## Discussion Question 2

*Challenges: What obstacles exist to achieving your goals for conservation, recreation, or reconnecting people to the outdoors?*

### **Albuquerque, NM**

She is convinced that one of the reasons for the crime is the nature gap in children. They have no fundamental underline joy for the earth that they live on. They do not have enough community centers for children. If you are going to convince the kids to go outdoors you need to make the experience pleasant.

Great Animals and he would like Secretary Salazar put more protection of them.

Cultural Resources. These resources are part of the landscape and anything that affects the land affects those resources. They are fragile and non-removable. There is a lack of appropriate scales where the state and federal government is involved. There is no plan and so one of things that need to be in place is conservation plans at the regional level. He was involved in putting together the Sonorian Dessert Conservatin plan and should be considered as a model.

She feels the biggest challenge is bringing people to the outdoors. Teachers are isolated in their classrooms so they are not connected to the outdoors either. They have parents that don't care.

She formed her own coalition. There are 6 members who are very committed to the community and the land. They have a relationship with Cochiti and Santo Domingo. They are not waiting for anyone and are doing what they want. She wants the Federal Government to have a vision for the 21st century that increases public lands and have an agreement with private land owners. Northern NM wants the toxic chemicals ceased and from getting into the waterways. She would also like to see a continental conservation protection plan.

Collaborative effort help to keep them moving. Teach them young and recruit locally. If you plant the seeds in youth there is ownership. Give the youth jobs and training so they can go to college and get educated in the environment and have the opportunities. Federal Government is not marketing these tools.

Challenges is communication. Many agencies overlook pueblos and tribal government. Anything tht deals with water and lands, they want to know about it. They worry about what is happening upstream. Conservation thought is already developed. There is a tremendous need for development and technology. He remembers farming with horses. What works for them in the pueblo community is to allow them to have the steering and guidance in projects. They have the conservation but there is the problem of dollars. Under the Federal Government is agreements. Tools and resources are themselves to make the earth better.

The federal government role would be to amend Bill 2747 so that tribes are eligible. He would also like to see the 1872 mining law reformed.

## Discussion Question 2

### *Albuquerque, NM*

*(cont.)*

There are lots of opportunities to be outdoors. The outdoors is free. Make more opportunities for free outdoor activities. Because of all the fees that exist it makes it difficult for families that can't afford it.

He has done a lot of programs with the federal and state agencies and people are very generous with their time but it is very hard to sustain that as a teacher. He feels that there needs to be a youth involvement plan. Things are not going to happen without a plan,. It's a hit and miss. Since the federal leads now want to do something, how about a plan.

BLM was told no more wilderness policy. That is the worst given about public lands to greedy corporations. Use it as the great outdoors and not as a market for greedy corporations.

She is involved with trying to preserve a wetland. They need to work more with federal and state laws and jurisdictions. There needs to be more coordination with agencies on preservation efforts.

His group formed a non-profit to accept monies. The BLM was designated as a lead and he doesn't feel that they would have been funded if the BLM staff wasn't involved. One of the things they do is hire youth to do watershed restoration. You have to work with your neighbors and designate an agency to get the staffing.

She has a problem with drunks when she takes her boy scout troops out and has had to pack them up and leave.

He brought a group of students from Gallup to the Youth Session and he works with youth conservation corps, planting trees, making trails and restoring tributaries. What they need the most is an agreement from the Federal Government to create and sustain conservation jobs. What ever happened to the agriculture workforce? Why isn't there more agriculture education in schools instead of welding? There is too much screen time in the schools and homes.

More marketing. No one is marketing these sort of jobs. They don't promote to these groups the opportunities that are out there so they have failed in that. They need to cross the threshold on how they can set monies aside if there are grants in their own federal organizations and how you can commit to these groups.

One of the biggest problems is that the motivation and encouragement for youth to be outdoors is not there especially with a society where there is more emphasis on image. Need to start encouraging in schools cause they are students and spend 90% of their time in school and the community should get the image out there. They should get more emphasis from the community and schools. She would recommend to the Secretary of Education that there should be more community gardens and outdoor classrooms in schools. Making sure how important it is and making it part of the curriculum. Kids do not see the importance. Having student mentors is another aspect.

Unplug from the indoors, Ipods, computers etc. and do something outdoors.

## Discussion Question 2

### *Albuquerque, NM*

*(cont.)*

Indoor distraction is an influence

NM is now his home. Has been working with the youth of NM and one of. Meaning of nature and holding it true and invest in the regions. Live in different worlds but how do you get them together. Whole week and bring youth together

Accessibility is big problem. Some kind of transportation would encourage people to get outdoors more.

Trash makes you fall behind. You need to try to get rid of it.

Access to recycling bins is a another big issue because a lot of people would like to recycle but don't know how to take it

Is a member of several clubs and they try to get other students involved and try to do different events but hard to get students involved because it requires money

Biggest issue is gangs and graffiti on the west side where he lives. Kids are afraid to go out.

Not doing a good job of marketing the outdoors. Many wonderful programs available but do not put monies aside this year for next year. There are non-profits that they can go to.

Rio Grande Schools gets the most rap in the state and because of this the school gets small profits.

She feels what we are dealing with in the big picture is a lack of perceived value of being outside. It is no longer considered a priority to get kids outside. Media can help curb that and we need role models. Perceived risk is huge problem. Making outdoors safe for everyone is really important

Biggest problem is money because they employ 30 students and pay them minimum wage. Money comes out of their school budget

Trash. It is dumped on the roads. It is not only cans. It is old cars, sofa's etc. If there was a way to get rid of trash they would get outdoors more often.

Scholarships and Money. Try to focus on the youth. The younger kids look up to someone who works outside. Use that as an incentive. If they see someone outdoors they will want to work alongside of them.

## Discussion Question 2

### ***Albuquerque, NM***

***(cont.)***

One of the biggest issues in the Gila Wilderness where he works is the fact that the trails, the corridor and the access to trails is deplorable. The budget for fires is huge and trail budgets are small. The signage on trails does not exist. He spends countless hours flagging out trails to find some sign of a trail. He sometimes literally searches on the ground looking for any sign of tread.

Lack of older mentors, supporting role models, education, more service learning based curriculum. It is all connected with taking care of the earth. It should be done through after school programs. Funding stream and supporting the budgets that are crippled. Sustainability of funding for programs that are educational in nature.

Access speaking from the urban setting like the Alb. metro area, urban youth have challenges and barriers even getting into nature. He thinks more organizations can be supported. He thinks connecting it with education through curriculum is important. Supporting conservation efforts through student employment. Working on Organic Community gardens. Catchment and conservation. Getting youth to tend a garden is good. Pollution is huge and that can be combined with education too and how can you protect the land for future generations

Thank you for coming to Albuquerque for a meeting to talk about "Wild Lands". I want to save our wild lands in New Mexico as well as other places in the U.S. and have worked to protect Otero Mesa and Valles Caldera and more needs to be done.

A major concern with me is keeping wildlife on our wild lands. The wild horses and wolves are not being protected properly.

The B.L.M. roundups are decimating herds in the West and their lands taken away. It is called "zeroing out". Every last horse is being removed, some being run to death by deadly helicopters. A foal had his hooves worn off and in Nevada many mares aborted their fetuses! Just this week twelve horses died as a result of a roundup in Nevada making close to 200 deaths of wild horses resulting from round ups just this year.

I oppose these roundups and object to sending horses to holding pens when there are already too many there, in dire jeopardy of contracting "pigeon Fever" many horses are suffering and several have died from that.

Being a cattle industry advocate you have proposed moving thousands of captured wild horses to preserves in the Midwest and East, which is like moving the Statue of Liberty to Hawaii.

Wild horses belong in the west and are a symbol of the West! They evolved and developed hooves as a result of the western range. By relocating herds to sterile lands or zoo like conditions, the rich forage will cause many to sicken and die.

## Discussion Question 2

### *Albuquerque, NM*

*(cont.)*

Access from an urban setting is challenging. Hard to get to outdoor areas, even the ones in the city, because of inadequate public transportation. Need more opportunities for youth/students to get out and apply what they learn. Need more youth conservation jobs, student employment. Community gardens are a great education tool and beautify the environment. Organic techniques are very important, we need to reduce chemicals. Need more agricultural areas, we are not practicing sustainable food operations in this country. Tending a garden teaches you where food comes from and gets you outdoors. Need to reduce pollution to maintain lands for future generations.

Access to recycling bins is an issue. Wants to recycle but doesn't know where to go. There are a lot of water bottles associated with sports activities/programs. Tries to recycle bottles and take them to bins. She is a member of other clubs and tries to get people involved in public service and campus cleanup. Her school doesn't have money to do a lot of the projects.

Big picture – there is a lack of value. People don't value outdoors and don't care for them. Something happened in the last couple generations that people don't want to go outside. Media and role models can play a role in getting youth outdoors. Pro athletes and celebrities aren't always the best role models for encouraging kids to get outdoors. We also need to make city outdoor areas safe.

Children are disconnected from wildlife, distracted by consumerism. Wildlife corridors are being destroyed. Her organization is trying to promote ecotourism to provide jobs and economic development. They are marketing wolves, wild horses to draw tourists. Government agencies should be using wildlife to market for tourists.

City transportation and general transportation is lacking. Need better public transportation to get around to different areas in the city. Need shuttles that take people to outdoor areas farther away from the city.

Distractions are an issue. Wants to go outside but indoor distractions (cell phone, TV) stop her.

Entry fees for public lands need to be affordable so parents want to/ can afford to take kids there.

Funding is our biggest obstacle. Government and other organizations don't properly market what's being done with taxes. Need to highlight the successes and profits of paying taxes. Need to show the public what their taxes are being used to accomplish.

Lands are being drilled for gas and minerals. Chemicals injected into soil. This makes lands unusable for ranching/farming.

Level of danger. This young man lives on the west side of Albuquerque where there is a lot of gang activity. The local basket ball hoop has been shot out twice. There is graffiti everywhere. He's afraid to go out because he could get stabbed/shot. His friend was jumped at the park and now he is afraid to go there.

## Discussion Question 2

### ***Albuquerque, NM***

***(cont.)***

Lives in Albuquerque's south valley, gangs and graffiti everywhere. There also aren't very many sidewalks to use and litter everywhere. They need better community centers. They want to play soccer but don't have safe parks/areas where they are. They can't ride bikes since there are no sidewalks. They have to drive to another part of town to do these activities. School is making a green house and she wants to do composting for garden/greenhouse. School is important but kids also need chances to get out and learn about the environment. They're from the "bad school" so they don't get very much funding.

Money is a problem. The YCC program pays students minimum wage. Just to afford salary they must partner with other organizations. Need more money for transportation and equipment.

One of the biggest problems is motivation and encouragement for youth to get outdoors. There's more emphasis on sports, college applications, materialism/consumerism. Need to encourage outdoors in school since this is where kids spend 90% of their time. Need media to make outdoors part of our culture, just like they encourage shopping. Kids are too busy right now. (Sec Salazar – What would you suggest we do in schools?) Community gardens and outdoor classrooms. Emphasize that what you do in your everyday life affects the environment. Need student mentors. Youth need to be part of sharing the message. Kids don't always listen to teachers.

Physical access isn't the problem, it's the mental access. If you don't connect with outdoors you don't want to go there. Need to give people jobs and outdoor education that makes them appreciate this resource.

Technology, media are one of the biggest barriers but could also be the best marketing tool. Need to get kids unplugged. We need to provide real jobs. (What can we do to get them unplugged?) 7-8 hours a day spent in school, 3-4 hours doing homework, other time plugged in. Need outdoor classrooms. NM had funding for outdoors classrooms and that funding was cut this year. Teachers and parents have recognized that students are better behaved and happier after going to the outdoors programs. We need to lean on our education system to provide more outdoor opportunities

There are a lot of programs in existence offering summer internships. We need to do a better job at marketing these opportunities. As a rancher, she deals with 17 agencies just to try and conduct ranching. Too many overlaps, too many boundaries. Agencies need to coordinate.

There is no connection with wildlife, outdoors. Attitude change needs to start up high. If we are slaughtering animals what will our kids learn to do? Different interest groups need to work together for common goals.

Trash does make it difficult. Spend a lot of time picking up trash instead of gardening or recreation.

Trash is a big problem. On the road people are dumping bags of trash, furniture, cars. We need better facilities and processes for dumping trash.

## Discussion Question 2

### *Albuquerque, NM*

*(cont.)*

US Army Corps of Engineers Employee – We need to do a better job of marketing and showing the public what we have to offer. There are a lot of resources that address the mentioned problems but people aren't aware of them. We also don't try to align our mission/goals with what the public is saying they need. Federal budgeting process is an issue. Sometimes the timing for a project doesn't align with budget. For example, can't use this year's excess funding for next year's projects.

We need a garden in every school. Need to educate people on the difference between "zero-scaping" (rock) vs xeriscaping (native plants).

We need service learning based curriculum. Academics need to connect and tie to hands-on, on-the-ground learning. There isn't funding for these kinds of efforts. Need funding stream that supports all the ongoing efforts. People are doing the work but don't know if they'll get funding. Need sustainable funding.

We need to support outdoor environmental areas, including farms and ranches. These areas are open space, wildlife habitat. We need to maintain private lands because they serve multiple purposes. There needs to be more support for farmers and ranchers.

We need to teach each other how to appreciate the outdoors and educate each other on our cultural values and ties to the outdoors. We live in different worlds and we need to communicate those differences. (Sec. Salazar: How do we do that?) Take a whole week to bring youth from across New Mexico together.

You can be conservationist and be a consumer. Most suggestions being made are cost extensive. We're in bad economic times. We need to create income opportunities but wisely use natural resources.

Schools are not likely to be funded for field trip. Start small....one class, take them fishing. If you catch a fish, it may lead you to examine how you are going to help sustain their habitat

Fed government needs to help cash-strapped municipalities establish large central parks – no where to get close to nature

Government seems impossibly remote, policy is dictated in unilateral fashion.

Extension Services are underutilized. They can play a role.

Trying to create something for us, a lot of people don't like to go camping or whatever. I spend all my time outdoors. Most challenging things: forests up north have too many trees. If lands would be managed well, there wouldn't be so many fires. Need to maintain stuff. Where is this money coming from? Insufficient access, but we don't have money to spend

## Discussion Question 2

### *Albuquerque, NM*

*(cont.)*

Working on uphill grade, because many communities are resistant to reclassification because they don't understand what the benefit is. Need education process on economic value.

Had to do a lot of talking with different groups just to get something to happen

Stop illegal shooting of wolves. Local regional director deploras it – FWS Director Tuggle. But nothing happens. Direct additional law to regional FWS office, request FBI involvement.

We need to educate community as well as children

State and national parks – lagging in implementing maintenance. They're starved for resources. Update plans, create a public process for monitoring.

Stay positive. Use words like entice, harmony, don't focus on the negative. Stay with the positive view. Then networks can function

Schools are held hostage to standardized testing. We can't get them out of the schools and outside.

I have been actively trying to find information on America's Great Outdoors since April – even went to D.C. and my congressman's office, and still couldn't get anything. Got email on Wednesday that this was happening – so many people couldn't attend at such short notice. Challenge is communication.

Website is an issue. It's not user friendly, it's too cluttered and busy.

Make it fun for people. Make it so they can touch wild animals

Concerned about wildlife on the land. Trying to have a wildlife corridor in Bernalillo, created beautiful murals. Photographers go, classes go, helps attach people to land.

There is an extreme distinction between government and private. Critical to break down barrier, private land owners get involved with federal agencies. Work with NRCS – because of them I'm still in business. Get word out to other private land owners, give more workshops

Shortsightedness – we tend to look at immediate problems. Look at bigger problems, longer range. Huge blind spot in forward vision – engage kids in conservation, land stewardship, recreation at a much earlier age.

Television can be a tool to educate. Not enough good environmental programming.

## Discussion Question 2

### *Albuquerque, NM*

*(cont.)*

We think provincially rather than regionally. Water, air, pollution, wolves, jaguars. Focus on larger issues, rather than 'my little piece of it'. Keeping kids here in State. Analysis paralysis. Keep going back to table. Eventually we have consensus, and it's time for action

"We are the only program fully run by Native Americans. A while back we were used as a model for other Native American Tribes in connection to the Public Lands Act that was put together in 2009. I would like to see something like this go forward. We have a great partnership with the Pueblo of Acoma and would like other tribes to have that option and to learn more about themselves, their cultural values, and their connection with nature. Tribes are losing their connection with traditional values, due to technology. Speaking from the point of view of Native Americans, I'd like to see Conservation Corps started on all tribal lands. We started with 42 members, and are now up to 80 members. We are very excited to see our program move forward, but we need some money. We train young adults to do preservation work on some of our projects. Working with young people is one of our main goals."

"Only 2 percent of our land is protected. Two pieces of legislation right now that could be passed in 2010 are those protecting the Rio Grande del Norte National Conservation area and the Oregon Mountains Desert area."

"What I would like to say, the most important thing President Obama needs to hear, is that nature is in crisis. We are currently in the middle of the sixth greatest extinction event on earth. The others were caused by natural disasters. I've been involved in conservation for all of my adult life. We judge our work on how good it is compared to how bad it could have been. We need to protect more areas, we need to protect more areas dedicated to nature. Another new frontier area is carnivore conservation. There is a tremendous amount of research on the importance of maintaining our large carnivores. Top carnivores are key players in the ecosystem, even keeping streams and vegetation intact. We need to restore large carnivores over landscapes so that they can operate in a way that is ecologically effective. In the Southwest, we have been trying to restore the Mexican Wolf. The Forest Service has not stepped up to the plate. We need bold new initiatives. We need to take a long hard look at all of our public lands policies."

"we're seeing more and more loss of trails every year. For those of us who are in favor of a recreational trails program, we would like to see that re-funded. And also, like everyone knows, it comes down to funding for the Forest Service. Also, we would like to ask the administration to direct land managing agencies to revise policies that hamper reviews - particularly overly strict criteria."

"You mentioned protecting wildlife. I am mystified that our government spends 100 million tax dollars to kill predators. That seems like an irresponsible way to use money, and it is used to kill things in horrible, cruel, violent, ways. I think DOI is about killing, not about stewardship. I think this is a great tragedy for this nation."

"100 million dollars is spent on sodium cyanide and other poisons to poison wildlife. I thought this was done by BLM and other DOI agencies."

## Discussion Question 2

### ***Albuquerque, NM***

***(cont.)***

"We are the only facility that can deal with large carnivores and mammals. We got a mountain lion in yesterday and are over run with bears this year. I want to talk about the premise of historical use. What history? What about pre-human history? We can't make everyone happy. We can't accommodate all uses. Our starting point needs to be how we maintain the health of the land and the uses need to be secondary. "

"I take kids on walks through the Nature Center. We explore bugs, the pond. They love it and are fascinated by it. Kids don't even know often that there is a river here in Albuquerque. I'm constantly surprised with how little interaction these kids have with the outdoors. A lot of families don't take their kids outside. They don't have money for buses. I think that is one very simple solution . Once a year isn't enough to form a relationship with nature. If they do, they will actually care about it and form a relationship for the future."

"I am a big proponent of wilderness. In New Mexico, less than 2 of the state is wilderness, the lowest percentage in the entire west. But wilderness can't do everything. We need to take better care of our forests and stop fragmentation. The Forest Service is not using the best science and is fragmenting the forest with fuel breaks. I wish all fuel breaks looked like those at the Grand Canyon. Another thing is that in addition to using the best science, we need to focus on long range planning and sustainable use. We are going to use the forest, more and more people, more and more use, we have to do the right thing long term. Limiting motorized use in the forest, allowing wildlife habitat to expand."

" I'm from the Pueblo of Acoma, Southwest Research and Information Center (board member). We recently had an area near Acoma thing, designated as a \_\_\_\_\_ by SHPO. This was initiated by the Zuni, Acoma, Laguna, and Navajo. This is now being appealed by the mining industry. Acoma sits in the heart of the Grants mineral belt. This was the most important area for mining uranium for years. Not only are all aspects of our environment threatened, but our culture. The mountain has been considered sacred since before Christ was born. This is at the heart of our spiritual foundations. As the 50 year legacy of uranium mining hasn't been dealt with, we are concerned because of the gulf oil spill that has been taking place. We are concerned that one of the federal responses to clean and green power is nuclear power. Again, the 50 year legacy of uranium mining has not been reclaimed. We have ongoing litigation on the San Juan river that has not been settled. We want the Federal government to please consider this historical designation. Not respecting this interferes with our first amendment rights of freedom of religion."

## Discussion Question 2

### *Albuquerque, NM*

*(cont.)*

"I'm with the New Mexico Department of Game & Fish. Stuff that is working - recognition that natural resources are important. Government and non-government entities talking more on a smaller scale. I think what confounds the fundamental desire of a lot of folks is that we as a society are electing politicians to incentivize growth. We encourage growth. It typically comes at the expense of natural resources. The government needs to said "incentivize conservation of natural resources." Bureaucracy of government, it has been said all day long. Lots of projects, lots of ideas, but we need to get past the red tape. That might take a review of certain statutes on the books. Bureaucracy is often used in legal maneuvers. I think that brings me to my last point, we need to move towards encouraging sustainability as an approach to life. No group gets 100 percent of what we want. We are probably our own worst enemy with natural resources."

"As far as people mentioning about buses, yes, that's an issue, but kids aren't being taught about nature or the environment either. No child left behind is a disaster. Environmental education needs to be addressed. There is an enormous amount of material out there. Teachers can't use them though, because they are teaching to the test. The other issue is what is going on with agriculture in our culture. USDA. The corporate farms and the type of agriculture that is going on in this country is an environmental nightmare. I'm not a fanatic about organic food, but would rather have that then genetically modified. Often foods are not labeled as genetically modified. Tremendous travesty. One company more than any other which is responsible for this stuff is Monsanto; you need to educate yourself about that. All our conservation won't make a difference if the destruction of our native seed isn't addressed. Everything will be a chemically poisonous soup. President Obama said we'll tell Conga that it isn't the Department of Agribusiness, but agriculture. I don't see that happening at all. All of the people he selects are from that background. We are all eating genetically modified food whether we know it or not. Much of the sugar that you are eating is from sugar beets which have been genetically modified, this is also true for corn. We're not being told the truth and it is being exported to the rest of the world. Chemicals to keep soil going, degradation of the soil, with documented effects to young people."

"Dona Ana county - I'm concerned with border security – will it have mechanized vehicles?"

"Greatest challenge is working together as partners, not finding fault with others."

## Discussion Question 2

### *Albuquerque, NM*

*(cont.)*

"We were both at the youth session this morning. A lot of the youth managed to sum up really strong and significant points. It was inspiring. Youth are often full of passion and have new ideas. Everybody talks about this specific designation or this specific cog in the machinery; we need to see the big picture. It will not take just all of our organizations, but all of our organizations working together. Without the dung beetle, all of those savannah ecosystems would collapse. The dung beetle rolls the dung and carries it underground, keeping the grasslands fertile. That keeps all the elephants, zebras, etc., all of those well known animals, afloat. I know a lot of people bring up problems, but we need to follow those up with a solution. This morning we talked about a significant problem in getting kids to connect with the nature – it is just not a top priority for a lot of kids. "Mental access" someone said this morning. Also, not every kid lives near open land. Friends, shopping, preparing for college, etc., take priority. Mentors are key. We should make sure that nature is part of the way we all think. We need to get networking done right as we sit here. We've got to get all partners together to come up with solutions. This morning at the youth session, some girls talked about having a walk for conservation causes. That is what all of the 7 or so organizations I have worked for have been trying to do for ages. I think it is really important that we can all work together. Lasting change – part of that is seeing the big picture. The national picture. Implementing things that will protect places on a national scale."

"We need to raise awareness for everyone. There are people that don't think about conservation, recycling, whatever. Making things like hiking and nature tangible and enjoyable is key for people to find value in other activities – promoting stuff through media or any way you can. Nowadays youth just look to videogames and technology. A big problem that I see is using energy sources that are going to be renewable. My friends don't really care about what their car does to the environment, they just want to get places. We have solar panels at my house, but they are very expensive."

"Thousands of farmers and ranchers are not here today. We work at growing products for the world. Every one of us is intimately involved in agriculture. As we look at landscape management, if we cannot maintain our food supply, we can't recreate or worry about wildlife. We have to get back to our roots that allow us the time to do these kinds of things. I agree with a lot of things that have been said. In defense of the Forest Service, we think they are doing too much for wolves. Otero Mesa is a very special place. The reason it is a special place, people that have lived and ranched there for four generations. Go to Otero county, talk to those people. No one there knew that it might become a monument. It was the fourth worst drought in 100 years. We don't want to see gas and oil drilling there, but do we just give away that energy source?"

"I have some brief items. 1) Childhood obesity – lack of exercise kids get – implement some kind of farm in schools, on school property, don't turn it into child slave labor or anything. 2) Water. When you go into restaurants, why serve water if people don't want it? Water on all of these tables. It bugs me to think that it will be wasted."

## Discussion Question 2

### ***Albuquerque, NM***

***(cont.)***

"I would like to speak in favor of the Oregon Mountains Desert area. We've worked really hard on it. We've had some surprising opposition from some people. The vast majority of people down there support it. I've been surprised at the deceitful campaign by some ranchers down there. One in particular brought forth issues regarding national security. These things are really hard to rebut. Thanks for supporting this. Subsidies - a lot of these issues come down to financial issues. The people who lose in the long term are poor people. Massive deforestation all around the world. More bio fuels, more soybeans, more pollution of natural resources."

"I'm with the Southwest Environmental Center in Las Cruces. Along the line of landscape conservation, I'd like to recommend a place known as Otero Mesa in Southern New Mexico be protected from being opened up for oil and gas. Rather than continue to fight with Federal Agencies, we'd like to work together to protect areas. "

"I'm a former member of New Mexico Mountain Club Conservation. The reason I came here today is that I would like to say "Amen" to this man about Otero Mesa. We have to keep some lands wild. We have to keep it wild in some places for future generations. I really came also to ask the question - how are the trails for these ATVs and these off-road vehicles that are tearing up the mesas, how are they related to conservation and maintaining the beauty and the wildness of this beautiful state? We owe it to the children not to let those expand any more."

## Discussion Question 2

### *Annapolis, MD*

Trail maintenance, don't have runoff into creeks, Advertise in outdoor retail stores, people in suburbs sometimes more ignorant of nature than those in city. Thinks sad that people don't appreciate physical labor that built this country. Likes Americorps, but thinks that kids in general are lost because the kids don't know what to do, he wants kids to start working with land. Wants kids to hike the AT. Agreed that it is easy for say 20 yr olds, to get lost.

Lots of people moving to the area (Washington-Baltimore) -conservation is absolutely necessary. Work with all levels of government—they can provide institutional support. This has made them successful.

