Bristol Bay's spectacular wildlands, world-class salmon runs and other outstanding wildlife. Please keep mining out of this pristine area.

To Department of the Interior: Please use all your powers to stop another environmental disaster. The Pebble Bay mine is a disaster waiting to happen and you can prevent it. Pebble Bay is too important environmentally to risk with an ill conceived mining project. The mine cannot operate without causing irreparable damage to the environment. Please put a stop to it now before we have another accident like the BP mine in the gulf that the project sponsors told us could not happen. They lied then, and the Pebble Mine sponsors are lying now. Don't believe them. Stop the mine NOW.

Administration I am writing as a citizen of our beautiful country asking that we protect our wild natural resources for the long term rather than giving into short term corporate interests yielding limited results and with enormous long-term destruction as the cost. The situation with the proposed Pebble Mine in the Bristol Bay is an example of just what I am very concerned about... Please review the situation and my comments with great care. We are talking about our national future and the world that we leave to our children and our true care for the planet.

Why more destruction of our planet just for the financial benefit of one or two already obscenely rich people? Clean Water Act standards for metallic sulfide mining should be more stringent. The benefits the Pebble Mine could bring to a few corporations are not worth the wholesale destruction this mine will wreck on Bristol Bay and its inhabitants. Although it is not located in a populated area like Louisiana the destruction will be much more severe and longer lasting than the Deepwater Horizon explosion. And despite the industry's lies there will be major accidents and constant pollution from that mine. Create a few hundred jobs for a few dozen years by destroying the thousands of years old way of life and existence of several thousand people? Please do not allow Bristol Bay to be polluted.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

,I would like to express my concern and opposition to allowing Pebble Mine to operate in the Bristol Bay area. I agree with Presidents George Bush, Sr., and Clinton that this area should be protected from mineral acquisition. Salmon runs will be at risk, as well as surrounding wetlands and other pristine habitat.

, I am writing to express my concern about the potential development of the Pebble Mine in Bristol Bay. Our public lands should be left undeveloped and unexploited, not given away for exploitation to the highest bidder. Please help to protect our cherished wildlands and outdoor spaces such as this and stop the development of this mine.

My reason for writing is to beg you to stop Pebble Mine! It is a travesty that this potential project is even being discussed. It's been well documented that the mine would threaten Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. The mine, planned by companies Northern Dynasty and Anglo American, would be the biggest mine in North America, with an estimated footprint of 30 square miles. Based on current projections, the mine would generate 7-8 billion tons of mine waste. The tailings waste would be stored in a seismically active area behind earthen dams. Any project supported by Sarah Palin can only spell disaster for the environment! The following are more reasons for stopping this mine: since they will bear the brunt of this disaster, if it's allowed to proceed. For the reasons stated above, this project should be stopped immediately. Leading jewelry retailers have also expressed their opposition to the mine, recognizing that the Bristol Bay watershed is an ecosystem of international significance and that much of the area is designated a Fishery Reserve. Many have now signed the Bristol Bay Pledge to show their support for protection of the Bristol Bay watershed. These include: Tiffany & Co. Ben Bridge Jeweler Helzberg Diamonds Leber Jeweler Caro Jewellery Fortunoff Brilliant Earth Blakes Fine Jewelry Goldsmiths Beaverbrooks Mappin & Webb Watches of Switzerland Fifi Bijoux April Doubleday JewelMak Commemorative Brands Hacker Jewelers Herff Jones Birks and Mayors McTeigue & McClelland Jostens Blair Lauren Brown Toby Pomeroy Reflective Images Michaels Jewelers Open Source Minerals CRED Jewellery Real Jewels Fair Trade in Gems and Jewelry Alberto Parada Ingle & Rhode Security Jewelers Zale Corporation For the reasons stated above Pebble Mine must be stopped!

. I understand a decision is being made soon on the Bristol Bay area of Alaska. Please don't let short term gains outweigh the long term impact for this area. Your decision will affect our children, grand children and all of our future generations. Please decline the Pebble Mine's request.

Nature is never out of balance. The question is will the balance of nature include man if we destroy beyond repair, the environment that has allowed us to thrive up to this point in time. Modern science is still in its relative infancy. Nobody really knows what the outcome of man's modifications to the earth's surface will be. Destroying or endangering the balance of nature in the few remaining wild places could leave us without the resources to go back to a balance of nature that includes man. Block this disastrous mine. The Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife, and traditional subsistence ways of life.

## Discussion Question 2

***(cont.)***

My governmental representatives, for your good efforts to manage our public lands for the benefit of all Americans, those living now and those in the future. I would like for you to please consider the best use of the area around Bristol Bay. We Americans have so little of the vast lands left for preservation for future generations, that we had when our ancestors first arrived in the 15th and 16th centuries. If we allow our public lands in the Bristol Bay watershed to be used for large-scale metallic sulfide mining, there will certainly be short-term gain; but that environment will be changed irreparably for perhaps thousands of years to come. Protecting our animal and plant habitats, and providing for subsistence and recreation resources should be as much of a concern for us as a nation as gaining some temporary wealth through extracting non-renewable resources from the land. In my humble opinion, our federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. In particular, with thoughtfulness about the long-term benefits to local people, not just immediate opportunities for wealth for big corporations, so as to protect our wildlife, whose home territories are shrinking. I might never get to visit these wild places, but I consider the animals and plants living there to be as much fellow citizens of our great country as my next-door neighbors, here in Dallas, Texas. Furthermore, our , since it is becoming more and more apparent that this country's most precious resource, water, is now something of an endangered species. If we continue to allow big companies to cause irreversible harm to our nation's water supply, through pollution of the soil and the water reservoirs, should we also expect them to supply our drinking water in the future? Folks, the actions you take today are going to affect our way of life for generations and generations to come. Please do the right thing for our children and grandchildren, and for all our non-human co-habitants. Please bring a halt to the mindless development of our pristine wilderness areas for short-term profits.

There are a million different reasons to protect the pristine natural landscape in Bristol Bay, but below are some specifics on why the Pebble Mine needs to be stopped: Natural beauty is quickly fading from our planet, and we need to take every opportunity to keep what we have left as clean and natural as possible. --

We all are empowered to do right action or wrong. It is wrong action when we do things, due to greed, which cause harm to others sharing our planet, which have no voice and no power to stop us. In typical fashion, what we do to harm and kill fish, wildlife and animals we share the planet with, eventually ends up hurting us as well. We have a great opportunity in front of us, to do right action and If we do not stop it, this mine will endanger Bristol Bay's spectacular wild lands, world-class salmon runs and other outstanding wildlife . Let us be moved by what is good for the future generations of all living things sharing the planet and not by dollars gained today at their expense.

For the above mentioned reasons, I am against the Pebble Mine.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am concerned about a recent plan to open a pebble mine in Bristol Bay. I believe that environmental conservation is not an option but an imperative. As a society, the time is now to act to preserve the health and well-being of our nation's wealth which is based on our ability to breathe fresh air and drink clean water. Sacrificing the last of our wild places which help to maintain our environmental balance is not in our best interests.

, Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. Relationships between federal and tribal governments should be strengthened. Clean Water Act standards for large-scale metallic sulfide mining should be more stringent.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To those this should concern, Please stop any and all forward motion concerning Pebble Mine. This mine will be a disastrous move against the ecosystem in that important and pristine area. Too many creatures, some of them already struggling to survive to ever constricting habitat, would be severely impacted and possibly devastated by the large-scale metallic sulfide mining that Pebble Mine would implement. Regardless of what the mining company and its experts will tell you, there is no way this mine can exist without poisoning and degrading the ecosystem it would exist in. No unbiased scientist can tell you truthfully that this mine can co-exist in such a pristine habitat without leaking dangerous chemicals into the environment. Not to mention there is no possibility of denying the severe impact that a massive pit mine will have on the area. Even if the mining of the gold that this mine would seek to rip from the earth did not require the use of dangerous chemicals, the very process of mining itself is essentially a rape of the environment, There is no way to successfully mine on a large-scale like this without seriously impacting the habitat geologically. This kind of mining will disfigure the very face of the land where it operates. Mining typically has a severe impact on things like erosion and thus the loss of crucial topsoil in areas effected by the erosion. Not to mention, I don't see how any human being with an appreciation of natural beauty could look at this region and want to erect a large-scale metallic sulfide mine or any mine at all. Mines destroy the area they are in and it takes decades and even centuries for the area to recover. And what is this all for? Gold? A precious metal used primarily to make jewelry. A metal that is largely about image, prestige and materialism. I'm not sure there could be a worse justification for the damage this mine will cause to the Bristol Bay area. This mine is for the purpose of making money for the sake of money. It's greed. The ore taken from the ground isn't a necessity, it's almost solely for the purpose of vanity. And for this the Pebble Mine will possibly eradicate species already walking a tightrope to other man-made pressures? Please, no. Furthermore, in general and in all cases concerning mining: The federal government should provide strong oversight of the mining permitting process and analysis of cumulative impacts to the habitat that the mine would be located in and/or around. And in the Bristol Bay case, In closing, I am pleading with those with the power to halt this mine, to do so. Please do not let this pristine and vital habitat be decimated by a mine that will do nothing but rape the land and pollute its wetlands. A large reason for myself and many others voting for the Obama administration was its stance on environmental issues. Please show us that we were justified in that trust and do the right thing.

Clean Water Act standards for large-scale metallic sulfide mining should be Enough destruction for the sake of pure unadulterated greed has occurred. It's time we started saving those resources we have left. You could be a leader and innovator in these efforts. Please do it.

To Whom This May Concern: Pebble Mine is clearly threatening Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. It seems obvious that public lands in this watershed should be closed to large-scale metallic sulfide mining. . Strong oversight of the Pebble Mine permitting process must be provided, as well as analysis of cumulative impacts to the Bristol Bay watershed. Moreover, , and the Please keep this kind of commercial mining away from our shrinking resources.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

:Bristol Bay is one of the few true ecological treasures left in North America. The Pebble Mine will most likely change that reality forever if the wrong choices are made at this point. Please consider these points carefully: It is imperative that the following facts be given priority in deciding the fate of Bristol Bay: The Bristol Bay watershed is one of the world's most productive wild Chinook salmon fisheries, and is critical to the survival of Alaska's eagles, brown bears (Alaska's grizzlies), and seals, as well as native Alaskan communities. For more than 30 years this vital watershed, which is surrounded by protected areas, has been closed to mineral extraction. But last year the Bureau of Land Management, under direction of the Bush administration, proposed a Resource Management Plan that would open up 1.1 million acres of this unspoiled wilderness to hard rock mining, putting subsistence and commercial fishing activities, as well as wildlife, at risk. The Management Plan is particularly problematic because the land is adjacent to the proposed site of the controversial Pebble Mine which, as one of the world's largest gold and copper mines generating over 9 billions tons of waste, would pose a risk to the entire Bristol Bay ecosystem. You know the dismal record of hard rock mining. A survey over 40 years shows nearby water resources are polluted 85 percent of the time. Earlier this year the State of the Salmon conference concluded that Bristol Bay's salmon fishery was a globally significant resource and top conservation priority. Yet the region is now at risk of being permanently transformed if hard rock mining resource extraction commences here with potentially devastating impacts on the fishery. Secretary Salazar has said he will abide by your recommendation. I'm sure you would not want to be the one who reversed three decades of sensible protections in favor of an ill-advised, ill-informed Resource Management Plan from the Bush administration, which failed to set aside enough Areas of Critical Environmental Concern and also failed to designate enough Wild and Scenic Rivers. Therefore I urge you to reconsider the Bush plan that favors short-term mineral development over long-term land management and direct BLM to prepare a Supplemental Environmental Impact Statement that reflects the exceptional value of the lands and waters of Bristol Bay. Working to maintain the current withdrawal of public land from federal appropriation until adequate safeguards are put in place, BLM will fulfill its obligation to this public land. Until you and your team devise a better plan, please act now to retain the existing protections for the Bristol Bay watershed. The health of these public lands and waters, and the wildlife, native cultures and industry they sustain, are depending on you.

I want my legacy to the next generation to be one of thoughtful, respectful, protective consideration of our natural places. I hope you will agree that greed, exploitation, and pollution are not the values we choose to pass on to our children.

STOPPING Pebble Mine. And the government also needs stricter standards to regulate large scale metallic-sulfide mining. This is a dangerous business and we cannot afford to pollute another healthy water body, We have done enough damage already.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

TO ALL CONCERNED: Keep Bristol Bay (a nearly untouched ecosystem rich with interdependent life, that includes us in the tapestry) safe from mining. Why? Bristol Bay is a working ecosystem of clean waters, supporting both HUMANS already there (both traditional subsistence, and commercial fisheries), and wildlife such as salmon, whales, seals, grizzlies, wolves. Consider just the SALMON! Bristol Bay supports tens of millions of them arriving there to spawn. The Threat: 1) foreign mining companies after gold/copper on our pristine land, Pebble. Hard-rock mining tears up the million acres/plus to get at it. 2) studies show that 85% of previous such mines polluted the surrounding waters. 3) the WASTE (formerly pristine, fecund landscape) would come to 9 billion tons, held back by massive earthen dams -- 20 miles from an active earthquake fault. THINK ABOUT THIS!!! We live in an Eco-SYSTEM, and our lives are dependent on the Whole. You destroy our environment, our literal home, and you'll find out "you can't eat money." The fish and wildlife cannot withstand such a huge development throughout. ONE ACCIDENT (and just think "Gulf" and "BP" before you deny such a possibility) would compound the destruction beyond calculation.

I oppose the development of Pebble Mine near Bristol Bay in Alaska.

We have a great opportunity right now to advance our campaign to You've already taken several online actions to help block this disastrous mine, which would endanger Bristol Bay's spectacular wildlands, world-class salmon runs and other outstanding wildlife. Now, committed activists like you have a rare chance to do even more. The Obama Administration is inviting input from across America on how to protect our nation's most cherished wildlands and other outdoor spaces. Please take a few minutes right now and tell administration officials -- in your own words -- why they should . The deadline for submitting your message is September 30. I know this action involves more than the usual click of a mouse, but I'm sure you'll agree it's time well spent for the sake of stopping the Pebble Mine. A thoughtful and personal message from someone like you can make a big difference! Here's how to do it: Visit the America's Great Outdoors <[http://www.nrdonline.org/site/R?i=k1KBl46evvPf015\\_7wFvPg..](http://www.nrdonline.org/site/R?i=k1KBl46evvPf015_7wFvPg..)> website and register to participate. Then, explore the Ideas page: <<http://www.nrdonline.org/site/R?i=HWzHwOvpjNANBPhiER111A..>> Post your own idea. Vote to "promote" ideas that call for protecting Bristol Bay. Please keep these talking points in mind as you write: You can also refer to our SaveBioGems web page about Bristol Bay <<http://www.nrdonline.org/site/R?i=Oz7lf1UCrgwn-At6T0y-HA..>> if you want more information. After you've submitted your message, would you do one last quick thing? Please send me an email letting me know you took this special action for Bristol Bay. Any time you can devote to making your voice heard in this process will be time well spent! for all you have done to help

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am writing to share my opinion about the threat the Pebble Mine poses to Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. I strongly believe that I also believe that, because without them, we will soon have no more wetlands, and most people either scientifically or innately realize that that would be a disaster for the global ecosystem. I strongly believe that the in order to protect our water. Please take this into consideration and do not allow the Pebble Mine access to Bristol Bay.

Pebble Mine is a potentially disastrous threat to the health of the Bristol Bay ecosystem. It threatens the clean waters, wild salmon, and wildlife. Public lands should be closed to metallic sulfide mining and the protection of habitat should be of utmost importance. The federal government should provide strong oversight of the permitting process to properly analyze the cumulative impact. Standards for clean water and wetland protection need to be strictly adhered to.

I am writing to your administration officials in order to express concern for Bristol Bay and to stop Pebble Mine. A great deal of harm is done by this mine and mining procedures. The environmental impact is at stake, along with many other important issues.

It has become clear that , as protecting habitat, subsistence and recreation resources should be a top priority. The federal government needs to provide stronger oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. Ultimately, so that we can save this precious resource.

I believe that protecting habitat, subsistence and recreation resources should be your top priority. In addition, Please ask the EPA to assess this and propose meaningful standards. Lastly, and such lands should be given all protections possible.

, We've all experienced, all too recently - with the reach of devastation in the Gulf, how devastating it can be to our natural environment when we place money over Mother Nature. Our resources are extremely limited here on Planet Earth and the areas that we have that are considered "pristine" are even less so. We must do everything we can within our power to protect the most sacred natural habitats that we have for future generations, and not allow them to be pillaged in the name of profits. As we begin to find our way out of this recession, it allows us to make a break from the old way of business. It provides us an opportunity for us to claim that we will no longer allow our children and our children's children to receive a Planet that "used to be" so beautiful but now is nothing more than toxic. The true impact on our ecosystem will be much more calamitous than can be expected if Pebble Mine is allowed to move forward. History has proved time and again that when left to self regulation and oversight companies fail to do so properly. When profit margins are the key success metric for a company all else becomes "risk management" I implore you to truly understand the impact that allowing this project forward will mean for our country. It is within your ability to make sure that we create a future that is full of life and beauty not metallic sulfide.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Why isn't it obvious to everyone that we need to stop ruining our earth for a greedy few. We have enough of everything already. - - - - - Please be aware of the horrifying waste it would generate. As proposed, the mine would generate more than 9 billion tons of waste held behind a series of massive earthen dams -- all of them taller than China's Three Gorges Dam and located just 20 miles from an active fault line. - A single accident here would be disastrous. The construction and operation of the mine could disrupt salmon migration and jeopardize the larger ecosystem. It's a risk Americans and especially Alaskans are not willing to take -- the true gold of this region, they say, is its fish and wildlife. Please stop the mining and the drilling!!!!!!!!!!

I am writing today in regards to the proposed Pebble Mine project in Bristol Bay. Please take the health of Bristol Bay into consideration, before allowing this project to proceed. There are many reasons why the construction of Pebble Mine should not move forward. The federal government should strengthen standards for mineral development in wetlands and Clean Water Act standards for large-scale metallic sulfide mining. I hope you will take my concerns into consideration, and not let the Pebble Mine project go forward.

Greetings, I am writing to request your action to save the pristine Bristol Bay, AK and thoroughly review and revise the permits for the Pebble Mine.

PLEASE STOP THIS GROUP FROM DESTROYING ONE MORE PART OF THE ECOSYSTEMS WE DEPEND ON FOR SUSTENANCE. WE HAVE GONE SO FAR ASTRAY IN OUR NEED TO RESPECT NATURE. MUCH OF THE DESTRUCTION WE HAVE WROUGHT IS IRREVERSIBLE, AS WELL AS INEXCUSABLE. of this matter.

Folks Many years ago I worked at Bristol Bay Lodge in Aleknagik, Alaska. Several times, though I was a humble houskeeper, I got the chance to fly over the surrounding wilderness. I can only say that the pristine nature and wildlife of this region are of far more importance any else. They are resource that must preserved for all time for the future citizens of America. It is simply a "no brainer." No Pebble Mine. In the words of the Beatles, "let it be." But not only that. Water is a resource that is far more important than gold. We need to preserve unpolluted sources of water, both fresh and salt. Polluted waters mean poisoned fish and wildlife, a toxic menace that eventually works its way into the human food source. I appreciate your reading my comments.