Follow up on having enough resources, and local access to enjoy outdoors, have adequate protections and enforcing laws that we do have, mineral extraction, quality of special places is being affected. Take another look at outdated mining laws is important to outdoor experience and preserve for future.

Assume individual responsibility for conservation and environment. ? each have to be the catalyst, motivator, of community, family, etc. for conservation where you live and where you work.

We should tie in the programs of Piscataway park and the forest but we need more oversight from state and federal agencies. Sometimes the local land use decisions are made for short term profit instead of considering a more long term vision that keeps giving to the people. Mattawoman has been considered important for many different species but it might be lost because the local vision contradicts the more long term goal which would continue to give back to the public.

In school to be a teacher; working with best friend's mom who is working on projects for 3rd grade students to teach about recycling and ways to help environment

field trips with kids – instead of going to museums, take them into nature and to parks; school initiatives – because you can't go that far away on a school day (and national parks may be really far from you)

good idea to divide people randomly

Farms, DC environmental education consortium. Forest communities, people only concerned w/ survival. Childhood obesity is real problem. Growing own food- impress on young people how important. Low cost, low carbon imprint food. Expose kids to natural world, draw kids in, meet kids where they are and teach them. Teach teamwork, teach about parks. Edible gardens, people sitting around not doing work, put them to work in gardens. Agricultural runoff is #1source of pollution. Wants DOI and EPA to work on this. Agreed that community gardens for disadvantaged youth good, radishes grow the easiest, growing stuff has to be fun

## Discussion Question 2

### ***Annapolis, MD***

***(cont.)***

We need an emphasis on Shenandoah part of CB watershed, CREP program gives incentive to get farmers to get interested. Often private firms supplement land trust. Federal government could look at VA examples and think of ways to leverage and expand on programs and create others.

Break down barriers: if it is perceived as not cool, break down stereo types. Get Gatorade type sponsorships.

Get out and experience areas. Limited accessibility

Thinks that an obstacle to young people is that they aren't exposed early enough to the outdoors and they don't know what they are missing out on.

Need to make water more accessible for people (eg public loading and unloading)

thinks the biggest problem is water quality. Runoff gets into food.

The cost of transportation is also an issue. Schools do not have the funding necessary to get kids to parks.

We need creative ideas. Funding is a common theme, but we know we will not be able to obtain enough funding to solve everything. We need other new ways to address these issues.

I also kayak a lot and I use bridges to access water. We need to work with the Department of Transportation (DOT) to create (boat) access at bridges.

Conservation Landscapes Initiative in South Mountain – PA Agency owns core of mountain, but foothills are fruit belt and they are struggling now to make it. Create an attraction to draw tourists from Gettysburg and market with agricultural growers and bridge gap. Landscape of apple growers is so tied to landscape in general. Agency is funding a buy local movement. CSAs popping up. Integrating working landscapes.

Private property adjacent to public land with no public access to public land. Someone needs to cover my insurance for people coming through my land to get to the public areas. If I am not around to grant access, then I'm liable.

we are not giving people an emotional reason to protect land in our watershed. Public access part is huge. Lesson in values is getting lost. None of this will happen with money until the emotional connection is made.

## Discussion Question 2

### ***Annapolis, MD***

***(cont.)***

Grants.gov is too complicated of a system to use. Volunteers need an easier way to get money for programs. It's much easier to get a permit than a grant - Improve the site! Eliminate funding programs based on no money in the budget. Lack of reliable dedicated funding for national historical preservation fund

Climate adaptation planning, such as done at MD state level, needs to trickle down to local level. Work being done needs to be shared up and down among levels of gov't.

There aren't enough events for people to enjoy the outdoors. I like the urban downtown parks, but people don't embrace it because there is nothing to do. There are events once or twice or year but we need more... events like hug a tree

Or if they made an app for the iPhone would help tune people in to the outdoors.

D.C. Parks aren't well maintained, but Virginia's are; Need to be able to get out easily - public access to trails

Young people don't go outdoors; my friends don't. I wondered why they don't go camping, kayaking, etc. It's because they lack the knowledge that the sites are there and the outdoors is available in general. There's also the fear of the outdoors. My boyfriend is from New York and he's afraid of deer!! We have to acknowledge this - people are fearful, especially around water! Boating can be scary. Providing assistance and training is very important. Also, the financial barriers are real - again, with water - boating is expensive. Even to rent a kayak or go on a guided tour costs about \$60 - most families can't afford that. Young kids make the family's schedule very hectic - we need urban (close by) parks. Families can't afford to drive an hour just to get to the site!

biggest problem is sewage and fertilizers getting into the bay. Also thinks MD building requirements need revision.

Access is the main issue. The outdoors need to be more integrated into fieldtrips.

larger buffer zones between roads and outdoor spaces. Enjoyable spaces are being ruined by having roads too close.

"No child left inside" Teachers need to be provided with lesson plans, training, or park service representatives to make the teacher comfortable outside.

There need to be bigger bike paths to encourage cycling and alternative forms of transportation.

Concerned about public lands. Need to designate land as protected.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

We need to ask what we can do better. May include real life issues like providing meals for kids.

Whatever you to engage children must be fun. Start early. Show job opportunities to your children so that they're environmentalists early. They have a pilot program: Woolly mascot, buddy bison. Where has buddy bison been:? Grades preK – 8 grade. Comes with toolkit. Come with local park maps. Buddy Bison website. Buddybison.org. Twenty-one pilot schools – new education centers in California, Nevada. Uses photos, stories, artwork. National grassroots movement. Connects kids through out the country. Biggest obstacle is transportation. Set up a program that's funded by scholarships for bus funds. High school organizations say if DOI would give jobs that are available, along with course work, developing skills, could increase hiring in the DOI. Little kids to older students; Simple and scalable. Teachers love it.

A program that has impact here and nationally is the NPS Rivers and Trails Conservation Assistance program (RTCA) – it is woefully underfunded. It gets more traction and leverage with communities than other federal programs do. There are a number of examples where RTCA has linked up local, state and federal agencies with non-profits. (\_\_\_\_\_ used to manage it.) One way to make it better is to fully fund it. The budget has been cut in half. I'm not sure everyone is aware of how much leverage this program has.

Themes : access, appreciate what say, need to figure out how we provide that access...schools, fed gov, work together. We hear you.

It's important to develop shared interests, for example, maybe people don't care that it helps urban environments to narrow streets, but community groups may see them as a benefit because they encourage slower speeds, shared goal but different reasons. Good economic sense = good environmental sense.

Sierra club, connecting kids to outdoors, need to get kids from all backgrounds. Get First family out there. Need good role models. Obamas, with two daughters, would be great role models. Climate change is an obstacle. Need corridors. Establish youth corps, get the kids out there to prepare for climate change.

job skills for youth are very important. partner w/ international masonry for historic place preservation.

An obstacle is that the outdoors is not 'group-orientated.' can make group orientated by having online community where encourage large groups to go outside together. Schools can also make the outdoors more accessible to groups by having available interships.

Kids need to be aware of outdoor activities. Have an online activity kit that they can download.

people would be more willing to ride bikes if there were bigger bike paths and if there was more awareness about cycling

## Discussion Question 2

### ***Annapolis, MD***

***(cont.)***

Trash is a big problem; lack of recycling in D.C.

lack of interest among kids especially of color –getting the First Family out more often with media so people can see them – we need role models – climate change – need to establish a more robust youth corps and give them jobs to prepare lands for climate change

teachers don't appreciate this time spent outdoors.

Getting to the city parks is easy but getting to the National Parks around the city is very difficult without a car

Yeah, just more public access would be helpful

Yeah, it could even tell you what kind of birds you're looking out

We need to take full advantage of available right of ways including levees, power line openings, railroad lines, etc. Any sort of right of ways. Make the public use(s) compatible with the original intent of each right of way.

Indifference is an obstacle. People are not aware of the outdoors and what is at stake. They also lack transportation.

educate people on what is recyclable

safety as a concern

also has to do with mindset

Worried about group that cannot teach others about wildlife. We have a lot of educational tools and we must get the kids out there.

spending too much time on facebook

stay positive though – try to be safe and keep boundaries; don't go in areas where you aren't comfor

## Discussion Question 2

### ***Annapolis, MD***

***(cont.)***

nothing to do in parks; basketball court, swing set, ropes à don't want to be there when it's dilapidated and vandalized

rushed – more time; extend it

recycling is inconvenient; government only collects trash one time a week – put up more recycling bins

mandate recycling

Incorporate games, projects into songs, education, etc.

quality of parks; distance and lack of accessibility

everyone is on facebook; accepting change; communicate with new people in a new market and new way – THROUGH facebook

Be outdoors next time

Environmental trust - no transferable tax credit for MD like in VA - driven by federal tax deduction sparked rapid growth. We need to get state tax credits going through congress to take the next step

Lives outside of Philadelphia, there are not enough places for people to go. Need to finance. Land and water conservation fund should be funded. Work with programs we already have. Invest in local communities.

We need matching funds for stewardship - invasive species removal projects.

Q #4 – land conservation – where has federal government made a big difference? From federal government need scale and plan component, really took state wildlife agencies forward. That was a federal requirement. States took money and invested in plan know that there will be little money to focus on their mission. Stateside land water conservation fund, has been consistent for states to do outdoor plan and that got states in open space planning business. How about we take that to local government level? How do we get local communities to do local open space planning?

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

I haven't heard anything about climate change today. What's going to happen to our conservation efforts without consideration of climate change. We need national strategies and funding for what is going to change and how we can adjust our strategies. Rising sea-level is going to change everything and the federal government needs to dedicate funding to gain a better understanding of conservation techniques based on the changing environment. We are already seeing the changes in the environment.

National Capital Parks -- Preservation of land. Their challenge is historic structures on historic lands. They are mothballed, or run as historic houses, due to lack of funding. Could do so much more with funding, but it's not there. Would be excellent sites for social studies and history curriculum. Challenge is that social studies program isn't supported in PG county. 27,000 acres have been preserved.

There's a problem with safety and health due to the way our parks are managed. We've exceeded carrying capacity for the white-tailed deer – lime disease is horrific and has ruined my life. Where is the wildlife management in our state parks? We have to improve the plant and wildlife communities – and indirectly benefit the people.

I've worked in national parks. They have the tools—biologists, ecologists, etc. - doing all these surveys regarding park management practices that benefit ecology and wildlife. The Park Service is not listening to its own experts. You need to listen to the strategies they are recommending in order to increase biodiversity. Implement their strategies. There are great published papers out there developed by Park Service personnel!

give people facts, make changes convenient; talk to people – best way is to communicate – educate them on importance and make it EASY for them to do it – inequalities exist based on where you live

it should be recycling; we have a huge pile of plastic

mass distraction of virtual worlds – needs to be a reconnect to Mother Nature

Engage through brook trout, fishing, enroll CREP not for striped bass and crabs, but for native brook trout, so they can fish with kids, we can gain a lot about focusing on local amenities of each area. We have CREP programs, temporary easements, need to migrate to permanent so have ecological function of floodplain, is there a way to increase flex in purchase easements. States don't have funding sources and want to protect land but don't fit wetland reserve, or don't fit CREP, need to think broader about funding sources.

should raise awareness about going outside, people do not know about outdoor activities nor do they know how to do them. Make outdoor activities more accessible.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

In urban parks, people are deterred because of expensive parking. Talks about federal hill and how it is impossible to get into because of parking. Connecting public transit to outdoor spaces would promote outdoor activities.

He is a 3rd grade teacher and believes that there should be connections with schools to promote parks.

Thinks that an obstacle to young people is that they aren't exposed early enough to the outdoors.

More public transportation. Refers to Hampton which is near the city, but nobody can get there because there is no bus service.

Access to our public places. Hard to get from Point A to point B, not close to beaten path. Need buses. Ex: NP by Baltimore but not on bus route so not used as much as it could be...need transportation to beach, etc more parking and public transportation

How can we work with you (federal programs) to make these things work? The key is to work together.

I have a concern and a question. Climate change is a huge issue and our policies are not keeping pace with the changes on the ground. What legislative changes will make a true difference? I'm a spiritualist – I work with our American Indian tribes. Why don't we require Ecology 101 for our legislators?

There's an overall lack of planning in these parks. Various trails are built but no parking is planned. Horse trails are developed but there are no places to park the horse trailers. In Howard County, there are parks surrounded by houses but there's no access provided from the houses to the parks.

Need multiple dimensions to make conservation happen. Ripple effect- multiple kinds of interests and programs and groups. Clinton admin had a program that worked well, but wasn't fully funded: American Heritage Rivers Initiatives (Loretta Neuman ran this White House initiative) State initiatives have great models, but not nearly enough funding.

Free events!

We're trying to engage youth in the outdoors? The best way to engage youth is with an adult in the outdoors. We need to focus on the adults in order to get the kids out there! We need to influence family choices. I'm with Ducks Unlimited – if you take a kid waterfowl hunting, you'll change his/her life.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

Anacostia Park was one of my favorite places to go, but they tore up the track so I can't run. I had to find another place. I would look at the river and be disgusted at the water. In Richmond, I love going to the parks with rivers or lakes and the body of water always attracted me, which is what I liked in Anacostia. The other place at Hains Point was a great park... I liked the statue of the man that's coming out of the ground.

Concerts, plays, movies

Some type of public transportation to the parks... on weekdays or holidays would help.

Increase access. Non profit support of public transportation in order to eliminate or decrease fees

Out west have problem in forests don't have enough money to refurbish forests so we are going to beneficiaries from forests. Why would they be part of solution. Out west water providers. In west reach out to water providers – need to be partner with FWS to help restore lands, your land your water will be jeopardized. If you want healthy forests we need your help forests and maintain campgrounds and trails so you need to be our partner. How outside of government do we get private sector to join us? They have stake in maintaining community, forest community. How do we get new constituents into this?

with the Show Institute in DC – working lands and recognizing value of preserving pristine landscapes and keeping land productive and economical – financing and funding for conservation we need to rethink how we fund it – organizations base their work on donations and industries that do poorly in a weak economy – needed financial security will secure a long-term future

grant to Commicut City Farm for seeds and making better connection of people with land – fear and fatalism we fight a lot – memories of elders and dreams of kids we can put together – elders baptized in streams and farmed fields here – idea for heroien users to start selling produce instead and it worked and the Marvin Gaye Amphitheatre is now there where the drug dealing was – celebration for the tiniest reason – kids a short distance away don't know the Fort Circle Trails – kids enthralled when they got through the invasives and saw the forests – government can through money at it and it will take down

We need to get rid of our old thinking that spending time outdoors is a waste of time. We still have that attitude! Public policies are behind the times thanks to the Puritans. We know that spending time outdoors is not a waste of time - we need to rethink how we encourage people to use their time.

Access to trails outside the city

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

Access: some areas are dangerous. Need for bus stops and side walks

MD - local land trusts - work really hard so we know what's worth saving - need more funding, not more data analysis. More money to purchase land - capacity building \$ to empower land trust (even \$25,000 goes a long way).

likes hiking trails near water. Notes how littered the paths near the water in the Chesapeake are despite efforts.

implement interactive activities. Kids are not interested in walking around places; they want to be doing something!

Education and engagement. Find ways to engage. Technology ideas good. Need to update Federal Technical capabilities

tax dollars for agriculture are a subsidy that benefits recipients and not taxpayers – same goes for cover crops – a corporate socialist system – ban our representatives from receiving contributions so representatives can better represent the people

teens see what others do, subject to peer pressure...kids will be afraid to step out..even if kids spent time outside, they aren't active, litter and smoke. Have to have meaningful experience when outdoors.

taking action on certain issues. Meadown Creek MD - this creek at brink of what it can handle in terms of toxins. he is worried that, if approved, a permit for a road will adversely affect the area. Thinks should use 60 millions for light rail instead. Connect light rail to metro. Also, driving down 210, he noticed that buildings are not used to full capacity. He is concerned about urban sprawl control, encourages smart growth.

can't eliminate recess, lose leisure time outside, curriculum doesn't value outdoor time for kids, Finland as exmple. Homework one example of why kids can't get outside.

kids will be in class 9 months/yr, have environmental education built into curriculum.

a lot of education takes place indoors, she was only required to take 1 semester of PE, half a credit..even gym activities took place indoors, we must push for environmental education...parents afraid to let kids outside, want kids to be safe.

State organizations don't have power over local authorities. More incentives to promote smart growth. That could change the bad local planning.

have to start young, have kids stop using plastic water bottles, they like knowing that they are doing something good for environment, reduce what use in first place.

## Discussion Question 2

**Annapolis, MD**

**(cont.)**

teachers won't let kids go outside if cold or hot, parents and teachers need to be involved.

Great to be here. Impressed with consistent themes. Been in DC 3 ½ years. Promote partnerships...biggest partnership with next generation. Introduced the “No Child Left Inside (NCLI)” initiative. Studies show youth spend about 7 ½ hrs day on electronics and only 4 minutes on outdoor recreation. There is a need to be tech savvy but something is out whack with those numbers. Support real resources to get youth outdoors. Primarily into school. Incorporate outdoor education. 1700 orgs across country pushing to get NCLI legislation passed. Hope to get included in education authorization. Gov has to perceive when people are pushing for new framework...new energy framework. Build new framework, the next generation, most aware of the environment, take over this issue, make it your issue, using social media you can become the leading edge in Environmental Awareness in this country. Most exciting thing in decades. Every high school should have an Environmental Club. Own it! Exciting prospect what you can do with this issue on the environment. Pledge to be a partner.

kids into tech, they are into social media, facebook, twitter - having activities outside should be a community effort. For example, sports to get kids outside.

People don't think it's cool to be an advocate for protecting the environment, kids have to know that it's good to be outdoors, must be encouraged to do things outside.

Potomac institute in dc. Working lands-- Use land for production of products. Financing and funding needs to be rethought. Connect to industry ecosystem services markets need to understand value of resources

State of MD hiring freeze. Losing key employees. Local government's red tape to hire employees. Job descriptions are limited. Government bureaucracy.

Children don't have enough opportunity to see the real thing—animals, specimens. Schools are overwhelmed and outdoor and environmental education often is cut from programming. There is still a digital divide—some kids don't have access to technology in support of programming. Some kids aren't interested in outdoor activities. Lack of funding.

Emphasis on environmental education

A lack of knowledge. We need outreach programs like flyers in neighborhoods. When people find out about these places and the problems they have, they want to volunteer more to help out.

People make choices by calculating the return on an investment. You can't do this for the outdoors if you haven't had that experience or don't know the options. You need to give people information to help them calculate whether the time and effort devoted to an outdoor activity would be worthwhile.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

In Baltimore, distance to open spaces and lack of accessibility keep people from getting out. One project that's been started is to change the community by converting vacant lots into green spaces. It's important to focus on parks in culturally different neighborhoods

Transportation. Kids may hear about opportunities, but never visually see it. To help with this, the Ground Works Team went to Great Falls. Some of those young people had lived around here their whole life and never seen it in person. You have to give them the chance to see it, and awareness that it's public space. So they can go home and say, "Hey, mom, you can go here, you can have a cookout there." People are not going to go out of their way if they're just going to be by themselves, too. It needs to be perceived as a popular thing to do.

People tend to put off getting outside because of time, weather, any number of excuses. You just have to know the right time.

People don't understand the benefits of getting out.

It's not just about getting people out there, but how to use it once they're there. Some people see a mountain as a place to ski, some want to hike up it, others just think it's pretty. You have to show people all the options of how to enjoy it.

So, one thing that it sounds like needs to be done is put all these ideas in language that young people understand.

Yeah, and it's really hard right now when teachers are forced to teach to standards. We're cutting gym classes and creative teaching activities because we have to cater to the tests.

So maybe that kid-friendly language more engrained in DOE curriculum standards

Some of the main issues that seem to keep coming up are making information available to open spaces easier for all people, and incorporating the outdoors into education- especially because school is the one thing that affects all young people

We could make programs that show the importance of the environment. We have one earth with limited resources, so it's important to realize that we need to make it better not by acting for more, but by improving our quality of life with what we have

we also need to find a way to accommodate standards while taking field trips, using the power of place to teach lessons.

Yeah, integrate the standards with place-based experience. You also need to do several lessons, take a systematic approach, with repeated emphasis. That's when kids really start to get it.

## Discussion Question 2

### ***Annapolis, MD***

***(cont.)***

I think its when kids get to middle school and high school that we really need to try to get them. It's easy to encourage them to get outside when they're young, but just when they get old enough to really enjoy it, lots of other stuff starts to get in the way. More outdoor learning spaces would be good. Maybe new buildings that maintain the classroom focus, but allow students to be outside at the same time.

So the funding would come from somewhere else, and maybe NRCS or someone could provide directions to schools for how to go about it successfully.

Cutting school funding keeps out many topics, so we probably need to focus on alternative types of education outside of school. It might call for a separate campaign for environmental education beyond the classroom.

Again hollistic information about the outdoors and the environment

Work with department of Education to incorporate outdoor education into curriculum standards.

Provide alternative transportation, special day programs and route planning to help people figure out how to get out.

Voluntary private landowner program – have capacity to deliver those programs. How do we get new landowners? Need flexibility to work with new. Doesn't matter who owns land but just want protection.

Conservation is the “Moral equivalent of war.” (William James)

Is this cap and trade? Personally opposed to cap and trade. Need to cap and not give provision to expand. Areas of concern in MD farmers – farmers are painted with same broad brush, \_\_\_\_\_ have conducted water quality studies. Some conventional farmers can have good water quality. All farmers are treated the same. Second issue is ignoring residential sector – chemical contributions to the Bay. USDA bears responsibility. Lots of different messages that are contradictory. Bay has not improved because MD acts as if climate change is not a problem, and roads are not impacting the bay.

I am active in Mattawoman Creek . This creek has been well studied by MD DNR. In this case have tracked fish stocks along with impervious surface and can see where hit about 10% fish decline. An obstacle that I see is that the permitting agency (MDE) does not listen to scientist and conservation experts or DNR or COE so they are allowing development and not connecting stream health with development and impervious surface. How do we get the development community respect special places?

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

We are all either in the choir or in pulpit and one thing that I hope this movement will lead to is somehow bringing together all of our various interests and tools and constituents because we all have tools and strategies for accomplishing our mission but if you think about all people shopping at LL Bean, tractor supply company not buying these things to recreate. So they are making the connection. Frustrating thing is to come up with funding, things get political very quickly. But tremendous constituency that have connection, how do we harness power of constituents to harness power from Washington?

connecting people to outdoors. How do we get consensus among groups to proceed. We are forgetting about we are choir, and we want to get people that aren't involved. Three obstacles: #1 competition – we are really busy and hard to connect young people need parents to go there and competing interests. #2 Cash – we don't have funds to take care of what we have. Land water conservation fund is only gotten 50% authorization. Historic preservation fund only received half of appropriation. #3 Condition- multibillion maintenance log at national parks, how do we expand when we can't maintain. If we are trying to get people engaged and they get there the condition has to be good.

Work for private foundation that provides grant to students in conservation. Connection to a specific place that has gotten to turning lives to conservation. Need to make sure those places are available and nearby so next generation to connect.

We have all these great ideas, but message coming from top, but involving public in message and having simple, NPS has amazing resources but get stuck in hole when on web site. It is hard for general public to extract meaningful info to public. We need to get fed government to simplify message for general public, it is as simple as get outdoors. That is message we need to embrace. Need simple and short message.

Analysis paralysis - "we need better GIS". There's a lack of communication between local and state / federal levels. They need to share this information so that they aren't repeating themselves. More time needs to be spent on the ground doing the work - local organizations aren't getting the information to the federal levels. GIS is hampering movement forward because we're always looking to improve GIS systems. If we can make all of the GIS information available, Federal, State and Local organizations won't be repeating the same data collection, waiting to make decision

community service, etc. service learning. One challenge she faces in federal service. Information is siloed. Information is not shared between agencies. Today is great example of sharing.

Concerned about the energy usage of family farms. One farm is putting in an energy plant that will account for 6% of P for the state of Virginia.

concerned citizen who likes the outdoors and grew up in Yonkers – as Boy Scouts we had urban overnights and overnight camps that I still remember and the biggest obstacle today is the prevalence of the computer and the indoors – change obstacle into a tool – a website by the NPS or others and TV spots and ads to direct people to an enjoyable summer

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

connecting to grown-ups – that group doesn't know how to do this stuff – NPS has tools such as Junior Ranger and Climate tools and education tools and resources at HFC, parks to help – the tool is the places to connect them

Education regarding climate change - how the landscape could be a viable resource to communities that could lose the wetlands and forests. They need to understand that these natural habitats are protecting their communities from natural threats.

Farming looks similar everywhere, but isn't. Farm Bill should be administered differently on different landscapes. Role of land trust should not be forgotten.

Federal authority to acquire property should be expanded to lands bordering federal lands. Use LWCF lands from state and fed to acquire property.

For next Farm Bill, count voluntary BMPs, more conservation easements need to have minimum conservation programs in place. Ag programs often the first cut out of school budgets. Need to continue Ag. New technology and energy to get farmers interested in working and living light on the land. What's permanent? Need to have people on the land—otherwise what is the point of conserving land. Buy fresh-Buy local.

Fort Monroe is a 560 acre area at the confluence of the James River and Chesapeake Bay. Is an Army base closing in 2011. City of Hampton tried to turn into gated community. Local citizens are advocating for the site to be a National Park, have gathered 7000 names on a petition. Site would provide bay access, trails, beaches, promenades. Her group is trying to overcome the challenge of how to convince leaders to be a combination of state and national park.

From a programmatic standpoint, one of the biggest obstacles is the fact that folks do not have the knowledge and the skills to recreate appropriately. Folks don't have the income to try recreational activities to find out if they like them or not. Through "Get Outdoors Pennsylvania" folks are introduced to recreation and it's free! People can camp, hike, kayak, etc. Single parents are one targeted audience. The equipment is available to check out. Each time they come back to the park, they can check out fishing rods, kayaks, and other equipment.

Funding is a problem. The Sport Fishing & Recreation Access Fund is good, but non-motorized boat access is still limited in Virginia. We reviewed the problem for the Secretary of the Interior – we interviewed the states. The outcome was: it is a "user pays/user benefits" program. Motorized boaters contribute to the Access Fund, so they benefit from it! Manufacturers of kayaks and canoes should come up with a funding mechanism to promote development of soft landings, etc., to promote non-motorized boating.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

Getting people engaged in the outdoors; we have to get them out – on the water & on the trails. Here in Annapolis – the “hidden gems” are the street ends. These street ends often lead to water – they offer people water access and the opportunity to put a kayak in. Need \*increased parking and increased awareness (that these places exist.) [\*Some areas permit only 2 hours of parking which is very restrictive.] What works is: Making the lands open to the public so they can get out on the water.

Growing up in environment of cell phones, computers, and competition on young people and have attention to popular things. Way to connect youth to outdoors is promote mountain biking, white water rafting things that get blood going that are thrilling and exciting. Youth have been going to music festivals and where is NGO presence there and giving us info and telling us how to get involved. NGOs are not in our faces, you come here to see each other, but some see us where we are. What made you so passionate about outdoors? Young guy – response - Grew up in suburbs of Atlanta and seeing sprawl and watched Chattahoochee River turned brown to red because so much of land has been taken off so now have clay enter river. Chat national recreation areas and being able to walk to that and not needing a car that allowed me to sit quietly. Also parents banned video games.

Her group has been fighting a lot of battles on the Mattawoman Creek, one of best tributaries to the Chesapeake Bay. There is a new highway proposal threatening the watershed. Need to work on educating local planners and politicians on the value of local land use planning. Need a national toolbox for communities for areas that need to be protected. Need to protect best tributaries to the Ches Bay. Need national blueprint for green and blue infrastructure that syncs up with transportation planning that makes these types of projects ineligible for fed funds. There are opportunities through the new livability initiative and reauthorization of federal transportation act. Should also prioritize providing transit access to national parks.

How can we blend this with other objectives and goals? For example, farm for future in NC. Happen to have civil war site so get in guided tour to enhance. They are open to new combinations and approaches.

How do we get consensus among groups to proceed. We are forgetting about we are choir, and we want to get people that aren't involved. Three obstacles: #1 competition – we are really busy and hard to connect young people need parents to go there and competing interests. #2 Cash – we don't have funds to take care of what we have. Land water conservation fund is only gotten 50% authorization. Historic preservation fund only received half of appropriation. #3 Condition- multibillion maintenance log at national parks, how do we expand when we can't maintain. If we are trying to get people engaged and they get there the condition has to be good.

I do a lot of kayaking and canoeing and when I'm out there I'm wondering “Why aren't there more people out here?” Because generally there's an eight hour commitment from put in to take out (on a river). People are not comfortable committing that much time to a recreational activity.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

I live in Bethesda, which is increasingly urban. The “age” of the people making decisions is an issue – they are disconnected with the outdoors. Open space is seen as wasted space. Other academic fields promote development. The prevailing attitude is if people want to go walking and exercise, they should join a gym. What about enjoying trees, and the outdoors while you exercise? The issue of providing shade is never heard. On the west coast – there’s much more open space everywhere – it’s a priority there. My daughters moved there because they were fed up with the attitudes here in the east.

I lived in Maryland for many years. Now I’m on the coast in Virginia. I feel like I’m in the wilderness. One big issue in that area is the amount of access to the water is extremely limited; far less than Boston, New York or San Diego. A study was done regarding water access around the nation – we passed the study on to local governments (in VA) and it fell on deaf ears. Local governments don’t understand or appreciate how important public access to the water and access to open space are. Not everywhere is advanced as Maryland is. How do we get local governments to understand the importance of access? Seven acres of live oaks were in jeopardy in Ocean View because the city wanted to sell the area to developers. Concerned citizens took the case to the city, the local court, and then to state court – they won at the state level. These people had to sue their own city to preserve seven acres of open space! We need to distribute more information regarding how people can obtain access to the water and to open space.

In order to have access to the outdoors there has to be public access. Ex: Forests along the Potomac River in Charles county due to be developed stopped by the grassroots level until the state of MD bought the land and created areas for public access. Ex: Hard bargain farm - working farm that also gives environmental education. Ex: Charles county public schools includes visits to working farms in their curriculum

Just here as concerned citizen, no professional connect. Got interested in outdoors through boy scouts. Had camp in NYC. Remembers what he learned. Prevalence of computer obstacle. Change that obstacle into a tool...sponsor websites that are aimed towards kids. Get tv/ radio time to direct kids to conservation website.

Keep your friends close and your board of supervisors closer. Feels that educating kids is a key to building public support for national park protection. If the park had had a major education program 20 years ago, recent hearings [regarding proposed development on the Wilderness Battlefield] would have gone better.

Lack physical access to bay. There aren’t places where they can get to water. Even if physically get to bay, very hard to find places to get on water. Programs that run through an institution are best to reach people. People must use outdoors in way that is special to them in order to engage. Can do program through institution, but people need to know how to do it on own. Find ways to connect so they can do outdoors activity themselves.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

Listening sessions are important. Here are examples that are “scale-able.” Kids won’t go where they don’t feel they’re wanted. In Los Angeles, there’s a park sign that has ten different “no” postings. We have to invite the kids - truly welcome them – otherwise they’ll go to the mall. We do need to overcome the incredible dearth of awareness about where open areas are! (Lack of) public transportation is an issue. Also, people don’t want to travel outside their “ethnic boundaries.” On the metro and on buses, we need to advertize how to visit Rock Creek, etc. That is not happening now.

LWCF doesn’t go out to states equally because Congressionals don’t get credit. Could do a block grant to states for consistency from year to year. Each NGO in a state would benefit. Constituency is not organized. One idea—“principles” tied to the state-side of funds. For the large landscapes, could use federal and state money in the same place. Need constituency advocating for LWCF.

Make it cool to be outdoors for the kids - they don’t need gadgets to enjoy the outdoors. Make the parks more interactive. DNR - you can form a parent - kid team to get free admission up to 10 parks over the course of the summer. You have to do some kind of challenge - hike a certain distance - fill out sheets based on what you learned. These parks should be made more affordable compared to going to a baseball game or movie. Increase domestic visitorship to parks!

MD - local land trusts - work really hard so we know what’s worth saving - need more funding, not more data analysis. More money to purchase land - capacity building \$ to empower land trust (even \$25,000 goes a long way). Make tax benefits permanent!

MD green party. Federal money that government has to hand out represents a subsidy from taxpayers to efforts. Conservation people will lobby to get tax money for their cash flow. Tax payers paying cost of doing business. Same for cover crops or corn . corn sold to chicken farmers, chicken waste goes into Chesapeake bay. Thinks we have corporate socialist system. Government officials bought by campaign donations. Spokesmen for corporate sponsors. Very worried about representation. Green party doesn’t accept donation

money is tight in this economy and parks on hold or get shut down or projects cancelled – we spend time now applying for grants to supplement our funding – we could not apply for some grants based on our narrow geographic scope – our trail was not long enough – a solution could be to reconfigure criteria or have dedicated funding sources for smaller-scale projects

More money for budgets? The budgets continue to be cut - agencies are already underfunded and under staffed - what is the federal government going to do to counter the cuts in funding?

National Wildlife Refuges have programs that are not well-advertised to universities and the public.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

Need to go to general public in addition to water company. Pump died and could see from pipe how water had gone down, problem is water comes from VA which has been paved. If public knew that somewhere there water is affected, would do something.

Need to work on National Landscape Conservation System (NLCS), codified in 2009. What's worked: gateway communities; work a lot with youth. Obst. No one has heard of NLCS. Best tool: need a Secretarial order to mandate conservation prescription for these lands, would help with management. Better partner: would like to see conservation as a priority. Would like to see NLCS raised as a priority within BLM.

not enough places to go, especially in the Mid-Atlantic – financial means to make more places happen – federal funding through matching funding such as LWCF or other and working with delegation should make that happen and working

Notes that a big issue in the last two comments is that they will cost money. He feels strongly that need to fully fund LWCF. Is how federal agencies pay for land acquisition. He supports efforts in Congress to require OCS revenues to be spent on LWCF.

NPS has an order for partnerships (DO-21) that is so burdensome to the partners that it imperils the idea of partnerships. It is difficult for federal land managers to work with. Unfortunately there was previously no organizational guidance on partnerships; now we have burdensome guidance instead.

Obesity is a huge issue in our country and no one is mentioning it. 38% of children (under 18 years of age) in Delaware are overweight. We are about to do a project working with pediatricians to start issuing prescriptions to make the kids go outdoors. People make bad leisure time choices and poor food choices. How do we work with the manufacturing system in our country to deal with obesity? The Center for City Parks, the Trust for Public Lands – they should initiate impact surveys. We need to do economic impact studies regarding the importance of parks in our country. We need to focus on areas “close to home” first vs. the national parks!

of interest among kids especially of color – getting the First Family out more often with media so people can see them – we need role models – climate change – need to establish a more robust youth corps and give them jobs to prepare lands for climate change

oil spill in Gulf shows how fragile our public lands are – this should be a focus in the AGO

One of the biggest problems on the Appalachian Trail is the threats to the trail from energy projects – have proposals for three major transmission lines, gas lines and ten wind generation projects. Need a national GIS system which identifies important resources married with a look at federal incentives that are fueling projects that would compromise these values.

## Discussion Question 2

### ***Annapolis, MD***

***(cont.)***

physical access to the water and Bay – not a lot of places people can go – even less people who can get on the water and to the shore – obstacles in Bay Network with adequate number – 2nd point: many successful programs are institutional and they are wonderful but many connections are personal through use that is special to them – person self-directed, but institutional context doesn't allow that extension of a connection to happen

Problem has been defining Conserved Lands and how they should be managed. Essential that you get people out there. E.g., Fear of ticks keeps people away. Inheritance tax is huge—still need to pay tax on conserved lands.

Protect & preserve habitat for waterfowl by focusing on the entire continent (migratory birds). Land conservation between Canada, the US and Mexico but it is implanted locally. What areas need to be prioritized? Track populations through migration to focus efforts.

Public access is very important. We have a dedicated funding source for Program Open Space in Maryland. We have an excise tax for water access. Those special funds are raided on a regular basis! If you are concerned about this you should contact your local elected officials and let them know. There is no mechanism to restore the funds to these programs once they've been removed. Carrying capacity is also an important issue. The call for more public access is drowning out the need for a study regarding carrying capacity for these sites. There's a reason there are only two parking spaces in particular areas – those sites can't handle 25 cars, and the nearby communities cannot handle 25 cars. Look at the sensitive areas – are we balancing their protection with appropriate amounts of public access? From state side, everyone is so interested in these efforts – we're seeing a federal effort that's "pushing down" on the states. The state's efforts need to be respected and looked at before the federal programs override them. We have many studies and programs already in place. The feds are forgetting that the states have already done a lot of work – they truly need to work with the states.

Recognition of the significance of the Bay beyond MD and VA is missing. Need designation of a National Park in each of the 6 states.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

Regarding efforts to bring children outdoors - the public schools should have a role in doing this. During the Bush years we reverted to a test-driven school system and with "No Child Left Behind" the kids are indoors so much! Public schools have cut back on field trips – private schools are great, but the public schools don't encourage kids to spend any time outside. We need more field trips – not just to museums – but to outdoor sites. Reintroduce these parks to the children and send the information home to the parents so the parents will want to visit. In Montgomery County, we have no problem connecting people to the outdoors on the Capital Crescent Trail. It is used by thousands of people every week. Our county council voted to plan the Purple Line – they're going to bulldoze 17 acres of mature forest. It's good to build up the city around the metro stations but losing trees means our quality of life will be diminished. We're a "walking community" – we should not lose that! We shouldn't have to drive to Rock Creek Park. It's a noble effort to close the Red Line but the non-destructive alternatives have not been studied. The county is proposing to spend \$1.68 billion to do the most destructive proposal to create the Purple Line. The State is furloughing state employees and asking the federal government for funding! This is a very misguided initiative.

Remember that poor kids can't purchase technology; and poor kids don't have yards and safe places to go. We need to work with over strapped underfunded school systems that aren't focusing on the outdoor experience. We need more funding in school systems for outdoor educational programs. And we need to target young children to help them to become comfortable outdoors; children can be molded to think anything is cool if they're young enough.

Save Americas treasures, national trust historic preservation – public private partnership – we have such common ground here and yet we feel like the afterthought, but we cohabitate in so many different places. For example, Historic Annapolis has a student program where they take kids on boat to familiarize kids with bay and teach history and how Annapolis developed because of the bay. Parents telling people when their children come home, they are very enthusiastic, more so than when in school. We need to have strong alliance between environmentalists and historic preservationists. National Park Trails – thank Save Americas Treasures Program, through them secure funding. Echo those comments.

Scientific communication is key in effective conservation, show them how they can protect butterfly. Bring science and make science exciting to public.

Sierra club, connecting kids to outdoors, need to get kids from all backgrounds. Get First family out there. Need good role models. Obamas, with two daughters, would be great role models. Climate change is an obstacle. Need corridors. Establish youth corps, get the kids out there to prepare for climate change.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

Some of the funding is tied to matching grants. Change some of the grant administration policies because many of us don't have matching funds. Maryland has a fantastic program for forest conservation and we're starting to see efforts regarding agricultural conservation. There is no widespread tax break for the forest conservation program. Some of the land is on private lots – the people on those lots don't respect the intent of the easement because they do not directly benefit from it (as the overall landowner does). Provide a tax incentive for each individual participant.

started grassroots lobby for historic preservation and there is a caucus in the House and we would really like to be working closely with partners and conservation because LWCF and HPF have the same interests and ability to get things done

tax dollars for agriculture are a subsidy that benefits recipients and not taxpayers – same goes for cover crops – a corporate socialist system – ban our representatives from receiving contributions so representatives can better represent the people –

Tension between private ownership and desire for more public access. How to make it easier or more fun or more lucrative to give more public access. Create a different incentive.

The lack of funding - properties in federal parks are intended to be intended but are still in private hands. There are developments in areas where there shouldn't be. Create a competitive program for easements on private land that promotes the historical aspect. Provide more tools for neighbors of refuges to do great things. When other federal organizations don't respect federal conservation - Highways going through wetlands undermining the protection from environmental organizations. The park culture is outwardly focused is great - it used to be inwardly focused on themselves rather than rallying with other federal organizations - support this culture.

Want to discuss funding. Budget been hit. Parks on borderline. Had to stop projects. Spend a lot of time applying for grants. Reach out to government, her organization couldn't apply . grants only there for national programs. They didn't qualify. Trail wasn't long enough to apply. Federal government should look at grant funding scope. municipalities should be included.

Water quality credits (PA has thousands of credits but there isn't any demand) the EPA needs to enforce the law or else the credits have no value and no demand. The sewer authorities are borrowing from their clean water funds to build infrastructure rather than addressing point source problems of pollution. This affects land use - best management tactics are important.

We also have to remember some kids don't want to fish and play outside. We can't reach everyone.

We have 125,000 acres preserved through easements. We want to bring land owner tax incentives back and make them permanent.

## Discussion Question 2

### *Annapolis, MD*

*(cont.)*

What are obstacles? I am involved in fish testing and seen decline in Mattawoman – getting more impacted, and not only is inner city even in country now, working hard to get kids to learn about nature. But air is not safe to breath. Water they can't touch. What are obstacles? How can teach kids about nature, but we say don't touch water because you will get sick and don't breathe air. But until enforce laws in place, before we make new laws, we need to enforce what is in place. Until we come up with growth boundary line. Sprawl is killing bay, until we address that, won't be able to get kids out. We need a growth boundary line.

working lands and recognizing value of preserving pristine landscapes and keeping land productive and economical – financing and funding for conservation we need to rethink how we fund it – organizations base their work on donations and industries that do poorly in a weak economy – needed financial security will secure a long-term future

The programs touch so many different areas for preservation and agriculture. Including clean air, clean water acts. It has become an administrative wide effort, not just the problem areas that were mentioned earlier. These were simply examples of the areas of focus, but not limited to the scope of conservation efforts.

There are parks but places where students do not want them to go. Parks are where gangs are, and outside is dangerous, inside is safer. Those kids are getting obese. Going outside is actively discouraged, safety is issue.

There is inconsistent messaging across the public landscape; a mosaic of messages. The user doesn't differentiate between federal, state and local agencies and organizations. We need to create consistent messages regarding public use. We need to derail the negative messaging. Our messages cannot be conveyed only in English – we need bilingual signage. Spanish is the dominant language. We need to commit to bilingual signage.

Uncertainty around federal tax incentives - owners are putting easements on hold until they figure it out in congress. Make it permanent, it's supported already! Conservation easements - decline in land values and development pressure have resulted in lower easement appraisals - especially working farms that need the money. Problem with a lien on a property - banks are giving us trouble with easements because they are being too conservative. Banks need reassurances or incentives to allow them to make investments in easements. Banks with pressures from foreclosures are usually the most conservative.

Virginia does a great job developing easements on private land. However, the easements do not currently include public access to the lands. A little more credit (transferable tax credit) should be provided to the landowners if there is more public benefit included in the easement. Perpetual easements are given in Maryland and Virginia to figure out where the land will go/how it will be used. We should put a clause in the easements stating that "the land may be a park in 50 years", or something similar.

## Discussion Question 2

### *Asheville, NC*

existing challenge for Parks at all levels – who buys the property across the street—ie, gambling at Gettysburg, or Walmart across the street Zoning for commercial business too close to historically significant sites. Education and understanding

Funding is shrinking and not available. Funding needs to be more flexible for conservation and other easements.

Parks and rec. leisure activities not seen as an essential service, enhancing property values

More roads are built in suburbs to handle traffic- need to be designed to handle bike traffic

Nature Conservancy-working—funding for outdoor spaces was good- but not now being funding at level LWCF- \$900 mill a year by revenues from off-shore oil drilling but did not get to them at the level authorized for.

Connecting to people. “The Last Child in the Woods” really opened the much broader topic of relevance. Relating to this is important. For people who don’t have any basis to develop the relevance, what is needed is a process to introduce the opportunities to engage. An example of this is the Park Service Science Centers. Experience of children in these centers are then brought back to the school systems.

Federal Government Role that is a real challenge. Big South Fork River and National Recreation Area. Five federal agencies with involvement with this watershed and four state agencies with involvement in this watershed. The federal agencies do not have a basis for interacting with each other. Interagency cooperation is a big issue. Agencies need to be directed, from the office of the president, to manage their resources so that no action taken would not prevent another agency from reaching their mission.

Intern. The people that are running the parks are “old”. Need to remember that to connect with younger people and to recruit younger people, you need to think like them and probably need younger agency people involved. Need to have young people at the table to be a part of the solution.

Parents today are overly concerned about safety. How do we lessen the fears of the parents so that they’ll take them outside?

Making the recreation opportunities that parks/forest provide accessible and known to the public. Need to do more publicity/marketing of these opportunities.

Use USGS more to provide more information- integrate with states and pvt groups who collect information- NOAA is absorbing some but doing it badly- USGS should be the clearing house

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

As a parent we had to look hard to find a neighborhood that was outdoor-friendly- most areas have no sidewalks- need to be able to get to green spaces without driving

There isn't clear alternative energy development. Need clarity regarding energy policy development. Speaking to example of tradeoffs between preserving viewsheds and supporting alternative energy – windpower.

The Rocky Fork tract still has not been fully funded. Critical to get adequate funding. Need to engage communities with regards to land planning/ green spaces in an ecological context which goes beyond biologists and conservationists to the general public. Need to have funding to explore those processes in a collaborative approach.

Need more emphasis on how to use MOUs and volunteer groups. In the face of climate change and invasive species, it will require a bigger base of federal employees.

Need more education- a key motivator is parents- educate parents in the positive effects that being outdoors has on the kids- need to see more of it- parents need to model it- talk more about how it makes people better later in life

Majority of the wildlands in this country are owned by private individuals. Owners are challenged by the high rate of taxing. Creative tax incentives would facilitate not sub-dividing parcels.

We have to start looking at the internet as a tool and be connected with the land.

Most land is in private land ownership. Need to create an ethic and mindset that there is a value to having more than developments and golf courses on private lands. And secondly provide the funding for protecting private lands.

Only major country where climate change skepticism is still a majority. We have a lot to overcome regarding climate change. Need strong public support from the federal gov't. Fed. Gov't has an obligation to educate the public regarding the validity and consequences of climate change. Would like to see more public education.

Look at signage in parks/forests. Many people unfamiliar with outdoors are scared by signage in parks warning of hazards. Signage should be encouraging, not discouraging visitors.

tie in together protection work with restoration work and land protection , ex: you cant get out on the river unless you clean the river and make it healthy

Put more money into river health and purchasing conservation easements to buffer river, buying land in the flood plain. Pointsource pollution issues need to be taking into consideration to protect water National blueways initiatives. Establish some sort of funds with national initiative to protect lands near water. Specifically in floodplains.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Reasonable salaries for such employees/staff people

Encourage passive recreation in parks.-also for consideration: equestrian recreation and more specific trailheads made to suit their needs

teaching young people that , what's your is yours' private respect of lands. Wesser Bald example of Public use on private land- Imminent Domain ruling took her families land. Crimes with proximity. Law Enforcement Challenge- not enough man power to enforce the law.

Conservation Easements are interesting to many people but for most people they're "land rich and dirt poor" and unable to take advantage of tax benefits because they need to find an income source; as a large landowner he'd personally like to put his land in an easement with some sort of sunset on it. Tie up land for generational easements and pay much less over time? Many local land owners don't trust government – the main thing they want to know is what happens after I'm gone That would buy a little time/bandaid step to get some things preserved – and address permancy issues

How come things are getting worse – kids obesity, kids spending less time outdoors. Technology is contributing to this.

Diversity of forest visitors and park visitors. Different races are not comfortable in the woods and enjoying the outdoors. Socioeconomic studies and need different strategies.

Virtual science museum would benefit from technology.

A lot of federal land is tied to certain uses (range, farming) and recreation is not an integral part of those land uses. Growing conflict between recreation and other land use.

Hard to convince youth that it's more fun to be outside than on video games, ipod. There's a perception that it's not as fun to be outside.

Challenge to get people over their fear of nature.

Economic impact of public lands and places where people can recreate. The long-term is that these places pay for themselves. In the short-term, the most immediate are addressed – housing, food, etc.

Streamline management planning- cut red tape-agency processes are not keeping pace with society--- recreation must be a purpose ....BLM's I and conservation program does not have rec as a purpose-need that authorization

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Has been a contraction in recreation access- only 24% of federal budget is discretionary, most of that goes to the military- how do we maintain rec resources on federal lands given funding limitations- rec organizations need to help- processes for managing public land are becoming much more complex- processes necessary to authorize are becoming much more complex- beyond the scale of local units- need to operate more efficiently - need to restructure- less overhead, more \$\$ to the ground

Access to information is a really big challenge. Free information is often not well organized.

Lot of federal areas restricted due to threatened/endangered species. Need education before we send them outdoors – perhaps areas wouldn't be as restricted.

Cultural resources (landscapes shaped by human activities). There are still historic features in the woods that no one knows are there, battlefields, etc. Nonprofits cannot do everything on their own. Recognition is important – if NPS would recognize the contributions of the nonprofits. Funding is also important (land acquisition) for less glamorous sites.

Live in Asheville neighborhood- no one outside- very surprising-

Physical Education! Education as a priority is minimized. Don't hold elected officials (county, state and federal levels) to the mark in order to fund education. Education is the root of the challenges we have discussed.

County, state, and national parks are available often for free.

Level of funding not keeping up with the changing needs of the NPS and other organizations. Should make sure we are applying for federal grants – however those fundings are being cut as well. Current federal budget suggesting that these areas need to be cut. We can't get ahead either way we look.

Take high school kids out (usually from urban areas) to parks and they will have the same response as the Statement made by Fred above

Investing money for maps, etc.-some of the ways to get information to the public is too expensive

have better access to information and make it more readily available

Grew up in a Maine mill town- conservation groups are often viewed as in conflict with local business- need to partner with businesses, eg a greenway for employees to walk at lunch- give businesses a chance to see themselves as stewards

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

taxes – agricultural easement limitations due to the requirement to make at least \$1000 from their land annually – hurts the elderly; reappraisal in 2006 – taxes went up significantly so people were forced to sell their farm land to developers

Leadership in scouting is missing. Mentors are needed.

Having a region embrace, as a core value of connection to the land and wellness. Implementation of this value by employers, school systems, health care systems.

100 million more people by 2050—where are they going to go? Open land now, will be gone—challenge federally to recognize/prevent. Wall-to-wall people- Population Growth.

Same problem—stewardship \$ for donation for easements- if Gov't would help contribute \$ to subsidize these.

No landscape vision for what these lands should be, should contribute to. Need a landscape-level vision for the Appalachian corridor, especially given climate change issues. State purview stops at state lines. States need a federal entity to bring together a landscape vision. USFW Landscape Collaborative is a new effort in this regard.

Represent horse enthusiasts- 600 acres/day disappear from equestrian uses- planners tend not to include equestrian uses in multi-use trails- horses are not the detriment commonly believed- disappearing because we are not being included in multi use trail planning

Community development block grants-need to get grants to design recreation

Riverlink- Climate change - really don't know all the impacts of that- Polarization of the country hard to accomplish anything,

Private funding is also down. The public and private partnerships are not there as in the past. A lot of public mistrust that develops when public land is used to generate public funding – ie mining, forest harvesting.

Technology, the internet, facebook, etc. is a challenge. Get people to take their iPhones in the woods or whatever so that they can connect to living outdoors.

personal – Spring creek easement- many farmers would like some kind of a farm trust- Madison Co not as well off- unrealistic to think they could come up with the transactions cost/ fees to help put farm into an easement – surveys, appraisal, inspections etc. Huge Problem for Rural counties to come up with funding.

Kids in cities can't understand what is so close (mtns). Local budgets are being cut and green projects are going away and losing opportunities to connect urban kids to land. Budget cuts impact existing programs. Nonprofits also have less money to assist urban programs.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Move USFS to USDI-would eliminate accidental clearcutting

Provision of services should be local. Facilities need to be provided locally. Need to make things happen where they are accessible to the people. In this economic environment we have the opportunity to buy land

Challenge of how do we wrestle with the roles of government? Gov' t should set a tone for conservation and recreation.

Need a national strategy of passive energy generation- need more discussion on pay-as-you go recreation- not supported by all

Local jurisdictions – Awareness in the community, outreach needed for economic benefits, quality of life, env benefits need to make them aware/proud of those resources—Educational Comment

Asheville facebook outdoor meet-up group for hiking. These young people are meeting on facebook and arranging a hike.