I would like to comment on the Pebble Mine at Bristol Bay. I believe I believe .I believe .I believe I believe I believe the I believe

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am writing to you to implore you to from a mining disaster. We have already ruined our Gulf Coast line with a massive oil spill. We cannot afford to leave our children a ruined country. The destruction that will occur is unthinkable. As you know Bristol Bay area is a treasure drawing many forms of wildlife, that require our protection to their habitat such as: grizzlies, wolves, seals and whales spawning salmon which are the linchpin of this glorious wilderness, supporting valuable commercial fisheries, indigenous people and a vast array of wildlife. Yet the whole system could come crashing down if giant mining interests get their way. The only way these foreign mining companies can get at the rich gold and copper deposits located in this pristine area that we the United State people have preserved, is to extract this ore through destructive and pollution-producing hard-rock mining. At risk is over 1 million acres of public land. This land should be preserved for our children and grandchildren. What kind of a legacy are we leaving exchanging dollars for natural resources that once gone will never come back? I tell you this beautiful piece of natural beauty must remain in its natural glory. It is our duty as human beings protecting the earth to be excellent sheppard's of this treasure. I implore you to use your conscience and protect this natural wonder that we the people of the United States have inherited. Think about it, do we want pristine areas with animals in their natural habitat roaming free? Or an open-pit mine that would be 2 miles wide (enough to line up nine of the world's longest cruise ships end-to-end) and 2,000 feet deep (enough to engulf the Empire State Building)? As proposed, the mine would generate more than 9 billion tons of waste held behind a series of massive earthen dams -- all of them taller than China's Three Gorges Dam and located just 20 miles from an active fault line. A proposed a single accident here would be disastrous. But even the construction and operation of the mine could disrupt salmon migration and jeopardize the larger ecosystem. It's a risk most local Alaskans and United States citizens all over the country are not willing to take -- the true gold of this region, they say, is its fish and wildlife. I live in New England and feel strongly we need to protect this area. It is our duty. A study of mines similar to the proposed Pebble mine showed that 85 percent of them polluted nearby waters. The Pebble Mine proposal threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. The government should enact the following guidelines immediately to protect this area: Can the Obama administration really afford to leave a legacy of destruction of our natural resources? Or will the administration take the right course to saving our beautiful land by protecting Bristol Bay from ruin. I implore you to act on behalf of our children and all the living creatures of Bristol Bay to stop the Pebble Mine development.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Please do not allow the Pebble Mine to come into existence. A study of mines similar to the proposed Pebble mine showed that 85 percent of them polluted nearby waters. At Pebble, a proposed open-pit mine would be 2 miles wide (enough to line up nine of the world's longest cruise ships end-to-end) and 2,000 feet deep (enough to engulf the Empire State Building). As proposed, the mine would generate more than 9 billion tons of waste held behind a series of massive earthen dams -- all of them taller than China's Three Gorges Dam and located just 20 miles from an active fault line. A single accident here would be disastrous. But even the construction and operation of the mine could disrupt salmon migration and jeopardize the larger ecosystem. It's a risk most local Alaskans are not willing to take -- the true gold of this region, they say, is its fish and wildlife. We have seen the effects of lax permitting processes and the disasters that have ensued. Please take these items into account when the Pebble Mine is discussed.

,We have finite Natural Resources and diminishing areas of undeveloped land on this planet. We cannot and in good conscience should not continue to cave to business interests. Once gone our wild places are never to return. I know of nowhere on this planet or in mankind's history where business or government has taken what it wants and not left destruction in its wake. As a species we are incapable of using only what we need and allowing nature to keep our ecosystems in balance. We are the only species on our planet that takes more than we need because of greed or a hunger for power. If we do not apply some self control we will destroy this world. One of our government leader's roles is to create and enforce this type of control., and any connections between those making the rules and those benefiting in any way from allowing business to spread onto our remaining undeveloped lands should be forbidden. We cannot trust industry to police itself. Please think globally and look to repercussions at least three generations into the future when deciding to allow drilling, mining, excavating, or any other ventures that create natural disturbances. Our world is not renewable and must be protected from us.

People, I am writing you our of a deeply felt and profound concern for the integrity of Pebble Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life.

To Whom it May Concern: I am writing to you today to try to dissuade you from making a huge mistake. This type of mining is a disaster for the wildlife and the ecosystem and we should be protecting habitat - not destroying it. The people that live in and around the Bristol Bay watershed are threatened - not only their health but the health of the ecosystem that provides for them. How many wetlands need to be destroyed before the standards for mineral development are deemed inappropriate? For once, can we not let \$\$ be the deciding factor in a project? Could you be concerned with the health and welfare of a nation and a planet? I hope that you can do so today when making decisions about this man-made catastrophe. There is bound to be much suffering if you go through with this project.

Please protect Alaska's Bristol Bay from a Bush-era mining proposal, which would expose 1.1 million acres of Alaska's wilderness to the devastating effects of hard rock mining and drilling.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

: I am writing because I am concerned about how the Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. .. Tighter standards should be established for mineral development in wetlands.

Administration I am a member of the Natural Resource Defense Council and have been advised that the Administration is taking comments on how to protect our nation's most cherished wildlands. I have chosen to write about protecting Bristol Bay and stopping the Pebble Mine that is planned to be built there and requesting Congress give the Clean Energy Act another try. Building a Pebble Mine in the Bristol Bay will threaten the clean water, wild salmon and many species of wildlife. I don't understand why it needs to be built there? Aren't there other flatlands or deserts that this Pebble Mine can be built upon? It just doesn't make any sense to me that an area so pristine and beautiful is even being considered for such a plan. The tribal governments views should be taken into consideration and the relationships between the federal and tribal governments should be strengthened not strained. Haven't we learned enough from the BP oil spill? Once these precious lands and waters are destroyed there is no getting them back. Also, please keep oil companies out of the polar bears habitat. After the November elections, please have Congress go back to work on passing the Clean Energy Act. The Green Movement will save this economy, in the long-run it will help reduce the deficit, eventually reduce our dependence on foreign oil and the threats to our National Security that come along with it, and keep America as the leader in the world.

I am writing to urge you to stop Pebble Mine from destroying the wildlife Eden of Bristol Bay. I am originally from Alaska, and the destruction that could fall upon my home if Pebble Mine is allowed to happen could be catastrophic. There are not many wildlife refuges left, and it is our job to protect them from such hazards. If the salmon are negatively impacted by this mine, what is to come of the grizzlies, wolves, seals and whales who roam this nearly untouched ecosystem, all drawn by those very salmon? And what of the native people whose lively hood also depend on them? Huge salmon runs are the linchpin of this glorious wilderness, supporting valuable commercial fisheries, indigenous people and a vast array of wildlife. The construction and operation of the mine itself could disrupt salmon migration and jeopardize the larger ecosystem, let alone what could happen if there were an accident. Plus a study of mines similar to the proposed Pebble mine showed that 85 percent of them polluted nearby waters. At Pebble, a proposed open-pit mine would be 2 miles wide (enough to line up nine of the world's longest cruise ships end-to-end) and 2,000 feet deep (enough to engulf the Empire State Building). Does that sound like something that belongs in a wildlife refuge? And as proposed, the mine would generate more than 9 billion tons of waste. For all those reasons . Our planet deserves better than that. Dr. Seuss once wrote, "UNLESS someone like you cares a whole awful lot, nothing is going to get better. It's not." Well I am that someone. And I urge you to be that someone as well.

I'm writing you today to preserve our biogems. Please do what you can to value what we have before it is sacrificed for something fleeting and temporary like corporate greed. There are millions of souls that will be our children that will come to this world. What kind of world are we leaving them? All that glitters is not gold. Not all that wander are lost. To move freely you must be deeply rooted within. ~ Faerie Wisdom ~

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Bristol Bay is a unique and pristine area which has supported sustainable lifestyles for generations. The Pebble Mine would wreak havoc on this fragile ecosystem. Please consider the following points: Mining interests and the corporations that control them need stringent oversight by the government, for their only priorities are exploitation and profit. It is becoming increasingly evident that the protection and preservation of our environment is the most essential, the most vital, priority.

Administrators, I'm taking a moment to write to you to add my voice to those speaking up for Bristol Bay and for those who cannot speak for themselves, the very Life of and the area itself. Now more than ever it is time to step up and act as Leaders vs shills for commercial interests. The evidence is in, that way of life is and will ultimately destroy all life. That's no way to run a Democracy. For while Democracy is admired for the personal freedoms it protects, it is less than dust if it stands on no foundation. That foundation is Life itself. Part of what it means to evolve as a species especially as humans is our intelligence and abilities to steward the gifts, those very vital foundations that Life affords us; our Natural Resources, for without them, nothing lives, let alone thrives. As we go forward into this next millenia, our actions, our applied intelligence as an organized whole will determine our very fate on this beautiful Earth. Will we survive as a Nation, an example of ever expanding, applied intelligence? Or will we rapidly decline in the already predictable slide towards utter decay and demise? You tell me. It is this question, which will be answered by your actions from now on, beginning now, by saving Bristol Bay from all private interests, preserving it for the greater good and foundational strength our our Nation, based upon an understanding, applied intelligence and unwavering determination to thrive that doing so will answer. Please protect us all now and into the future and stop the Pebble Mine, .

I would like to comment on our nation's need to protect Alaska's Bristol Bay from strip mining. I've been to Alaska with my family, and we were impressed with its natural beauty, abundant wildlife, and also the fragility of its Arctic ecosystems. Alaska's natural environment is already threatened by climate change more dramatic than what we're experiencing in my home state of PA. Though I've never been to Bristol Bay, I feel strongly that it must be protected for future generations of Alaskans and Americans to enjoy and appreciate. As the permitting process proceeds, the federal government should provide strong oversight of the cumulative impacts to the Bristol Bay watershed, so that the decision-makers can weigh the costs and benefits of mining vs. protecting this gem long-term.

No question then that our government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed, tightening , making more stringent rules governing clean water standards for large-scale metallic sulfide mining and development and forging stronger relationships between federal and tribal governments.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

: As a member of NRDC and as a citizen concerned about the environment, let me say at the outset that I strongly object to the proposed Pebble Mine at Bristol Bay. This mine is a threat to these pristine waters, wild salmon, wildlife and the natives' traditional subsistence way of life. It is my belief that: The federal government should provide strong oversight of the Pebble mine permitting process and cumulative impacts to the Bristol Bay watershed. It is short sighted and selfish for those with the power to do so to ravage a pristine area for short term gain. I hope you can be convinced to reconsider.

, I am writing to oppose the Pebble Mine and express my concern for the damage it will cause to Bristol Bay. I am an avid fly fisher with a great love of the outdoors, and also have a degree in anthropology and archaeology. Our wild places are slowly but surely being destroyed, and once gone can never be recovered. Similarly, traditional ways of life and cultural diversity is being lost at an alarming rate. I believe allowing the Pebble Mine would be both an environmental and cultural disaster – it will negatively impact the health of the Bay and its wildlife, as well as destroy the ability of the local people to carry on their current way of life. Mining is not only damaging to the ecosystem, but mines are an eyesore that will prevent tourists and other visitors from wanting to visit what is now a spectacularly beautiful, scenic, pristine, vibrant and living place. The Mine will have a negative impact on the salmon, who are already under threat throughout their range. This impact will also harm the other wildlife around the Bay that relies on the salmon for sustenance. All of these actions will serve to protect this rare and beautiful place for future generations. It will also send a message that we care about the environment and things beyond financial gain. Wild places are necessary, both for the health of our planet and for the mental health of our citizens. Please do the right thing and protect the wild places we still have left, including Bristol Bay.

, As a citizen of the both the United States and planet Earth, I wish for my voice to be heard for the welfare of the people and animals of the planet. The current prospect of The Clean Water Act and Clean Air Act standards for any act of resource extraction in water or by land should be more stringent. It's time to return to the country our fore fathers' dreamed, believed and created, a democratic nation. Money is paper, People are power. We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity Please consider Pebble Mine's threat to the justice, tranquility and welfare of our posterity in Britol Bay's region.

Please consider the dire impacts that allowing a disastrous mine in Bristol Bay... Now is the time for Relationships between federal and tribal governments to be strengthened & to improve both the standards for mineral development in wetlands & Clean Water for large-scale metallic sulfide mining. After all protecting this now, with benefit the local community & wildlife now for generations to come, whereas allowing it will leave a legacy of distruction & pollution for many more generations. While the local community & wildlife suffers, a few rich distant shareholders will benefit without having to live with the consequences of their actions.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

, The following are reasons why Pebble Mine would have a disastrous impact on the Bristol Bay ecosystem and what should be done about it. 1.) Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. 2.) Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority. 3.) The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts to the Bristol Bay watershed. 6.) Clean Water Act standards for large-scale metallic sulfide mining should be more stringent.

America's Great Outdoors, Bristol Bay is a national and environmental treasure. I can't believe the Pebble Mine has gotten as far along as it has. You cannot have "safe" metallic sulfide mining any more than you can have safe cyanide mining or safe deep water drilling or safe nuclear power plants. Every one of these disastrous types of projects is a ticking time bomb. Just look at the history of various giant conglomerates which care only about corporate profits and nothing about indigenous human and wild populations. We cannot allow metallic sulfide mining at Pebble to kill more of our precious ocean environment than BP and assorted criminal organizations have already done. Our poor earth has sustained incredible damage from unprincipled, environmentally destructive practices. At a minimum: Public lands in the Bristol Bay watershed should be closed to metallic sulfide mining. It is unconscionable to allow big corporations to stomp on indigenous rights, placing environmental protection above corporate profits. Clean Water Act standards for large-scale metallic sulfide mining should be vastly more stringent or better, prohibit it.

I am an American citizen who loves our country and its treasured wildlands and wildlife resources. As I read the news, too often I am left with the feeling that our Government Agencies are more on the side of business and developers than they are intent on protecting our natural resources from destruction. The mandate of our Government Agencies should as a priority be the preservation of our land, seas and the wildlife that live there for future generations. - Specifically, just now the Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence way of life. - Public lands in the Bristol Way watershed should be closed to large-scale metallic sulfide mining. . - The federal government should provide strong oversight of the process which might permit such a venture as the Pebble Mine. The federal government should be much more stringent before considering permits and analysis of cumulative impacts to the Bristol Bay watershed. - The relationship between federal and tribal governments should be strengthened. - The federal government should strengthen the standards for mineral development in wetlands and should make them tighter. - - The federal government should also be much less generous in issuing permits to special interest groups, such as ranchers or all-terrain-vehicles, which lets them use our public lands. The American Voter voted for change. The change should be for the protection of the interests of the American Citizen and future generations

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Watershed of Bristol Bay is NOT a safe place for mining or other industrial activity. Key reason why the Pebble Mine must NOT be allowed include: The federal government has to provide strong oversight of the Pebble Mine permit review process and analysis of cumulative impacts to the Bristol Bay watershed. Relationships between federal and tribal governments need to be strengthened. Standards for mineral development in wetlands, and Clean Water Act standards for large-scale metallic sulfide mining must be applied at their most stringent level, considering the sensitivity of the Bristol Bay eco-system, including its wild salmon.

I am appealing to you to curb the mining and other development interests in Alaska that threaten its environment and wildlife. I have been fortunate enough to visit some of the beautiful spaces in this great state and hope it can be preserved for the enjoyment of my grandchildren. The Pebble Mine threatens that future. It also threatens the well-being of tribal interests in the Bristol Bay area. As a resident of our most densely-populated state I know first hand how uncurbed development can wreak havoc on an environment and how difficult it is to repair what has been damaged. The time for prevention is before the damage is done.

Alaska is home to some of our country's most spectacular wild places, and we need to protect them for the enjoyment of all Americans. Once such place is Bristol Bay. Commercial interests such as the proposed Pebble Mine threaten to do irreparable damage to Bristol Bay.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Obama Administration, It is a shame that the modern primary environmental statutory legacy of the U.S. lies with the republican administration of Richard Nixon. Historically, Teddy Roosevelt was the father of our National Park System. Even George W. Bush established the world's largest marine sanctuary. When will the democrats make history? It is important that we don't waste any time finding ways to protect our wild lands and wildlife. We have so many beautiful lands that need our help. Once they're damaged by abuse it is very hard if not impossible to fix them. A good example is the Gulf of Mexico and the Gulf Coast after the oil spill this year. Much of the marsh has died and will continue to die. The habitat for the wildlife and the protection for cities like New Orleans will be gone. The economic impact could be devastating. Once the land disappears into the Gulf there is no way to bring it back. Any additional drilling should be halted and strict oversight of the present drilling should be a top priority. Another area that demands immediate attention is the Bristol Bay in Alaska. At this time many people are fighting to keep out the Pebble Mine, proposed to be the the world's largest gold and copper mine. Opening up this unspoiled wilderness to hard rock mining would generate 9 billions tons of waste and pose a risk to the entire Bristol Bay ecosystem. This mine will harm the clean waters, wild salmon, wildlife, recreation and traditional subsistence ways of life of the native people. The and the The government must do a thorough environmental impact study which will reveal the devastation this mine will cause. The Arctic National Wildlife Refuge should never be used to drill for oil or gas. There must be somewhere on earth that is left alone for the wildlife and free from the footprint of the oil and gas industry. The Ivory-billed woodpecker, America's largest woodpecker, is probably gone forever because of the practice of over-logging their habitat. In the Sept. 2010 issue of the Smithsonian magazine: James Tanner an ornithologist who studied and recorded photographs of the Ivory-bill in 1938 in a large virgin forest in northeast Louisiana called the Singer Tract wrote in a 1942 article in The Wilson Bulletin, " 'there is little doubt but that complete logging of the {Singer} tract will cause the end of the Ivorybills there'. The tract was indeed completely logged, and an ivory-bill sighting there in 1944 remains the last uncontested observation anywhere in the United States." The practice of fracking by the gas industry must be given a complete evaluation by the EPA. According to many people the water in their wells was polluted by gas and other chemicals used in the fracking process after the gas companies started extracting gas on their land or nearby. It has the possibility of polluting the water and killing wildlife in streams and rivers all over the United States not to mention polluting the drinking water of millions of people. More Americans die each year from coal ash pollution related diseases than died on 9/11, but where is the equivalent outrage? The mercury from coal ash pollutes many of our lake and streams. The mountain top removal common in West Virginia must be stopped. It not only harms the beauty of the mountain, it pollutes the streams and rivers nearby. If you can't drink the water and you can't breathe the air, there is no way to live a decent life. There must be someone telling the companies responsible for all this pollution that they can't have it all, that there are limits to what they can take from the environment and what pollution they can produce. The only one with the ability to do that is our Federal Government. We are asking you to help to save our wild lands, wildlife and ourselves.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To those of you in charge of the Mine Project: Do you “get” it now? for giving me this opportunity to voice my opinion against the Mine. Now get busy and get outta there. There is probably something else you can do today right?

Green energy and resources are the future. There is no bridge that needs to be built between now and the future – the future is NOW. If it isn't renewable – why do it? Just to ruin another area so a tiny few can make Millions/Billions with the Excuse that it creates a miniscule amount of jobs. Look forward – forget the rhetoric.

All of these -- and the the culture of devastation of our natural treasure that has steadily been taking place in the last twenty years, which has undone the culture of preservation our pioneer forefathers began, several giving their entire careers to the projects, is beyond me. There is no need. Every day scientists discover new ways from what we didn't know before. I talked with a fellow fifteen years ago whose company has a method for mining, leaving the ground above virgin and useable. Wonders are possible. We will learn soon we'd better stop denuding the land or else. As for using space, don't get me started! So wrong headed. Empire is what that is about. In the meantime, our own government is willing to blindly proceed in Bristol Bay, eradicating its wildlife, cruelly, disrupting the human inhabitants' culture and livelihoods once again. Where have we come? No where. I'm seventy eight and I weary. Protecting habitat, subsistence and recreation resources, should be top priority. Federal and tribal governments relationships must be strengthened and Native welfare must be prime. Standards for mineral development in wetlands must be stringent. In fact, we need all wetlands preserved in perpetuity. If not, we imperil ourselves. Is anyone listening to the scientists? If you go ahead despite us, the Clean Water Act standards for large-scale metallic sulfide mining must be totally stringent. I believe we don't need mining. We are sophisticated. We have gone beyond it, Yet, in a rush as always, we want the simple way so we may rush ahead to the next mistakes, the cheaper ways, to our loss..

Please know that I oppose the Pebble Mine and urge you to take action to protect Bristol Bay by opposing the mine as well.