80% of country lives in the urban environments. Children growing up need to develop an appreciation of this. Children in many ways have no way to get outdoors. Need larger pieces of open space in urban areas. Kids only know asphalt. Develop neighborhood gardens. We are missing an opportunity to educate kids in urban areas. Need to leverage funds.

delays and lengthy reviews are prohibitive; strengthen federal law to maintain easements

LWCF mostly goes to the west and should come to the East; at issue is Southern Appalachian mtns' new road construction (interstates, state, forest service roads); states and agencies need to hold back on construction and look at more holistic approach

Eastern US has majority of population and don't have the land base that western states have; criteria for availability of Federal funding is a disadvantage to get LWCF and other funding; criteria needs to be scrutinized to go where the greatest need is

Look at incentives; temporary success with charitable contributions for Conservation Easements; temporary program should be made into permanent program; NC was 1st in credits to easement donors – 180,000 acres have been conserved; provides for negotiations with landowners; dollars stretched with state conservation dollars; credits are not currently transferrable

Authentic, inquiry based learning should be brought back.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Biggest Challenge To Youth and the Outdoors – reconnecting people to the outdoors: “Getting Kids from Inside the Schools” – maybe only get outdoors once per day. Moving kids from inside school – have more outdoor activities as part of the school day.

leadership needs to come from administration to raise awareness of LWCF needs

DOT’s may drive development – they should be here as a key stakeholder. Roads take away character of National Forests

Funding- non- profits are all competing against each other for the same \$\$- need to work together- example is sharing membership program with NC Arboretum, sharing lists-

Private working forests – millions of acres of timberland harvested heavily – ecosystem service (pulpwood) is undervalued relative to carbon value – government needs to move on carbon, set fair and reasonable price on carbon. Need to make sure that policies are based on current and future priorities as opposed to past legacies.

When economy is down, opportunities are created; full funding through Land and Water Conservation Fund for public agencies is critical now

Forest legacy and other initiatives require matches; is there a way to incentivize local governments with large tax base to use federal funding

easements benefit small farmers

Difference between convening people around species and connecting people and constituencies; equal amount of effort needs to be focused on the latter; National Forests float above the landscape at 2500’ – connecting with national forest lands are difficult since there is such a buffer of private land; funding from states for “small pocket connections” deserve attention; there are already plenty of species connection plans in place – need to focus on heritage and urban site connection planning

Connectivity of people is a critical need. An example is Old Fort NC where 1st piece of land was purchased under the Weeks Act. The Forest Service is at the table but isn’t able to invest much or offer communities’ assistance; needs to strengthen community assistance and cultural resource management; staff presence is a missing link; cultural and heritage resources are a point of connection between people – need to interpret local traditions, historic sites important.

Danger of creating islands where we conserve our resources, and we don’t connect those islands to the lands in which we live. Always be fighting the battle of exotics that are problematic. Funding (particularly from states) is perilous. Federal government could help with higher level funding (cooperative extension). Connecting funding sources to national/state parks would be great.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Contracting with federal agencies and the agencies difficulties in bringing on SCA interns is an issue. Bring youth as a capacity building function—have the youth bring new technologies and innovation to the federal agencies. Another issue is to get more training for youth leaders and also recruiting agency staff that want to be youth leaders.

Creating better pathways for young people to get jobs. Also providing opportunities for diverse young people.

communication between tourism groups and federal agencies-rules and regulation regarding access to public lands and marking areas (not enough signage in some areas about what resources, amenities, etc, are available)-directional services-policies regarding signage

little mgmt on multiple use area since court system is impacting us federally So hard.

Federal and State good, but State/Local good, but Fed/Local conservation easement not easy. Fed govt' needs to work better with land trusts. Need to have staff/agencies to do the work. Too many other things interrupting. Ability of dealing with easements on lands.

Time spent outdoors with a caring adult contributes to conservation ethic; need to increase programs like "No child left indoors"

Talking to people's pocket books can create initial interest and can create personal interest. Discuss jobs and duties outdoors. See outdoors in different light - Personal funding – can encourage to see the great outdoors is a positive thing – connect to jobs training, agricultural things. Inter - city areas

Consider methods to engage all demographics, not just programs for students.

Water sports, lessons and rentals. Nature groups in high schools. And promote americore programs for students coming out of high school and college. Youth conservation cores should also be more promoted.

Get beyond the EOG and connect the students by other means, music etc.

Fee areas, put profits earned back into the parks where the revenue is being made

more patrolmen to reinforce regulations and keep park users in check. (ex: lesson litterers)

So bad that you have to get in your car to go from one shopping center to another- need better urban design- needs to be a network, not isolated routes

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

obstacle is resistance from school systems and lack of willingness of leadership to speak out – it must be mandated for people to fall in with these environmental education programs.

people don't get outdoors, they have lost sight and knowledge of the "fun factor" of the outdoors in the forest-there is no talk about forest...

ENFORCEMENT! Need to be more enforcement of rules and regulations-needs to be more transparency when things are being funded, and there needs to be more accountability-more enforcement of already listed regulations

Wanted to know how involved the Department of Education is with this effort. One of the challenges is the state standards of learning/education standards/teaching to the test. Teachers are too afraid to break from the testing curriculum and take the kids outdoors.

Need to understand and go to where there is greatest need. This is inner cities and isolated rural areas. Currently, many of the programs/organizations working on these issues are concentrated and we're missing areas.

More marketing and information- awareness---need to put it on the stations kids are watching---fund LWCP and RTP

The funding is getting cut. Federal Funds, state funds, etc. This contributes to a maintenance backlog. Visitors don't have access.

Financial challenges when people have easements on properties, there is a tax benefits for those. The IRS is not wanting to honor those deductions. Work with the IRS for resolution of this issue.

LWCF; climate change will have huge impact – need to keep change in mind when prioritizing LWCF acquisitions

have a plan that everybody buys into that is long range and in visionary (ex: dikeman plan)-have collaboration (!!)

Richtop development and wind power--- fear of developing wind power mixes with conservation mandate. Needs to be changes in attitudes. Influence of fed government to show us an "equilibrium with nature" there needs to be marketing of the importance of everything the outdoors has to offer as well as how we should continue to practice conservational efforts to better maintain such valuable recreations Tougher and tighter regulation of what goes into the rivers. (ex: pigeon river) make private industry sectors more accountable, they should be using their profits from dumping to also clean up the waters, etc.

Reorganize the priorities of where our government funds are going.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Some programs work really well, depending on the budget. Exposing kids to natural and cultural resources. Use art, poetry, etc. to engage young people. NPS site stories should be relevant to today's life – creating 'schema' in interpretation. More about the 'people' than about strategy.

Teacher for many years. Best things she ever did was getting kids out of the classroom. Too much funding associated with teaching to the test to allow teachers more flexibility to get kids outdoors and in "Muddy Sneakers", e.g.

Most city facilities don't really operate sufficiently (don't have the money and budget). We've grown up in a culture where public facilities should be free to us. There is a balance between the value of activities and the costs to the public.

Youth Learning Institute (Clemson) claim to impact 100,000 youth each year. Lots of organizations working with youth. Opportunity – get some of these groups sitting around the same table, one organization may have fundraising arm, and another has the curriculum – mega opportunity. Reduce duplication, and don't worry about who gets credit as long as common goals are met.

consolidate program opportunities; had a hard time finding SCA program info; if he'd know opportunities were available in while in high school he'd have been working every weekend but was never exposed to it and when he heard about it, hard to find info; military recruiters are in the schools all the time; fed govt can help with better exposure to opportunities and possible career paths.

Ecosystem services – where to put your \$ - conserving lands does more than recreate on –clean water/clean air - talk about this in way people can understand- Federal gov't could help

embed groups in the communities to tie the economic benefits

More staffing to enforce protected areas and increased surveillance.

FDA comment period open for 2010 dietary guidelines. They are proposing that we reinstitute recess, physical education, home economics into curriculum. We need to get these things back into curriculum for number of reasons including childhood obesity.

Obstacle is how to reach parents of young children. How do we get the parents outdoors.

Communicate with those who are not enthusiasts in a way that they can feel comfortable

Government agencies need to be involved in dialogue with partners and communities

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Fully funded LWCF in 1964 would be \$3 billion now; current requests in NC of \$7 million might “break the bank”; there is a huge scale of unmet needs

difficulties with land protection work – timing is an issue on the federal side of LWCF projects; properties often end up owned in fee by land conservation groups for two years or more; individual landowners are forced to wait a long time for closure; Forest Legacy is not currently a successful program in NC

Lack of appreciation and feeling of inclusion and being part of community. Different lifestyles need different methods of awareness and some need assistance with funding.

Losing entire hemlock forests in Southern Appalachians; direct more \$\$\$ to treat hemlocks and save the species; this is a great tragedy of our lifetimes

community planning , community efforts, educational components, give more opportunities to the citizens-lacks of conservation funding-or inappropriate expenditures/allocations of funding

education of land owners and users and citizens... educate them about our facilities

Find that land trusts will help negotiate conservation easements; but finding that USFS in particular is not interested in taking on the property because there’s a permanent conservation easement on a piece of property they’re being offered. #2 Access to public lands – federal agencies sometime block off access points when navigating between federally and privately owned land

as NC expands lands programs, it would be a lot better to have more access to federal and state agencies – find out what lands are strategically important to all of us; work through acquisition process with federal land managers – historically hasn’t always been what it could be

confusion at all levels that are involved with Clean Water-*ie.* City of Realign want to shut off flow but Corp said no—National Priority needs to not fluctuate in direction and goals

Quality of life issues and funding. Would like to see dedicated, full and equal funding for state side funding. Specific request for NC Parks and Recreation (Hickory) that Land and Conservation fund be fully funded and that state side would be equal to the federal funding.

Senior Citizen, went along with Muddy Sneakers one day. The teacher and the naturalist sat down before hand, and the teacher taught from this after the excursion. Funding is a problem – most is funded by donors, school system funds some of the bus expenses. Open to every kid in the public school system in the fifth grade in these counties. Funding would mean that every fifth grader would be able to get out.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Getting kids and families back into the outdoors. NPS could teach families how to use their time at parks. Supply recreational opportunities (eg. rent kayaks, bikes). Need system of teaching unfamiliar outdoor families how to connect with outdoors.

Consistent funding

State side of LWCF has been even less consistent than federal. No commitment to states.

Disconnect in understanding that conservation and recreation use are an economic engine- there is a dearth of knowledge-we are working to develop economic data-people don't understand how the hospitality industry develops around that, with products, services,etc- need to better understand the economic return....lack of awareness of what we have- natural resource heritage program very important to know what we have---- access is greatly limited to private lands- esp. where only source of \$\$ for local communities is property tax- local govt sees too much advantage in putting houses on the land-

grants for trail work received from DOT have to be built to their standards

cannot give public access to conservancy lands due to costs

Fees may be an issue, particular to lower income families. May reduce or provide free passes to NPS lands (maybe at the bottom of tax forms, if income below a certain amount, check a box if you would like a free pass for the upcoming year)

LWCF funds dedicated could help land managers better plan

Timber management – hard to do good silviculture in NC; losing early successional habitat; biofuels; education that relates to timber management

Urban forestry work --budgeting at local level (municipal) is losing every time without Federal/State funding—should not be Cops or Trees, but cops And Trees. Safety. Happiness and environment sustainability needs to collaborate and support-grassroots importance needs to be done.

Programs established but never funded. Private donations often make up the deficit, but not always. Cherokee Nation forestry program never funded.

We need a national priority for collaborative restoration of our public lands. Look at the species that we have lost – such as the American Chestnut trees. The urban and forest interface ordinances. Fire prone zone – you need a metal roof, safe zone.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

educating people on how to care for parks; example is abuse at ATV trails in Nantahala National Forest – people have built illegal berms, people have been injured, etc. Safety measures need to be implemented to keep the forest from being scary.

Private funding for advertising: how to get the message out there and promote awareness and education. There are just lacking funds.

“Commercial users fees” and day fee areas. Enforcement with fee areas

lives near Catawba river on Pisgah NF – has conservation easement (forestry program) on his land – feels like he is penalized in taxes on his land due to neighbors activity

need to break the cycle and get to young people to help address long term conservation – find models like Muddy Sneakers and others throughout the country; need to create a seamless web for exposure and integration so that people continue to want to work in these fields

local people don't want government to take property or interfere with their lives; may be inclined to sell land to a developer rather than a conservation easement or working with governments

20 yrs non-profit work-trend over time of DE-investment in staff, hurts overall. ARRA burst nice but gone after this year. Society needs to think do we want to invest in our public lands—if so how important and how to pay for it.

have more directional information, easily navigable user database with an inventory of recreational opportunities, and advertise it nationally (ex: great American outdoors online) have an index of all these activities

Educational field days-places/stations for schools to go out to and learn from park staff at these stations as well as learn recreational activities and safety.

Challenge is public fear of the federal or state government's role in land preservation and conservation. Public fear of losing private land ownership rights. Challenge to put an economic value on the land.

Need stricter zoning around NPS sites to prevent encroachment. Would be cheaper than buying adjacent lands.

What if there was a 'screen-door' Tuesday...just open your doors/windows on a Tuesday as a first step.

National Trust of Historic Preservation's campaign to help communities engage in their cultural resources; increase efforts to help people donate easements; fund Historic Preservation at a national level

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Conservation and cultural heritage are falling by the wayside, especially in public schools; there is a huge disconnect with youth and heritage

Not enough support in the right areas – schools, camps, educating the youth.

DOT is critical partner in this process – they need to be brought to the table

climate change is biggest challenge to land management; protect, connect, and restore; lands such as wilderness study areas need to be designated wilderness (keep promises); money needs to go to agencies for restoration efforts

Unfortunate that some public schools only get small opportunities to engage in outdoor education.

Watauga Parks and Recreation Authority has sponsored a newly formed Tourism Development Authority pushing for more outdoor recreation opportunities; very fortunate to have tourism-based community; state and federal parks cutting staff but more people are coming to local, state and national parks.

Continue to have the tax credits for conservation. NC has a state credit for conservation. On a national basis, encourage states to provide tax credits for conservation. Collaboration needed with Land trusts. State/Federal need to be open to re-purchasing the land acquired by Land Trusts.

Need to do a better job of interpreting and preserving the Rutherford Campaign, the southern frontier in the American Revolution. It's a national story and should be done by the NPS in concert with the Blue Ridge NHA.

Federal agencies need to be talking with each other. Interior and Commerce need to work together. What are we doing at the national level to build sustainability? Need to break down agency barriers to working together. Need to see it more broadly...find some balance and work together for noble and worthy goals.

unstructured play missing in today's neighborhoods/communities/schools; partly a safety issue; even if teachers want to take their kids out some principals and liability issues are discouraging it. Even local daycares don't always have grass – and when they do they're caught in issues related to bugs, etc.

more and better zoning regulations can bring sidewalks back to communities

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Management of TNC's lands and private lands – use of fire as part of ecological land management; 4 states in the mountains have gotten partnerships to help the needs of wildlife and reduce fuels in forests. Partners on state side, NFS, NPS help people realize that fire is critical component of ecology. An obstacle: concerns about effects of smoke on human communities, roads, etc; small window of when prescribed fire can be implemented; need to work with EPA to develop a more realistic window for burning

Taking kids out into the woods (fieldtrip style) : take the kids out for a few days, and then they want to take their parents out.by teaching the kids about the outdoors you are indirectly teaching and reconnecting the parents.

There is a fear factor: people have never been in the woods and are afraid to get out there because they are so unfamiliar

Mass transit systems that connect people with national parks, forests and open spaces. Need to put mass transit into the equation for connecting people to the outdoors.

NPS good at interpretation. FS is good at managing forests. BLM has different focus. Would we be able to reorganize agencies/public centers to have the people who are good at one thing be in charge of that aspect.

Planning logistics of outdoor trips is time consuming and needs expertise. Classroom teachers don't always have the resources needed. What is needed is a position, Environmental Education Coordinator in the schools who has the job skills and desire. Even during depression we created National Parks; therefore, earmark funds for these activities.

Need to assist small, individual farms in competing with the big players. Until the government stops subsidizing food and have experts look at farm bill and not lump all growers together. Let consumers choose local food over mass produced food. Make connection with the outdoors and local farms. This also creates jobs and labor and better foods.

State tax rarely touches family farms.

Bureaucratic obstacles (laughter). Excellent opportunity for Trail development but bureaucracy got in way on the Cherokee NF. Simplify ways to get trails in – too much red tape.

During economic hardship, land prices are cheap and there are tons of opportunities, but not funding to capitalize on it.

Teacher. Many teachers out there who have an understanding/knowledge of the outdoors. As long as we define school success as a test or standards, everything else will be lost. Teachers and administrators are forced to give up physical education, field trips, recess, music, etc. so that they can demonstrate that they are using all of their time teaching test components. Problem is that the only system of accountability is the test.

## Discussion Question 2

***Asheville, NC***

***(cont.)***

Need full funding for LWCF. Never appropriated fully. Congress diverts funding.

Inconsistent interpretation of volunteer programs of work across federal boundaries.

Need to evaluate how many times young people make use independently of the great outdoors. This could be a measure of success. Challenge/obstacle is how young people are able to access the great outdoors, public transportation would be a part of this.

There are tons of interest groups, yet they don't always have opportunities to interact among each other. Perhaps a role for DOI/ DOA to assist in getting groups together and create awareness among groups to increase teamwork and unite ideas/funding/staff, etc. Creates an efficient use of talent.

Hope to expand and make permanent Federal tax deduction for conservation easements.

dedicated funding for land/water conservation; #2 need to do a better job of marketing the federal agencies resources – lands, parks, etc.; bring message to a wider audience and raise awareness through a variety of programs

Working on a number of programs for Fontana Foundation. Working to secure private funding—challenge. Also, helps with Stecoah Valley Center—historic and cultural resource. Obstacles are trying to raise finances to implement programs. They have the knowledge, but funding limits opportunities.

Liability is a big concern.

introduced wilderness to 10000 kids in past 20 years; do school programs, etc. – short term experiences are great, but need longer term opportunities when kids are so programmed with other activities, etc.; public school budgets may not be able to accommodate this additional exposure; her program focuses on private schools with a limited demographic and not much diversity

building playgrounds, etc; but nothing for older kids – ball parks are ok, but trail systems might help this challenge. There's money for shovel ready projects, but no money for planning- and trail systems take master planning; hard to build something and not always using effective

uses state and national parks for experiences and sees inconsistencies in permitting/application fees/etc – need more consistency across agencies

Ocmulgee NM expansion needed (11,000 acres) -great opportunities – 90 min from Atl airport in middle GA – would link some state, other fed lands, much land still private, not protected

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

66% of land in US private. Need to expend more energy on conserving this private land – limited activity now. Needs momentum

Farm Bill – increased ownership length requirements – eliminated lots of land owners from the program.

Roads are barrier to conservation activities. Cannot connect biologically rich areas. Roads are not designed for wildlife passage. DOT does not consider this. Road widening projects are not considering wildlife. Several examples of this given (US 74A). DOT needs to come to the table and consider wildlife crossing in planning.

Private land being used to preserve longleaf pine. 2009 funding was being delayed and got stuck – sitting on accountants desk on USDA

Transfer of Development Rights. TDR program ran into 2 issues – no funding to buy development rights, don't have any demand for development rights currently. Need to develop a source of revenue to buy development rights.

accessibility to outdoor recreations /liabilities

Money for staffing. Rangers are understaffed and overworked. They are also the ones working and connecting with the youth. Ex: junior ranger programs, campsite talks, they aren't being offered as greatly because they cannot be provided for

Can only continue to afford his land if the present use value program continues.

Importance of partnering with health providers to spread our message and to potentially counter-act the safety/parent issue.

Support the No Child Left Inside and Elementary and Secondary Education Act --would encourage supplemental education for teachers. EPA puts out environmental education grants for states each year and this funding is very limited—need to provide more funding and more grant opportunities. Also, create funds/grants for connecting people to the outdoors. Lack of funding needs to be improved and provide incentives for teachers to get additional training.

The positions that are cut first are the positions that are seen as supplemental...environmental specialists, sustainability specialists. State and federal levels need to tout the programs that are working.

Challenge of wanting adults to work with youth and the liability concerns that they have. Reliance on volunteers further exacerbates these concerns. Volunteer in Park, Volunteer in Forest program (workman's comp program in GSMNP) to see how we can cover child abuse/injury type liability issues.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Publicity for National Trails Day is very good. They use website to make all the opportunities known. Can the federal government create website where trails groups and other organizations can upload information about recreational events/opportunities for the public. Would be one-stop shop for finding rec. opportunities. American Hiking Society's National Trail Day website. Make it easier to find opportunities.

Teachers have not done a good job of documenting our successes or showing the impacts that our programs are having on children. Depth of experience may be as important than how many million kids we reach.

Federal partners need to bring partners in as part of the "family". Organizations do not want to be controlled by grant requirements, reporting requirements etc. Simplify grant process.

Form partnerships between public and private groups to help with funding.

from SC – funding sources from Conservation state programs has dried up. Lack of county support. Difficult to proceed.

Agrees with Jess (above) but suggest some government funding for groups such as YCC and summer programs for students and youth to continue volunteer spirits. IAUP: interpret, appreciate, understand, protect.

Challenges of getting message to Congress. Big returns to investments when it works. Brag on success stories. Get lots of return \$\$\$ for \$\$\$ put in. 4 to 1 investment return on Fed spending in NPS \$\$\$\$. Convey message.

Tax structure can also be disincentive. Estate tax is bad – causes people to sell land. Land rich, cash poor folks suffer. Land is sold and developed. Don't have money to give to people with good intentions for their lands.

We're not going to win the "leave your cell phone at home" battle. We need to better understand technology and use it.

The impact of the current drive for "national education" standards is challenge. The standards are not the problem, but the TEST is the problem. The test is the measure of success/gateway to next level and that is why teachers are teaching to the test. Pressure in education is not to innovate, but is all conventionally structured. Test drives educators with no tools to do only that which they know—conventional teaching methods. School administration is also a challenge—not willing to take risks.

Need to broaden the measures of success for land trusts. Should not just be measuring acres preserved, but community impact. Much broader measures of success.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Most people don't think about land conservation and associated jobs.

Less land to access within easy distance and. Discourage use of waterways due to pollution problems and overpopulation.

PSA's play huge role. Positive input is needed! Engage television audiences.

Need to have more hiring programs for youth like SCA or provide ways for more agencies to use SCA programs.

Conflicts among different federal and state programs. Those groups/agencies need to come together – prioritize and plan together.

there is no money to be made in conservation, America is monetarily driven

Refer to RTP, funds derived from gas tax-ability to access the funds vary from state to state- small towns have a hard time applying- need staffing time

Convincing children that it's okay to be outside.

Kids using social media spread information to other kids effectively.

Knowing that spending time in SCA may benefit you in college, earn college credits, makes it a more attractive program.

We don't have the resources as park rangers to look outside of the parks to see who we're not connecting with.

Ecosystem services – new USDA small office- Office of Environmental Markets?? –they Should tie back to local – fund the things we need to do adequately like clean water, rangelands etc. Also – need to communicate Clearly with local for economic opportunities,. Recognize local gain is vital to local, since no more timbering etc, no more revenue

wildlife corridors and biodiversity is being affected by land fragmentation; fragmentation makes prescribed fire for restoration difficult; conserving land or resources

BRP viewsheds overgrown – volunteer partnerships help but staffing is cut in half so how to accomplish

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

There's a lack of inertia, a disconnect between outdoor education and kids. Programs start but don't follow up. Offer competitions outside on youtube to attract youth.

We need a park service ambassador to visit schools to promote programs.

\*\*\*STAFF STAFF STAFF

Ref LWCF funds-Congress diverts 85%to non-rec purposes. Need a fully-funded NPS-operate at 2/3 baseline budget- we are fortunate to have such a large park in our region

work in an area with national forest that only comprises 23% of the proclamation boundary; working to acquire more land – need more LWCF dollars to acquire more

Never see advertising on TV promoting careers in NFS/NPS etc...

Funding is biggest challenge for private (NGO) groups in land management – such as conservation easements; bureaucracy – grants are so labor intensive to apply for and hard to administer; grants all seem to have different deadlines and matching requirements; relevance to the public – need to connect environment to people; public misconceptions about land management; no land use zoning in South Carolina; urgency – people do not see the need

policies are prohibitive

Boulder and Portland good examples of bike-friendly communities- known for best place to work, retire, raise family, etc.- not an accidental connection

We're competing against people going to the mall, message not out there that nature is readily available. Most think it's too far away.

Mapping paddle trails-many opportunities sbut not enough providers- liability is a big obstacle esp on non-federal lands-

Focus on access to green and blue ways when developing communities

LWCF needs full funding and re-examine how funds are distributed; need more money in the east due to population centers; how are federal agencies using LWCF; huge disconnect in where the money is going – example Uwharrie NF

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Too many multiple mandates for the federal agencies- these can be very conflicting management directives-recreation does cause some damage- how does that info get across to people- how can the public better understand all the impacts

bureaucracy – FS – local Rec area had to be closed – Volunteers offered to pick up garbage etc but the FS imposed such cumbersome rules that group could not do the work and collapsed. Group would have had to be non-profit and pay incorporation – in the name of liability

Valey fill permits and Mtn top removal process- Federal gov't has not set penalties -High enough so companies ignore and pay penalties and keep going as is.. West VA in particular- BP oil created giant island of gravel so they could make a loophole

Too many obstacles to getting a park service job. Too much red tape.

get Congress to Act in legislation – House Nat Resources has voted on offshore oil, land etc. Would like more support of that

No brainer-need more\$\$- pvt foundations looking for joint projects- trust funds very important-many states would kill for the kind of \$\$ we have in NC-more collaboration among groups needed- need to use trust fund \$\$ wisely

Using science is a good way to connect to nature.

We have met the enemy and it is us---we cannot wait for the fed govt to act

Encourage “No child left inside act” !!!!! Oriented to \$\$ for schools to take buses into national parks and national forests- teachers need to get the students engaged. Currently the testing systems actively discourage teachers from teaching outdoor education- only given resources to teach what is on the test

Also 80% live in cities, where parks are not- lack of parks in urban areas

Agencies have multiple jurisdictions --don't communicate with each other- volunteers have a hard time getting agencies to talk to each other- when they do, great things happen-volunteers are the mortar between the bricks- initiatives don't come together unless the volunteers do it

dedicated funding for the farm bill, not subject to annual allocations can help individual farmers

The connection to Federal tribes: US needs to be as good as Canada in connecting with native peoples. An example is the Cherokee tribe and connection with GSMNP; shared management structures with native peoples – National parks and national forests are tribal lands

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Cobb county in TN – will take a collaborative effort not only from traditional stakeholders; need more funding in LWCF – did congress forget about this? Need to work in partnership with congress

What can we do to offer benefits/rewards to kids for going outside? Offer rewards for time spent hiking/camping etc... Once we get them out there they're more likely to stay.

Coordination – one program doing the same thing as another – need to work together

Aging of volunteers

Inconsistency of legislation – varying tax credits and funding of programs. Need long-term consistency.

USDA appraisal process does not work well – takes forever.

Missed at least one generation of getting folks outside. Need to focus on 1st graders and their parents as well.

LWCF has no mechanism for reimbursing administrative costs.

Americorp program works well – support conservation and gets kids out.

-contact college, etc, to engage student in community service work or public work

Money (!!)

The burden of taxation on the local level is misunderstood. People are afraid of tax increases., which leads to lessening of maintenance of recreational greenways and trails as a result of lacks of funding and communal involvement.

-Issues with pollution and how to watch that/supervise how it is kept cleaned or protected

Recreation centers for kids: interactive games (ex: bike pedaling games where you are getting a work out/exercise, but it simulates being outdoors)-use the technology out there to promote (non-nintendo style)

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

How do you make going outdoors “cool”? (ex: gogreenzing.com)

-keep up to date !!

Initiatives towards institutionalized “fitness” campaigns, as well as recycling campaigns and Go Green type pitches. Get kids outdoors, childhood obesity and benefiting the land.

-they are also the personnel who help maintain safety in the recreational areas and parks.

Needs to be a reframing of service on public lands. It needs to seem less like work, chores, or punishment. Education provided to help lesson impressions such as those listed.

Conservation tax credits.

Full LWIC funding.

Collaboration and Cooperation to maintain lands uses as they are meant to be.

the first place people call for info is local parks dept – don't have resources – no clearinghouse for outdoor tourism information – need a data base for this

LWCF needs support and funding. Strong local support

orienteering needs a detailed map – unique skillset – don't hold on NPS lands because of management changes – would like to create MOU to use fed lands – landowners don't support because they don't understand the low level of impact of the sport

no incentive program for “good” development patterns – need to consider incentive program similar to cons. Easements, & like credits for historic preservation or LEED building – hard to get lands for greenways – can we increase tax benefits for greenway easements? - Need to increase \$ for CWMTF – supports local growth.

½ of trail complete – mostly in WNC – barrier – no camping allowed for camping on BRP – if allowed for trail, would promote use of the trail.

local challenge – communication w/land managers – not sure, inconsistent about what the clubs are allowed to do formalized w/agencies

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

need more agency partnerships – will help us do a better job – access to areas also a challenge (where we can ride)

lawyers & politicians the challenge – must convince them the value of recreation – should be a core mission for local govt – for lawyers, legal challenge regarding liability for private landowners – state/fed legislation to fix this?

State pop. to grow – but most growth in a few counties – outdoor rec is a (maybe the) legitimate growth strategy – rural counties need to adopt to grow in the future – also tout health benefits of outdoor recreation

Youth Summit held in NH – a Dr. mentioned how the next generation will ID their preferred location – will be looking for life opportunities first, then find a job (a switch from previous generations) – also needs help with liability issues

need to look to Europe for outdoor liability models & consistent, integrated signage

getting more diversity outside – more minorities need to be drawn outdoors

Urban youth not traditionally a part of the outdoor conversation – most opp's are city parks – to change, need to fund urban school programs to offer greater opportunities – didn't have parents that did this, also need to give “safe” access – in the area and getting there – “NPS Outdoor Nation” an example – need to be given the skills to gain confidence

Infrastructure Working fund – used to fund project for rec on NC in the past – need to look at current examples like this (CO) – bring opp's closer to urban centers – a shift from extractive mgmt to rec and sustainable management (esp w/FS) – partnerships can help move further in this direction – look at groups working together to find solutions for these – land managers need autonomy to work with local groups – when lost, things get difficult

FS trails is appalling – major problems – too many “bad” trails were adopted from other uses – too much pressure put on volunteers to try and maintain and fix bad trails – NF's NC/Pisgah has not provided the management needed to help (their job mostly a firefighter) – poor trail knowledge by FS trail managers – must increase manager's trail education – trails needed to get people on the groups – and to put people there in a sustainable fashion – must reinvest – more emphasis being put on small parks/trails, but major land areas also important – not good knowledge of trail assessments – need to better assess need to take advantage of available resources

Confusing to know the rules in each NF unit – “can I have a beer here?” - not communicated well – need to get the info out better for the public

## Discussion Question 2

### ***Asheville, NC***

***(cont.)***

In GA, had the same problem with family services, made a small sub-agency from representative of the larger agencies to help public navigate the bureaucracy

NEPA is great, but is a hurdle for trail management – moving the trail often improves the land, but too expensive to do the NEPA to clear the projects – allow more CE's for this work – often keeps trails in bad locations – need to reallocate these human resources – look for good examples abroad – Wales is a great example of management integration between parks & forests – 5% of GNP made up of trail use/tourism and infrastructure – need a tool to show green infrastructure and econ development are inter-related – also tie to the “value” of the health benefits generated – also, how to let trails help cut use of fossil fuels/oil dependency – more walkers, bikers in a community – problems managing trails in Wilderness (not enough sawyers to keep open) – need more flexibility

Would like to see volunteer liability coverage extended to cover issues of using youth in trail maintaining

Create consistent standards for Wild & Scenic River designated areas – need a designation of “wilderness lite” to allow for a great breadth of human-powered use (like bikes) -could be a permanent congressional designation

Problem with kids – no money/time/knowledge in schools to take kids to nature area – need to teach kids what they are looking at – doesn't have to be a beautiful forest, could just have weeds in a back lot to get kids connected to nature

Gang activity is due, in part, to lack of recreational activities. People are afraid to go to public housing because of the 'label' or stereotype. Connections that older people had with the land aren't there now.

African Americans do not want to go “in the woods” because of the history of how they were treated in the past. Have to make things relevant.

One of the reasons these wonderful programs are being developed is because existing programs aren't very good. Programs being developed outside of schools are better than ones “officially” part of the curriculum. They should be the ones in the schools, and throw out the existing programs.

See exhausted and frustrated teachers. Not just taking kids out, but also training the teachers how to do the program (Muddy Sneakers)

Need to revamp how we conduct education in this country – maybe have pilot school – try

Oftentimes federal and local governments are tasked more with enforcing laws and regulations.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

The city is challenged because of funding insufficiencies. Public spaces not getting enough money to maintain and enhance. How do we use private dollars to help with these funding inadequacies.

Intrinsic conflict between urban and rural population regarding taxes and funding for public lands.

Lack of funding to take care of the lands we have. See that with the EPA, statewide only 7 people to do erosion control. Things fall through the cracks when you don't have capacity.

A challenge in education is that we haven't reached the educational policy makers. There is a fear that kids won't meet appropriate mandated national education standards.

There is a challenge in reaching the staff – educating the teachers.

Funding. Upgrading and maintaining our parks.

Greenway development. Referred to British government as a model for preserving green spaces.

Old SCS (NRCS) is an excellent example for ecosystem protection. Need a regional look within the federal perspective to align investments. Focusing cost share money where it can make a difference. Ultimately the private land needs a stronger focus.

Issue of fear of engaging in nature.

Federal agency emphasis on consequences of climate change.

Advocacy is not generally seen as part of a federal employee's job. It is difficult for public agencies to be advocates.

Agencies who want partners are not the ones who are writing regulations. Too much red tape just to do anything on forests ervece land. Need to streamline means to work with partnerships.

Better labeling on food needs to occur. Need to crack down on big agriculture and focus on small farms. Federal gov't should be a better educator regarding food labels.

Preservation, protection of honeybees.

## Discussion Question 2

### *Asheville, NC*

*(cont.)*

Technology and how to get young people away from this technology is a problem. Technology is probably a positive and a challenge. Understanding technology and how to best use it is important. Solitude idea is also important.

Local foods initiative by Michelle Obama recognizes that parents are audience we should be targeting. We should follow this model.

Need way of funding the programs that can demonstrate that they have made a difference.

Many sources of funding are confusing. Most people don't know about the various sources of funding, especially with state funding. The challenge is to know what funding is really available and that it is used most effectively. Potential for funding is lost in administrative and government processes.

Physical connectivity with the land. Parks were created based on the land that was available, and maybe not the best locations for the parks. Connectivity of all of our public lands and how they work together to preserve and conserve our environment.

In certain communities there has to be a lot of trust and communication. So you don't lose land to heir disputes by the petition sale. The land is gone, developed, and the family members get no compensation.

Keep our waters clean. Protect the headwaters of our stream

The cost benefit of public lands is not communicated well to the general public.

What about the scouting organizations? If it works, then we need it. The problem is not leadership.

Social media and technology – challenge to see those as tools for communicating and encouraging participation outdoors.

Challenge – Diversity – getting children interested is a great start

Sustainable development. Most of current recreators she sees on trails do not reflect the population. Many people have to spend their \$ on gas to get to work or to pay their utility bill, not for gas to drive to a trailhead. Need to go to Girls Clubs, Boys Clubs to teach kids how to enjoy, conserve and live a more sustainable way.

Challenge is to figure out a way to use the preserved, conserved lands for communities. Need to find a balance between preserving and use.

## Discussion Question 2

***Asheville, NC***

***(cont.)***

Challenge of more outdoor activity in schools. Fear on the part of parents and school administrators. Need to find a way to make Outward Bound type programs more affordable to all. Need to find a way to fund outdoor equipment for schools.

People in Washington are totally disconnected with people in the real world. People in Washington need to spend 2 weeks working in the programs they implement.

Access - closer natural areas

Safe access

Safe transportation

Marketing - jobs, funding, more local, community-based advertising

Fear of nature

Cost

School buses, transit buses can be used

Free time

Video games

Interesting incentives

Parents fearful for children of nature

Lack of knowledge, what will I gain from going outside?

## Discussion Question 2

### ***Asheville, NC***

***(cont.)***

Integrating outdoor learning to classroom setting - making a connection with nature

Having a specific area for teachers to teach outside

Connect children to their specific environment

Transportation

Greenways

Turning dammed rivers into natural rivers

Have something available for all ages (disc golf)

Increase awareness of outdoor opportunities like SCA

school

don't have a car, access to trails

electronics - tvs, computers

parents (afraid kids will get hurt)

people don't know what to do outdoors, show them what there is to do

make gym class outdoors

shut down nicklodean TV so kids will go outside

## Discussion Question 2

***Asheville, NC***

***(cont.)***

more showers, nicer bathrooms in campsites

keep open/.reopen road areas for four-wheeling

not many roads you can bike on without cards

more money into programs to get kids out

read

shopping

work/school

I enjoy outdoor activities when others are enjoying it with me. I'm often deterred if I can't find others to go with or if I don't feel secure.

Safety definitely an issues for young, single women

Experiencing nature is a new phenomenon, rather than just watching in on TV

urban areas, gang violence: lot of parents don't have the time to go with their children, and refuse to let them out on their own

Lack of it being explained and taught in schools (history of the parks, etc.); normally just about going to visit what we have in Washington, DC

part of the challenge is how to get people who don't have nearby outdoor recreation activities to participate. lot of people take the opportunities they have for granted. have to break the original barrier of getting others outside

## Discussion Question 2

### ***Bangor, ME***

Local land trusts need more help with stewardship, woods wise get that out it works and funded, recreation trails Fed highways and recreational transportation enhancement very successful , but limit of no ATV's, fully fund the LWCF, pocket parks

Challenge is not fully staffed national monuments

Recreational opportunity and the since of community, a persons concern for the local environment based on experience, community development and stewardship based on recreational opportunity. Fed comes in and interferes with recreational opportunities. Recreation angling for Atlantic Salmon would have benefits

Sense of scale 1.3 Million, upper right corner of transportation corridor, doing a pretty good job of managing private lands, please pay attention to Main scale is small impact is BIG.

Farming example, Fed owns lots of land in the west farmer graze cattle in the west pay a fee to GOV, in Maine how about State pays farmers a grazing fee for the "State owned" Wild life (Eco Serv)

Keeping Maine's forest and keeping Maine's economy, broadband access to the rural areas of Maine, limits future business success. Public and private partnerships to

Landowners under stress to maintain public access, all levels of Govt to help landowners to keep land open instead of purchasing

There are different perspectives on the fact. There needs to be information to drive decisions and policy. For instance, landscape planning is expensive, but something that is desired. Science, data, education needed. Infrastructure is a great need. Infrastructure and promotion needs to be increased to increase the public use of these areas. Big difference between Acadia and the Northern Maine Woods; there isn't support for infrastructure to take the burden of private land owners.

Federal programs: there are a lot of niche programs so they are inefficient to deliver. Could niche programs be combined to make them more efficient to deliver.

No kids left inside-Maine is working on this effort. Having environmental education is a big priority with youth 15-25 years old, as heard in an AGO youth session this summer. Kids are saying that they want environmental education.

## Discussion Question 2

### ***Bangor, ME***

***(cont.)***

Owns 150 acres in Maine that is open to others for use. Uses others lands for hunting, etc. With open access comes challenges. Could there be funding to enhance users of private land on impacts of that use. Funding is very low for current programs and are the first to be cut. Understanding use responsibilities would help to decrease cost of maintaining the private lands. Users should be as respectful of private lands as they are of public lands. Also, if there could be funds available to mitigate issues from usage that could result in environmental law infraction and fines. EX: dumping happens near population centers.

Protection is hard while trying to be a good steward. It's hard to share when people do not respect the land. Thinking that posting is easier, but doesn't want to close of access.

What is landscape scale conservation? Islands are not urban or rural. LWCF and partnerships are important. 2 million people per year go to park and expect undeveloped views of islands. Like to see administration help us create partnerships that don't stymy progress. Trust fund, challenge fund for citizens by Fed Govt instead of something tied to apropos. Desert Island bus is a great partnership but need more bicycle lanes, more funding for gateway community to make area safe. Friends group is not allowed to lobby because of 501(c)3 regs. That is not fair. Should be able to advocate.

We live within 8 hours of 30 million people. Keep protected. His group is focused on resource extraction. Logs going to Canada, gravel is going to Europe. People don't want to see clear cuts. Be wise about shipping raw materials out. Windmills are not going to improve economic development and tourists won't like to see them around every corner.

Sawmilling living traditions need to be economically healthy and viable. Logging activities give access to remote places. Rural Maine traditions are [based in] conservation. Living traditions need to be retained and people educated about them in rural Maine.

1) In Acadia National Park 1.1 million visitors come to the park and I guide them. Primarily working with adults from cruise ships, no young families. Need to get young families and teenage groups involved. This is a small national park, 40,000 acres, with a small amount of staff. Need more permanent qualified staff and need to conduct research on air, water, soil quality, shore birds, wetland birds and habitat conservation. Friends of Acadia are volunteers doing a great job. Need new research on Schoodic Peninsula and Winter Harbor. 2) Need more involvement with scouts (girls and boys) and ME schools and summer camps. 3) The proposal of a northwoods national park needs more research and cooperating agencies and other partners. Science and local politics are involved. This area of Maine is a nursery for Bald Eagles, Canada Lynx, migrant birds and is the heart of the forest products industry. 4) Encourage TWS to get involved in education especially youth groups and schools. Woody Higgins and his group issued 33 \$1000 scholarship going to camperships.

## Discussion Question 2

***Bangor, ME***

***(cont.)***

Economy is bad. Forced into looking for pots of Federal money. Some fit, some don't. Need flexibility. The need for federal match is a problem. It is hard to find the [non-federal] match. Don't have a lot of time. Endangered Species Act creates a different playing field for different industries in the state. Balancing act. Need a level playing field for industries and still protect species. Streamline the Endangered Species Act (ESA) Section 7 and Section 10. Development of ESA Conservation plans need to be coordinated by all agencies, e.g. USFWS and Marine Resources .

It is hard to make money from growing trees. Pellets and chips are energy sources that we could encourage, but Environmental Protection Agency (EPA) is an obstacle.

Nearly 1 million acres have been conserved and 10 million acres needs to be conserved for sustainable supply of wood. HFRP is very creative and enabling language allows it to be used beyond endangered species, but in Maine it is only Canada lynx. Look at that program to see how it could be used by industry for non-endangered species. Healthy Forest Reserve Program (HFRP) allowed the use of University of Maine to do creative management planning. Private land conservation easements also work but can become a problem depending on the easement terms. HFRP may allow for protection of certain sensitive areas while giving landowners funds.

Need to look at common ground, breakdown distrust and work together with feds, especially financially. There is fear of fed involvement. How to get beyond. This meeting is a start. Private landowners are critical stakeholders here in ME. Private ownership is good and should remain. As Land trust representative, when we take on an easement, the job has just begun to monitor and manage the land. Most easements now include stewardship funds, 5-10%. Fed programs should also allow land trust to hold the easements and build in stewardship funds. Forest Legacy and HFRP are good programs and need to be promoted.

Came to Maine because private landowners can do what they want without regulation on their land. [I was asked not to come] What works is without federal intervention. We don't need the feds. Federal government can't do anything right. If you get involved, what are the regulations? Do we want to trust the feds in Maine? Around this room are the betrayed and the betrayal. The whole wildlife project is backed by the United Nations. Executive Order is part of wildlife policies. Look up on computer that the feds and United Nations are in this together. Federal government and the United Nations want to have a wildlife refuge from Maine to the Adirondacks. Head Water Project - land acquisition and land grabs. Conservation Easements want to have Public/private ownership. U.S. does not allow this, but land trusts are what that is.

Fed match grants are 50%, this hamstrings efforts. 75% [fed]-25% is a better match. USFWS data is consistent with state agency. State data sets are not necessarily consistent within the state. Conflicts occur with what is on each type of maps and known species [location]. Hard line reading of the Clean Water Act hamstrings doing effective work. Beginning With Habitat program is not getting implementation funds so not getting down to the local planners in order to do the conservation planning. Funds have dried up. Need more funds for this.

## Discussion Question 2

***Bangor, ME***

***(cont.)***

For achieving large scale conservation, the Feds have done a good job to get programs going but only have a trickle of funds. These programs are underfunded. Need to increase the money. Current Farm Bill has caps and that makes it harder to do river restoration projects.

[not] Fully funded Land & Water Conservation Fund

Project SHARE focuses on salmon restoration. It is successful because we will put up with the process. So much process is associated with fiscal year funds, that it is hard to sustain long-term programs. Farm Bill - NRCS was key partner with WHIP in 2006 and 2007, but the new Farm Bill put cap \$50,000 per client per year, so the new laws prevent doing large dam replacement projects. It is a statutory [obstacle]. It would need a legislative fix, not a rule fix. The land has to be privately owned, it can't be state-owned. State owns land under dams.

U.S. Forest Service State and Private Forestry grants have been reduced and that makes it hard to do the conservation work that needs to get done. They have changed from formula to competitive awards.

Transportation for field trips gets cut, kids don't get outdoors

Promote the outdoors, let's have a program called "No child left indoors". A lot of our volunteers come from such an education program. We need to push the youth outdoors. Most Maine jobs are outdoors, like forestry, fishing, recreation. Keep the kids here by educating them as to what we have. We need value-added such as in the recreational activity, site-seeing, and furniture.

Need scholarships, transportation, and equipment to get kids outside. Maine has camps that the kids get the outdoor experiences and kids talk to their parents about their [outdoor] experiences.

Amend the federal estate tax law. Right now we don't pay any estate tax. The current exemption will be reduced to 1 million dollars and over 1 million will be taxed at 55% in 2011. This will effect a lot of landowners and forests. A lot of land will change hands [because the financial tax burden may cause landowners to sell their property].

There is a decline in the fragments we have left of important [undisturbed] forests [in Maine]. Find the places that are natural and preserve them. On our watch, dedicate resources to preserve the best of Maine natural resources.

Q2: Focus on one tool in particular. Important that the people at the table were comfortable and in agreement. The tool is really empowerment. Allowing the people that do the work in the field enough authority and autonomy to do the work and move the ball forward. In order to advance a conservation we must use resources wisely. Penobscotts makes decisions for seven generations into the future. Do the federal employees in the field have enough power to move a project forward? They need to be able to move forward, not just go back and forth between agencies. Empower agency employees.

## Discussion Question 2

### ***Bangor, ME***

***(cont.)***

By working with the system as a whole then we can really get the context for the river down We tried to take this approach (landscape) 30 years ago. It wasn't until we were able to get the river in context of the landscape that we could really make a difference.

What happens in the rivers really affects what happens on the land and vice versa. What happens on the land affects the streams. What happens in the stream affects what happens in the ocean. Look at the Machias River Forest which has been protected so that the watershed can be protected and produce healthy Atlantic Salmon.

Recreation: Snowmobiling is extremely important to the non-coastal areas of Maine. In these areas winter is THE season. The visitations to these areas has opened up winter; fortunately in that particular area, we've had great report over the years with land owners. Dealing with private landowners is something I greatly enjoy because I'm in the position of having a back and forth relationship with them. The federal gov't could help us by making funds available to help us. We cannot sustain ourselves without snowmobiling. It's disconcerting to me when I have guests who find snowmobiling environmentally unfriendly when it is our driver for the economy. Snowmobiling is very important to the non-coastal portions of Maine. In some areas, winter is "the" season for economic strength. Canoeing and kayaking have dropped off in central Maine. I work with \_\_\_\_\_.

Dollars is the biggest challenge. We need help. The land and water conservation fund is a great place to help. But we also need flexibility in the funds we have now. We need to be able to move money in order to fund projects. I think that the challenges that the federal gov't has given us has really put a spark plug underneath us to get things moving forward.

I think good use of dollars is also important. This Penobscot River Restoration project is good use, where as there are other projects that may not be.

Go back to \_\_\_\_\_'s points: we need the leadership \_\_\_\_\_ pointed to, but we also need a culture of 'yes.' It was a real collaborative effort. Solutions start locally and if the culture is the same all the way up it makes it successful.

We also need a long-term time commitment. These commitments go longer than political cycles. It takes a long time to make some of these things come to fruition.

It takes a collaborative effort, we all take a role to maintain the sustainability, the imposing Federal regulations that could shut down biomass plants, proposed regulations, and no longer considering woody bio plants carbon neutral.

Carrying cost associated with owning land. Farmers priorities sometimes compromised to meet uses and objectives of recreationists, no compensation to landowners.

Posted no trespassing signs

## Discussion Question 2

***Bangor, ME***

***(cont.)***

Generally no one funding source to complete an entire projects, requirements of multiple funding sources start to collide with conflicting needs.

Many fed programs many landowners are not eligible for many programs in the already fragmented lands.

Wildlands and Woodlands to conserve 30 million acres will take a long time and require

EPA, ESA,BMP Maine has terrific wildlife management plan, Fed is coming in and upsetting the apple cart with Lynx, EPA new green house gas rules will be a problem in Maine, BMP works beautifully in Maine, new fed court ruling determines log roads are a point source and again upsetting the efforts and work.

FLP consider some of the money going to LO comes back

Local land trusts need more help with stewardship, woodwise get that out it works and funded, recreation trails Fed highways and recreational transportation enhancement very successful , but limit of no ATV's, fully fund the LWCF, pocket parks

Agency blinders, like the multiple funding sources but limitations of specific funding, fund only remove dam, only fund fish way, paperwork of grant reporting 6 weeks of work after project was down, separate record keeping.

Money, depend on time and donations of people, getting harder and harder to find money, Federal money more infrastructure and signage to get people out on the land and interest them in the land and more likely to donate.

Grants tracking takes lots of effort, difficult to find the matching requirements

Open access why I come to Maine, the threat of a National Park, many areas are of limits and limits the enjoyment of large areas, jobs would be eliminated.

Polarization of the groups that want NP and the groups that want it the way it was 25 years ago, open large paper lands.

Accessing available dollars to get the youth to work on public lands, difficult in knowing that the money is out there but how to get to it. There are 1000's of young people who want to serve. More systematically more effectively fund the programs to protect the lands

Endangering ESA for development puts wildlife photography at risk

## Discussion Question 2

### ***Bangor, ME***

***(cont.)***

Climate Change big challenge, need adaptation plans, conservation models, habitat and wildlife corridors.

Caps in programs to limit funding amounts in single year, guarantee phase funding to do landscape,

Invasive Species. Prevention and management is a large challenge. Education and outreach efforts regarding forest pests. There are not enough state resources. NGO's have to fill in were state and federal officials cannot.

All messages have to relate to local impacts so that people can identify with the NNIS problems.

Just not enough resource to be able to act quickly enough. The global economy also presents problems with NNIS.

There is more to Maine fisheries than Atlantic Salmon. We should look at all fish.

Look at non-traditional funding opportunities. Look at kids with obesity. Look at getting kids out of urban area and into the outdoors.

Acadia is like Swiss Cheese. We have \$8,000,000 in land with willing sellers and we have only \$1,000,000 to purchase land.

No Child Left Behind SHOULD include outdoor education.

There is often much debate about creating a National Park, but there is almost unanimous support of a National Park once it has been established.

Some federal grants require matching funds that preclude some really small projects.

Reward risk-taking in federal and state organizations. A failed risk should not be a career-ending decision.

Solve the most important problems through creative solutions. We need flexible programs and flexible solutions.

We do not have time to protect forests. We need to be humble and come up with solutions now.

## Discussion Question 2

### ***Bangor, ME***

***(cont.)***

Although the local grade school had great natural resource education, but the high school had budget cuts eliminate natural resource education. Our school standards do not require that students learn local biology - where a student lives and the students relationship with biology.

Pharmaceuticals damage the environment. We have collected nearly a ton of un-used medications and disposed of them properly. This was fist funded by the federal government, but that money has run out. The State has back filled funds, but the money has run out. This needs to be fully funded.

Fully fund the LWCF. The Allagash River is a special place. Participated with people of Maine's Forests , Penobscot River RP, Land use Conservation Fund. Canoeed the Allagash Waterway- It is a huge success, but its a narrow strip. It needs more protection. <http://www.nrcm.org/>

Loves Maine and loves the world. Is a researcher. Struck by opening panel's emphasis on working forest and that the panel emphasized motorized recreation. Panel should have represented and activities where humans tread lightly. Those areas are as important as working forests for our heritage and need to be emphasized.

Models for future of Maine could be Florida now, Presidio, perhaps Ches Bay. Takes people with common goals to work together. Should look at all resources throughout ME and find best administrative structures to make everything come together. Going after individual pots of money from Feds may work, but larger line items need to be in the President's budget for a large variety of projects. Could be for ski trails, snow mobile trails. Need LWCF funds to finish acquisition of land at Acadia NP. "Finish" the Penobscot project. Scuitick Fish facility needs to be funded to educate young people and do research. Give serious consideration to implementing Keeping Maine Forests.

It's incredible how far wildlife conservation has come in the last 30 years. Conservation must be tied to economic development. Been in business for 25 years, and not considered viable operation by the bank. SBA loan is way too lengthy to be efficient (his was 6 inches thick). There must be benefit to local community for eco-businesses. Forest product industry is suffering in parts of State. Recreation is an industry in ME and that needs to be recognized.

Wants to speak to urban end of spectrum. The mentality of people in Bangor that have camps don't think of conservation in the city. Not everyone has a car so it's important to have outdoor recreation opportunities in the city. #1 problem is finding funds for land acquisition. Stewardship and invasive species. Purple loosestrife is creeping along in the city. Don't have resources and guidance in how to deal with invasive and climate change. Need help. When do you fight and when do you resign self? Environmental literacy thread running through school programs is needed. Our agendas need to be in other branches of the govt. Transportation corridors. Planning should involve how project will reduce sprawl. Need good overall philosophy on how to deal with invasive.