: I hope that you will be able to understand: Pebble mine threatens Bristol Bay's clean waters, wild salmon, wildlife and Traditional subsistence ways of life. Further- I hope you will be able to understand that: Public lands in the Bristol Bay watershed should be closed to large-scale metallic Sulfide mining. Protecting habitat, subsistence and recreation resources should Be the top priority. The federal government should provide strong oversight of the Pebble Mine Permitting process and analysis of cumulative impacts to the Bristol Bay water- Shed. Clean Water Act standards for large-scale metallic sulfide mining should be More stringent. Please use your influence to bring about good solutions for the above areas of concern.

I write to you to express my concerns about the Pebble Mine and how it will detrimentally affect Bristol Bay, a cherished wildland, and how we must do a better job in protecting it and other cherishes wildlands and outdoor spaces: Please make my comment a part of the public record and put into action my comments.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I seek your courage and support in opposing the foreign corporation based Pebble Mine project. There are so few wilderness jewels left in the world. These places have a value all their own, and yet we persist in destroying them. We attempt to put safeguards in place to prevent ecological disasters, but history has shown us that they fail again and again. Their failures result in destruction to the environment, death to wildlife, financial disasters, and a toll on human welfare. Consider that the Pebble Mine will be at the headwaters that feed Bristol Bay, one of the largest fisheries in the world. Besides the destruction that will be done to the area just to get to the mine site and build the mine, consider that the failure of the retention pools will destroy the rivers that feed Bristol Bay. This will result in the loss of a billion dollar fishing industry and destroy a subsistence way of life to the native people. Mr. President do what is right and stop this project.

I would like to express my concern about Bristol Bay and Pebble Mine.

Generally, I would like for our government to strengthen environmental protections across the board. We should stop clear cutting our forests. We should stop mountain top removal coal mining. We should dramatically increase fuel efficiency standards, and dramatically increase research and development of solar, wind, and other renewable energy resources. We should stop subsidizing the nuclear, oil, and coal industries. We should move away from nuclear power, oil and gas development, and coal mining, period. If we continue to destroy our natural world, we are going to run out of clean air and water and we are all going to die. Preservation of our natural world should be our top priority. Destroying and polluting these very special places, like this Pebble Mine would do, should not even be considered...

I am writing today to urge against Pebble Mine being allowed to operate in Bristol Bay. Pebble Mine threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life. Public lands in the Bristol Bay watershed should be closed to large scale metallic sulfide mining. Protecting habitat, subsistence, and recreation resources should be the top priority. The federal government should provide strong oversight of the Pebble Mine permitting process and analysis of cumulative impacts of the Bristol Bay watershed. I also believe Clean Water Act standards for large scale metallic sulfide mining should be more stringent.

I am writing to express my concern with the Pebble Mine project and to support the preservation of Bristol Bay. Mining is inherently dangerous and destructive, and mining companies wreak destruction on public land and leave the taxpayers to clean up and pay for the mess they leave behind. We depend on government agencies to look after our interests when Big Energy tries to harm our public resources, and this is a time when your help is essential. In order to protect Bristol Bay and similar natural resources, and Big Energy cannot be trusted to carry out its operations unsupervised on public land. The public interest must be protected. I am counting on you to do just that.

I urge you to please protect Bristol Bay.

***(cont.)***

In general, National Parks are perhaps the greatest invention of the United States, but we are ignoring them. The funding necessary to properly upkeep and staff the Parks is minimal, yet it is not done. It is a shame.

I understand that someone from an urban environment may find it difficult to appreciate the value in preserving our natural environments. Having grown up in the Yellowstone Valley, I have first hand knowledge of that value.

It is a place close to my heart as I've often been in that area. The land and all its creatures need spaces in which to just BE, and that helps us humans to just BE as well. As we face global climate change, protecting these connections will only become vitally important. They allow us to breathe!

The National Park Service is supposed to be the agency that protects and preserves the national parks, but Congress won't fund the agency. And hence, we have volunteer groups that work in the parks to maintain trails and help with many other tasks. I believe that representatives from the Departments of Interior and Agriculture should evaluate the parks that have the most to lose, ecologically and make those a priority. Yellowstone National Park has some of the most unique features of any place in the world, including the wildlife.

Not allowing the BLM/ State of WY to sell off valuable land to Oil & Gas Companies. As we face global climate change, protecting these connections will only become more important, in keeping the emissions from the gas wells on a stricter regulation.-There definitely should be an Air Quality Fund as well. It all goes hand in hand in protecting the beautiful landscape of Yellowstone, the quality of life for both humans and the wildlife. Especially the wildlife, as this was their home first.

If we want to save our environment we must engage the man on the street in the awareness and love of the Great American Outdoors. He/she must know and be aware of it. Unfortunately too many Americans aren't. The Outdoors beyond the walk to the car is a blank, an unknown hostile place that has nothing of any use to their lives.

***(cont.)***

Dear Pres. Obama, I live in Wyoming, the state that has coal, uranium, oil, coalbed methane, natural gas---you name it and a state that supports you very little..sorry to say but we all know why....the Democratic Party used to behalf of our state legislature, but not now...Sen. Alan Simpson will attest to that...I recall him supporting early protection of the environment with Land Use Planning, The Siting Act and strengthening the state Environmental Quality Act (late 60's and 70's) Yellowstone is of course one of the most precious places on the planet...there must be more stress to protect it and the larger surrounding large region of GYNP. Kids of today are missing way to much by using their computers for everything...especially texting...they will not learn to communicate thoughtful, critical observations because they are not forced to put the damn things away and look at nature. I am an artist, and former art teacher and know that nature's beauty is not appreciated, protected, and used for thoughtful and visual comtemplations as it should be. Moving from Kansas to Wyoming in 1960 (to teach art) I later developed into an environmentalist/political activist. My 41 year old daughter in CO is the same. A rock climber, skier, backpacker etc but at this time forced to return to college because of losing an excellent job in Paonia, Co. We all must work to get off the gross diets that are bringing this country's health to its knees. We must stop taking kids everywhere...they must walk, observe, see, smell, feel, and learn independence without texting every second of their spare time. There is one place that must be protected more completely and that is the Red Desert in Wy. and Co. I encourage you to contact Biodiversity Conservation Alliance and arrange a tour with \_\_\_\_\_, Laramie, Wy. Thanks for reading this environmental sermon. support the Obama Administration's America's Great Outdoors Initiative.

The Greater Yellowstone Ecosystem should be a top priority within the initiative. Yellowstone & Teton NP's, the 7 national forests and two wildlife refuges make up one of the largest unfragmented wildlands left in the temperate zone in the world. This is a world heritage site that deserves special protection. Thank you for your consideration.

I DO NOT support the Obama Administration's America's Great Outdoors Initiative. I believe that representatives from the Departments of Interior and Agriculture should leave the Greater Yellowstone Ecosystem as is. - As the world's first national park, Yellowstone should be a priority area to be left alone by the Administration. Efforts to develop strategies to reconnect people to nature and conserve our treasured landscapes should not be a priority of the government. We do not face global climate change and the efforts to protect these connections will only become more lies to the American people. - For America's Great Outdoors to be successful, the Administration must listen to all people and not just the GYC and Sierra Club.

This isn't a time of great appreciation for the outdoors in our country. There will be a time when we have more appreciation for nature, and we need to act now so that when we finally appreciate what we have it isn't too late.

I worked in Yellowstone for 5 summers. I was there the first summer that we registered over a million visitors. That was back in the early '60's. With the population of the U.S. now almost double what it was then, the need to preserve those parks and wilderness areas is more important than ever!

## Discussion Question 2

***(cont.)***

I am an Alaskan, and I am writing to you today to express my opinion of the proposed Pebble Mine in Bristol Bay in Alaska. I do not support the establishment of a mine of any kind in the area around Bristol Bay and I am asking you today to, please not allow the plans for the Pebble Mine to continue. As an American it is one of my top priorities to protect ecosystems and natural resources that we are so lucky to have across our nation. Growing up in Alaska I have been blessed to be surrounded by pristine wildlife areas and undeveloped land. These areas are important for our enjoyment, the livelihood of Alaskans, and most importantly for the functioning of global ecosystems. I have fished, both commercially and for recreation since I was a child and I have family who commercial fish currently in Bristol Bay. I am asking you today, to protect Bristol Bay and to refuse to allow the building of the Pebble Mine. I do not believe that there is any clean way to do this type of mining. This project has no public benefit for Alaskans or for Americans. The project will benefit a few already rich executives, and no matter what they say, it means that many (including many Alaska Natives) will lose their livelihood. I also would like to protect the salmon populations for the sake of the salmon. They are an important species in the ecosystem there and deserve to remain. of the US government and especially the EPA. This is a chance to strengthen the relationship between the Alaskan Native Tribal corporations and the Government. This is a chance to take the write stance on environmental policy and reverse some of the damage done by the Bush Administration. Please increase the standards for mineral development in wetlands. Please do this for me, everyone my age and younger, for our children.

I'm writing to you today to express my opinion of the proposed Pebble Mine in Bristol Bay in Alaska. I do not support the establishment of a mine of any kind in the area around Bristol Bay and I am asking you today to not allow the plans for the Pebble Mine to continue. As an American it is one of my top priorities to protect ecosystems and natural resources that we are so lucky to have across our nation. These include, but are not limited to, Bristol Bay, the Tongass National Forest and the Boundary Waters Canoe Area Wilderness. I have been happy to see over the past years that Alaska can successfully manage a fishing industry in a place like Bristol Bay that doesn't overwhelm the Salmon population, but also supports the jobs of many, including many Alaska Natives. As a Minnesotan, I have been lucky enough to eat a great deal of Salmon fished in Bristol Bay. I love to have a source of food that is ecologically sustainable, incredibly healthy and delicious. I like supporting friends who fish there and send me frozen fish to Minnesota. As a visiting resident of Alaska for the past 5 months, I was able to witness firsthand the beauty of that area and also of the challenges for many Alaska Natives. I would like to live in Alaska again and I someday hope to spend summers fishing for salmon in Bristol Bay. I am asking you today, to protect Bristol Bay and to refuse to allow the building of the Pebble Mine. I do not believe that there is any clean way to do this type of mining. This project has no public benefit for Alaskans for Americans. It is so a few people can get rich, and no matter what they say, it means that many (including many Alaska Natives) will lose their livelihood. I also would like to protect the salmon populations for the sake of the salmon. They are an important species in the ecosystem there and deserve to remain. of the US government and especially the EPA. This is a chance to strengthen the relationship between the Alaskan Native Tribal corporations and the Government. This is a chance to take the write stance on environmental policy and reverse some of the damage done by the Bush Administration. Please increase the standards for mineral development in wetlands. Please do this for me, everyone my age and younger, for our children.

**\*\*At issue are the hundreds of lease's on the public lands adjoining this national treasure.**

**\*\*While the original purpose of establishing this special place is its scenic grandeur, it is the spectacle of its wildlife that draws the millions of people here.and to end conflicting grazing leases as they come due.**

This is not our planet, we are borrowing it from our children and generations beyond.

Our precious lands are disappearing at alarming rates and pristine areas such as Yellowstone must be given top priority.

Go try to ride a bike in a Wilderness Area. See how free you are then. Guess what? Even though my bike is more environmentally friendly than a horse, it's not allowed!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Environmental Education courses are not part of the US Public School Curriculums by and large now. Funding would have to come from Progressive School Boards who see the benefits and value of these types of courses and replace existing courses like Global Technology Curriculum that are so watered down they have little value. The value of a strong science based curriculum that would be part of an Environmental Education course would be significant. Private Foundations exist that would fund the development of these curricula. I know because I am working with a Private Foundation and a local school board to develop a Renewable Energy Curriculum which has environmental education elements in it.

The "sustainable" part of the current land requirements is lawyer speak (very subjective) and is being used to keep ORV use out of all the public lands near where I live. Land managers say our existing trails are not "sustainable" and close them and prevent any new areas from being introduced because they are not "sustainable".

The idea posted is based on the false premise that use and conservation are mutually exclusive. The truth is, effective conservation requires some amount of use. For forest managers to actively manage lands some access is necessary. There are only roads on half or one percent of the lands. I think we are already doing an excellent job of conservation. We already have 120 million plus acres dedicated to Wilderness protections. We are doing a very good job of conservation already. It is painfully clear to me that the "less informed" are actually the environmentalists. Comments supporting climate change—a false science recently completely debunked—is one example. The notion that OHV users' sole purpose in life is to destroy the lands they recreate on is another example. The idea that OHVs are polluting the lands and chasing the wildlife is yet another unsubstantiated "feel good" claim. If you environmentalists would just be honest about the problems you would find that your selfish desires are the driving force behind this conflict.

I know how much I need to have quiet at times. I decided one day to sit outside and listen to what the wild has to listen to from AM to PM, well, didn't realize how much noise all around there was, and we live out in country sort of, lots of woods, can't enjoy all of nature this way, we want and need quiet time for sleep and peace of mind and find ways to have that if possible. WHAT can animals do to have any quiet? This really upset me and hope anything that can help on noise in certain places can be reached to help these animals.

Yes, I agree with the idea Families and Friends actively together in the Great Outdoors. I think that sounds awesome. Heavy industry and farming causes far more harm to our country. Also, people that think all genetically modified foods are bad are crazy! Almost all the food Americans have been eating since like 20 years ago or so is genetically modified. It saves far more lives than most people realize. It also helps to slow down the farming of new land growth overall in developed countries.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There is a demand that far exceeds the financial resources available to voluntarily enhance and permanently preserve private working ranches. A fundamental goal of the Initiative should be to increase the funding available for voluntary conservation easements held by third-parties. There are ranchers across the west who have placed their ranch under a conservation easement, preventing development and fragmentation of vast open spaces in perpetuity. The ecological and economic values of these ranches today are ensured for future generations, while the long term stewardship remains the responsibility of the rancher, who also continues to pay property and other relevant taxes. There is a long list of ranchers who are willing to permanently preserve their ranches and we urge that the Initiative provide additional funding for the voluntary acquisition of conservation easements on private working ranches in strategic places.

In addition, this initiative should place a significant focus on voluntary natural resource stewardship enhancement opportunities on private working lands. Both the U.S. Fish and Wildlife Service - Partners Program and the Natural Resources Conservation Service Environmental Quality Incentives Program (EQIP) are key examples of successful programs that cost-share voluntarily with private individuals to improve natural resources. Presently, both programs lack adequate funding to meet the demand. This initiative should bolster programs that have proven to be successful and where landowner demand outstrips program availability, in order to improve the nation's natural resources.

A long-standing challenge to our partnership's overall mission is the estate tax. The Rangeland Coalition supports permanent, targeted reform of the estate tax in ways that both preserve private working ranches and reward commitments to lasting rangeland conservation. We believe an important means of helping meet the goals of this Initiative would be to support permanent and targeted reform of the estate tax, assisting in the preservation of large intact ranches that support a diversity of native plant and wildlife species. In California, the estate tax is one of the leading causes of the breakup and loss of family-owned ranching operations. California ranching families faced with estate tax debts are often left with no choice but to liquidate assets or sell significant portions of their property.

A long standing challenge to implementing voluntary conservation on the ground is the need to obtain permits from various local, state and federal agencies to complete the projects. The Initiative should support interagency collaboration to improve the regulatory atmosphere for voluntary conservation projects. For example, efforts to create programmatic permits and streamlined permitting amongst agencies for voluntary restoration and enhancement projects should continue in the future. Partners in the Rangeland Coalition are aware that ranchers seeking to implement voluntary habitat restoration projects face a complex regulatory process. Our partnership supports opportunities to help ranchers complete environmentally beneficial projects on an expedited process, while still preserving the integrity of the environmental regulatory program.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In short, our partnership sees financial constraints and particular program requirements that hinder additional on the ground voluntary enhancement and preservation on private working ranches. We encourage the Initiative to solicit and support stakeholder input in improving the effectiveness and efficiency of current programs and the allocation of additional funding to voluntary conservation programs. In addition, outreach and education about the outdoors and agriculture--in particular the public benefits produced by private working lands--is an important element to include in the Initiative, targeting the general public, agency staff and elected officials.

regarding the e-mail from Ken Salazar, just don't shut out off-road vehicles from any more access and we will be just fine.

Hello, Thank you for your interest in America's Great Outdoors. While I appreciate your comment and would welcome it elsewhere on the AGO site, it's not germane to the Terms of Participation. Please feel free to re-post to a more appropriate place. -----Original Message----- Sent: Thursday, February 17, 2011 11:37 AM One of the things that drives me crazy as a hunter and hiker in Montana, is the overgrazing on Forest Service lands. Specifically, the Custer National Forest-Ashland District. I understand that many individual ranchers get permits to run cattle there, but the Forest Service must not have any enforcement people because the amount of cattle trails and shrubbery destroyed is sad. I, personally, have a major problem with private companies using public resources to make private profit, whether its mining or ranching. Does it create jobs? Yes, most likely, but when the minerals or timber has been harvested, what is the public left with? Bare public land...with the monies from such activities going to the hands of the few, rather than for the 'good of all Americans' which was the intent of designating lands as public inholdings. I could blather more about this, but my ranting isn't solving anything, so instead I would offer a suggestion to look into how public resource money is 'spread' around. My guess is you'll find large companies own the majority leases and are exploiting public land for the gain of very few. In my opinion, that isn't why those lands were set aside. I guess I thought those resources were to be sold and the money would come back to, I don't know, the general fund or something. The materials would directly help America bring in more money for the government rather than for lining the pockets of private companies that only have thier best interest in mind. Not the lands....

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Hello again, One way to ensure that our wilderness regions and our wildlife will remain safe is to become aware of the forces in this Government of ours that because of their corrupt ideologies, and their pandering to powerful special interest groups would deny future generations of Americans from enjoying a legacy of still pristine Wildlands and Forested areas home to our wonderful wild fauna and flora, that they should be able to enjoy! Irrespective of which portion of the political spectrum people align themselves with, we need to make them aware of what we stand to lose if special interest groups, with greed and vile motivations, are not countered and checked by those of us who want America the Beautiful to remain that way; and not just be a passing slogan. Special interest groups have had far too much influence and historically have gained too much vocal and influential power, which they abuse! Examples are the cattlemen and shepherders lobbies, which are anti-predator, and our environmentally naive President ignorantly appointed Ken Salazar to be Sec'y of The Interior. This man has been and still is in the palm of the corrupt cattlemen's lobby and deliberately removed the gray wolf prematurely, from the protections of the Endangered Species Act, throwing their protections away and allowing over 1800 wolves to be poisoned, trapped and shot in the Greater Yellowstone Ecosystem. As a former livestock veterinarian, I have had the dubious distinction of having had to lock horns with the cattlemen's lobby members and also the infamous Animal Services sub-division of the U.S.Dept. of Agriculture. Animal Services (originally known as Animal Damage Control) originated in 1931 and they are nothing more than lackeys to the cattle and sheepmen. Since when do these two groups deign to speak for all Americans, when they run their livestock for a pittance per animal and degrade our Public Lands; and then have the temerity to demand removal of all predatory mammals from these Public Lands?? This is America not 16th Century feudal Europe! Animal Services is funded by Your Tax dollars! Other politicians that have vile records with respect to Wildlife and the Environment are people such as Sarah Palin, who upon becoming governor of Alaska, immediately set out to have the Board of Game issue orders to kill all the wolves in the Yukon Charley grid of Alaska, where AK. adjoins the Canadian - Yukon Territory. All 85 wolves were killed by gunners in Helicopters and the Canadians who had radio-collared many of these wolves were very irate; as these wolves were under study by their biologists; and also were very habituated to human presence. The killing of these wolves is in addition to aerial killing wolves over 80% of Alaska; where wolves have never had any protection at all; and are also subjected to year round leghold trapping and wire snaring that also kills non target species of wildlife! Adding to Palin's infamous career is the fact that she openly endorses the formation of the Pebble Mine, a project thought up by European multi billionaires, to extract gold and copper from a mine in Alaska that would have a manmade above surface ten mile square pool of extremely toxic waste poisons such as cyanide, chromium and other extremely dangerous chemicals that can and will leach into the surrounding wildlands, as well as imperil the very important Salmon Fishery at the mouth of Bristol Bay! Many thousands of Alaskan fishermen depend upon that extremely valuable salmon fishery for their livelihoods, and they are seething with discontent over this proposal endorsed by Sarah Palin. The loss of wildlife would be catastrophic, since the headquarters of the site for the Pebble Mine, is very rich with mammals such as brown and black bears, wolves, the rare wolverine, caribou, moose, Sitka deer, to name just a few and very rich with bird life as well. . PLease think about that!

## Discussion Question 2

***(cont.)***

he US Forest Service is about to unlawfully destroy a historical cabin built in 1901 by Bill Timms, 40 miles NE of Yellow Pine, Idaho. Bill Timms was a historical figure at the start of the 20th century. He was a prospector, assayer and postman in the former town of Roosevelt, Idaho. Roosevelt was named after then president Theodore Roosevelt. Roosevelt, Idaho was a prospering mining town with more than 10,000 residents until a landslide turned the town into a lake in 1909. In May of that year, the landslide blocked Monumental Creek just below town and backed the creek over the town. Today, you can still see remnants of 100+ year old buildings just below the water. Most buildings were inundated by the flooding, however a few remained above the water line. Only one structure remains fully intact, that which was built by Bill Timms and is currently lived in, maintained by Jack Walker. Bill Timm died in 1963. The USFS falsely claims he then built a cabin in 1969. Bill Timm was 93 years old at his time of death in 1963. If the USFS account is correct, a 99 year old ghost built the cabin and it should be preserved as the first case of a ghost building a cabin by paranormal activity! The USFS has been at war with Jack Walker for more than 40 years attempting to destroy Bill Timms cabin. In the latest turn of events, the criminal organization we call the USFS has unlawfully falsified the historical report of Bill Timms' Cabin and has suggested eviction of Jack Walker and the destruction of said cabin. Your help is needed to stop the USFS from violating federal law and illegally burning down this historical structure. Please call the Payette National Forest and tell them NOT to burn Bill Timm's cabin, an important piece of history!! Once this 110 year old well preserved piece of history is destroyed, it will be gone forever.

There is a lot of buzz in the hunting and fishing communities that this task you are taking on is nothing more than a smoke screen to buy public lands and then prohibit certain activities (such as hunting and fishing) once the lands are open to the public. Can you comment on this?

Hi, I recently read in Appalachian Trail Conservancy's magazine that AGO was to issue a report of its findings on Nov. 15. A review of websites and Facebook pages (there seem to be many of them) are all virtually silent on the report. As someone who attended the NH listening session and has followed this issue closely, I'd like to know the new deadline for the report. I realize that it's a different political environment than it was when this effort began, but I believe AGO needs full transparency if it is to be credible. To not be in dialog regarding findings and reports, even if they are to be delayed a number of months, is a disservice to the thousands of individuals who gave their time, thoughts, and support to this worthy cause. Thanks.

## Discussion Question 2

***(cont.)***

I live in the middle of a huge forest beetle kill area. This epidemic has damaged our forests by killing our trees and may result in erosion of our soil. This serious national issue also poses danger to the thousands of individuals that are active in our forests camping, hiking, skiing, and sight seeing. Though there may not be too much we can do to stop the beetle devastation, I wonder everyday why we cannot devise a plan to provide Americans that are out-of-work the opportunity to work at clearing the dead trees from our forest. There are millions of acres of forest that are damaged by this problem. It could be that many Americans will appreciate the opportunity to earn a living during this tough economic time and will welcome the chance to help make a meaningful contribution to our forest environment. I'm not suggesting a clear cut or unnecessary roads to be built in our national forest, but more of a well-managed effort to restore our forest while engaging Americans in need.

Dear Mr Ken Salazar, Great outdoors with no wild horses and burros, no mountain lion etc. , is it still great outdoors ??? \_\_\_\_\_

I support the America's Great Outdoors initiative and commend President Obama and his Administration for recognizing that we need to protect our natural world to ensure our health and that of future generations. I hope the Administration will immediately implement the recommendations outlined in its Great Outdoors report. This initiative is important to the people of Tennessee because:

- \* It can help ensure clean water supplies, support jobs in tourism and recreation, save working farms and ranches, and preserve the special places where our community goes hunting, fishing or just to enjoy nature.
- \* It is driven by communities and encourages local people to recommend the best ways to save their lands, waters and coastlines.
- \* It is aimed at preserving whole natural places, including entire forests, mountain ranges, migratory corridors and rivers.

I urge the Administration to take action now on this initiative. Key first steps would be full funding of the Land and Water Conservation Fund <<http://www.nature.org/initiatives/protectedareas/support/art30842.html>> , a permanent extension of conservation easement tax incentives, and support for other government programs that protect our local lands and waters.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

AGO, I am curious about your apparent concern for the environment. Please enlighten me. If the US government was seriously concerned about the environment why would it: A) allow a criminal organization (BP) to control the clean up of the nations largest oil spill? B) allow BP to dump thousands of gallons of Corexit into the ocean, set turtles on fire, cut bird heads off, deny clean up workers the right to wear protective equipment and talk to the media? C) leave 400 million barrels of oil to sit in the gulf for 6 months and then not clean it up? Did I miss the story in the media stating that skimmers from Norway, Germany and Iceland were allowed to assist in the clean up? D) allow 400 million barrels of oil to stay in the gulf where it could be carried to all areas of the ocean and travel the rivers of the US that serve as the drinking water supply for millions of citizens? E) allow the chemicals used to extract natural gas to be dumped into the water supply of millions of citizens as well as state parks? F) why was the natural gas industry exempted from the clean water act? G) why was a former employee of Monsanto put in control of the new food safety division when it is common knowledge that GMO's are harmful to all living things? H) why are GMO's allowed to pass through the US food system without labeling? I) why does the US military continue to dump thousands of tons of barium and aluminum into US airways? If you argue that this isn't true then why are people all over the country finding barium and aluminum in their water using basic water tests? The US government has the one of the worse records for recognizing environmental safety hazards and in fact does more to harm natural ecosystems. It is the tendency of the US government to take life ( see 3 wars being fought in three separate countries), destroy the environment ( see nefarious ties to dirty corporations like Monsanto, BP, Halliburton etc. and above) and pass the burden of pain onto the American taxpayer. This latest initiative looks to be more of the same. The politicians are financially aligned with the corporations to make money at any cost and the average citizen pays for the blunders that ensue. I don't expect an honest and informed response to the above questions because the tactic of a deceiver is to respond with rhetoric or not at all. But go ahead. Surprise me. One Of The Growing Numbers Of Sheep Who's Eyes Cannot Be Covered With Wool

Ducks Unlimited, in partnership with the federal and state agencies, numerous NGOs and private landowners, including the U.S. Fish and Wildlife Service, have worked to curb habitat losses in the Prairie Pothole Region to ensure the future of migratory birds and related natural resource conservation opportunities. Despite these efforts, the native grasslands and wetlands of this cultural and ecological treasure continue to disappear faster than they can be conserved.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

. Some time ago in the history of mankind, humans lost harmony with nature. The people of this Earth (or at least the majority) have forgotten the nature of existence. This planet does not belong to us, we belong to it. We've been selfish and greedy for far too long, and during this eleventh hour the ignorance must cease before it's too late. We must federalize sustainability NOW. I live in Myrtle Beach, SC, and I cannot even pay this city to send recycling trucks to my neighborhood. If the government doesn't take the declarative initiative to change this country for the better, (a policy the president we elected campaigned on), then how else will the ignorance stop? I love America, it has given me my life and happiness, but frankly our lack of appreciation for this planet, and our lust for ourselves, is utterly humiliating. How can we travel to foreign countries and boast of our strength and honor, when we have none back home? It is time Washington. There are more than 7.5 billion people on this planet, and it consistently rises. Frankly, there is no more room on this planet for the ignorant and the selfish. We must take decisive action and we must take it immediately. What are we waiting for? All of environmental science tells us of the urgency, and still we twiddle our thumbs and throw trash out of our car windows. We have the opportunity to literally create a brand new world here in America, and if the rest of the world has a sense of good being like I know All truly do in their hearts, they will listen to our example. Whatever happened to honor? What happened to respect? What happened to love? This nation is divided for all of the wrong reasons. Unite it for the right ones. God bless America.

Dear President Obama: America's great outdoors are special to us all and we have a great responsibility to protect them for future generations. We can help keep America special by protecting more Wilderness and quiet recreation opportunities, preserving more habitat and connectivity for wildlife, and permanent protecting remaining old-growth forests. Here in Oregon, we enjoy some of the most beautiful and awe-inspiring public lands in the nation. But places like the Wild Rogue River, the wildlands surrounding Crater Lake National Park, and the Siskiyou Wild Rivers are at risk from logging, mining, and other harmful development. Oregon has protected only 4% of our land as Wilderness, lagging far behind our neighbors. For the wildlife that call our public lands homes and for the millions who enjoy these places for quiet recreation, it is time to correct this Wilderness imbalance.

One of the principal barriers to effective and efficient conservation of fish and wild life species is the lack of dedicated funding for the full array of fish and wildlife. For nearly three century, the Pittman-Robertson Act and later the Dingell Johnson Act have provided critical quarters of a funding for states to conserve game species. These Acts have successfully brought back wild turkeys, striped bass, elk and many other species . However, they do not directly address the needs of over 90% of the nation 's fish and wildlife that are not hunted or fished.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Therefore, I am forwarding a copy of my prepared remarks directly to you. The purpose for doing so is to once again bring to your attention that there is opposition in Maine to the environmental lobby that is attempting to shut down our forest products industry through various "conservation" schemes and some who are still trying to create a federally-funded Maine Woods National Park that will take the core of Maine's working forests out of production and kill jobs. You have been contacted before in a March 18, 2010 letter regarding a Maine-based effort called the Great Maine Forest Initiative and its proposed tie-in to the federal Treasured Landscapes Initiative (Interior) and the All Lands Initiative (Agriculture).

Millinocket has a paper mill that is currently on indefinite shutdown and the community has been working hard to develop new economic development opportunities and jobs in the area. Our current growth industry is outdoor tourism, although we also are maintaining a solid forest products industry in our geographic area.

This initiative and its components such as the Treasured Landscapes and All Lands Initiatives are viewed by the extreme environmental lobby as their newest piggy bank to finance themselves and to effectively bring private ownership of Maine's forests and thousands of jobs to an end by controlling these private lands through restrictive conservation easements that freeze in place current uses and generally prevent the development of new opportunities, such as the ATV trails mentioned earlier. Freezing in place today's status quo via conservation easements is to sentence the Maine forest products industry to no future growth by socializing our private forests and ceding control to the environmentalists who seek to shut down this critical Maine industry.

Conservation easements have become a trendy growth industry for those who seek further control over privately owned land. These easements end economic growth, block or restrict public access, and cost taxpayers huge sums of money for no public benefit or gain. These easements are in perpetuity. No one has a crystal ball to know what our needs will be in 25, 50, or 100 years. Easements placed today could have terrible impacts in the future as times and priorities change. The Town of Millinocket is not willing to support such efforts that could bring such great hardship to our State, our major industry, and our people based on the shallow promises of certain environmentalists that they are here to help us. History clearly demonstrates that they are not.

Nighttime satellite photos of the United States show a great dark void where the woods of Maine are located and it is the largest uninhabited area east of the Mississippi River. It is dark because it is a privately owned working forest. Environmentalist plans to "preserve" it are not necessary as the landowners themselves keep it this way because they make their livings there.

While some of the environmentalists adamantly deny it, we believe that these efforts are intended in the long-term to create a 3.2 million acre Maine Woods National Park that would eliminate the core of Maine's most productive forest land. This newest initiative presents them yet one more financial opportunity to realize this goal. Millinocket rejects the park, the key political leaders of Maine reject it, and the people of Maine reject it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Given these major challenges that face us, taxpayers would be much better served by a program that enhances the various uses of the Maine forests. Recreational activities continue to be a major part of our economic base. Federal monies used to enhance these opportunities through grants for things such as publicly funded multi-use trail development can help Maine, especially when done in working partnership with Maine's private sector. Conservation easements that impose a status quo and stop any consideration of growth take us in exactly the opposite direction of where Maine needs to be. While there may be specific, limited land parcels that are worthy of purchase, landscape scale conservation easements are simply not necessary and are, in fact, a direct threat to our economic well-being and future.

On behalf of the Town of Millinocket, I urge you to reject the use of America's Great Outdoor Initiative and its related funding programs to economically lock down our State's major industry and destroy our economy in the process. Rather, use these funds to directly enhance recreational opportunities and forest practices that actually encourage people to partake in outdoor activities, create jobs, and improve our economy.

My personal concerns are in regard to our Great Salt Lake and surrounding wetlands. While the Lake and more specifically certain areas such as the Bear River Bay are currently threatened I believe it is important to manage the Lake and surrounding wetlands in a way that will preserve and protect this international and local treasure for the enjoyment of both humans and the water birds that live there.

The wetlands surrounding the Lake are currently in their worst condition in history. I am concerned that even though Forestry Fire and State Lands (FFSL) receives millions of dollars every year from leases and royalties by allowing extraction of minerals and/or harvesting of brine shrimp from our sovereign lands, the money is tied up in some sort of bureaucratic red tape and therefore not spent to protect and repair the wetlands and Lake. Even though the Department of Wildlife Resources currently spends \$200,000.00 per year inside the Waterfowl Management Area's on various Phragmites control; the vast majority of Utah's marshlands lie outside the dikes on state sovereign lands administered by the FFSL. There are several options to deal with the Phragmites issue and restore the lost wetlands such as aerial spraying of glyphosates to affected areas; burning; or allowing cattle grazing in areas of concern. There must be a long term plan to deal with the Phragmites problem and sources of funding must be made available.

Overdevelopment of Great Salt Lake sovereign lands by industries which are currently found in the North Ann, Bear River Bay and Stansbury Bay for mineral extraction ponds as well as causeways and dikes is unsustainable for long-term use and will have an increasing detrimental effect on the Great Salt Lake. Issues such as Great Salt Lake Minerals plan to expand their evaporation ponds an additional 91,000-acres seems to be an unreasonable request for an already exhausted Lake. The effect of mineral and salt removal needs to be analyzed to determine the effects on the salt balance in the Lake. The impact of additional evaporation ponds that would be widespread throughout the Lake and it would disrupt the shallow sheetwater and water flow that ducks, geese and other shorebirds require to live. Proposals such as these could over time destroy the Lake's natural ebb and flow.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Water quantity and quality are both very important to the Great Salt Lake Ecosystem and surrounding wetlands. Water treatment facilities are important to the health of the public; however, they must be required to control the levels of phosphates and nitrates prior to water entering these wetland areas and eventually the Lake. Currently the lack of controls and monitoring of phosphates, nitrates and other chemicals released into the water is objectionable. Regular water monitoring for phosphate levels in these areas will alleviate the negative impact on the native and migratory species that inhabit these bodies of water.

The quantity of water is lacking in the Great Salt Lake at this time and it is extremely important to prevent further diversions of water to take place. A sustainable water now which provides for Antelope Island to actually be an "island" and Farmington Bay and other bays to have a viable level of water will prevent them from becoming a dust bowl. If these Bays' s become too dry it continues to impact the already poor air quality along the Wasatch Front.

As you know, many Americans are hurting from the impacts of a great recession brought on by failed economic and regulatory policies and greed. In my home state of Virginia, neighbors have lost their jobs, their businesses, their homes and in some cases families have been torn asunder. Some are running out of unemployment compensation and sadly, some feel life is no longer worth living.

Sadly, the promise of LWCF being an equal partnership between the states and the federal government has been lost over the past several years. But it can and should be rediscovered and can become a hallmark of your administration.

There are those who believe they can make better decisions about how outdoor recreation and conservation funding can be spent than the local and state governments who now compete for Stateside Assistance grants from LWCF. That kind of thinking is what drives wedges and creates silos that minimize partnership and collaboration.

We are deeply concerned about reducing our dependence on fossil fuels while increasing our security and commitment to renewable energy and green jobs, and we are anxious to see comprehensive energy and climate policy finally put in place a system to regulate and limit carbon emissions. As the legislative battles continue, we must not lose track of our country's valuable natural resources in the bargaining process. We therefore ask for your continued support to safeguard our precious public lands and water resources by providing full and dedicated funding for the Land and Water Conservation Fund (LWCF), including special protections for key lands and waterways now threatened by development and climate change.

The Land and Water Conservation Fund was established in 1965 to protect America's Great Outdoors by using oil revenues to fund the conservation of natural resources. However, the Fund has yet to receive sufficient appropriations in any year, and without these funds it cannot fulfill its potential for our communities, families, and environment. Full funding for the LWCF was included in the Consolidated Land, Energy, and Aquatic (CLEAR) Act, which passed in the House of Representatives in July, and in companion legislation pending in the U.S. Senate. We hope you will advocate for continued inclusion of full funding for the LWCF as these bills move forward.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

With increased awareness of the hazards of fossil fuel extraction, it is clear that full and consistent funding for programs like the LWCF and increased support through that Fund for the creation of new parks and monuments to protect vulnerable landscapes are two critical steps that your Administration can take to help us do just that. Even as we work toward passage of comprehensive climate legislation, we can take meaningful steps to protect our natural resources through full funding for programs like the Land and Water Conservation Fund.

Large, intact and functioning ecosystems, healthy fish and wildlife populations, and public access to natural landscapes are vital to our nation's quality of life and economic well-being. Important wildlife movement corridors and crucial wildlife habitats within these landscapes are critical to maintaining healthy lands.

As states have primary trust and legal obligations to manage and conserve wildlife in the United States, it is imperative that states generate and maintain landscape-scale wildlife information. Western states must, however, work closely with federal agencies that have management authority over much of the public land in the region. The Department of the Interior (DOI), in particular, is launching a number of similar wildlife mapping efforts, including Landscape Conservation Cooperatives and Rapid Eco-Regional Assessments. These initiatives are well intended yet need to be well coordinated both within the DOI and with the state DSSs so that the public can be confident that governmental landscape-scale mapping tools provide consistent and complementary information. Furthermore, for the states to fully develop and maintain their wildlife DSSs over time, additional non-state resources will be required. Devoting federal resources to the states for this purpose would be an efficient use of these dollars as GIS-based state wildlife data that is available, current and compatible across the states, assist federal mapping efforts and lead to consistent public information on wildlife from both levels of government.

For programs such as this to be truly effective, the Administration and Congress must give these agencies the resources they need to deliver. The National Wildlife Refuge System, 150 million acres of the world's premier system of lands devoted to wildlife suffers from 44% funding shortfall, and the President's budget request for FY 2011 would make it even worse. In order to fully realize the potential for on the ground conservation, these agencies must be fully funded; coordinated, comprehensive and effective landscape conservation simply can't happen when the FWS and NWRS are starved for adequate staffing and resources.

A comprehensive vision for "America's Great Outdoors" must include the NWRS and it will be essential to address fundamental FWS funding shortages and operations and maintenance backlogs - over \$3.6 billion for the Refuge System alone. Addressing this issue will be essential to achieving the promise of that vision.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Collaborative conservation, however, will not be sufficient to address all of the difficult issues that the nation confronts in managing our natural resources. When collaborative initiatives succeed, it is often against the backdrop of pending litigation or legislation or some other threat, such as a possible endangered species listing. And collaborative efforts take quite a bit of time and resources, which may not always be available. The Washington County legislation in Utah, for example, involved more than five years of tough ongoing negotiations, while the Nine Mile Canyon agreement was reached with the threat of costly litigation looming. This is not to denigrate the various grassroots initiatives that are underway across the West and elsewhere, but it is to inject a note of cautious realism about this approach. The tougher the issue, or the larger the affected landscape, or the more intransigent the parties, the more difficult it will be to achieve meaningful conservation results in a reasonable time frame, if any consensus can be achieved at all.