Need to deliver on promise of LWCF. Nat'l parks are America's best idea, but at Acadia it is unfinished. Need to follow through. Acadia is how I developed my love of the outdoors. There are 130 unpurchased parcels.

## Discussion Question 2

### ***Bangor, ME***

***(cont.)***

Manage 1 million acres of forest in ME. He tried to get working forest in the KMF initiative. Private landownership works. Maine worker is an endangered species sometimes. Try to find ways to help us. Not sure federal money is a great thing, but could work on inheritance tax relief. Now people have to liquidate crop they grew or sell. Capital gains treatment has to be preserved for purchase timber off lands. Bank rates are phenomenal (bad). Feds could be careful with regulations. Broad brush impacts mills, foresters negatively. Land for Maine Future is a tremendous program. Straightforward conservation easements are excellent. Feds don't need to own much land to 'preserve.' Land needs to be in production.

We live within 8 hours of 30 million people. Keep protected. His group is focused on resource extraction. Logs going to Canada, gravel is going to Europe. People don't want to see clearcuts. Be wise about shipping raw materials out. Windmills are not going to improve economic development and tourists won't like to see them around every corner.

We manage 1.1 million acres. Landscape planning scares hell out of him because others are deciding what land should be. Northern ME is in good condition. Different land holdings have different objectives and when someone from the outside says what the vision should be is wrong. When you leave it to private ownership the mosaic is more diverse. Work should not be in north woods, it should be south of Augusta due to environmental issues that need to be addressed. Conservation easements are not worth it because landowners are dictated to by what they can do. Generationally, you have to focus on youth. No interest in the outdoors for visiting. We're doing a good job in North woods, but leave us alone.

Funding. We're in a key moment as Senate votes on oil spill bills. LWCF, Forest Legacy Fund have been great. ME is an excellent place to use Fed funds due to prices. Want to see sense of spirit Congress had in enacting this legislation. See continue to focus on whole ecosystems. Fragmentation is a problem. Whole communities of interest for partnerships. ME Forest Biodiversity Project worked together years ago. State's Land Fund program is a coalition that benefits the environment. It comes out of common sense - ME has always made sure forests were taken care of. We've had engineers from China come to see Penobscot project. Keeping Maine's Forests is a discussion, not a final report. Economics have also been linked to the project. We need Fed participation in KMF program. There is a ton of work ahead not done by email, or a meeting every 6 months. A lot of people are talking about what the forest industry needs. This didn't happen 10 years ago. Conservation groups understand now that everyone needs to work together.

Haven't heard much about work in southern Maine to protect coastal estuaries. NAWCA, Coastal Program (FWS) people are incredibly helpful. Appraisal process with FWS is a stumbling block. Recovery Act funding to protect buffers were great. We have to piece these things together, though. Make sure that land trusts know they can reach out to FWS Regional Office in Hadley, MA. NAWCA grant limits to a 1:1 match. If you have a \$6million match you can only get \$1million which is disadvantageous. Set priorities each year regionally that can move around to get more funding. NOAA should have been involved in this process.

## Discussion Question 2

### ***Bangor, ME***

***(cont.)***

Interesting paradox: Landowners like to share their land, want others to use their land..BUT lots of users don't know how to use the land. Landowners are not necessarily getting an economic benefit, but would be more happy to see an education program to teach people to be responsible USERS of land that others have opened for access. Visitor's need to realize they are there at the grace of the landowners. There should be no dumping; they should carry out what they bring in. There have been people who have four-wheeled through a wetland that could have caused him to be fined for an environmental infraction. Maine is 92% privately owned, so there is plenty of opportunity for private land use if people are respectful.

Laws are good, but enforcement needs to be increased-bolstering availability so that there are wardens available to enforce laws and be available when there's trouble. There isn't federal funding to assist in hiring more wardens.

1. A lot of people that come to the park want to know about volunteerism and how they can become involved. Government needs to leverage that desire through maybe a volunteer credits system that will equate to discounts later on? 2. Leveraging private dollars with federal dollars, i.e. Centennial Challenge?

Most landowners are not looking for money, but working farms need to count the dollars. Special areas should be protected but impact the bottom line. Perhaps alleviating the tax burden on these areas would be helpful.

Tree growth tax going away will increase development because of tax burden to the landowner. Inheritance tax is also an issue in protecting open area.

Air quality effects the aesthetics of the views at the park . High mercury in aquatic species is a direct effect of water quality. Severe storms effecting the forested areas and shorelines. Species in danger of being lost due to climate change. Biomes are in danger of being lost.

## Discussion Question 2

### ***Berkeley, CA***

Poverty, access

Distance

Pay kids/legal resident aliens

Volunteering for X and getting Y

NPS narrowly -- defining role to include local and state natural areas

Mission alignment

Continuity

VIP -- 50 mile barrier

Hub for youth in each N.P.

Must move past cultural and language barriers

Parents don't understand the value of letting children participate in activities

Youth development and public land agency partnerships

How do we institutionalize partnerships? Through schools? Possible issue with funding gaps

Need funding for transportation costs

## Discussion Question 2

### ***Bozeman, MT***

To put into practice the multiple of environmental evidence on protecting our wildlife, their dispersal and migration. This needs to be a priority, especially for wildlife corridors near national parks, specifically Yellowstone in this area. An educational component is important to educate the next generation. The surface Transportation Act of 1991 adapted by Montana that allows commercial semi trucks (long haul) to go on any Mt. roads. MOOT has therefore made all roads accessible to the large semis and not all roads should carry semi trucks. Work with Montana Corridor association to agree to preserve our ecologically sensitive areas. The things that work are the Montana Dept. of Transportation and local community support.

Funding for parts and balancing "mixed". Human caused destruction of our natural resources, such as global warming (climate change), uncontrolled logging, mining and it associated consequences such as the current crisis in the gulf.

Protecting wildlife migration corridors like the Madison valley. Protecting and preserving water sources. Preserving land.

Reduce traffic speed and eliminate long-haul trucks from the Madison Valley. Implement setbacks on riders and eliminate dumping and pollution. Corridor development and get more land into conservation easements.

It is critical that outdoors activities and the facilities to provide them are able at all levels. Local governments and states have increasing use, aging infrastructure and limited staff and operations to provide these types of opportunities close to populations and with easy access.

Fully fund the LWCF with equal funding to the stateside to provide operate and maintain local recreational opportunities

Water and energy conservation, requiring a paradigm shift from the currently unsustainable "American way of life". Ensuring access to public land boundaries

Support grassroots efforts with federal and state money. Tough legislation to face individuals and cooperation to take appropriate action.

We are not creating any more lands, but we are supporting more people. We must preserve our diverse and unique public lands and landscapes, watersheds, wildlife, fish and bird habitats for future generations and engage young people in their protection. Uses must be appropriate not destructing public lands belonging to all Americans- whether or not they even visit them- they are out national heritage. Local people must avoid seeing these lands as theirs not ours. Politics, money and climate change.

How do share access to wilderness and out doors without people feeling left out- There should be NO snowmobiles in National Parks- but there should be places for them - some with atv's on some trails ect. Balancing is the key!

## Discussion Question 2

***Bozeman, MT***

***(cont.)***

Climate change and building resilience into our ecosystems so they can adapt to this change. Connecting people to natural landscapes and fostering future conservation leadership. Protecting our remaining core habitats on public and private lands that do not currently have permanent protection

1. Climate Change 2. Land Fragmentation 3. Resource Extraction

Many people in our country have a short term. Selfish, greedy attitude

Manage our resources for future generations not for short term profits

Fractal landscapes from development sprawl, great demands in fewer resources - (water, air) as well as transportation routes. Threat of "no net gain" of public lands is strong in Montana, but is very shortsided and destructive. Please protect against "no net gain" policies.

Climate Change- Environmentally destructive energy development . Development of critical national ecosystems habitat alteration/ destruction. Human Population growth.

Reconciling agenda 21 goals and maintaining private property rights. Agenda 21 specifically eliminates private property rights as well as most agricultural freedom. We cannot destroy these freedoms without destroying our way of life.

Revise our game flow to promote not destroy private property rights. Most of the best managed lands in America are privately owned and the worst are federally owned

Fundamentally, recognized that current populations density and levels of resource consumption create pressure on ecosystems and wildlife that did not operate as strongly in the past. Consequently stronger policies for preservation of ecosystem function and species conservation are necessary.

Loss of land at alteration/ development -Climate Change - Degraded/ Damaged landscape

Perhaps the most overlooked conservation challenge is the impact of invasive species. They harm our ecology and economy in many ways but the impact is often hidden in ways that prevent people from understanding the extent of the threat.

Most land managers recognize the impact of invasive but lack of resources and egony commitment,. I reenergizes NISC give it the same emphasis as the Clinton administration did. 2. include basic funding for invasive in agencies and field units.

## Discussion Question 2

***Bozeman, MT***

***(cont.)***

Lack of understanding that all the natural world is connected and we are part of this web. Showing how a philosophy of what is the common good is important not just "what's in it for me"? Implementation use of education in schools about connectedness. Get children off electronic games. understanding how to show people to understand what each does and what one state does affects all of us. ( environment is not a bad word)

Keeping connection to outdoors in forefront of children. Lack of understanding of importance of natural world, everything we were given for free! We cannot create new native shows how native Americans, an ancient cultural sites are important

1. leaving natural resources , especially wildlife, of NPA Parks unimpaired for the use of enjoyment of future generations. 2. To easy, inexpensive access, for use and resulting degradation, to our public lands, by private interests at the expense of public interest . 3. dewatering rivers and streams 4. continuing decline of wildlife toward endangerment.

1. NPS get back to its most basic, oldest mission 2. revise update the 1972 Mining Act 3. Fully fund LWCA 4. Strategic land trades and purchases to enhance public benefits of public lands.

Climate change, all land management units within DOI must have explicit mandates to manage their lands for both present and future climate impacts. Decisions should be sound science. climate smart management should four on 3 main tactic 1. protect adequate core areas, buffer areas and connecting corridors 2. limit non-climate stressors (logging, ORV use, ect) 3. Interagency coordination with state and local counterparts to develop and implement ecosystems-wide climate-smart management programs

Pryer Mountains of south central Montana needs better protection of anchant his tried sites and better protection of the land with control over 4 or 2 vehicles

More patrol over the mountain ranges to control vehicles and looter who raid ancient sites that are owe thousand or more years old mountains should be under one agency

Support financial and with policy local watershed/ conservation groups. Support flexibility with work and school programs to encourage people to get outside. Start educating kids about restoration early -middle school, continue through college, Support these programs. Support financiers for salaries for people working on these efforts.

1, keeping lands open to monitories access, youth and the age will be better able to access these places, house specific trails/ paths for motorized access., Have specific trails for non motorized activity. 2. raise the estate taps or eliminate it. Better/ easier easements. Incentives for youth farmers/ ranchers 3. developed new oil strategies on lad not 50 miles out in the ocean.

open spaces, wild places, intact ecosystems, climate change

## Discussion Question 2

**Bozeman, MT**

**(cont.)**

Loss of native wetlands (prairie pothole region) North central and north east MT. the Dakotas.  
Access to public land and those public dollars have been used on private lands

1. over-zealous use of minor technicalities within the endangered species act.

Climate change, human intolerance, human indifference to conservation needs and values.

Corporations wielding illegitimate power over election, public policy, public agencies and more.

Water quality and quantity

Global climate change, motorized use poorly managed, over grazing on public land

1. Do not lock up public land (national monuments) to eliminate timber, mineral, oil extraction. Especially in the Baitken Shall Area 2. Do increase access to public lands. Even through mandatory easements. 3. man made climate change is bull shit.

Top Issue: global warning + plans to adapt to it for example. Beetle killed trees cover 1/2 of our forest in some places, when the entire forest burn this summer or next, where will the wildlife go? How will be handle the remaining bare hills for the next 20 years? How will we address the water degradation, spill its too late to save the tree but not too late to have a recovery plan. Another example is the declining waters- drill more water wells, dam some streams have the coastal communities use desalinized water from the ocean rather than keep taking fresh water from the west.

1. the lack of awareness and knowledge of the role of agriculture in this nation 2. the lack of wildlife management by federal agencies wildlife belongs to public, state of Montana

The influence of lobbyists and legal action is causing very little to actually happen. Almost all groups that use the lands wont to preserve and develop better opportunities to use land. All the involvement is causing very little action

Pine Beetles and blisher rust in the Greater Yellowstone Ecosystem

Remember balance between natural resources and cultural resources

Global Warming. Dwindling interest in the outdoors among children.

## Discussion Question 2

***Bozeman, MT***

***(cont.)***

Kids are out future conservationist, and they are spending, less time outdoors and more time on the couch. We need to find ways to re-connect children with the outdoors, whether on a large scale (trails, national parks) or small scale (urban parks)

Sprawl, development pressure, special interest influence pork barrel politicians, programs and policies working at cross purposes, lack of definition of the public interest

Funding, climate change, energy demand. Pollution, education

Protecting water quality, ensuring adequate water supply to meet our growing needs. Understanding critical connection between air quality- water quality, resources. Fostering stewardship ethic among youth through education (k-12, informal education, after school programs etc). Curbing the trend among youth to remain sedentary and inactive. Public health issues are enormous, there needs to be a cross-disciplinary interagency efforts to address these or the healthcare budget will overshadow everything else and become our biggest priority.

Climate change and lack of funding for the agencies responsible for management of open spaces (forest service, NPS, etc). Corporate resource extraction co leasing unsustainable extraction techniques over use as the U.S. population increases. More open space is becoming criticized for both humans and wildlife.

Destruction of wildlands by motorized recreationalists

Using public lands to protect winter ecosystems and opportunities for non-motorized winter recreation

Climate change, Ecosystem degradation, fragmentation. Public values for ecosystem, natural resources.

Education and empowerment of future generations. Lax attitude of ability to change anything

Climate change, energy, natural resource protection

Addressing climate change to preserve our natural landscape. Access to outdoor opportunities- climbing, mtn biking, hiking, skiing etc. Exposing youth to outdoor activities. Protecting wildlife corridors. Support local sustainable food.

Safeguarding and expanding the large-scale, contiguous wilderness areas needed to ensure the continued existence of ecosystems and animal populations. Lack of public understanding of the precious treasures that America enjoys and which are no longer found in highly developed areas of the world.

## Discussion Question 2

***Bozeman, MT***

***(cont.)***

Getting kids outdoors and interested in their environment

Outdoor education programs in schools. Modern technology in National Parks so that kids will be more excited to learn and visit

Thank you to the President and U.S. Government for taking on this very important issue. We must protect the environment we live in and the animals with which we share this environment. They cannot protect themselves and if we do not do it, it will be our undoing. Our children must carry on the legacy in an even stronger way. Montana Dept. of Transportation and other organizations that can make a difference to make this wildlife corridor issue and immediate priority. The Western Governor's Association suggestions regarding wildlife corridors must be implemented.

These meetings need to be held in a town hall format in all of the small communities so that all of 8-5 working people and at producers can attend not be an inconvenience to them, and not cater just to the special interests groups.

A problem is that these sessions allow all comment, but does not encourage dialogue. The guy next to me is a logger, I can learn from him and he from me but we wont really get to talk. Smaller groups would be better to organize but would create better understanding and better ideas that are supported by all. so this was a good start- how can dialogue be created? smaller groups.

Agriculture other suffer additional restrictions when public lands are discussed. The populations of the world is to be doubled by 2050 and agriculture must represent to feed this inexpand. Countinued and increased funding for agriculture research in land, water and terrain, that will allow increased food production must continue. access to public lands for all people must improve.

A healthy environment is the foundation our public health, our quality of life, and out sustainable economies. It has been overlooked because of the pressures on the Obama Administration from the problems inherited and some new ones that have developed (recession, war, oil spill ect). However we need to think about solving all our other problems within the framework of a healthy environment based on function natural ecosystems.

Any initiatives must enhance and protect private property rights, Every infringement and regulation that hinders property rights destroys the fabric of our nation. So much emphasis is put on accumulating more land in the public trust the emphasis should be on the stewardship repsonsibility of what you already control. The most unhealthy forests and watersheds are on public lands and some of the healthiest are on private grounds. There must be real meaning behind public/ private partnership.

## Discussion Question 2

***Bozeman, MT***

***(cont.)***

I appreciate "Washington" coming to Montana. I appreciate that the issue are complicated facing the Administration regarding putting a value on nature. I am worried about what is happening in the worlds oceans- over fishing, pollution. I thank the administration's for cancelling the Bush administrations last second oil and gas lease sale and instituting needed reforms for onshore drilling. End the BLM's "No New Wilderness" policy It's wrong to have surface and subsurface rights separate surface owner should own subsurface. Ranchers should not bar canoes, boaters, fishermen from access at bridges. RS2477 is being abused BLM and Forest service are asked to protect and sell off for lease land- allowing land abuse is this the fax guarding the hen house? No more natural world is being made, It's vital to our health- mentally, physically and spiritually.

We have our agencies in place use them and stop appeals in could. Help us use or land practically with out governing. Money which this our hands, If we could count our timber and open our mills it would bring dollars back to our schools put our people back to work. We don't need more govern closures on our lands, NO MORE WILDERNESS land of no use. If people want more trails and parks raise money privately and use volunteers. My main concern is loosing my ranch three government control by zoning and not allowing me to do raise on my land. I wont our water rights lift in Montana not sold to out of state.

Montana Black Management Program, which allows hunters to access private lands for a fee needs expansion and more funding. Both recreationalist and hunters and landowners want this but the program is limited by funding which only comes from out of state hunting fees. America needs a mandatory service year followin high school to give urban and rural kids experience in the outdoors that otherwise are unattainable.

Stop promoting Teddy Roosevelt if uou are truly going for a ground-up approach. Many people associate President Roosevelt with resources socialism.

The price which consumers pay of oil and gas should reflect the true cost to the environment

Winter needs to be considered when developing strategies and the allocational of resources.

There are so many people in the discussion (70+) each person speaks approximatly 2 minutes. Each person has a great deal to say.

## Discussion Question 2

**Bozeman, MT**

**(cont.)**

In the limited time that you - that we all - have to restore our relationship to each other and to earth, I believe it makes to focus of a few overarching issues that simultaneously govern the multi-faceted challenge. The single most important thing this administration can do is to help alter our agricultural subsidy systems which has led to a disproportionate dependence on the corn-soybean-feedlot machine. The perverse incentives inadvertently created by the systems are at the root of our core issue. Dependence on petroleum, disruption and contamination of hydraulic systems of pollinator systems; immigration and labor imbalance, urban/rural divides; loss of habitat for away and other habitats, rural crimes, rural and urban obesity, diabetes, and other health issues and even inequitable unstable international relations. I value greatly our national efforts to care for specially designated protected areas, but this issue supersedes even that.

Regarding bruceccsis in wildlife in the Greater Yellowstone Area: bruceccsis eradication is not a reasonable goal. Reuse animal and plant health inspection service bruceccsis regulations. Clarify that bison are values native reublic trust wildlife just like eck and other wildlife. Promote systems that manage livestock reasonably and wildlife ecologically. Phase out USFWS feedgrounds in Wyoming and promote habitat preservation work on better livestock vaccines-not wildlife

if we don't use our own resources we will be owned by midwest oil.

why do people come to these meeting and complain about drilling for oil and gas, tthen get in their cars and drive off.

Estate taxes on farms and ranches in burdensome. This will cause "old time" families to sell their lands to pay the taxes, passing ranches on to the next generation is becoming difficult at best. This is either breaks the lands into small parcels or locks it up by wealthy owners. Conservation Easement should have the tax benigits reinstated that sunsetted in 2009

allowing recreation in our public lands is going to be a dying mission. The agendas of groups to allow their type of recreation is going to limit all recreation from happening. Trail maintenance and trail; building is going to be the future of forests. Do not allow public lands to become wilderness areas. allow all to use out lands

Keeping roadless areas is important. Roads are poorly planned and don't take wildlife into account. Watersheds and recreation are important. Don't take stand one way - need to work together. Involve kids.

Indian trust lands have only received 25% of the conservation dollars that private lands have. Need parity. Tribal irrigation projects haven't been funded for the past 20 years so they haven't been done - yet EQIP requires that to be eligible land must have been irrigated for 2 of the last 5 years. Needs a policy change on irrigation history requirements for EQIP. Wants USDA and DOI to work together as a package deal. Wants to get schools involved through outdoor classrooms and community gardens. USDA/DOI should set up a committee to work together on natural resources on tribal lands.

## Discussion Question 2

***Bozeman, MT***

***(cont.)***

Concerned with wildlife corridors in the Madison Valley. Problem with animals crossing the highways. A lot of commercial vehicles are using the roads. Have been working with the MT DOT. Need to protect the wildlife corridor and educate children why it's important. Needs federal support for their efforts and funding.

Has outdoor TV show about hunting/camping. Access to public lands is important. Fully fund Land and Water Conservation Fund. Funding will always be an issue. Hunters and fisherman already pay - now time for other user groups to pay. Private land incentives are important. Must have local buy in. Political process may be unduly influencing federal agencies in carrying out there public trust responsibilities. Feds need to be more adaptable. Gave example of inflexibility of APHIS on brucellosis issue. Need more flexibility in management to get easement. Also need flexibility in land exchanges to be able to deal with small local parcels.

Using science and social expertise to raise awareness to the plight of white bark pine in the Yellowstone ecosystem due to pine beetles and blister rust. 95% infested. Investigate solutions. 200 + volunteers. Testing anti-beetle solutions. Role of federal government is to give exposure to the problem. Tools - using modern digital media to document and monitor decline of forest and determine what should be done.

Is 74 years old. Has given up backpacking. Depends on ATVs, horses and snowmobiles. Concerned about lack of opportunities. Wants accommodation for senior citizens who can no longer hike or backpack. Local knowledge is important to help agencies identify best options. Federal role is to back off and leave decision in hands of local people.

Motorized recreationist. Small farmer. Can't make a living on farm due to wolves, brucellosis, dead timber. Too many lawsuits. Solution is to remove all pending lawsuits. Go with the local agencies existing plans. Logging roads could be used for ATVs and snowmobiles etc. if managed right.

Take personal responsibility for kids outdoor education. Don't need federal dollars to do it. Concerned about Treasured Lands initiative locking up land in eastern MT. His kids like 4 wheelers and don't like to walk.

Concerned with ecosystem health. Wolves are good. There's too much motorized use. Need better bison management. BLM need to improve sheep grazing management in southern UT

4th generation rancher. Likes easements. What's to reinstate 2009 tax benefits for conservation easements. Estate taxes are a major issue for rancher - need sell part of ranch to pay them, resulting in breaking up the operation and potential subdivision. Need to fix estate taxes.

Concerned with large corporations taking over agriculture. Gave example of how corporations control USDA funding for dairy supports prices.

## Discussion Question 2

**Bozeman, MT**

**(cont.)**

Encourage, partnership state and local govt. with Feds. Fed \$'s sustained state side funding down. Written testimony, meager budgets, can meet 50 f\50 grant share, support full, Higher level decisions hurt local communities & local demands are not being met- Communities are not able to find 50% of funding Bring equity to the program so everyone can enjoy the benefits

Can do? Find a way to let land managers & foresters do their work on the ground Taxes? Not so high have to sell & take land out production Grow trees on property instead of subdividing, manage fed. Ground, challenges – FS – hands tied, litigation, safety – millions acres dead trees in MT, rec. on ground, huge issue with hazard trees, need to address, FEDS – Find way to let land managers do their work on the ground. Tax issue – to high forced to sell

ARRA funding, fund authorities, matching funds, tough to meet, support youth corps act of 2010, good changes, 25% cash match (big deal for non-profits), work with existing non-profits rather than creating own corps workforce

Lines on map is challenging-need regional approach Need to know what watershed you are in-bioregion Example -Upper Miss. Watershed alliance

Orgs motivated to work within themselves and with others, face challenges with \$, Ag lands – disconnect youth with great outdoors, remedy – prioritization on locally grown foods, eat foods grown in own backyards, ask where food is coming from, empower agricultural producers on their own lands

Wildlife corridor & traffic, don't mix, Feds restrict long haul trucks causing issues, identify and sign wildlife crossings

14 listening sessions around MT - riparian habitat, impacts to riparian corridors, transportation issues, snow plowing, connect rural to urban areas – riparian habitat conservation. Protect these, education , involve youth, plantings, supported by Fed. \$\$'s – keep \$'s coming, challenges – BMP's competing and conflicting policies

Get youth involved in conservation-get them away from TV, PC's. & video games

Need more education-keep youth involved

Expansion of wilderness limits agricultural development, access – overlooked, lack of senior citizen participation, don't restrict access to outdoors to seniors with more regulations, trail bikes, snow machines, bikes restricted

Wanted to reiterate ideas-FS has local needs-keep roads plowed in winter for use-animal migration corridors important-get youth involved with efforts-facilitate more people to engage in activities

## Discussion Question 2

**Bozeman, MT**

**(cont.)**

What works-Public/private partnerships Accelerate conservation on the ground-working together Programs successful when done the local level Challenges-Government programs not matched well with local needs-lack of funding-NRCS program adapted to allow grazing on wetlands-

Build on state and tribal issues, locals know what works on the ground at the local level, need local involvement, need inventory on what is happening on the ground. Communication is needed across all. Kids are not involved? MT maybe not the same as other places, youth are outside, urban parks serve far more people than YNP, Feds need to support state efforts, utilize partnerships, need to participate, protect water Thank you for listening!