Simply put, not all conservation challenges can be effectively resolved through local dialogue and cooperation. President Teddy Roosevelt, recognizing how polarized the various parties were during his tenure in the White House, used bold executive actions to accomplish his most memorable conservation achievements: the creation of 24 new forest reserves, which are now vital parts of the national forest system; the creation of the first wildlife refuge, followed by several others; designation of the Grand Canyon National Monument to protect this iconic landscape; and the establishment of several other important national monuments. If the Obama administration is serious about its conservation legacy and promoting landscape scale conservation, then I urge you to include bold executive action as one of the potential AGO strategies. In this era of ultra-contentious, hard-ball politics, it will not be possible to appease all of the competing factions involved in our public land and resource debates. Roosevelt recognized this hard political reality, the Obama administration should do the same, while pursuing collaborative solutions for those issues or landscapes that lend themselves to this approach.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Most importantly, given the conservation challenges that lie ahead in the 21st century, I urge the AGO initiative to promote landscape-scale conservation strategies that will enable LIS to address effectively climate change, biodiversity loss, and other ecological stressors. One way to promote landscape scale conservation is to ensure the federal land management agencies coordinate their planning, in decision making efforts, both among themselves and with the states, local governments, Tribes, and other landowners. At the federal level, either by regulation or Executive Order, the President could require the land management agencies to prepare an Interagency Coordination Statement as part of their land use plans or NEPA documents, which would require prior notification to other agencies potentially affected by any upcoming agency action. An opportunity to comment on the action, and a requirement that the action agency respond specifically to any identified concerns, including whether any feasible alternatives are available to avoid potential harm. Such an approach would help to emphasize the need for better coordination, ensure that landscape level concerns are identified, and that alternatives are fully considered. A similar approach might be developed to address related concerns from the states, local governments, tribes, and private landowners. While such an approach would not solve all of the problems inherent in planning and managing at a landscape scale, it would ensure that shared ecological concerns were identified and addressed before any irreversible actions were taken. Too often, under the current NEPA regime, these types of shared concerns are either not highlighted or simply not addressed, undermining any notion of landscape scale conservation.

Another vitally important landscape conservation measure that AGO should consider is employing executive authority to protect sensitive places and special ecosystems. Just as President Roosevelt used the Antiquities Act to protect the Grand Canyon, President Obama should exercise the same authority to protect special, sensitive places (treasured landscapes), as identified through the AGO listening sessions. President Clinton made effective use of the Antiquities Act during his time in office, and though many of his 23 new national monuments were criticized at the time, Congress has now legitimized his BLM-managed national monuments by creating the National Landscape Conservation System. Whenever presidents have acted under the Antiquities Act, their actions have initially been criticized, but without such actions we would not have the same national park system that we do today, and the nation would be poorer for it. Given this, one such national monument designation that merits consideration is a "Canyonlands National Monument" in southeastern Utah to "complete" Canyonlands National Park by extending its boundaries to the edge of the geologic basin that forms its natural boundaries. Such a designation would ensure protection against oil and gas development within the Canyonlands basin and enable the Park Service to control presently out-of-control off road vehicle activities that are severely degrading this fragile desert landscape. Beyond the Antiquities Act, the administration should consider using its withdrawal powers to protect other sensitive places from ill-advised industrial development, as in the case of uranium mining claims on the perimeter of Grand Canyon National Park.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I also suggest that the administration consider designing and establishing new National Restoration Areas to restore damaged landscapes for their future conservation value. The major eastern national parks, including Great Smoky Mountains, Shenandoah, and Mammoth Cave, were established on badly depleted lands that had been timbered and farmed. Once restored, these parks have become vitally important wilderness redoubts and recreational settings for a major segment of the American populace. The same is true for the eastern, southern, and Midwestern national forests, 1110st of which were acquired by the federal government under the Weeks Act and then gradually restored to their present condition, which provides important wildlife habitat and recreational opportunities for citizens living in these areas. In the West and elsewhere, we have abused landscapes that could be restored to a near-natural condition and that could offer the same habitat, recreational, and open space values to future generations, whether as national parks, forests, or wildlife refuges. This proposed National Restoration Area strategy is admittedly long term in nature, but our grandchildren will surely thank this generation for having such foresight, just as we are indebted to our forebears for their foresight in restoring some of our most precious landscapes.

Finally, the Obama administration should support expansion of the national park system. National parks are widely recognized by the American public and readily accessible to most people. They constitute a wonderful resource for introducing the general public, which is increasingly urban and removed from nature, to the wonders and challenges of the outdoors. They also provide excellent recreational opportunities, which could help address childhood obesity and other fitness challenges. And unlike the other public lands, the national parks have an educational component through the National Park Service's highly regarded interpretive programs, which can help visitors to learn about the natural world and to gain a new appreciation for nature conservation. By combining an educational and recreational mission, the national parks are a setting where diverse segments of this nation's population can be connected with the natural world around them and provided an opportunity to become directly engaged in conservation and restoration work. In this vein, consideration should be given to expanding the Park Service's "national significance" criteria for assessing whether an area might qualify for national park designation; one additional factor that should be included in the criteria is the possibility of restoring damaged sites for future inclusion in the national park system.

"America's Great Outdoors" should advocate increased funding and innovative efforts to protect our land and water. We can revitalize local economies and create American jobs by protecting water resources, sustaining parks and forests and providing places for outdoor recreation and tourism.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

At the homegrown listening session in Phoenix roughly sixty Arizonans came together and identified the lack of funding for conservation programs such as the LWCF, including a lack of agency staff positions, as well as a general lack of education and awareness programs that involve youth, families, and diverse constituencies, as the major challenges and obstacles to achieving conservation goals and reconnecting people with nature. Attendees felt programs to get people out into nature – volunteering, doing service projects, and enjoying outings – are the most effective ways to reconnect people to the outdoors and encourage their stewardship. Programs such as Sierra Club's Inner City Outings were specifically called out.

Local farmers also attended the listening session, as did AmeriCorps members. They called for an increase in programs supporting urban agriculture in Northern Memphis and efforts to get youth to connect to the outdoors with hands-on farming options. Attendees noted the possibility of connecting Wolf River work to farming, as the family farmers near I-240 about an eight-acre lake and the Wolf River. Other session participants lauded the successful efforts in Tennessee, Arkansas, and Kentucky that connect science curriculum to hands-on water care, using physics, chemistry, and biology to assess river health and problems. Session participants stayed afterward, building new connections based on the shared ideas and visions for regional greenways and blueways.

All Americans deserve to enjoy our great outdoors, but far too many individuals do not have adequate access to clean, safe parks and natural spaces. For many Americans, their first real experience with the outdoors and the natural world is a creek, stream, river, or lake. It's no wonder since virtually all Americans live within a mile of such waters. Sadly, too many communities, large and small, have turned their backs on their rivers and many are no longer accessible, enjoyable, or even safe for people to discover our natural world. Fortunately, rivers are resilient and with some care and commitment, are able to bounce back. A federal commitment from a variety of different fronts is necessary to provide access to new constituencies who have a need and desire to experience the outdoors on their hometown rivers, which are most often the natural asset nearest to their community. The great opportunity here is that not only are rivers and streams desirable places to recreate, but establishing urban parks and restoring riverfronts also provide direct economic, public health and community safety benefits.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Numerous anecdotes and studies demonstrate that communities from Chattanooga, TN to Portland, OR have rediscovered their rivers have enjoyed significant benefits by attracting new businesses, retaining populations, and enhancing property values. By strategically locating and developing open spaces, places like Milwaukee, Wisconsin, Toledo, Ohio, and Chicago, Illinois are able to significantly reduce their level of polluted storm water run-off. In places like Tulsa, Oklahoma and Mecklenburg County, North Carolina, people have been able to move frequently flooded properties out of harm's way to higher ground and reclaim those abandoned lands for public spaces that also more effectively and cheaply manage flooding. Those same lands provide a tremendous resource for the community year round and serve as entry points for people to discover America's outdoors. After devastating flooding in 1965, the City of Denver launched efforts to clean and improve the South Platte River and Cherry Creek, establishing 150 miles of hiker and bicycle trails, boat launches, whitewater chutes, and parks. Throughout the country, citizens are also discovering their streams, rivers, and lakes through volunteer efforts and programs like the National River Clean-up™. Clean-ups provide a fantastic opportunity to introduce citizens to the outdoors and create new stewards in the process.

2. Leverage existing programs to build "green infrastructure" Meeting our nation's water resource needs is something that has been traditionally accomplished through pipes, plants, levees, and dams. We spend billions of dollars each year building, maintaining, and operating this "grey" water infrastructure to meet our growing needs, but communities throughout the country are beginning to embrace a new path. By investing in approaches that rely upon natural landscapes – e.g. wetlands, floodplains, forests – communities can maintain clean water, ensure adequate water supplies, and manage floods, by developing parks and other green spaces. There are numerous federal programs that help fund water infrastructure that can and should be shaped and leveraged to not only meet those water management goals but can be used to purchase and develop parks and open spaces for communities around the nation.

3. Restore Rivers by Fostering Volunteerism Millions of tons of trash end up in our nation's rivers and streams every year and while this debris may not pose the greatest threat to our nation's rivers, it does represent the most visible. One of the most frequent and easiest ways to introduce and engage citizens with the outdoors and environmental stewardship is through river and stream clean-ups. This was clearly evidenced by testimony from several listening sessions, including St. Louis. America's Great Outdoors should fund a grant program to better facilitate and foster these efforts nation wide. A commitment of \$11 million annually to the River Clean-up Program will result in 2,000 river clean-ups each year, and lead to the removal of more than 20 million pounds of trash. Full program funding will provide each clean up with \$5,000 for expenses, and also provide an additional \$1 million dollars for a river clean-up director and staff.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

4. Urban Waters Initiative EPA's Urban Waters Initiative should be used to better connect people to their rivers in urban areas. Clean and safe water directly relates to well being. According to a recent Gallup-Healthways Well-Being Index survey residents living in the top 10 metro areas for access to clean and safe water are 8 percentage points more likely to be satisfied with their city or area as a place to live, and more than 10 points more likely to say their city is "getting better" than are those living in the bottom 10 metro areas for access to quality water. While the Administration has focused on smart growth issues in cities, access to clean water should also be a priority. Increasing funding for river access and increasing urban green infrastructure will provide multiple benefits to city-dwellers including improved public health, reduced air pollution, increased access to green space, reduced local flooding and clean water.

Establish a National Blueways Initiative Blueways (a.k.a. blue trails or water trails) are an innovative, locally-driven way to connect people with rivers and riverside lands. Across the country participants in the listening sessions highlighted the blueways on their hometown river and called for the establishment of a national blueways initiative. A blueway is a dedicated stretch of river that enjoys special clean water safeguards and is a destination for fishing, boating, and other recreation. Blueways, like hiking trails, help people discover rivers and provide a connection between both urban and rural communities and the outdoors. Blueways provide a fun and exciting way to get youth outdoors and are economic drivers benefiting local businesses and the quality of life.

Establishment of a national Blueways Initiative would improve regional and landscape level conservation through development of partnerships across all levels of government, non-profit organizations, and private landowners. Expanding on the National Trails System model, the national Blueways Program would emphasize the connection of communities and America's treasured landscapes, and require plans and strategies for protecting these areas and enhancing connections.<sup>1</sup> The initiative would provide for trail-wide coordination and management of lands owned by government and private entities along Blueways.

USFWS Partners for Fish and Wildlife Program – Through voluntary agreements the Partners program provides expert technical assistance and cost-share incentives directly to private landowners to restore fish and wildlife habitats. Any privately-owned land is potentially eligible for restoration. Most participants are individual private landowners. For purposes of this program, "privately-owned" means land not owned by a State or the Federal Government. Benefits for the landowner include fulfilling habitat conservation goals on the land by working one-on-one in partnership with the local Service biologist; and for the species, restoring the important habitats on private lands that may result in the recovery of Federal trust species.

NRCS Conservation Programs – NRCS is a leader in working with farmers and rural communities to restore and protect water resources. These include numerous place based efforts such as the Mississippi River and Chesapeake Bay, Conservation Technical Assistance Programs, Environmental Improvement Programs, Stewardship Programs, Water Resources Programs, Easement Programs, and Community Assistance Programs.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

America's Great Outdoors provides an opportunity for us to re-examine our conservation history and to re-invest the nation in the open spaces, wilderness areas, national parks, waterways, wildlife refuges and city parks that make up our natural heritage. This will not happen without leadership and bold action. Collaborative efforts to engage communities and local leaders must be pro-active and directed toward tangible conservation outcomes. The Greater Yellowstone Coalition views America's Great Outdoors as a vehicle to work collaboratively at a large landscape scale to address and overcome the new set of challenges that confronts the region's communities and wild places.

Launch a new, world-class climate science facility located in the Greater Yellowstone Ecosystem that can provide the research capacity, resources and guidance that land managers will need to monitor and safeguard this region in the face of global climate change.

For 45 years, under both Republican and Democratic administrations, the Land and Water Conservation Fund has provided critical dollars for enhancing and protecting public lands, wildlife habitat and recreational opportunities. Since the L WCF has only once been funded to the full level authorized by Congress, and recent appropriations have been at record lows, a proposed increase in the fund, derived from royalties from offshore drilling, shouldn't go unnoticed or unappreciated.

To create a lasting legacy from a focus on America's Great Outdoors, the Administration must consider how to strengthen a movement that comes from the grassroots of America's rural communities, embraces problem-solving over partisanship through collaboration with diverse interests, and yields economies that are centered around the conservation and restoration of thriving populations of wildlife, functional ecosystems, and valuable ecosystem services.

Many past conservation initiatives have focused on small islands of protectionism while the vast fabric of the western social, economic and ecological landscape are sidelined (and deteriorate). Through the America's Great Outdoors Initiative, the Administration has the opportunity to address what one of this nation's greatest devotees of natural places – Wallace Stegner – asked for decades ago: to build a society that would match our scenery. The models, tools, experience and leadership are in place to achieve this today – the opportunity is for the federal government to invest in them to secure a lasting American Great Outdoors.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The undersigned participants in the Rural Voices for Conservation Coalition appreciate this Administration's willingness and effort to reach out to citizens to solicit guidance for its America's Great Outdoors Initiative. We believe that the natural resources, recreation opportunities, communities, and cultural values of the rural West are valuable to the Nation as a whole for the goods and services, knowledge, and skills they provide. Our shared vision is one in which working, interconnected public and private landscapes provide multiple value streams to rural communities themselves, and society at-large, and are part of the solution to our greatest 21st century challenges (including sustainable provision of natural resources, climate change, loss of ecological capital, uniting citizens across political divides, etc.). Communities involved in the stewardship of public and private lands play a vital role in protecting robust ecological functionality and biodiversity, producing food, fiber, fuel and other raw materials, providing aesthetic value and recreation opportunities, and supporting the cultural and economic underpinning of rural America.

The key to protecting biodiversity and ecological resilience is to invest in rural communities and landscapes across our nation. The RVCC includes many place-based collaborative conservation initiatives that are charting a new course for rural communities, one which can supply urban areas with local sustainable goods, provide land stewardship services, and promote sustainable recreation and education opportunities that strengthen the connection between American society and the land. This transition is not just about rural communities providing goods and services to urban centers. Rural communities are also positioned to transform their own economies, create local markets, and become healthier, more economically resilient, and maintain the critical tie to the land that is central to culture (including tribal peoples, ranchers, commercial fishermen, etc.). America's Great Outdoors Initiative must recognize the need and value of a stewardship economy to strengthen rural communities.

The resource management paradigm in the West is transforming. Over the last 15 years we have seen strides in collaboration, the advent of community-based organizations that strike a balance between conservation and sustainable utilization, and the development of new rural enterprises, contracting mechanisms, and markets that support both healthy ecosystems and local economies. After decades of polarization that harmed ecosystems, rural economies and the fabric of local communities, leaders from rural communities across the western United States are showing that rural people have the energy and creativity to develop locally crafted solutions that provide resilient, long-term jobs based on good stewardship of the natural environment.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While specific additions to our nation's wilderness, parks, and protected area systems may be warranted, the vast majority of western landscapes need help transitioning successfully from the old economies of extraction to new economies of stewardship. The real opportunity at hand in 2010 is to develop a comprehensive system that will yield sustainable resource economies across the landscape, restore and conserve the ecological resources of working landscapes, and heal the social polarization that has too often resulted from resource management disputes. What is needed is a determination to change the broad social, economic and ecological system operating on the land. Only a focus on the working landscape can align diverse strands of the American society to work together for common interest, at a scale that is ecologically and economically meaningful.

We see potential for the most success and the greatest opportunity to galvanize diverse Americans and leverage our natural assets by supporting collaborative community-based efforts that represent the best of small rural entrepreneurs and land managers, skilled non-profit organizations, and the federal government all working together to transform our rural economy and landscape. As the Administration considers an array of options to reconnect citizens to America's Great Outdoors, we urge you to support and invest in the ecological, social, and economic resiliency of rural communities and working landscapes in the West. Far from an obligation, it is the only real opportunity to create systemic improvement for our resources, our economy, and our people.

In the West, the federal government owns over 54 percent of the land (ranging from approximately 29 percent of the land in Montana to approximately 85 percent of Nevada's land base). Rural communities with natural resource based economies, especially those in public landscapes, have endured boom and bust cycles for decades, following the country's alternating impulses to exploit or protect its natural resources. These communities are a part of the solution to environmental challenges. However, they continue to experience instability, including high rates of poverty, unemployment, and overall economic decline, and consequently, the infrastructure to participate in a green economy is seriously diminished.<sup>1</sup> Social and economic challenges are mirrored and often exacerbated by pervasive ecological challenges, including; catastrophic wild land fire, diminished and degraded water supplies, overstocked and diseased forests, the spread of invasive and noxious species, habitat fragmentation and conversion, and species decline, among others.

Rural communities are leading the charge to address the myriad challenges that face their communities and the conservation challenges of the Nation. There are literally hundreds of examples of projects, programs, and organizations involved in this new era of restoration and stewardship. We know that in the communities where we live and work, our efforts and innovative solutions are beginning to have an effect. Rather than list each group, we have chosen to highlight what we believe to be the most significant characteristics shared by these nonfederal approaches. Although there is no set formula for success, there are a number of general commonalities.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

**Power sharing:** Shared decision-making power is vital to a healthy and democratic system of management and stewardship. Decision-making processes that recognize social, economic, and political inequity and strive to balance and improve these disparities bring communities together, rather than pit them against themselves and each other.

**Triple bottom line commitment:** Use of integrated approaches that address ecological conservation and restoration, local natural resource-based economic development, and healthy communities and strong social fabric.

**Business and market strategies:** A business and markets orientation – driven by local expertise – that finds a role for federal conservation investments as a complement to broader business models or economic development plans that combine public and private capital and “sweat equity” for lowest cost, highest value outcomes and long-term, sustainable revenue streams.

**An “all-lands” approach:** Developing solutions that work across landscapes, from public land forests, to higher elevation private forests, to the ranges and valley bottomlands managed (whether on public or private land) by ranchers and farmers. Effective management and policy recognizes and addresses the social, economic, and ecological connections between private and public lands that share ecological process and span the forest, range, farm, and aquatic systems that characterize the West.

The role of non-federal entities in conservation and stewardship in the American West cannot be overstated. There are many types of entities that are filling important intermediary roles that neither government nor the private sector can fulfill on their own. The movement of community-based conservation and stewardship that is redefining the West is being built largely by the will and capacity of community, or place-based organizations, and by regional organizations. These intermediary institutions complement one another and ensure that our conservation strategies can go deep into the communities and landscapes we care about, but also spread, aggregate, and regionalize the practices and approaches that emerge from local efforts.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In the past 15 years, we have seen the success of locally-based groups that occupy the space between diverse stakeholders, civic groups, businesses, private landowners, rural citizens, and government agencies. We refer to these groups as community-based organizations (CBOs). They have been essential to the successful implementation of both private land conservation efforts by landowners and the collaborative management of federal lands, and have also excelled at harmonizing conservation objectives with local economic needs. CBOs play social, ecological, and technical/financial roles, including: providing critical support to collaborative structures and institutions that assemble diverse interests and viewpoints, and facilitate toward common ground; serving as a buffer and conduit between landowners and federal and state agencies (as well as other outside resources) – in many areas there is significant mistrust of government agencies and CBOs can serve as a trusted go between; serving to “re-aggregate” the landscape by coordinating and aligning multiple landowners (including government agencies) to achieve landscape scale impacts, particularly in fragmented landscapes; providing skilled resources and staffing to help local landowners, businesses, and contractors understand and work with state and federal conservation programs, and successfully meet the requirements (proposals, bids, contracts, etc.) necessary to capture and utilize funding; adding value to federal program delivery by integrating federal programs into a broader economic and environmental strategies supported by local communities; and, reaching ecologically and economically significant scales and impacts by intergrating public and private lands at a whole watershed scale that effectively bridges the “silos” imposed by agency missions.

To support and leverage the work of CBOs and rural small businesses, we must also promote the regional organizations and networks that convene multiple local efforts, help to disseminate lessons learned, and accelerate innovation diffusion. These networks are integral to scaling-up place-based efforts. Regional organizations can be based in urban or rural areas and work across multiple sectors, communities, counties or states. Regional organizations play many roles at different times in the process of implementing community-based conservation and economic development strategies. Regional organizations provide improved access to technical expertise, tools, and philanthropic communities. They build and bring political clout to promote solutions, and connect rural non-profits and entrepreneurs to wider networks, markets, and opportunities. Roles include: helping to catalyze and build local organizations in places lacking this capacity, as well as strengthening existing groups; providing bridge staffing, facilitation, and technical support in communities that are rebuilding institutional and social capacity; serving as liaison between local efforts and federal officials by providing the venues and forums to initiate and build relationships when they are absent and/or frayed; reaching out to distant stakeholder groups and interests that have traditionally been at odds with local efforts and assisting with reframing and building common ground; documenting and communicating trends and issues that affect multiple communities to improve policies and procedures, including providing vital data collection, mapping, and analysis; organizing multiple communities to work together to promote shared vision and solutions; and promoting peer-to-peer learning and adoption of best practices.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Natural resource management functions, renewable energy development, conservation-oriented forestry or agriculture and other businesses can provide high quality, living wage employment protecting, restoring, and stewarding the environment. They include jobs that restore and maintain ecosystem functions and services, such as clean air, clean water, and forest and rangeland health and biodiversity, as well as those that reduce energy, material, and water consumption, and move us toward a low carbon economy. The promotion of rural green businesses can help local economies recover by expanding value-added businesses and industries, and creating living-wage jobs that have positive multiplier effects in rural communities (economic activities that maintain and enhance essential local businesses, such as hardware stores, sawmills, feed stores, and by extension, schools and hospitals). For-profit enterprises play the vital role of providing: service and stewardship work on public and private lands; entrepreneurial skills, training and employment opportunities; capital assets needed for conservation work; equipment necessary to perform land management objectives; processing and manufacturing facilities to create wood and agricultural products to provide building materials, food, and energy; ability to take demonstration projects to scale and profitability; and, market-driven revenue streams that reduce long-term dependence on public funds.

Integrated community-scaled biomass utilization strategies can offset the costs of forest restoration and hazardous fuel reduction activities while contributing to rural economies, energy independence, and carbon emission reductions. The following programs represent a comprehensive approach to encouraging efficient, community scaled biomass utilization strategies across the nation. It is critical that Congress fund all of these programs as each fulfills a different need for support, planning, and implementation of broad biomass utilization and climate change planning strategies.

Develop a coordinated National Conservation Strategy'- Articulating a common vision and strategy for protecting American biodiversity, ecosystem services, and cultural and historic resources, based on a comprehensive assessment of protected and threatened resources, would help set common goals and roles among federal agencies and private partners. Using new tools provided by Landscape Conservation Cooperatives (Lees), inventory and monitoring programs, the U.S. Fish and Wildlife Service and the National Park Service should lead this integrated effort on public and private lands.

Promote Landscape Conservation - The Department of the Interior should lead landscape conservation approaches to conserve and restore fish and wildlife and ecosystem services by promoting inter-agency cooperation, partnerships with states, communities and nonprofits. Identify Important Geographies that are under immediate threat from development and climate change, and that enjoy strong local support, such as the Everglades, Chesapeake Bay, Lower Mississippi, Great Lakes, Southern Texas, and the Mojave Desert as America's Great Outdoors - Treasured Landscapes.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The work we are doing is representative of the challenges and opportunities we all face in metro areas across the country in creating healthy recreation opportunities on our public lands. We would like to share our best practices and aspirations with you to create a world class urban forest that meets the challenges of limited open space in a community that suffers from high rates of asthma, diabetes and obesity.

Our nation faces great challenges in sustaining traditions of conservation of our lands and waters and in combating lifestyles which have caused skyrocketing rates of obesity and stress. Happily, the America's Great Outdoors Initiative provides a forum for discussing creative means to combine energies and resources to combat all of these challenges in a sustainable way, connecting more people to the Great Outdoors, making them both healthier and more committed to safeguarding this treasured legacy.

Implementing the Action Plan is a key emphasis of several Federal Agencies, with many other federal agencies actively engaged through a federal caucus, and continues to be a priority of State and Tribal Agencies as well as private industry, making it a potentially key player that stands in place and ready to help move the AGO initiative forward. While it is certainly recognized that these are financially difficult times across the country, the Action Plan is an already existing plan and framework working for the betterment of our Nation's Aquatic Habitats, which are the life blood of our natural world.

Just as the buildings at CC are important to our history, so too are buildings all across the United States. It takes dedicated hard work and funding to maintain such meaningful places, and in these difficult economic times many of them are in danger of being lost.

If we want our children to view history as more than dry names and dates to be memorized for an exam, if we want them to be able to "walk into the past," then we need to preserve those places that are important to us as individuals and as a nation. We want to preserve our Alma Mater; wouldn't it be wonderful if we could preserve the places that tell the story of who we are as a people?

The Endangered Species Act listing of the Atlantic Salmon. Last year the US Fish and Wildlife Service listed the Atlantic Salmon as endangered on the Penobscot River. Lincoln Paper and Tissue along with the State of Maine, commented in opposition to this listing. The State believes their Standards are protective of all fish species including salmon. The Service will likely be involved in all municipal and industrial waste water discharge licensing. A direct concern to us is that in similar situations in the western US the Service has requested impact studies which have cost millions of dollars.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The need to support biomass burning for the inclusion of renewable energy and carbon neutrality.

Biomass carbon neutrality is a widely accepted principle used to differentiate biomass-derived carbon from fossil fuel derived carbon due to its role in the global carbon cycle. It reflects the fact that biomass-derived carbon is part of a relatively rapid natural cycle that, when in balance, neither adds nor subtracts carbon to/from the atmosphere, whereas fossil fuel-derived carbon is not part of such a rapid cycle.

Failure to recognize the carbon neutrality of biomass will be disruptive to national climate and renewable energy strategies and result in harmful environmental and economic impacts. Policies that treat biomass-derived CO<sub>2</sub> identically to fossil-fuel derived CO<sub>2</sub> will be particularly harmful.

There are three major obstacles that continue to impede recreation, conservation and reconnecting people to the outdoors in the Chesapeake watershed:

1. Lack of public access to the Bay and its tributaries,
2. Great need for additional resources and tools for land conservation,
3. Shortage of both formal and informal environmental education policies and programs.

Over the years we have learned that citizen involvement with and commitment to the health of the Chesapeake and its tributaries is greatly affected by personal contact with the Bay and its environs and by educational experiences. But discovering the Bay is a challenge for most citizens, and particularly our youth.

Despite improvements, still today less than two percent of the Bay's shoreline and its tidal tributaries is open to the public, and recreational experiences at these access sites is often limited to those who have boats. Because of high land values and high population densities, providing increased recreational access to the Bay's shorelines for swimming, fishing, camping and hiking, among other outdoor activities, is a major challenge. Likewise, there are 3 million K-12 students in the Chesapeake Watershed, but only a very small percentage of those students have the opportunity to participate in meaningful outdoor watershed educational experiences through their schools.

To make our lands and wildlife more resilient in the face of climate change America's Great Outdoors must focus on reducing targeted stressors such as mineral development, logging, and overgrazing; protecting core areas and corridors to allow species to migrate and adapt as the climate changes; and insist that all federal agencies with land and water management responsibilities coordinate with their state and local counterparts to develop and implement ecosystem wide climate smart management programs.

Lack of public access to the outdoors close to where people live.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Limitations at the municipal level. Many municipal officials don't understand or value the importance of greenways and open space to community prosperity and sustainability. Most municipalities do not have the resources to invest in trails, parks and open space and do not want to take on the maintenance burden.

Lack of incentives and funding for inter-municipal trail planning and building to create regional trail networks.

Transportation planning and funding is too focused on automotive travel and not inclusive enough of pedestrian/bike paths.

Insufficient funding for land conservation.

We oppose wilderness and similar designations that isolate the land by employing a "hands off" management approach. Areas designated as such have proven unsuccessful as evidenced by the catastrophic pine beetle infestations in Black Hills wilderness areas and those in other forests across America. Such practices have not "protected" the land, but rather created a situation that invites disease and fire.

The NEPA process is good in theory. However it is expensive, slow and can not adapt to rapidly changing situations (eg. natural disasters such as fires, tornados, floods, etc.)

Expanding federal ownership of land is inappropriate and can not work in a broad conservation plan. The Federal government should not seek to obtain ownership of private lands for any purpose. Our federal government cannot financially manage the land it currently owns. Many land management agencies have huge backlogs just to repair and maintain what they have. Conservation funds should be used to improve forest health and infrastructure, not to acquire more land.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Administered by the National Park Service (NPS), the Historic Preservation Fund (HPF) provides vital financial resources for a variety of important preservation organizations and programs that form the foundation of our nation's historic preservation system, including funding State Historic Preservation Offices (SHPOs), Tribal Historic Preservation Offices (THPOs), Historically Black Colleges and Universities (HBCUs) and Save America's Treasures. Inadequate funding for HPF also limits the matching grants that are available from SHPOs, THPOs, and HBCUs and reduces support for preservation activities such as planning, survey, inventory, project review and public education. However, not since its inception in 1976 has the Historic Preservation Fund received full funding to carry out the provisions of the National Historic Preservation Act. In fact, since 2001, appropriations have declined from \$94 million to less than \$80 million. Thus, we strongly recommend that the administration put the HPF on an equal footing with the Land and Water Conservation fund, both of which support the protection of our irreplaceable natural and cultural resources, by fully funding the HPF at its authorized level of \$150 million per year.

Threats to such sites has led the National Trust to include 24 different national park units on the list of America's 11 Most Endangered Historic Places (11 Most) since the program began in 1988. The need for maintenance and repair of historic structures has reached crisis levels in many parks, including Valley Forge National Historical Park and Mesa Verde National Park, both of which are included on past 11 Most lists.

Under the NPS Organic Act, these historic and cultural places must be managed and left "unimpaired for the enjoyment of future generations." Unfortunately, many historic properties in our national parks are being destroyed by a lack of agency funding and, sometimes, by a lack of will and priority to protect them. For example, 46 percent of historic buildings and structures located in national parks are in fair or poor condition and funds should be allocated for repair and maintenance before they are lost. We support a Cultural Resource Challenge to elevate the importance of cultural resources planning, maintenance and protection within the National Parks and the historic preservation and cultural resource programs within the Department of Interior and the National Park Service.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Our federal public lands contain historic and cultural resources that are estimated to be in the billions, many of which—such as those in southeastern Utah—attract thousands of visitors each year. However, the vast majority of those lands have not been systematically inventoried for historic and cultural resources, so the location and condition of the resources remains unknown. As a result, development projects are frequently targeted for areas containing significant cultural resources, creating conflicts between development and historic preservation that could have been alleviated through better information and planning. National Historic Trails (NHTs) provide clear examples of the negative implications of this for connecting people with the outdoors. Trail corridors provide a fantastic combination of outdoor recreation and education opportunities and can be havens for native plant and animal species. One hundred communities of 50,000 or more people, including many large cities, lie along NHTs so the trails can directly connect inner-city youth and adults with outdoor travel and education. However, none of the NHTs have been completely inventoried and mapped and agencies do not consistently manage and protect trails from the physical and visual impacts of development. As a result, these great links between cultural and nature, city and country, are slowly being erased. We recommend that funding to survey historic and cultural resources on public lands be significantly increased.

Cultural resources and whole landscapes under BLM management are increasingly endangered by potentially destructive activities such as unregulated and inappropriate recreation, inadvertent visitor damage and even looting. A notable example of the need for increased inventory and greater protection is demonstrated by BLM's Monticello Field Office, located in southeastern Utah's San Juan County. For more than 12,000 years, generations of families from Paleo-Indian big game hunters to Mormon settlers traveled to the area and, in particular, to the archaeologically rich, roughly 476,000-acre cultural landscape of Cedar Mesa. Their stories are now buried among Cedar Mesa's estimated 100,000 prehistoric and historic sites—an archaeological record that rivals that of nearby Mesa Verde National Park. San Juan County has seen an estimated 30 percent annual increase in national and international visitors since at least 2006, but BLM has little money to educate visitors about proper site etiquette, no cyclical maintenance money to repair, stabilize and interpret heavily visited sites, and only one law enforcement officer to patrol the entire 1.8 million-acre field office, of which Cedar Mesa is only a part. In FY 2008, the Monticello Field Office received just \$86,000 for its cultural resources program—an average of only 4.6 cents per acre. As a result, many sites are being "loved to death," with visitors taking surface artifacts and damaging walls and rock art. In its 2004 Preserve America report, BLM asserted that it manages "the largest, most diverse, and scientifically most important body of cultural resources of any Federal land managing agency," yet BLM receives the least amount of cultural resources money per acre of any federal agency. Many of these resources are not contained in the National Landscape Conservation System and therefore do not received increased financial resources for their inventory or preservation. We recommend an increase in base funding for BLM's Cultural Resources Subactivity 1050 account by \$7 million each year from FY 2011 through FY2015 for permanent annual base funding of \$50.6 million.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

NPS has the authority to work with local governments but no means to create incentives for local governments to work across city, county and state lines, especially when local governments are competing with one another to increase their tax bases. For example, Wilderness Battlefield is a part of the Fredericksburg and Spotsylvania National Military Park in Virginia and stretches across three counties. The Wilderness Battlefield is threatened with a 53-acre Wal-Mart Supercenter and adjacent retail development within its historic boundaries. The Wal-mart is sited on land that is designated by Congress as part of the official battlefield yet it is unprotected. NPS should provide financial incentives for local governments to work with the agency to best preserve cultural resources for the long-term and avoid shortsighted ad hoc planning, especially in areas experiencing rapid growth. NPS must preserve the setting and context of military parks and battlefields—especially Civil War battlefields in the mid-Atlantic region but also battlefields from the Revolutionary War and the War of 1812—before they become isolated small patches of green surrounded by urbanization and sprawl.

These incredible landscapes and the fish and wildlife that inhabit the area are at substantial risk on numerous fronts, but perhaps none more so than the grassland and wetland communities of the

Prairie Pothole Region of North Dakota, South Dakota and Montana. The proposed Dakota Grassland Conservation Area offers hope, and if implemented, assurance that the region's worldclass fish and wildlife resources will remain abundant for future generations to enjoy.

We face unprecedented challenges such as climate change and must ensure that we employ science-based management practices. As demonstrated in the Gulf Coast oil spill, if we don't have data and

information, we cannot make informed decisions on how to strategically conserve our natural resources for generations to come. The bird conservation community has monitoring programs in place, some of which have operated for decades some of which have an extensive citizen science component. By expanding and strengthening these existing programs and identifying critical new programs, we can efficiently extend environmental quality monitoring while involving more Americans in conservation.

Our government spends ONE HUNDRED MILLION DOLLARS of our taxpayer money on sodium cyanide and other deadly poisons to kill predators in the wild to protect the cattle industry, a commercial venture. That is over \$60 thousand dollars to kill each "predator." Not only is this fiscally irresponsible, but an inhumane, brutal and extremely cruel way to die. It upsets the balance of nature and overlooks the basic fact that we need predators to restore that balance.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

That money is desperately needed for many wildlife conservation programs based on valid science, not distorted by special interest groups for their own benefit. Biological diversity must be maintained at all costs. For example, our wild horses, who are legally designated wildlife, used to run free in our country, are in crisis, and in danger of disappearing from the landscape forever. Consider that it only costs \$25 plus expenses for one contraceptive shot-PZP-per year per wild mare, and the millions of dollars spent on cruel and unnecessary roundups, plus all the wasted taxpayer dollars used, incarcerating wild horses who are cramped into holding pens, then eliminating this senseless poisoning program would provide more than ample money to care for these priceless mustangs, and programs for all the other wildlife in danger ... there would even be ample money to buy back public lands, where they used to roam freely, and would provide safe sanctuary for our wild horses, who are without question, a national treasure. In addition this highly effective contraceptive program, which can be done on horseback, from multi-terrain vehicles, or from helicopters would provide hundreds of well paying jobs for returning vets or unemployed Americans. The science is there, but PZP has not been effectively used by our government. This must not be overlooked, in favor of wasting taxpayer dollars on cruel roundups and holding pens which solve nothing, and are an irrational and illogical "solution" to a so called problem that was created to accommodate a commercial industry.

My second concern is that this most revered mammal on the American continent, the 33,000 wild horses we have left, are headed for extinction because of mismanagement and because 4.5 million cattle on public lands are given precedence. The BLM, The Department of the Interior, the Forest Service, and persons involved in the Cattle Industry, etc., etc., have failed to protect and preserve wild horse habitat, have decimated their herds, have caused thousands of unnecessary deaths, and have systematically done everything in their power to rid the American landscape of these proud and noble beings. There must be accountability and there must be drastic changes in the leadership in all these government agencies, and anyone in these agencies who are ranchers, who own slaughterhouses, or are in any way involved in the cattle industry, (which is HIGHLY subsidized), and are benefiting from it monetarily, **SHOULD NOT BE ALLOWED IN THOSE AGENCIES BECAUSE OF A CONFLICT OF INTEREST. THEY SHOULD BE REMOVED OR RECUSE THEMSELVES.**

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The government's policy to keep conducting cruel and unnecessary roundups where, horses are terrified and break legs, mares miscarry as they are running, newborn colts die from running their tender hooves literally, and those who survive the frightening roundup are separated from their herd, is an American TRAGEDY. (NO OBSERVERS ARE ALLOWED TO MONITOR OR MAKE REPORTS OR FILM THESE ROUNDUPS. THERE ARE NO STATISTICS AVAILABLE REPORTING HOW MANY HAVE TO BE EUTHANIZED FROM EACH ROUNDUP, AND UNDER WHAT CIRCUMSTANCES, AND WHO DECIDES, AND HOW ARE THEY EUTHANIZED, HUMANELY, OR JUST SHOT TO DEATH IN FRONT OF ALL THE OTHER HORSES?) Observation must be allowed, and there must be access to film the roundups and make reports to the public who have a right to know that crimes against nature are being committed in our name using OUR taxpayer dollars .. (When mares miscarry, as they are terrified and funning, does the Forest Service or the BLM go back and rescue the newborn and reunite it with its' mother or is it just left to die in the dirt? And what about the mare hemorrhaging after such a traumatic birth-does the Forest Service or BLM immediately provide veterinary care?) If the American public could view films of these roundups from beginning to end there would be immediate and enormous public outcry all across this land, and I believe they would end. THERE MUST BE FULL DISCLOSURE. Anything less is a travesty.