Civil collaboration works-appropriate uses while preserving lands, watersheds for future generations-support more folks on landscapes, need to preserve lands, No destructive uses!! Local people need to see land as "ours not theirs"

Invasive species, affect ecology and economy of the US, hydro power invasive species, impact us all not recognized as a #1 priority, clean angling program, inspect clean and dry gear when done, private sector deliver this, Fed role is commitment to national invasive species council, fully fund state aquatic nuisance program, encourage partnerships, simplify grant programs, need social marketing tools to change behavior, youth education, successful programs are long term, keep them outdoors on a frequent basis, Need \$'s for teachers not products,

Need clean rivers and lakes, with access. Need access!! Thank you for being here! Promote fishing and boating, gateway to youth to the outdoors, local organizations get kids on the water, LCWF successful-need to consistently fund, Challenges-clean rivers, support Senate Bill 2427, get \$\$ to FS & BLM, Public access is needed-\$\$\$ for invasives

Enforceability is needed, ensure ecosystems and wildlife can adapt to changing climates, protect core areas, LCWF \$, connectivity across private lands (Assistance to landowners to help out)

Ski area prospective-pine beetle-safety of forest lands Ski areas responsible for removal of infertive trees Climate changes-huge issue Alternative energy needs to be a priority-pursue cleaner energy development Tourism-play larger role- Any help from federal govt appreciated to promote snow sports

Do better job in sustaining national resources, Feds, much to do but little thunder, 1992 GAO Fed. Lands – inadequate public access report, worse now than then, derelictions of Fed. Workforce, access to boundaries is the issues, can't get to the fed. Lands then can't recreate, Leadership all need to get serious about this issue, collaboration – cosmetic exercise, not used for policy making or decision making, beltway policies (sell these vs develop at local level), human communities – keep all the pieces not just a few

NPS return to old mission leave as is, bison of YNP, LWCF need full funding, access is needed; revision of the 1872 mining law, degrading public lands, repeal now, balance public uses of air water and land, uses have been skewed to private uses vs. public uses, need to find balance for today's conditions and populations

## Discussion Question 2

### ***Bozeman, MT***

***(cont.)***

This outreach great, maintain populations of plants, animals in concert with humans, protected areas of parks are not large enough. Need community based partnerships to preserve for future, Challenges- energy development, climate change – don't compromise the environment, support scientific best science available, help funding, guidelines & regulations where necessary

Local businessman-Build snowmobiles Access to public lands important to business Don't recognize snowmobiles have zero impact on the environment-quieter, sensitive to environment Oils synthetic-want to help Lack of forest management-dead & dying trees-need to act soon-maybe too late-fires-endanger land, air quality Needs to be less words & more action See more designated for motorized activities-

Ranch owner, multiple use – timber mgmt , grazing, hunting, motorized and non-motorized, doing this for 120 years (family). This is just a start. 8 – 5 folks missing as well as rural, need town hall meetings at night not during the day. Ag communities keep the open lands, avg. age +60 young folks are coming on, hostile to grazing (public) lack of grazing mgmt principles, Special interest groups hostile to agriculture. Public comment of everyone is a problem, Stage 3 allow diseased bison to roam, Gallatin NF, uses impacts from motorized is very small more being taken away. Decline in use do to this.

40% of FS budget is spent on litigation Reduce litigation!! Get NEPA sufficiency to multiple use lands-NEPA wastes money-big cost to the Forest- Many projects are litigated-cost to private, govt.-wastes time and \$\$ Reduction to multiple use access contributes to reduced use and outdoor activity Language is important-definitions need to be cleared up-get on the same page

failing way behind on demand, not suitable for existing uses, propose initiative to get trail construction project going to get folks to work like in the CCC days – Feds need to do. FS no \$'s, woefully lacking \$

Cultural sites-all federal agencies lack-not protecting cultural sites Some sites carbon dated-1000 years old!! As a Crow Indian-can tell Crow story by looking at paintings-Pryor Mountains - Need protection! Under 3 federal agencies, NPR, BLM, FS,-NONE WORK TOGETHER!! All agencies should work as one unit-all federal agencies- Work against each other-programs do not work together- Biggest complaint-FED AGENCIES DO NOT WORK TOGETHER!!

protecting landscapes, need to think about eastern part of the state as well. All now is in the mtns in the western part of state, Good areas exist in the eastern part of state, Protect landscapes, Pryor Mtn's – Ekalaka, Chalk Buttes- short grass prairies by Malta, Terry badlands, Need to protect landscapes, need enforcement, restoration, conservation easements, access to all, challenge work with the right people at the right location Protect Pryor Mountains of Montana!

## Discussion Question 2

***Bozeman, MT***

***(cont.)***

Open spaces-un-roaded spaces like the lungs-keep land open- The west lands open Thank you to the Administration for starting the listening sessions here Thanks for cancelling Bush's oil drilling in Utah No new wilderness policy needs to be revisited Lands in Utah open to ATV use & abuse & oil drilling BLM has authority to San Rafael Desert protect-do not road illegally Don't stretch authority so thin-can't enforce infractions What's working- Private groups Challenges- Group coordination Dollars stretched thin Time stretched thin Need to be showing how everything is connected vNeed to speak for fish, birds, animals, and water Like to see fear combated-change causes fear-working together is strength not weakness Vandalism-Big problem-makes her sick Teaching connectedness will help with vandalism- Last child in the Woods great book Last word-we are all connected

voluntary program, incentive based, buy real estate rights and convey to other non profits or feds, Need \$, Fed Role, huge need in MT, cash strapped landowners need to some cash, WRP, GRP, programs funded thru farm bill need more \$'s, fully fund LWCF, appropriated program but not appropriated, \$'s critical to feds to implement program. Don't revert \$ to other efforts

concerned about private property rights of individuals, 40% of lands in MT are in public trust . Need to do a better job of mgmt. mostly from private lands, run like Germany manage the lands better

Strong advocate of public ownership for hunter & angler access 2 programs have been great- Pitmann Robertson Act Dingle Act- Industries-hunters & anglers spend large amounts of money for management of wildlife & fisheries-working & working well Need to improve & expand on program-state wildlife agencies are strapped for funds-expand product or user based LAWCF funds-can't emphasize how important program is-needs to be expanded-support working landscapes & improving access

Recreation, education, & Stewardship - Water is important, Feds – help strengthen clean water act, reconsider private land ownership and split estate ownership for subsurface rights. Put surface and subsurface rights back together

Collaborative effort to protect ecologically linked to health of the public lands. Broad partnership started by FS. Locally community involved. Preserve livelihood of folks who live there, voluntary land easements, sales, restoration, use land use plans from locals, need \$'s for LWCF, public land managers reach out to neighbors to encourage partnerships, Feds – don't do projects that will harm these type of projects. Wildlife habitat.

The influence of money and status is gradually destroying the heritage the average citizen has enjoyed for so many years. Individuals and corporations are subtly turning those resources into commodities for sale to the highest bidder, or in the case of the very rich, into their private playground. In doing this they are committing violations of the public trust doctrine that would make Theodore Roosevelt turn over in his grave.

## Discussion Question 2

***Bozeman, MT***

***(cont.)***

No one is asking to hunt private property without permission but the problem is not confined to public wildlife on private land. There are vast tracts of B.L.M. and National Forest land unavailable to the average citizen due to property boundaries and closed roads; roads that are vital for such activities such as fire suppression and law enforcement. But neither federal or state agencies aggressively challenge these closures.

Numerous large ranches have changed hands and are now charging up to \$14,000 to harvest a bull elk--A public bull elk. They have manipulated the system so that they can also determine who can legally hunt on their ranch by misusing a program that was designed to help outfitters have a more stable income. An outfitter, who will follow the ranch owners orders, will sponsor selected hunters and they are awarded an automatic license. Hence, the big spender are selected to harvest Montana's biggest and best game at the expense of the citizens who have underwritten successful wildlife management in this state for so many years.

Several western states have already lost control of the wildlife allocation process by implementing unabashed programs such as Ranching For Wildlife where landowners sell the opportunity to harvest big game on their property. The average hunter now often refers to these programs as Wildlife Ranching For The Rich.

If this trend is allowed to continue we will see more and more citizens turning away from their outdoor heritage. The public trust will have little meaning beyond lip service. If we allow our wildlife and access to public land and water to become just another commodity to be purchased by the highest bidder, outdoor activities such as hunting will become less tolerated in our society as fewer young people choose to participate. It could very well spell the end of those values that gave us the greatest system of wildlife management ever devised; the North American Model.

## Discussion Question 2

### *Charleston, SC*

if you don't have natural areas this is all for naughts. Tax incentives work – we had enhanced tax incentives for conservation easements – we had easements rolling in until that ended; renew the tax incentives that existed until end of 2009. CRP works – an investment of half a billion dollars; need a re-enrollment program that allows Los to sign up for a second K and requires mgmt such as thinning trees to 70 sq basal feet, frequent burning, and planting native warm season grasses; we have commodity, peanut, etc programs, but we don't have it for the forests – why can't we do the same thing for the forests. If you remove the cropping history for CRP, more Los will be able to participate. Fully fund land acquisition, LWCF.

we really don't have a program that helps land continue to be managed properly –no financial incentive to retain it in longleaf – kind of like CRP but what's going to happen at the end of the day to retain llp when lo dies or land is transferred; lots of little tiny farms on worn out land that continues to be farmed because there's a federal subsidy to grow things we don't really need – corn, cotton, etc. they do it for a federal payment – locally called insurance farming. Why can't we do something about that

1000 pound elephant – estate tax/death tax; most people who own land are land rich cash poor so her kids will have to sell off the timber or sell off the land – that's the issue – the fragmentation. Constantly having to look to the future to figure out what the tax situation is going to be. They're trying to figure out which parts of the land should be sold first to pay the taxes. 30 to 50 years you own land; value of land is risen but you have no cash; there has to be a way to look at that.

agrees with \_\_\_\_\_. A major challenge is most forestry and usda programs do not apply to small landowners in her community – they have one acre properties. How can they do llp; 4 to 10 people own a 15 acre property – they won't qualify for the program. Thinks you can't have a group of people apply for a program like CRP – they won't qualify. Plus they need financing. If zoning could change sso you could get tax credits if they use sustainable practices.

most landowners aren't able financially to attend an even t like this; if it were a Saturday then perhaps we could reach landowners. Almost every event like this there's only a handful of landowners . they can't afford to come. If you are truly trying to listen we should have it on weekend. No wonder they don't trust us or they aren't engaged or we're not reaching them. Evenings, have a meal; take care of local business .

Gullah sea island coalition does food and drink and meeting on you and your land and how it can benefit you or zoning changes and how they can affect you; that pulls people together. People of color are not on the lists to get in meeting slike this. There's no trust factor because we don't know you exist so there's no trust. How was I gonna go, I had to work. And what about my children. Need a different mindset about who are you trying to reach. Everyone communicates differently, too. To \_\_\_\_\_, easements sound really good; to Gullagetchees, it means theft. Need educational campaigns geared to different cultures. We need to taylor things so they see themselves in it. If I can't see what you're saying, it won't work.

## Discussion Question 2

### *Charleston, SC*

*(cont.)*

silos of natural resources preservation; cultural preservation and ; there are also silos of government agencies, but everyone wants the same thing – sustainable communities, etc. but they don't talk to each other.

costs in planting; costs in management; so if you're going to have LO's successfully planting ll, you're losing \$\$ so they're planting the more productive, faster-growing pines that they can harvest after 15 years or so whereas for LLP

challenges – lots of folks use watersways for subsistence but there are no laws for that so these families get caught in the middle. The Savannah River Plant pollutants are coming down because of this and the feds just gave the plant more \$\$ so causing more issues for the subsistence fishermen. And why do the studies if we're going to finance harmful activities anyway; one agency worried about toxins, but another funded what created the problem

CRP typically targeted farm acres – how do you get to acres that have not been farmed? The small farms?

1000 lb. elephant is the Estate Tax. Most people who own land are land rich, cash poor. Children would have to sale the land to pay the taxes. Landowners love their land and they are having to sale so the children will not get stuck with taxes. This is another way the land is vanishing away from the conservationist.

Most landowners are not able financially to attend an event like this. Suggestion would be to hold this type of meeting on a on Saturday. This would reach landowners more than through the week. If the gov't is really trying to listen to the landowners- then the meetings has failed because the landowners are few in attendance today. Suggestion is to go to the events that the landowners – local landowners, tree farmer meetings attend at night with dinner sponsored by local business and a local educational experience such as local Forester or Clemson Ext. agent provides instructions. Trust is not there since Govt is not meeting with the landowners.

The bottom line is the land owner. When planting longleaf pines the landowner is concerned with the higher costs of planting and decreased profit in the end because the production is less that the loblolly pine. Those that plant long leaf pines will lose money due to less production, higher costs of container seedlings, etc. Land ower needs incentives after 15 years - they can only thin with little profit and they have been patient for 15 yrs. Survival rate on longleaf pines is not as good as the loblolly pine.

growing loblolly, redhead woodpecker loves the long leaf pines. The matured long leaf pines in the nesting ground for the redhead woodpecker. So when there is a presence of the woodpecker, then regulations are in place that say a land owner can't cut the trees because of the endangered species presence. Coordination from the agencies to eliminate this regulation is necessary to encourage the planting of long leaf pines.. This has the appearance of a being a penalty for planting long leaf pines.

## Discussion Question 2

### *Charleston, SC*

*(cont.)*

Gullah Sea Island Coalition does have sponsors for meeting providing food & drink. Like today, minority groups/individuals are not usually invited to these type of events. She suggested an Educational campaign to the different cultural of people. The only way to make the Great Outdoors successful is getting the people to see themselves in it.

Challenges – waterways used for subsistence but there are no laws & families get caught in the middle between State/Federal laws. There needs to be a better coordination of regulations.

silos of natural preservation – same goals for all agencies – but they do not communicate with each other. Everyone wants the same thing –sustainable communities, etc. but the difference programs for the agencies are so territorial but the practices are the same/similar and working toward the same results.

Budgets are a major factor with providing education to meet conservation goals, recreation and reconnecting people to the outdoors for the Extension Service. Hire more Forestry Experts. More funding for Forestry Commission across the southeast to put in prescribed burning teams to facilitate burning under proper conditions

Establishing a new stand of longleaf pines requires seeding, fertilizers, etc. People need more grants to cover establishment costs. Landowners need more updated growth and yield tables so they can make sound investment decisions regarding longleaf forestry

Keeping the minority landowners on the land. Convincing people that working with others is important. People do not trust the federal government

prescribed Burning education for the public. Federal recognition that prescribed burning in conjunction with forest management is needed to provide endangered species habitat, propagate plant species native to the lands, prevent wildfires using burning, prevent non-native species from encroaching, and improve sustainable wildlife habitat. Stop mandatory hoops to jump through to receive federal funding. Forest management plans are worthless because landowners do not understand the information. Keep programs simple. Add more funding for long leaf reforestation after clear-cutting. Implement a mid rotation pine release program for offsite hardwoods and non-native invasive species. Promote burning in all southern states through cost share programs. Campaign nationally that prescribed fire is good. Federal agencies are not utilizing prescribe burning practice because there is a liability issue.

Take the opportunity to allow people to fall in love with local parks to appreciate the outdoors through government education programs

Key to good management is working to educate landowners and add more incentives for reforestation costs

working w/ military to establish buffers. Landowners waiting to see if federal incentives going to come through. Back log funds in jeopardy. Get people outside. GET KIDS OUTSIDE. The kids ARE THE FUTURE.

## Discussion Question 2

### *Charleston, SC*

*(cont.)*

Chas Audobon – educating children. Charleston Co Parks system – educating adults/children, getting them outside. But it's not enough. More children outside. Protect what we have in the future.

Less recess time for kids at school – emphasis on testing insane. Making grass roots effort.

Pushing child left behind has led to no child left outside. Kids LEARN while outside

Teach mom and dad, too. Going to the woods, where you learn what is important. Kids don't know about hunting culture and natural resources. Summer camp program in national forests, national parks.

Private timber lands used to be owned by timber companies, they leased hunting rights. Tax credit to a timber co for allowing recreational hunting would be a good program.

youth events. Depends on USFS, USFWS. Costs involved with events – grants such as more kids in the woods. Keep competing for that grant \$\$\$ for MKIW.

Promote technology that is attractive to youth (IPOD apps)

simple land ownership. Connecting the dots between ownership, public education/knowledge. Hunger for knowledge. Lots of information out there. No matter how large or small your ownership, small landowners do not know where to go get information. There is disconnect – folks within the conservation community disagree – about hunting, for example. Even residential landowners need to think of their backyard as “landowners”.

OHV groups. Motorized access to the woods for hunters/anglers. There are places appropriate for motorized recreation. SCORE. Unmanaged trails – claims (incorrectly) that there are less than 100 miles of motorized trails in SC (there are over 200 miles on USFS alone).

Use of fire – how do we burn 8mm acres every 2-4 years. Air quality issues/regulation in conflict with need for prescribed fire. 800k acres in NC of fire dependent ecosystems that need to be burned every 2-4 years. Not getting it.

Liability issues – are a huge concern for private landowners. FIREWISE. Working w/ communities in WUI. Hunting/public access. LONG TERM FAMILY /ESTATE PLANNING – community planning. How to manage towns and communities. DOD – how to get public access to military installations.

Leadership through policy and vision. Need to protect private/public properties so public can still have access.

## Discussion Question 2

### *Charleston, SC*

*(cont.)*

Need to reach out to young leadership of color. The generation coming behind us needs to be recognized. Demographics and changing population.

TRUST – the larger the organization the less people trust it. Work from the bottom up.

BUDGET - this is a critical issue. We are telling the public that federal land conservation programs are not important. Reconnecting people to the land – leads to political will.

Estate tax – window this year, this is a huge issue. Working farm being forced to sell their land upon their death because of estate tax. Can get a huge conservation bang. Extension of favorable tax incentives – make it permanent, not 2 years at a time.

Budgetary. Cost for maintenance of Ft Sumter, etc. is huge, in this coastal environment because of heat/humidity. NPS needs to receive enough funding for backlog maintenance. Increase diversity in workforce. Education – public schools, let kids learn their local history.

preservation of hunting heritage. Adults may not have ability to take kids out to hunt, experience public lands. Can't infringe on adults rights to hunt.

Walkable bike-able communities – LWCF. Bicycle commuting needs to be emphasized. Bike lanes. Bike friendly communities.

while in Chicago saw urban sprawl overtaking the land; doesn't want to see such changes happen; has concerns over development pressure

effect estate tax has on fragmenting and management of conservation lands

expressed concern over water quality; need everybody working together to maintain/enhance keep water quality

need to start early in order to reach kids and make them ambassadors of interest in the great outdoors; following initial dialogue need to work at building relationships and trust; made reference to the declining number of hunters and evolving recreational interest

mentioned that it was difficult to validate changes in participation in different pursuits or recreational activities with no registration or licenses to track

when developing and implementing the plan(s) need to get in touch with the right people

## Discussion Question 2

### *Charleston, SC*

*(cont.)*

inclusiveness of everyone, especially those you wouldn't normally think of, especially in urban communities; when you exclude partners, you really undermine your efforts; building relationships is important; some kids in Jacksonville may never have seen the ocean; need for parental encouragement, children's interest, opportunity, available resources, and access to come together and everyone might be more inclined to get involved in the outdoors; we need to provide resources, for example, a free day on the bus/metro system to get people out to the woods or the beach; or find out who in the neighborhood can take others to the outdoors; made reference to restrictions related to land ownership affecting national trail connectivity because of individual parcels of land being owned by different agencies

importance of getting people out to experience "real" versus "manufactured" nature

open access to private lands especially in the Southeast is not commonplace; number 1 reason why people no longer hunt and fish is loss of access; need to fight the negative perception of visiting public land during hunting season being unsafe; all related organizations need to talk about this

Legal issues with federal acquisitions/easements and grants compromises county donations (USFWS) in Charleston County

number one obstacle is transportation, linking people with interest to available places open for access

needs increased consistency with how federal agencies deal with partnerships; policies don't change and partnerships affected as individuals change (as an example changing priorities associated with change in National Forest Supervisor); inconsistencies between agencies regarding federal funding/matching requirements

outreach to kids is great but don't forget the parents; need to educate parents as well; if parents not interested it will be difficult to recruit kids

hands on events initially get kids and others involved; but once exposed it is important that follow up activities take place to retain interest; access to such opportunities may be lacking; how are they going to recreate, reconnect with nature and cultivate that interest if there is no place locally available for them to do so; access, both public (Making Public Lands Public) and private (Voluntary Public Access) initiatives need to be encouraged and expanded to enhance ongoing outreach and incentives, especially to private landowners, to make more lands accessible; spoke to each affiliation must first support the mission of their own organization, but that there are many commonalities that we can all work together on, making reference to longleaf pine restoration and the newly signed agreement between USDA, USDI, and DOD; expressed concern over the continued loss of rural lands to development

## Discussion Question 2

### *Charleston, SC*

*(cont.)*

mutual interest among federal agencies has got to be there for partnerships to succeed; you can't start from scratch with an incentive, the interest must already be there, incentives just make it easier to pursue the interest; federal and non-federal partners in the ACE Basin are all "landowners"; and some landowners won't deal with federal funds because they are too much of a hassle

Done research on landowner; most won't make money on the land but still have a connection to it; Nat'l survey on recreation and environment showing people's use of/connection to the land has been going on since the 1960's but in jeopardy because of fundin

Pollution is a challenge; hard to encourage use when air and waters are polluted; aging sewer systems, storm water runoff, sedimentation issues; mercury contamination of waterway. EPA enforcement of 208 plans

Aging stands of longleaf attract RCW's – endangered species issues; environmental laws need to be incentive based, not penalty based; Safe Harbor a good thing for RCW but Estate Taxes another deterrent; Need to have better environmental education so that

Permanent conservation easement a road block – something more short term (20-30 years?) more appealing?

Used to be that you got perpetual tax benefits for gift of 30 years conservation easement – but no more. When the gov't took that away, they deterred a lot of people.

Paperwork that accompanies some of the Fed. programs is a deterrent; landowners are basically afraid of making errors for fear of what gov't might do.

Money given to counties by the Fed. gov't to help with infrastructure placement – no one living there but have added infrastructure – now the development follows – not most efficient use of funds. When you continue to give the money to the counties for i

Placement of infrastructure not only encourages sprawl but costs the landowners – not a good way to achieve the goal of protecting 8 million acres of LLP; In some ways, septic systems (when properly installed and maintained) are better than running water

Inconsistency in how programs are interpreted – not only across the nation but within the state

Staff the nature centers, keep open, fill positions and have them work on the educational programs Stay open on weekends Environmental literacy, related to state standards, but it would be better to be required

Healthy markets, capitalism works non-industrial pvt landowners, tax codes need changes, help to owners keep Land prices/hard to keep in forests Conservation Reserve Program works

## Discussion Question 2

### ***Charleston, SC***

***(cont.)***

Stability, what will be in there to provide consistent support, newer programs more complicated  
Will it be there next year and 5 years and beyond Lack of time to build relationships

Long Leaf system, different agencies, classification of long leaf ---no ecological benefit to just planting 600 long leaf trees per acre, need all ecological components—direction he would like to see ecological restoration Value longleaf for economic benefit also, but Need to further define what practices are appropriate for feds to give money so that it is clear and consistent Establish what we are doing Some people have knowhow, but have had failures, If you know soybeans but not long leaf you are the wrong guy to be giving instructions—need training for foresters and others No disturbance, no herbicides, problem to uses farming techniques Education needed

Control pasture grasses, re-establish native cover, burn

Protected a lot, resources to manage that, burning issues around smoke, how to work with neighbors

Low country swamps important also, keep those ecosystems too

Prescribed fire

Forest fragmentation Tracts broken up Ecosystem services—whole suite of things not paid for, can we pay the private landowners Thinnings and pine straw vs Conservation Reserve Program incentives Green belt tax laws (Florida) need knowledge of

Recreation hurt by sprawl, can't get to areas due to the is that is why connection is broken zoning important (as Louise said) Take care of current built environment we have so we can build less

Private lands burning hard to meet demand for svcs to burn enough Liability insurance coverage, max coverage/liability

Worst issue—fire—fire will be essential

Access to land, urban kids an opportunity to get outside! Have a place, and funding to make it happen Grants available

Salaries, ok to fund!!!

Not enough money available,

## Discussion Question 2

### *Charleston, SC*

*(cont.)*

South Carolina forestry commission is too focused on old school forestry programs, and not progressive conservation

Natural Resource Conservation Service—commented that he sees some emphasis on more progressive use of Federal funds We need a Land Stewardship think tank—they determine where the \$ are going to get the goals met, more successful More academic driven distribution of funds

Longleaf understory, native grasses can be used for feed stock or livestock funding gone

Charleston County spending for conservation—public needs to understand the full public benefit! Causes a problem when this conflicts with public access. Can't all be accessible, some areas are sensitive or on private land. Conflict there unless there is understanding, also public benefit on Private lands or off-limits areas make a difficult debate, sophisticated concept

Southeast most is private access not always possible, but cleaner water, air, etc. benefit

Santee corridor—Francis Marion National Forest, Cape Romaine National Wildlife Refuge, Santee---comprehensive plan—ISSUE that Fairmont Plantation (hunting rights not able to be retained—simple problem) could not to be incorporated/retained due to this problem

Where are the properties that allow the public access?? Whatever this initiative spurs, easement location needs to be a part of it. I believe in public lands when they can be afforded and well managed and in the right place. Some of our SC parks have little visitation, and I wonder if that was a good place to put that park. I hope as we move forward that we look closer into where public dollars for public access is going, and is it well thought through? Being able to drive the same road, and they want that place to look the same, that corridor, they want to see the things they have always seen, and that's value, and sentiment, and for example Hilton Head, we watched that change drastically, and if you look at Bluffton, to see what had been done on commercial forest tracts--it was clearcut--and now it's gone, and that's what could happen to Charleston, but easements are a good way to help prevent this. I think Richard Louv's "Last child in the Woods" should be required reading for all educators. There is a major disconnect between urban/rural residents. If you don't see it and live in it, you don't understand the rural vs. urban. Someone in the breakout group asked him if there were other ways, other than easements, to protect private land. He answered that there were other options, like for a landowner to allow for public access, on an easement, or one week of the year, open their property for use by school kids. It isn't incentivized, but it is the right thing to do that. He concluded that an easement was the best option.