In conclusion, our wild horses are in peril, because of reckless, unrestricted government policies which are out of control.. We need to recognize that they are an integral part of our culture. If anything defines the American spirit-it is our wild horses. If they become extinct in our country which is the present agenda, (concealed from the public), it will be considered by most Americans a theft of one of their most precious creatures-the wild horse. Wild horses are a huge resource for green tourism, for hikers, for artists, for cinematographers, wildlife photographers, researchers, and tourists from all over the world. This hasn't been exploited or developed yet and the markets are there.

The efforts of AGO are needed in these landscapes because both are threatened by unprecedented levels of development and fragmentation. More than 80 percent of the 26 million-acre Northern Forest remains unprotected. The Green Mountain National Forest is projected to see increased housing density on 500,000 acres within ten miles of its boundary-an area larger than the entire national forest itself The Connecticut River watershed ranked among the twenty most threatened watersheds nationally in the Forests on the Edge report issued by the U.S. Forest Service in 2005.

There are plenty of taxes collected via vehicle registration fees and other sources which are designated for expanding areas for off road vehicle use which wind up funding other projects. This is most unfair.

My area of the world used to be farmland, forests and fields and is now becoming one big urban sprawl of subdivisions and mini malls. Please do something to stop this so that these actions don't eventually take over our county and national forest areas also. We're running out of green space, so please do something to bring it back.

## Discussion Question 2

***(cont.)***

. The world is getting smaller everyday. We need to save what we can before there isn't any left.

. Our health and sustained livelihoods depend on these spaces. Thank you.

. Don't let our country turn into India or a land of concrete and destruction. Keep America beautiful.

. We don't fully yet understand why we need to keep these things around, but we won't be around to figure out why we did if we don't.

I live in southern Maine and as people buy up land around us it becomes more important that we have access to land owned by the Federal Government and that we continue to support non-profits such as the Kittery Land Trust, Rachel Carson Preserve and make sure town/states continue to care for state parks such as Fort Foster, Fort McClary, etc. Having this land available allows me and my family to walk, take bike rides, talk about nature and GET EXERCISE. We need to make it as easy as possible for all Americans to be able to get out and enjoy the outdoors to stay fit. Among many other factors, not having outdoor space available or not being familiar with what to do outdoors (I hear that is now the case although I grew up climbing trees and spending every afternoon after school playing outdoors) is a leading cause of obesity in our country. And that, we definitely can't afford.

Dear Folks, i thank you for the opportunity to engage in conversation regarding the great outdoors initiative. when i visited the "discussion" site, i was unable to access the discussion portion. i also noticed, that according to the little topic icons on the right margin, the largest voiced opinions on this issue were from folks who want to use offroad vehicles and keep the mountains or other natural areas from being protected. i had the opportunity to visit the listening session held at occidental college in los angeles in the spring. the greatest number of people at that meeting seemed to have a great variety of interests. my prejudice is toward protection of the environment and encouragement of understanding of and participation in nature. as a docent at my local county natural area, i see people hungry for open natural space. on weekends we have people of all stripe, age, income, background come and visit.

CHALLENGE: i see people needing work. i noticed that our san gabriel mountains were badly burned( one third of the angeles national forest was burned. while there is some natural recovery in a burned forest, there is the issue of access, as the national forest in seventy percent of our los angeles county public open space. I read in a website for tree people, how they wanted volunteers to help remediate the forest, using a grant or partnering with boeing corporation. this is all very nice for tree people, but boeing is a military government contractor, which receives taxpayer dollars.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

what federal government can do : same as above to employ folks to rebuild destroyed structures, access roads and or trails, remediation as needed for the forest, challenge: we have limited access to the national forest. we have a transportation system which needs to be available more hours to more people to more places. we have manufacturers out of work what works: let our stimulus package help folks to make buses or trains (running clean?) and train operators to run longer hours here. let appropriate local state and federal agencies partner with local manufacturers to improve public transportation. let same as above agencies partner with local private public interest agencies to help train folks to run improved public transport system to open space.

challenge: need local easily accessed parks along urban corridors of los angeles and san gabriel rivers what the federal government can do: declare the "emerald necklace" to be a special essential area, create a chain of local riverside parks including employment of park groomers/hosts, naturalists/ interpreters, and/or rangers along the river corridors in partnership with appropriate local public and private agencies

i had the great privilege to be present at the listening session for the great outdoors initiative at occidental college this past summer. i would like to submit my feelings and ideas, in the words of others who give good form to some of my thoughts. challenges: San Gabriel Valley and other los angeles county residents have traditionally suffered from limited access to open space as well as high diabetes and obesity rates. Federal support for a San Gabriel Mountains National Recreation Area will expand healthy recreational opportunities for our families along the San Gabriel and Los Angeles Rivers and in the San Gabriel Mountains. How the Federal Government Can Help/Tools: Provide Transit to Trails program to take inner city children on fun, educational and healthy trips to mountains, rivers, beaches and other natural open space throughout the nation for low or at no cost, compared to the benefits. Transit to trails would enrich their education about land, water, wildlife and cultural history and emphasize the importance of physical activity and healthy eating for lifelong health.

challenges: People of color do not enjoy equal access to recreational and natural space resources. i.e., Latinos are 50% of population, but only 11% of visitors to Angeles National Forest. 25% of population are Asian, but Asians are less than 5% of Angeles Forest visitors. African Americans comprise only 1% of National Forest visitors and 0% of wilderness visitors.

challenges: there are not enough toilets, garbage cans, rangers, especially bilingual ones along the heavily-used areas of the san gabriel river (and los angeles river). I would like the Administration to help find solutions, like forming the San Gabriel River National Recreation Area.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

How the federal Government can help/tools: In order to improve access for all the campaign for america's great outdoors can provide green jobs forthrough Civilian Conservation Corps Style jobs for youth of color and low income that would also improve parks, recreation, the . environment. This program could provide work in this time of severe unemployment. challenges: Of the local native ecosystems, Coastal Sage Scrub is one of the most endangered on the planet. There are lands in the San Gabriel Mountains/ Watershed worthy of Wilderness Protection and rivers that deserve the designation "wild and scenic." "Wilderness" is a designation that protects "undeveloped" land from development. Wild and Scenic" designation protects rivers from damming and development. The federal government can help protect the san gabriel mountains and watershed by designating more areas like the San Gabriel and Sheep Mountain Wilderness(es).

challenges: provide more park cultural historical sites that preserve the stories and resources of diverse people for this and future generations. more sites should facilitate an experience that weave the stories of diverse people faithfully, completely and accurately. how the federal government can help: The National Park Service and the Forest Service should provide leadership for protection and interpretation of diverse sites. Park and heritage should stimulate and provide a greater understanding of, and dialogue on, civil rights, democracy, unvarnished history. these are lessons learned form best practice examples like Manzanar National Historic Site.

I am asking you to seize this opportunity to find new ways to support reasonable management of our public lands. I'm not particularly fond of Wilderness or National Parks. Both have too many rules. But finding a balanced approach to manage the land in a sustainable way is definitely a priority. My personal priority is protecting wolves from trophy hunting. There is no reasonable argument for killing wolves. I would support any measure to provide fair compensation to farmers that lose animals to wolf predation, but killing the wolves is not the answer. Another personal priority is keeping federal land open to dogs, preferably off-leash. My dog is part of my family, and it's not reasonable to restrict dogs on public land. Dogs only become problematic when they are cooped up and on leash. Allowing dogs to run free and get plenty of exercise enables them to act appropriately in every situation. (You could probably say the same thing about humans, but...) I also believe that mountain biking & snow kiting have been over-regulated by power zealous federal employees. These activities should be perfectly acceptable in both wilderness areas and national parks. Well, that's my two cents for now. As a very liberal outdoor-loving athlete and dog owner, i beg you to find a balance between the stupid hippies and the stupid hunters. Neither side is rational. There are reasonable solutions to every dispute. Thank you! I think that you are doing an exceptionally good job as President.

Jackson, WY

## Discussion Question 2

***(cont.)***

What is the basis for this family" connection to atv riding? I can understand DINKs riding together. But I can't understand why a mother with an infant would ride a motorcycle which is the most dangerous form of transportation on a per trip basis (Flying is the second most dangerous per trip.) Why would a parent send their inexperienced child out on a motorcycle the most dangerous form of transportation? In these times of unemployment foreclosures and outrageous health care and education expenses how many families can afford multiple atv's uniforms and safety equipment trailers and pickups? Why do we so rarely see women on atv's let alone families? DINK: Double Income No Kids. "

Protect 24 million acres from OHV restrictions

OHV user HAVE HAD ACCESS TO THE PARKS AND SHOULD CONTINUE TO!

The United States already has enough restricted wilderness. We need a new classification for the lands we want to preserve so we can use the lands to their fullest potential. We need to be able to log, and mine, the forest to get more jobs without the ECO TERR. suing the gov. every time they turn around, that would allow for more roads for OHV use, and bring in more revenue for the gov. and which will lower taxes for the rest of us.

The national forests are already used for mining, drilling, and logging, that's part of the problem. Some of this is ok. I think we have surpassed the amount of development that should be allowed in our forests.

Here are some facts and figures. There are enough roads in our national forests to go around the Earth 17 times. There are approximately 60,000 miles of illegal roads. 50% of our national forests are open to logging, mining, and drilling. These activities are fine, do we really want them in every area. Should some things be preserved for the good of people and animals. These are areas that provide clean water, air and recreation. Don't forget, development is also allowed in almost every other area outside of national forests. Do you have facts to support the continued destruction of our remaining wild areas or is the pursuit of the all mighty dollar your only argument? You would think after a long history of environmental dilapidation that we would learn a lesson.

I have been offroading for over 50 years. I raised my family (2 girls, 2 boys) on motorcycles riding in the mountains, desert, and MX tracks. My family and I love the outdoors. We enjoy it by camping, hiking, mountain biking, motocross, and off-roading. The kids have turned out to enjoy the outdoors as much as I do. I believe that most responsible people enjoy and care for our great outdoor areas. As with most things, it only takes a few misfits to completely mess up the opportunities of others. Too bad we (the people) can't get honest people in our government to run this country, as it was meant to be run, by the people!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

This is a LOCAL issue. Is it at all appropriate for this site? If you think getting national attention is going to HELP your cause, caveat emptor, somebody a thousand miles from you WILL impose rules that make no sense and you will lose big time. The western forests are a complete disaster because the east and west coast enviro wackos think they know what is best for everybody, regardless if they have ever been to your area, or ever intend to.

How much land do these roads actually cover in our forests? The manipulation of numbers goes both ways. In terms of acreage, roads cover 0.5% of the national forests. Your numbers seem to suggest that we have built freeways through the forests and they are being raped and pillaged. How is that possible if only 0.5% of the land is actually covered by roads? You continually ignore the simple fact that while 50% of forest lands are ELIGIBLE for logging, mining, and drilling, only a small fraction of a percent, again, is actually used as you suggest. There are over 100 million acres of land in the Wilderness program today, enough land to cover the entire state of California. Isn't it rather ignorant to suggest we haven't set aside enough land yet? You also need to factor in National Parks and the 99% of USFS and BLM lands that are being preserved already. At some point the scale tips and all of the land you want for no uses becomes a serious burden. A long history of environmental dilapidation" What flavor of Kool-Aid are they serving these days?"

A road impacts a large area. I agree that access is important. Roadless areas are also important. They are excellent habitat for big game animals and provide some of the cleanest rivers and lakes for fish. They also provide clean water and air for people. Not to mention recreation. These areas benefit people and animals. Do we really need to drill in every valley. You obviously want more development in our national forests, I think there should be less. I have always believed these areas should be for the preservation of wildlife and wild land, not more areas for development. What is no uses". The only thing not allowed in wilderness is motorized vehicles. How does that make it no uses. What has become a burden is the large cost of maintaining the enormous amount of roads in national forests. People saw years ago that areas were worth preserving. These areas have become some of our most treasured assets. I like when confronted with the facts some want to call it manipulation of the numbers. Facts are facts. If 2% of the lower 48 states is a lot to keep out of the hands of developers to you \_\_\_ maybe you should stay away from the Kool-Aid. "

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I wonder if you have any original thoughts anymore? Your response reads exactly like all of your responses here. "A road impacts a large area" What exactly does that mean? What facts do you have to substantiate that claim? Certainly the Environmental Impact Studies done by the USFS and BLM land managers do not support that contention in any way. I NEVER said I wanted more development. What I see is some development on BLM lands. I do not see oil rigs on USFS land and I see a lot more USFS land than the vast majority of people on a daily basis. You have been fed a lie and the lie is there is some big push to destroy forests and wildlife. "No Uses" pretty self explanatory isn't it? The ONLY thing you can do with a Wilderness designation is walk in/out or ride a horse in/out. Please put some numbers to your claim of this large cost and burden to maintain roads. You do understand that the bulk of the roads serve a purpose such as fire mitigation and access to water sources. These roads are rather necessary don't you think? In my area the roads used for OHV's have been adopted by the counties and are maintained by the counties and volunteer trail groups. There is NO COST TO YOU for this. 2% refers to the total landmass of the United States hardly a relevant starting point. That claim lacks credibility because 100% of the land is not suitable or eligible for protection. It would be more relevant and HONEST to start with USFS lands in which case we are closing in on HALF of that land being off limits to anyone but hikers and horseback riders. That sure seems excessive to me."

My responses read the same because the same issues keep coming back. A road impacts a large area means more and more development in the area once a road is constructed. If there is so little development in our national forests and 50% are available for this purpose, I don't see why you have any issue at all. There should be plenty of area available, according to your own contention. Your facts are wrong on wilderness. Besides motorized/mechanical vehicles, almost the same things are allowed. One of my first comments was access is important. If you were unaware of the large cost to the government on road maintenance to the huge amount of roads in national forests, sorry to break the news to you. Here is a fact you are totally wrong on. 20% of USFS land is designated wilderness. I don't know how you came up with 50%. So let's be relevant and HONEST.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

I'll parse this to answer your questions... My responses read the same because the same issues keep coming back. A road impacts a large area means more and more development in the area once a road is constructed. " That simply is not true. Just because there is a road does not mean there is more development. The vast majority of these roads in the forest have absolutely no development around them. As I mentioned many of the roads are there for fire mitigation and water source access with recreation being yet another use for the road. In none of those cases does additional development occur. What facts are you basing this claim on? "If there is so little development in our national forests and 50% are available for this purpose I don't see why you have any issue at all. There should be plenty of area available according to your own contention." Right now there is plenty of land available for all uses. What I do not want to see are further unnecessary closures. I believe I have been quite clear and consistent on that point. I have an issue with those who think we need more land closed to all uses except hiking and horseback riding again I think I clearly stated this. "Your facts are wrong on wilderness. Besides motorized/mechanical vehicles almost the same things are allowed." That is a huge ALMOST THE SAME. In fact many things are not allowed inside Wilderness designations. Now land managers must hike in to maintain trails this adds great expense to the care of these areas more than it costs to maintain OHV roads for sure. Fighting fires via mechanized equipment is banned as well. To say that eliminating OHV use is just a small component is simply an ignorant statement. Millions of taxpaying US citizens are banned from using their OHV's on PUBLIC land. This is no small issue as you should be able to glean for the subject matter on this site. "One of my first comments was access is important. If you were unaware of the large cost to the government on road maintenance to the huge amount of roads in national forests sorry to break the news to you." What exactly does it cost Steven no free pass on this. You and a few others use this as a point of contention all the time. The numbers should be published since it is a govt agency and public land. How much do we spend to maintain the roads you claim are so expensive? You completely ignored my comment on the county's controlling hundreds of miles of roads in the forest and funding their maintenance at the behest of the local citizenry. "Here is a fact you are totally wrong on. 20% of USFS land is designated wilderness. I don't know how you came up with 50%. So let's be relevant and HONEST." We both missed it the number is 33% of USFS land. What that does not account for however is the land not in Wilderness but closed to motorized vehicles. There are not good stats on that number but from looking at my forest maps there is easily 50% of USFS land closed to motorized vehicles which is the same net effect. So you think access is important one hand but support 50% or more of USFS lands being closed to motorized users. I'm not sure how that stance lends you any credibility."

You just can't stay on topic can you? The OHV vs hikers fight is not present in this idea, take that fight elsewhere. This comment from \_\_\_ is patently ABSURD Man has enough area to play on while wildlife has very little left to survive on." Maybe in your urban neighborhood this is true but it is nothing short of a lie when you consider the vast open lands east of the Mississippi and west of California. We have so much wildlife I am sure we would be happy to ship you some. Please get to work immediately renovating your back yard."

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You ask me to bring facts when you bring no facts. Once a road is constructed, logging, mining and drilling seem to follow. Not to mention houses or cabins. These activities are fine, we should have area without them, also. Here is one of your statements about wilderness "Fighting fires via mechanized equipment is banned as well." Is this based on a fact. From what I read you are 100% wrong. As OHV use increases and the population grows more regulation is inevitable. How are citizens banned from using their OHVs on public land. Just because you can't ride on every bit of public land? Part of the problem is some view wilderness as only for hikers and horseback riding. I don't do either of these and I am still an advocate of wilderness. Some areas in my view are more important than what recreation we are able to carry out. Wild beauty is a deeply held American value. From what I have read the deferred maintenance on USFS roads is \$8.4 billion. Do you have facts to refute this? Or do you get a pass on that? If some roads are maintained by local citizens that's fine. I think that is an important piece to having access. Remember I said access is important. According to the USFS website 20% of USFS land is designated wilderness. How are you getting to 33%? Again you ask me to take my time to find facts for you when you make statements with no or misleading facts. Yes I think access is important. I also think some areas should be left roadless. If that makes me less credible to you then so be it. How credible are you when so many points you bring up are so easily proven wrong."

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

OK so when a road is built in the forest, the best you can do is to state that development seems" to follow. So that tells me you have no way to verify this claim you just "feel" it is so. I would LOVE to see you drive a firetruck in to a Wilderness designation. It is going to be pretty tricky though since these areas are roadless. Citizens are banned from operating ohv's in wilderness areas what kind of semantics are you going to try next to say this is not keeping taxpayers out of the forest. Only a precious few are able to hike these areas. Let's continue to feed the elitists that plan ought to work out just swell as long as you are one of them. The most recent report regarding budget proposals for the USFS claim \$3 billion in deferred maint. The total budget for construction and maint is about \$500 million. The deferred catagory is a bit of a joke. This is nothing more than a ploy by politicians to fleece the public for more money. I would think you of all people would support deferred maint because the ultimate result of that is fewer roads in the forest. So YES I have facts to refute that. If we are going to discuss areas closed to motorized recreation the numbers get fuzzy fast. You are correct I was wrong 20% of USFS land. However that does not include USFS lands otherwise closed to motorized recreation which should be added to the Wilderness designations as the result is the same closed to motorized users. You would also have to start factoring in BLM Park Service Fish and Wildlife all who manage public lands including Wilderness designations and motorized closures. In the end you have 756 Wilderness designations totalling at least 109 million acres of PUBLIC land. That is larger than the state of California or the entire country of Iraq. The point is when will it be enough? That is a tremendous amount of land open exclusively to hikers. I guess we come to an impass because you consider no use of the land a good alternative. I want to know what you are saving the land for? Who is enjoying the land God created for us the elite few? I think that is wrong you think it is a good thing I think your stance is absurd. Use of lands does NOT equate to destruction of lands or wildlife that is a seriously flawed premis Steven. 590000 acres of public lands managed by the USFS are roadless again at what point is it enough for you? I have also been able to prove most of your points incorrect. Depends on how you want to spin it. How many times have you tried to argue that only 2% of the US landmass is Wilderness and how incredibly irrelevant is that point Steven. I want to know how much more you think should be closed to motorized use? When will it be enough for you? Do you intend to continue advocating more and more closesures to responsible tax paying forest users based on your opinion of what is a good use and what is not? Please stop trying to impose your flawed veiws on the rest of us. Yours lie in a seriously small minority. Expect to see the pendulum swing back coming to a forest near you soon."

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Here is a good example of how a road brings more development. Since I seem to be the only one who needs to have any facts to substantiate my comments. The road to the north slope of Alaska was built to service the pipeline. Now they want to expand oil development to a wildlife refuge. That's more development and is an example that is one very evident to anyone. How does wilderness only benefit the elitists? I would say it's just the opposite. Wilderness benefits people and wildlife. A lot of other areas that allow more development allow rich elitists to gain huge profits from development while the common people gain nothing. Your facts to refute the high cost of road maintenance in national forests seem to prove my point that road maintenance has a high cost. I am for fewer roads in national forests. The latest thing I read says there will be less roads because of the cost. 50% of wilderness designation is in Alaska. That means an area the size of Wisconsin is the amount of wilderness in the lower 48. Remember, let's be relevant and HONEST. Who uses wilderness? Hunters, fishermen, campers. Your favorite, hikers and horseback riders. Anyone else who enjoys clean water and air. God created this land for everyone and wildlife. Not just OHV users. I think your stance is absurd. We should bring our development to every corner of our country. I say we have enough areas to develop. As we expand more and more, some needs to be set aside. How exactly did you prove my point wrong? 2% of the lower 48 is the amount of wilderness designation we have. Facts are facts. I stand by that number. Because you don't like the fact does not mean they are not facts. There is no spin on that number. It is what it is. One thing I learned using this site is there are a good number of people who feel the same as I do. I'm not sure who is in the minority. I am not one who wants to close OHVs out of the forest. I have also said access is important. I think there should be plenty room for activities like OHVs. You don't really know what I do in my spare time. I do support leaving areas that are currently roadless without new roads. I also support wilderness. These are important. Because my views are not the same as yours does not mean mine are flawed. You shouldn't impose your views on the rest of us, either. Do you intend to continue advocating more and more roads, impacting responsible taxpaying forest users, based on your opinion of what is a good use and what is not. Just keep in mind there are people like me who believe in my views just as much as you believe in yours.

I am in support of responsible reasonable ORV access. We already have millions of acres of land in the US that is designated Wilderness and is there for those who want solitude. There is no reason to further restrict millions more acres of land as Wilderness and further restrict access to only foot traffic. What is the percentage of hikers who access our public lands compared to the other users? I don't know the percentage, but would think it's less than 15% of the total population. So is it fair to deny everyone else access? I am an avid hiker, mountain bike rider, and a dirt bike rider. I consider myself a conservationist and think our public lands should be used, but not abused. I have encountered hikers, mt. bike riders and horseback riders on trails designated for dirt bikes and everyone gets along well and shares. There is no reason that similar users cannot share some trails. This is not to say that everything should be open to motorized access and as previously stated, we have millions of acres of land designated as Wilderness and National Parks that is off limits, as it should be. Please think of others, not just yourself. Have respect for our land and its local inhabitants and other people you encounter. The beauty and joy that our public lands offer should be accessible to all of us to enjoy in our own way.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

How about posting this Idea: Non-OHV and OHV groups work together to identify and cultivate positive relationships" I organized the most successful beach "Coastal Cleanup Day" site in my county for three years straight--staffed almost 100% by OHV volunteers. Coastal Cleanup Day is a big environmentalist thing so how come off-road volunteers are #1 here for three years in a row? Because OHV groups are pro-environment that's why!"

I'm gonna jump in here for a quick comment- I think a lot of motorized users are a bit extreme" sometimes after seeing so much land closed so quickly (it IS happening and is pretty tough to absorb here in the west). I respect the opinion of others but at the same time if that opinion is based upon ignorance well that should be noted. For instance you may be right that the lower 48 has 2% of total land protected as wilderness but I would bet that 2% only includes directly designated wilderness and national parks which would not be truly fair - many other forms of de-facto wilderness have been created by multiple agencies: wilderness study areas areas of critical habitat etc which are for the most part withdrawn for OHV recreation. One frustrating part of these de-facto designations is that in many cases OHV recreation has been taking place for many years and the agencies own EIS show little or no long term damage (talking motorcycle singletrack trails here especially in Colorado and UT) So when you add these other (de-facto) areas up then you compare it against a truly valid measuring point - such as available public lands that number is MUCH larger than 2% (don't want to speculate too much but at least 20 times that). In my own area we have approx. 225000 acres of national forest and 8 miles of legal singletrack for dirt bikes. We used to have probably 250 miles plus most of which were designated mountain bike only in the last two decades; the rest were closed. There are two wilderness areas multiple areas of critical habitat a watershed that is totally closed to people... In my area I'd guess 10% of total land is designated as wilderness but the total land closed to OHV use is likely more like 90-95%. Ninety five percent for no valid reason (as shown in the FS' own EIS) is a tough pill to swallow and begins to feel an awful lot like the "King's Land" as my buddy calls it. I'll give you a final point to ponder: America's Red Rock's Wilderness Act would designate 44% of the total land area of Emery County UT as wilderness; area that was settled grazed for 100 years before OHV travel began taking place; an area that used to have hundreds of miles of trails and now has about 100; an area who's economy is based upon OHV use. The proposal was made by a New Yorker not a Utahan with no local input at all. We loose so many trails so many areas and it's easy to over-generalize and perhaps exaggerate a bit.."

Let's not forget about Americas STATE Parks. State Parks hold more lands and historical resources in trust and are visited by more guests than the National Park System. To check out the latest from YOUR State Park, click on the following link to see one of the many ways State Parks are actively seeking youth participation. { <a href=http://americasstateparks.org/youth\_ambassador\_application.html" rel="nofollow" target="\_blank">Link</a> } "

We have oil spills nearly every day, many are small and most never make the news but they still kill wildlife, destroy habitat and entire ecosystems and that is the truth. Sadly I have come to expect this type of ignorance from uneducated or uncaring (or both) people like you but do your really want your stupidity in print for all to read?

## Discussion Question 2

***(cont.)***

Why do you feel the need to justify your use of public lands, the public lands belong to everybody they dont belong to special interest groups. Our mid term elections speke volumes on how the average American feels about the people that manage public lands and public business, cant wait for the next election so we can continue to make a change" in the right direction. Its sad so many think the tax payers work for them we dont they work for us it wont be long and these people and their special interest groups will be purged from the system and the PUBLIC will regain its access to PUBLIC LANDS."

At the core of this issue is that most of the current forest road system was not developed for recreation but for timber. Roads are in the wrong places, don't have the pull-offs needed -- and are way beyond the capabilities of the Forest Service to maintain. As a result, we face safety, access and environmental problems. The agency is dong a good job of addressing the challenges, but we -- forest recreation advocates -- need to demand that the Congress address the cost side of the issue. Many of the roads critical to forest recreation site access are NOT aided by funds from federal motorfuel taxes. And they should be.

I also respect the opinion of others and agree that if an opinion is based on ignorance, it should be noted. I have said there should be plenty of room for OHVs. My conversation was to also show the importance of wilderness. One thing that is a fact is the more OHVs there are, the more regulation there will be. I agree that years ago, before the activity was so popular, there probably were more places to ride. I don't want to speculate too much either, but my estimation is in my area 95% of the public land is open to OHVs. We had an area the DNR wanted to preserve the wild character of. Some things they did was closed some roads (there was an over abundance) and restricted OHV use. The area still has a wild character and it has been years that we have been visiting the area to camp and hunt. This area will hopefully remain intact for generations to come. Also, as a side note, we rode three wheelers in the area when these restrictions came about. I'm not for or against the Red Rock Wilderness Act, but it was originally proposed by a Utah representative, who asked others to continue his work after he left. I know that and I'm not from Utah or New York. So I also agree with your statement that it is easy to over-generalize and exaggerate a bit for some.

Here is a great example of what I been talking about go here and look at the pictures { <a href="http://www.suwa.org/site/PhotoAlbumUser?view=UserPhotoDetail&PhotoID=14678&position=2&AlbumID=5821" rel="nofollow" target="\_blank">Link</a> } Complaining about the tracks now look at the whole picture see those rocks and bluffs in the background they are products of hundreds of millions of years of erosion now these people are complaining about a OHV accelerating that erosion by maybe 100 years? And if a OHV never had been on that same lands how could you tell? And if the land erodes away whats the problem? If the erosion is a problem whats being done to prevent it in areas closed by OHV's. See what happens when some dope smoking hippy perceives their is a problem. { <a href="http://www.suwa.org/images/content/photos/large\_13909.jpg" rel="nofollow" target="\_blank">Link</a> } Look at that picture tracks in the sand now look and think about the BIG picture where did the sand come from? The sand that you see the tracks is a product of MILLIONS of erosion of the sand stone and the tracks are hurting? Notice the text "ORV damage " then no explanation of the "damage" typical left wing scare tacit sad so many fall for this brainwashing { <a href="http://www.suwa.org/site/PhotoAlbumUser?view=UserPhotoDetail&PhotoID=14677&position=4&AlbumID=5821" rel="nofollow" target="\_blank">Link</a> } Look at that picture complaining about tracks look at the damage to the mountain in the back ground whats being done to stop it from eroding away why in another 500 million or so years it will be completely worn away. { <a href="http://www.suwa.org/site/PhotoAlbumUser?view=UserPhotoDetail&PhotoID=23098&position=6&AlbumID=5821" rel="nofollow" target="\_blank">Link</a> } Yeah and? whats your point I have hundreds of pictures of OHV's making a water crossing like how to imply the guy on the motor cycle is doing something wrong how do we know that water crossing was made on public lands? "A new breed of ORVs can even climb near-vertical walls" Yeah so the problem is your anti social and want the rest of the world to be anti social too or you have other uses for those rocks what were you doing with those rocks before the ORV tried to climb them is their a shortage of rocks I dont know about is the rocks going to go extinct? { <a href="http://www.suwa.org/site/PhotoAlbumUser?view=UserPhotoDetail&PhotoID=14671&position=7&AlbumID=5821" rel="nofollow" target="\_blank">Link</a> } And the problem is? In this next photo I see billions of years or mother nature eroding away sand stone by not allowing ORV's to drive through it will preserve that eroded mess another 50 years? Come back in 1000 years I bet you wont be able to tell the difference. { <a href="http://www.suwa.org/site/PhotoAlbumUser?view=UserPhotoDetail&PhotoID=14674&position=8&AlbumID=5821" rel="nofollow" target="\_blank">Link</a> } Here is a classic at its best "An eroded streambank in Tenmile Canyon." hey STUPID you know what created the "stream" erosion created it go back and look at that same area after a real big rain that implied damage you took a picture of will be gone and if its not gone the problem is? 50 more lbs of dirt in a stream that has millions of tons of dirt already in it? Or let me guess muddy water just like after each natural rain. { <a href="http://www.suwa.org/site/PhotoAlbumUser?view=UserPhotoDetail&PhotoID=23100&position=9&AlbumID=5821" rel="nofollow" target="\_blank">Link</a> } Whats the problem here read the anti social comment below the picture { <a

[Link](http://www.suwa.org/site/PhotoAlbumUser?view=UserPhotoDetail&PhotoID=23099&position=10&AlbumID=5821) } Another classic look at those black tire marks those tire marks have me puking blood just worrying about them every day of my life before the tire marks you were using that section of the rock that is probably 20feet wide and 15 feet long for what? Now their is black tire marks on that 300 square feet of rock in a park that has billions of square feet of rock the real problem is your anti social and just cant stand to see Americans using public property. { <a href="http://www.suwa.org/site/PhotoAlbumUser?view=UserPhotoDetail&PhotoID=14669&position=11&AlbumID=5821" rel="nofollow" target="\_blank">Link } This problem they complain about lasted what 8 hrs in one day of the 15 billion year history of the earth haha guy has taken too many hits off his bong again another example of anti social behavior. { <a href="http://www.suwa.org/site/PhotoAlbumUser?view=UserPhotoDetail&PhotoID=14668&position=12&AlbumID=5821" rel="nofollow" target="\_blank">Link } Look at this guy driving up the canyon that was created by erosion { <a href="http://www.suwa.org/site/PhotoAlbumUser?view=UserPhotoDetail&PhotoID=14683&position=14&AlbumID=5821" rel="nofollow" target="\_blank">Link } I could go on for days giving examples but I think you get the idea of the stupid that is happening with the LEFT wing environmentalist. "

Civil war battlefields are a link to our past. They should be saved at all costs!

It was Ronald Reagan who said the federal government has a duty to protect our natural resources from damage due to industrial development. Stop the OHV industry from destroying All the American Wilderness.

I am afraid that your reply displays quite a bit of ignorance. I live just a couple hours away from where those photos were taken, I have spent a lot of time in that area. One rainstorm, or one windstorm, both of which are common, erases those tracks leaving no trace. Mother nature is much more resilient than you give her credit for. The suggestion that OHV's making stream crossings is the cause for a decline in fish populations is completely unsubstantiated. All of the photos were taken in designated OHV areas as well, there is no destruction in any of those photos. Very few OHV users have an urge to destroy, what a ridiculous fallacy you put forth. Why would you tell such lies?

As an older rockhound, I would like to see Restrictive Speed Limitations placed on all new and used OHV that have a gross weight of under 3,500 lbs. If a quad, ATV or dirt bike can't travel faster than 25 mph the outlaws riders" would decrease in number and be easier for Law Enforcement to catch. Also the fines for off trail use of OHV on public lands should be very impressive in size or OHV seizure."

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

OHV Landscape disfiguration" The land looks disfigured before OHV's You could listen to \_\_\_ who seems to have first hand knowledge of this area but I strongly suggest you personally go investigate this for yourself see that is the problem and the whole point of my posting links to those pictures all you bleeding heart left wing dope smoking hippys will buy anything thats negative about OHVs without thought blindly follow stupid down the losing path for your type its probably a good thing when they lock up wilderness areas you would probably kill yourself trying to enjoy it.. Hows that omnibus public lands bill doing looks like nobody is buying that load of BS either cant wait for the NEXT election then we will see some real "change" GOD bless Merry Christmas. "

The death of the omnibus is a HUGE victory for opponents of new Wilderness designations. They tried to revive it yesterday but thankfully they all went home where they can do less harm to our country. It will be years before the liberal special interest has the numbers to submit land grabs of that size again. One small victory for common sense land use policy.

U.S. Senate Majority Leader Harry Reid (D-Nev.) has dropped his effort to pass a massive omnibus public lands bill that would have restricted responsible off-highway vehicle (OHV) access to thousands of acres of public land. Cant wait for the next election so we can have some real change maybe appoint several hundred OHV czars to run the national parks that czar crapola the current admin has pulled could be used in our favor.

Keep all OHVs on trails and roads. Stop the ecological disaster. Biological soil crusts (BSC) in desert areas are easily destroyed by compressional disturbances. Soil Compaction due to recreational activities such as off-trail OHV use. Keep all OHVs on trails and roads. Do No Harm. OHV causes the Destruction of scenic beauty, Destruction of animal habit, Soil erosion, drainage disruption and dust creation, Soil Compaction causes the inhibiting of native plant growth and is a disturbance to local wild animals. Keep all OHVs on trails and roads. Save the environment you came to enjoy.

Great idea, this should be imposed on hiking trails as well. Evidence of hikers cutting switchbacks would result in closing the trail. Oh way, not so practical after all..

In many cases wildfires have devastated our overgrown public lands I have not studied this, but I would think mother nature could take care of herself. She's been at it a fairly long time. &gt;&gt; Private property owners ... are better stewards Private lands in small quantities (relatively) to live and for some uses is very useful, but I don't think that is what is being talked about here. At a large scale, selling proportional to dollars rather than to bodies could very well be unconstitutional and very inequitable to future generations (especially if the parents were not very wealthy). Private lands sold to the highest bidder would have the obvious problems of rule of law being set by very few human beings -- maybe by only one -- from the hundreds of millions of Americans. There is a clear misrepresentation of interests of the public. Each person would not get land on a per capita basis despite all of us being equal citizen and human being partners/co-owners. Such sales would almost surely be at micropennies on the dollar of its worth to the entirety of the US population.

## Discussion Question 2

***(cont.)***

Landscape wide planning for public lands helps reduce some of the threat described by tragedy of the commons". This becomes more significant for areas near large human populations."

Those who want to privatize, raise your hands if you agree that it should be split evenly on a per capita basis and taking into account all the humans that will live in the US over the centuries? Since when does having more money make you deserve having significant exclusive rights to any more of the land beyond your own modest space for living? If we partition all the land so each person gets some and we reserve for future generations, then those that want to traverse or use for extended periods anything beyond their fair share allotment can pay a small rent to all who own such a lot. In practice, to promote general well-being and order, a large chunk will always have to be available to significant public use. A right to access land is greater than a right to buy, trade, and amass private-access land. That is, a right to life is greater than a right to exclusive-use property. At least the essence of this view is stapled across the Declaration of Independence, our Constitution, the basis of many major religions, etc.

I'm a Disabled American Veteran and the only way I can see a lot of the terrain and scenery in our great country is via an OHV. Ban or no ban, outlaws will destroy the scenery whereas the ban will simply keep law abiding citizens from enjoying America's beautiful scenery. Not all of us who ride are rude and we don't much care for the rude one's either.

Now a tax on your health insurance so you can pay for the people that work at places like walmart that has no health insurance. Its sad when you take land you got for free, the land is paid for, open it up into a park and still lose money, they need to privatize these public parks and let them be run like a business so they are profitable then start giving tax cuts to the tax payers. \$4 billion a day the U.S. government must pay merely on the interest charges for the debt. â€œFour billion dollars a day then you have some bleeding heart wanting to make the government bigger and spend even more money. Just think what good you could have done spending 4 billion dollars a day on anything but interest payments to a communist country. These pro tax advocates need to wake up.

Please share with us the details of this damage" your telling us about also please in great detail tell us the facts you have about how dangerous they are. We need to verify this "damage" right now it just reads like emotions gone wild. I am glad your worried about OHVs being injured what are your feelings about the 49000 + Americans including children that are killed in automobile accidents each year? Thanks"

The whole planet earth is one big ball of erosion can you please show me this erosion thing your having a issue with. OHV foot print on planet earth is not even measurable yet for some reason its a issue, well then lets see it.

## Discussion Question 2

***(cont.)***

No doubt you have facts and proof to back up your claims in this Idea" I tried researching this and could not find the info that supports your wild claims you have made. If you please can you provide the details so I can continue my research. Not sure how people can promote a "Idea" based on what appears at this point to be fiction I have to admit it reads well and might be plausible but I am not easily fooled I need to see documentation that backs up the statement made here. Details please. 1. damage to water quality 2.damage to wildlife habitat 3.damage to conflicting uses like dispersed recreation and restoration 4.where the roads were costing way more that the trees would ever be worth. 5.Miners pay almost nothing for mining claims and never clean up their messes. Were all on the edges of our seats here. "

these vehicles do a heckuva lot of damage" Please show us this damage you claim I also want to see the extent of the damage others claim wildlife is causing. "

A sheriffs office is investigating if some of the actions in the Bureau of Land Management's wild horse roundup are animal abuse. { <a href=http://www.mynews4.com/story.php?id=37409&amp;n=122" rel="nofollow" target="\_blank">Link</a> } Someone on a OHV drives by a wild horse and its considered harassment. Another failed government program at its best making the same mistakes over and over and over wasting more tax payers money again and again and again. Lets ask them to do more for us were too dumb to make decisions ourselves we need someone in Washington to run it for us. I am no expert but I think you could simply build a corral where they feed and water one that has many gates once a month drop some food in the middle of the corral (chum them up) get them use to eating meeting their when the population gets too high then dump a bunch of food then close the gates. I know my idea cuts out the good ole boy network with the helicopter charging the tax payer millions of dollars to round them up but thats just too bad. "