## Discussion Question 2

### *Charleston, SC*

*(cont.)*

Outdoor recreation is important to him-I grew up outdoors, spent lots of time outside. What lands you can and cannot go to? You have to go to 20 different resources/places to figure out where you can go, and we need a central place to go to get this info. What do you do when you get there? Maps-some are up to date, some are very old, and common person/middle class dad isn't going to know where to go/what to do, and we need to have a better info. system. How the average person, who doesn't have much outdoor experience, can get more experience outdoors It doesn't have a to be PRT, but also other groups. Letting public know what they can access. That's when they will become an outdoor advocate...when they can become involved

MONEY-it's our challenge. The county is doing well. And the half cent sales tax has been functioning, despite the state economy, it's had a huge effect on Conservation Bank. Easement purchase-landowner gives up some, we pay some. When you don't have that funding source, lots of protection is stalled. And without that, it's stopping the progress. We have a great plan going on in Charleston, but with more money, and multiple funding sources, it could build momentum, and incentivizing landowners, and giving tax advantages, it really impacts the landowners and motivates them

We don't have enough money. Politics. Challenge to deal with politics, and strike balance. Elected officials listen to constituents and listen to needs, and we have to sometimes defend why projects were successful. The Nature Conservancy has used sales tax funds to purchase properties, but there is so much bureaucracy at the federal level, so if we can realize that we all have same purpose and try and work together we can get further and accomplish more

Money. River pollution. Not enough incentive for smaller landowners to protect riverside with corridors/buffers, which protect from stormwater runoff. In Columbia., we have rivers that experience over 150,000 user days per year, but we have small utilities that pollute the water and they are not even required to report to public that they contaminate water, so there needs to be more money, a mechanism to address these things, but the bottom line is that we need clean water to recreate in and drink and without a doubt, the highest environmental concern nationwide is clean water, so we need to really think creatively on how to address this

Boats that use water for recreation. We have access points--Broad River, and public lands. Sumter National Forest, Chattooga headwaters, and there is a debate about allowing landowners to go in and kayak on upper regions on Chattooga. Not a lot of boaters go in there, but everyone is entitled. Greenways, in towns, in Columbia. We have a good greenway, but there is a 10-mile stretch that is privately owned that is a barrier to continuing this greenway b/c 4 or 5 people, private landowners, are stopping this. Uneducated people who don't follow laws, they ruin a good time for others, and we don't have enough money for law enforcement

Money. We try to be creative and partner w/ outside groups, and this is the only way we can deliver statewide programs

## Discussion Question 2

***Charleston, SC***

***(cont.)***

Conservation easement concept is great, and we need to go with this. Over ½ of our easements are donated, so I don't think funding is major obstacle, rather inconsistent and short lived tax strategies is the issue. We haven't done any easements b/c we cannot tell them what the tax implications are yet b/c the tax law is not written, and it will be at least September until it's done, which leaves us just three months to complete a years worth of work. This is inconsistent and we cannot keep up with USDA rules and regulations. Tax issues are at national level/federal/estate tax

Capacity is an issue. The way federal money gets filtered down is driven by programs. OMB is saying that's not good enough, we need to see what's going on--on the ground, and we need to prove this work, when they say \$ that is coming to your state for accomplishments has to be designated to a specific project, thus you lose capacity. If you don't have folks to provide technical, on the ground assistance, you won't get the project done. I feel like we as natural resource agents tend to hang our hat on the most current solution..here's the silver bullet. I am afraid conservation easements are the silver bullet. While I'm a big advocate—for example, CRP land was a silver bullet years ago, and now there are others, my fear is that cons. easements are great for a limited portion of the population, and we must create more tools in our box to reach out to other landowners who can't utilize them. We need a multitude of tools to make the reconnect happen.

Consistency would help. It makes it hard to plan. Must consider tax ramifications. If it isn't there consistent you are up in the air

Money is always a problem. We have done all planning and we have built ideas, and on conservation easement side, we have done special area management plans, and we have pulled groups together to get done stuff without money, but you have to have some money. Don't need a lot of money...we can take dimes and turn them into dollars. Conservation easements are a great tool. Property is protected/plans are in place, but there is money in Berkeley County that is needed b/c some of our landowners can't rely on a tax-write-off to donate property. Their property is a real investment. We have landowners with conservation ethics, and they want to do the right thing, but we need money too

The challenge is consistency on part of gov't/. They don't have education to be able to develop a vision. The elected gov't officials want to be leaders, but they don't develop a vision, b/c they have particular expertise, and they drive that, and forget overall good for the community, and that's a problem. They have a vision, and they don't prioritize, they don't get funding

I spend lots of time explaining the tax code to landowners and I get the same basic questions, b/c it's so complex, that people cannot grasp it, and it takes so long. The biggest challenge is funding. To keep our jobs. If you look at educating public, we meet with young people and put them outdoors, and we educate landowners and the agencies that are doing this are getting hammered with budget cuts and loss of staff. People are retiring and this experience is leaving, and the landowners rely on this experience, and the lack of people is hard. We can't educate without the expertise

## Discussion Question 2

### *Charleston, SC*

*(cont.)*

We need to be more flexible w/ funding sources. No two states are alike or forest stands. Need to

Our landowners want to do the right thing, but we have made it so hard for them to do it. We have made it so hard they are doing the wrong thing and they don't know it

If we could get the agencies (we can handle private sector) to look at the conservation programs they have, regardless of agencies, as an equal system approach, that would be key. Each agency has its own single program and approach and they need to come together and interplay and the opportunities will be there. The folks that control the game need to get together and make it happen. Equal system plan. Try and get a handle on what's out there. We need coordination at the top

Recognition of our successes. It doesn't cost anything. We have Earth Day, and we talk about why we are where we are and what we need to do, but we are not celebrating or recognizing our successes. Talk about our nat. resources. What we have. Let folks know. We talk to ourselves too much—not our audience—Joe Public. Folks everywhere—New York City, and rural areas. Everyone needs to hear our message

Federal hydro-power dams - comprehensive plans are not in place. This has negative impact on recreation and species. We are still operating under 1940s understanding.

Need to fix certification

Need cost share to level the economic table for longleaf.

Closing Comments: Listening Session was valuable. It shouldn't be conservation vs. industry. Great that all agencies are working together. We have the tools we must work cooperatively. Fix capital gains tax.

Mandating that the LL forest be thinned by a certain year (negative impacts on pine straw \$).

Forest fragmentation, large industrial landowners that have sold huge acreages.

US tax code penalizes NIPL's

## Discussion Question 2

***Charleston, SC***

***(cont.)***

Clean air, water, wildlife habitat and recreation - all public benefits from forests that the public doesn't pay for. Ecosystem services should not be free. US citizens want to enjoy the benefit of forests, they need to pay for those benefits (National park system has admission fees, USFS has user fees, US taxpayers pay to run NF's and NP's...then they pay to enter and enjoy them. NIPL has only taxes...all he does is pay.

## Discussion Question 2

### *Chicago, IL*

The National Trails System is 42 years in the making, yet only one of the current National Scenic and Historic Trails is complete (the Appalachian Trail).

Altogether, 9,700 miles of the National Scenic Trails are currently open for use. But their total authorized length is 16,400 miles. That leaves some 6,500 miles of gaps in our National Scenic Trails to be filled mostly on private land that will need to be purchased from willing sellers.

For 16 of the 19 National Historic Trails, about 1,000 key natural and cultural resource sites still need to be preserved, according to the National Trails System FY09 Annual Report.

Without adequate agency operations, LWCF, and Historic Preservation funding, the necessary efforts of Federal agency and non-profit partners to complete the Trails land acquisition, trail construction, and trail interpretation will not be possible.

I am the plaintiff pro se in litigation against the U.S. Department of the Interior in which I seek to invalidate the March 2007 final rule promulgated by the Bush Administration removing Endangered Species Act (ESA) protection for grizzly bears in GYA. The litigation was commenced in August 2007 and is pending in the federal district court in Boise, Idaho. There are two other cases involving the same goal that I will mention in a moment.

In my opinion the Bush Administration was the worst in U.S. History from the environmental standpoint. All key positions in the most important agencies, the Interior and Agriculture Departments and the EPA, were occupied by anti-environment ideologues who sought to reverse environmental regulations and policies that had been painstakingly developed over many years. The ESA was a particular target for the Bush Administration. The father of modern environmentalism, Theodore Roosevelt, a Republican, would have been heartbroken by the actions of the Bush Administration.

The Interior Department in the Bush Administration sunk to a new low for government agencies from the standpoints of integrity, morale and faithful accomplishment of its statutory mission. Interior's Inspector General issued scathing reports with regard to Interior's derelictions of duty.

In this context I voted in 2008 for President Obama with the highest expectations that an Obama Administration, under his leadership, would mark a new beginning for the environment. I was euphoric when President Obama was elected.

It is difficult to find words to express the level of my disappointment when President Obama's performance in the environmental area to the present date. The disappointment began with President Obama's appointment of Ken Salazar of Colorado as the Secretary of the Interior, succeeding Dirk Kempthorne of Idaho, who succeeded Gale Norton of Colorado, a protege of an earlier infamous Secretary, James Watt of Colorado. Secretary Salazar's ranching background in the West virtually assured that the days ahead would be difficult for wildlife, and the certainly has proved to be the case.

## Discussion Question 2

### *Chicago, IL*

*(cont.)*

Grizzly Bears. At one time there were at least 50,000, and probably as many as 100,000, grizzly bears in the western United States. When they were given ESA protection in 1975, only about 1,000 remained as a result of human-caused mortalities; about 300 were located in the GYA (Idaho, Montana, Wyoming). In March 2007 the U.S. Fish and Wildlife Service (FWS), an agency of the Interior Department, removed ESA protection for grizzly bears in the GYA. At the time of delisting there were only about 500 bears in the GYA, an increase of only about 200 during over 30 years of ESA protection. There were only about 1,200 of the bears in the western United States; almost all of the bears not in the GYA were in the Glacier National Park area in Montana. Three lawsuits are pending against Interior and FWS to invalidate FWS's delisting of the bears. Two, including one in which I am the plaintiff, are pending in federal district court in Idaho. The third was filed in a federal district court in Montana, and in September 2009 the Montana court issued a decision in which it invalidated the delisting and restored the bears' pre-delisting protections under the ESA.

President Obama's Interior Department, rather than accept the decision of the Montana court, has appealed that decision to the U.S. Court of Appeals for the Ninth Circuit in San Francisco. In other words, Interior continues in litigation to preserve the Bush Administration's removal of protection under the ESA for the relatively few grizzly bears that remain in the GYA.

Wolves. Many good and dedicated people worked incredibly hard to reintroduce wolves in Idaho, Montana and Wyoming after they had been eradicated by human-caused mortalities, but the slaughter resumed in Idaho and Montana due to the Obama Administration's removal of the wolves ESA protection in April 2009. A federal district court in Montana (the same court that issued the decision for the grizzly bears) issued a decision on August 15, 2010, restoring the wolves' ESA protection.

The Obama Administration, instead of conceding the issue, has stated that it is considering whether to appeal that decision to the U.S. Court of Appeals for the Ninth Circuit. In light of the Obama Administration's appeal of the same Montana court's decision with regard to grizzly bears to that court, as previously mentioned, it appears likely that the decision will be to pursue an appeal in the wolves case.

Polar Bears. In May 2009 FWS issued a News Release stating that a special rule issued in December 2008 for protecting polar bears under the ESA would be retained and that FWS would closely monitor implementation of the rule to determine if additional measures are required to conserve and recover the polar bear and its habitat. Polar bears are listed as threatened, not endangered, under the current rule. The rule also states that incidental take of polar bears resulting from activities outside the bears' range, such as emission of greenhouse gases, are not prohibited under the ESA. The rule has been properly criticized by many persons on the ground that it does not sufficiently protect polar bears.

## Discussion Question 2

**Chicago, IL**

**(cont.)**

Loaded, Concealed Weapons in National Parks. President Obama signed a law in May 2009, originally introduced during the Bush Administration, with the backing of the National Rifle Association, that allows loaded, concealed weapons to be carried in our national parks if permitted by state law (as is the case for three states within the GYA). That law surely will lead, among other adverse consequences, to the deaths, through poaching and otherwise, of wildlife in our national parks. We already know of the shooting death of a grizzly bear in Denali National Park in Alaska in May 2010 as a result of this new carry law.

Those of us who care very much about the environment and who were euphoric about the Obama Administration's replacement of the Bush Administration have been let down by President Obama. Today we feel that President Obama's campaign slogan, at least in the environmental area, should have been no, we won't instead of yes, we can. President Obama's Interior and Agriculture Departments appear to be no different from the standpoint of wildlife than those departments under President Bush.

Returning to your original question for this hearing - How can the federal government be a more effective partner in helping to achieve conservation....? - the answer is that President Obama must take charge of his environmental policy. He must make clear that the goal without exception, consistent with his yes, we can campaign rhetoric, is to preserve and protect the environment, including wildlife, public lands, water and air. He must ask any and all officials in the Interior and Agriculture Departments and EPA who do not understand, or want to implement, that mandate to depart immediately and replace them with more enlightened officials.

Poor public image. The public must have confidence that parks are safe, well-maintained, and readily accessible.

Increase the opportunities to connect Americans especially our children to the Great Outdoors

One barrier is that volunteers who want to work with youth have to be finger printed and background checked prior to volunteer which can be pricey

There are barriers for adults who want to work with young people: the costs of getting fingerprinted & then having a background check maybe the federal government could subsidize this in some way?

When I work with young people, I have to get fingerprinted and give \$65 per person to get background check at local police department. This is a barrier for volunteers. It creates a hurdle to volunteer. Most programs don't pay for this and it falls on

As child I would just take off all day and only go home at night. Now as a parent, I need to know where my kids are at all time. I don't know if real or perceived but greater fear about leaving your child alone. Now my kids are more programmed. I drop

## Discussion Question 2

Recommendations are that everything starts at home & parents need to encourage kids; need to focus on security & safety be conscious of where going; this is also a community issue the community needs to think about youth & needs to make a change; during

Youth don't understand what is going on outside, going bike riding.

In Chicago Public Schools system is physical education still a requirement? Response is in theory yes, but in reality no. This time can be a study hall; physical education be a requirement in all public schools K-12; we are having to make up for it befo

In sessions yesterday and today & defining what it means to be in the great outdoors for some means riding a motorcycle or ATV, or firearms use; need to define it as how people actually use it; it's not cardiovascular exercise, but it is a way of enjoying

One suggestion: Make it not so hard to hire people!

Perceived as "nerds" if they were interested in outdoor activities.

Way we talk about it prevents people from coming out talk in way that sounds exciting

We need help in how do you define outdoors? forests & lakes? Or just being outside your door

Heard a lot of innovative things being done by park districts in Illinois and Chicago. They have been able to do these things because they have funding. Many other states they are cutting services, One of the first to be cut is parks and recreation. S

His recommendation is that if students can't go to programs, provide funding to make programs go to students; go to schools and be in the auditorium or gym to show what's outside like forests & plants

Land managing agency professional staff are natural resource or history specialty professionals; they are not trained to do youth programs; need person on other side of partnership, language, time and volunteers available on weekends need different level

Most land managing agencies have professional staff with degrees in conservation or law enforcement or history or biology. They are not trained to work with kids. If the volunteer cannot work with the people, you have created a huge invisible barrier to

Most of the land managing agencies are in a profession of natural resources, law enforcement, etc. Not trained to work with youth- If you don't have the person on the other side of the partnership who can work with the people you've created a huge invis

## Discussion Question 2

**Chicago, IL**

**(cont.)**

Older individuals were taken to parks and outdoors- challenge to getting youth involved is getting their parents involved to take them outdoors and engage them in outdoor activities

The adults I know were taken to national parks when we were kids. Now the challenge to getting kids outdoors is to get their parents to take them out. So must appeal to the adults to take the children out. Appeal must go out to families.

I think we are demonizing youth in the language we are saying- society is built on children being in front of a screen- well who puts them there? Parents. So I think we need to listen to what we are saying, we have to be careful that we find ways to mes

It is a challenge to define what youth is and how we talk to segmented demographic. Is a 16 or 17 year old a youth? Sometimes youth incorporates up to 30 year olds. How do we send the proper messaging to different segments of "youth"? Biggest distinct

Struggling defining what youth is...very segmented demographic. Youth Summit in NY went up to 30 years old. Inability to define what a "Youth" is has made it a challenge in how to communicate goals. Biggest barrier- making decisions as an adult or as a m

We demonize youth when we say kids today spend 6 hours a day in front of a screen and now we are saying get outdoors. When I try to get my teens outdoors they are upset that their iPhones are going to be taken away from them. Should we try to mesh techn

What is youth? youth can be a very segmented demographic; are 17 y.o.s kids?; a NYC Outdoor Nation youth summit included persons up to 30 y.o.; many people there resented being called youth as they'd been living on their own 6+ yrs, etc.; in other words t

There needs to be a sea change in how to sell youth on the outdoors; right now the language being used is demonizing youth; in all the talk about kids today, speakers have highlighted that kids spend 6-8 hrs with TV; but parents/adults put them in front o

In talking with coworkers at Arboretum learned that field trips are opportunities for kids to experience nature; often what holds many back is that programs don't have enough money for a bus to bring kids; suggests providing federal funds to schools/prog

We have a lot of field trip opportunities to have kids experience nature. The things that hold schools and kids back is that they do not have money to pay for a bus to bring kids out. There might be Federal funds to schools to pay for transportation cos

Some kids stay in cause it is dangerous outside

In meeting with an urban group learned importance of understanding sounds of country before going on other experiences; sounds of silence, owls, etc were unfamiliar and scary; consider getting youth ready & familiar to hear sounds, not just educating with

## Discussion Question 2

### *Chicago, IL*

*(cont.)*

We were talking to kids they told us they did not feel comfortable with the sounds. The silence, the hoot owls, were unfamiliar to them and they were terrified. So to get them ready, they need opportunities to get familiar with sounds.

Crime and Violence- not just automobile accidents. Needs to be addressed in communities

Safety- she does not feel safe cycling

Safety. She doesn't feel safe biking in Chicago on the streets; you can't without having practiced doing that a lot. If you haven't been brought up that way, you never feel comfortable doing something like that.

Obstacles and challenges are kids are not excited; need to get youth excited & make it appealing; talking about going on nature walk is not fun, instead focus on experiences great hikers have had, tell stories; show that while appreciating nature you can

Meet with a group of urban youth and they expressed they did not understand the sounds of the county- the hoot owls, etc sounds were terrifying to them. Part of getting them ready was getting youth familiar with the sounds not just the words.

Certain types of activities do not fit in with the Urban culture- need to break that thought that certain people do certain things. Should start with schools, get parents involved by talking about all different types of activities and the kinds of people

Among ethnic groups and urban areas, there is a belief that certain kinds of activities don't fit into their culture. Other people do that. They think: "We don't rock climb. We don't ski." We need to change thought. Needs to start with schools in ver

It is challenging to engage students, esp. urban, students. There is a tendency to use a language that is very elitist when talking about outdoors. This language does not have traction. It makes this "other place" seem so very far away. Language is cr

No longer a time when can give 10 kids to park ranger for a day program. The law does not allow it. Also, he is not a youth development specialist. Many conservationist are not educated in youth development.

There is also a challenge with managing risk. When work with minors have larger insurance costs. Transportation also presents insurance challenges. If I transport minors to programs or I take them out in kayaks, etc. , my general liability cost is huge

Leave No Child Inside program successful; have Outdoor Bill of Rights; did an event with parents & kids around this Outdoor Bill of Rights did stations based on Bill of Rights; showed parents they can go to city park and not have to go far; also suggests

## Discussion Question 2

**Chicago, IL**

**(cont.)**

Make sure there is accessibility to outdoors; the outdoors is not accessible for many; some can walk near the forest preserve, or it might take 3 CTA buses; suggest more buses that to straight there or even PACE buses; Chicago crime rate is high; need it

Violence- it is safer to stay home

Accessibility: getting parks closer to home and making them more accessible In Chicago, the outdoors aren't very access able to a lot of people. To take 3 City busses and a train takes a lot of effort. If there could be stops for outdoor

Gang violence. Is easier to stay indoors and watch TV than going outdoors and risking being shot because wearing the wrong colors. Need to take the extra step and fix gang violence so kids can feel safe walking 3 blocks outdoors

Accessibility to outdoors. For many people in Chicago, the outdoors is not accessible. If you live next to the forest preserve, fine, but some of us have to take 3 buses to get to the forest preserve. Take public transportation is very hard. Open more

How can we use the technology to provide rewards or opportunities?

In my neighborhood. Programs for little kids, not teenagers my age. Just anything to do that gets me out of the house that is fun, not boring like chess. Interacting with other kids, animals, gardening.

There is a lack of actual programming; outreach & offer them something give pay or show something they get at the end; be in 1- 1 contact & in their face & show what they can gain; Young Life was a great organization working with Chicago school systems t

Lack of programming in Chicago. Need to reach out and get them involved, be it pay or an incentive to show them what you can gain. One on One Contact is a great organization- got kids to get outside and do homework and the kids would earn points to do o

Safety problem, not save n neighborhood; not a place to go. Parks are not cooperative, gyms are not open. Need a safe place to go

A park manager is not a youth development specialist; there is a void between park managers and youth development specialists park managers have a lack of skills to do group activities; youth development specialists are often young people themselves; con

Are so climate controlled, that kids don't know how to be comfortable outdoors. Prevents people from going out when it is hot, cold, buggy. Kids are just kind of wimpy to these things because they are so climate controlled

Climate controlled culture- people are uncomfortable in warm, cool, or wet weather

## Discussion Question 2

**Chicago, IL**

**(cont.)**

Barriers can be not having a safe, clean environment; might not be able to travel to downtown to enjoy a cleaner environment, or barriers because of asthma; recommend helping to bond with outdoors have competition and tournaments; do Wii tournaments on b

Adults also spend a lot of time in front of computers too. Not just kids

Education and awareness. Not a lot of kids in her community know where to go. Places that are safe, not easy to get there. Safe travel is not there to get to safeplaces. Can not afford transportation to get to safe parks. Can't go to local parks beca

If we don't define the great outdoors we allow for some outdoor use and but say other outdoor activities are not good- Cultural difference in how we look at these things

Kids are constantly terrified of trails, snakes, bugs. Have never been outdoors long enough to know they wont be attacked by coyotes. Kid cried when she picked up a toad and showed it to him- kids spend soo much time inside, instant gratification from i

Not out there that it is safe to go to forest preserve and be outdoors and have fun.. Young kids are not going outdoors to have nature walks, go there for family outings

Tendency to use a language about the outdoors that does not have traction with urban young people and does not connect to their environment within their community. Transportation is a huge liability when working with urban youth- especially if you want t

The way adults talk about it- does not encourage kids to get outdoors

A lot of people can't get to programs; why don't we send programs to schools/communities. Bring animals to schools and show kids what they can see if they go outdoors.

Message needs to start at home and get the parents involved. Have parents kick kids off facebook and get outdoors. Safety awareness; community needs to take heed and invest in youth and invest in future. No one will make a change if kids aren't encoura

Have organizations at a local level that can provide opportunities, and access to funds/resources. Transportation is an important issue, getting kids to places. Use media to create funds. Create something global on a marketing scheme to get funds.

Funding is an issue. If we can't get students to programs, bring programs to kids. Send anybody to schools and show students what is outside, in forests- plants, animals.

No child left inside- many schools cannot afford bus costs for field trips

## Discussion Question 2

**Chicago, IL**

**(cont.)**

They have a lot of field trip opportunities to get kids out to outdoor places like arboretum or national parks, but schools don't have money for transportation. If there could be federal funds to pay for this. For a lot of kids, their only opportunity t

To get kids excited about going outdoors, because now they are not. Until they go out and see/learn things, they aren't going to know how great it can be. Also to have opportunities closer to home.

SCA summer internAccessibility: getting parks closer to home and making them more accessible In Chicago, the outdoors aren't very access able to a lot of people. To take 3 City busses and a train takes a lot of effort. If there could be stops for outdoo

Keeping parks cleaner, keeping a safer environment. Kids don't want to go out because not clean or safe. Kids have asthma and air is bad. Getting WEE tournament outdoors on big-screen.

In Chicago, there is a lack of programs. Need to have programs that offer them something- pay, something they will receive. Need one on one contact, and show them what they will gain. Young Life= great organization working with kids on after school pro

No child left inside act-covers what kids do in schools. Most of the field trips to the arboretum are cancelled because the school can't afford school busses. If the fed gov can provide \$\$ to schools for field trips to outdoor spaces

What is outdoors? Parks or walking outside of the house in the neighborhood and feeling safe

-Nice to have access to playground, outdoor space to stay off the couch, especially in the summertime

National parks, far off places, not accessible

Most youth do not know ecology, need to understand more about it to enjoy wilderness

Lot of outdoor work, sweaty, nasty; arms got big cutting invasive plant species, burns calories by working outside. Feels good to get outdoors, get exercise.

Is also a parent have 2 kids now & need to know where they are at all times; perception of danger is a challenge; kids are very programmed with people all the time because of such concerns; maybe needs more programming to have safe supervision for young

Weight issues, people need to know about active lifestyle and food that provides good energy

## Discussion Question 2

**Chicago, IL**

**(cont.)**

Obesity- friends buys lots of candy and junk food

Obesity why? When younger it was bad for your kids if go outside, video games instead. Rather be playing X-box or Nintendo games than going outside tossing around a football. More interesting to be in front of the TV. Aren't really any places to go is h

Physical education is only a theoretical requirement in public schools. In practice, gym time can also be study hall or other things. The Feds can make physical ed a requirement in all public schools in US, K-12. If it isn't we send the wrong message.

How special exercise is- you have to take time out of your schedule to go to the gym. IF there was a safer environment to incorporate walking into your day ,It would seem like a lot less of a challenge to get in the time to exercise each day.

Language can contain a lot of elitism creates among ethnic groups and especially in urban areas; must address cultural expectations perceptions that we don't rock climb/ski/etc. & that only certain people from certain cultures do certain things; should

Asthma harder to stabilize breathing, people who are littering are not helping to keep environment clean and is a problem

People don't eat, good , fast food restaurants, go there to spend a dollar for a burger and salad is \$5. Parents don't serve carrots or broccoli or if they do serve broccoli it is broccoli and cheese

Noticed that in working with students, especially in urban programs, programs are using elitist language to refer to out of outdoors; youth connect to their environment & this other place seems far away and foreign; risk is also an incredible barrier; he

Her mom walks on the lakefront each day. Once you start wllaking long distances, you have to find a way to get back; can't just jump off the treadmill- you build up endurance. Better way to get exercise is outdoors

Requested to improve physical activity within adults. You can take time during your lunch break to workout but you won't be paid for it- start in the agencies and encourage parents to go outside and show that the government endorses the outdoors during t

Sometimes being the great outdoors means ATV and hunting to kids. Is this how we are defining it? Are we minimalizing their definition of the "great outdoors". By not accepting this definition (hunting and motor sports) are we perpetuating the conflict

We requested to improve physical activity among adults at our Federal agency. They told us that we could take time during lunch break to exercise. We could take a full hour if we were exercising, as opposed to the 1/2 hour normally given for lunch. But

Obesity, kids eating lots of candy; if they knew more about getting out and getting healthy. IF they knew about the forest preserves, they wouldn't be getting unhealthy

## Discussion Question 2

**Chicago, IL**

**(cont.)**

Ninety percent of a stream is in Cook County forest preserve yet has not been maintained. It is a resource that should be utilized for outdoors recreation for example game fishing. Nature preserve is being over run by coyotes. There may be a sewage issue

Concerned that children are hearing too much scary information about the environment. All should remain developmentally appropriate when engaging children  
David Sobel has done research on what is appropriate. Different levels for 0-3, 7-10, 10-12, 12+.  
We

Need to bring additional federal agencies corporation for community services. It is not a priority on paper to some agencies. We are trying to work with DOL, DOJ. DOI is working well.

Concerned that staff of those agencies are not interested in developi

Reach out to kids via social networking to raise awareness. Popular culture does not provide good role models. Kids are not apathetic, they are ignorant and lack information. There is a loss of story teller generation. Both parents work, even grandma isn'

When she was talking to park service, there is a reticence from staff workers who say "this is not my job, I don't have time for this."

Lake Michigan connections are not always clearly understood (drinking water supply, beach closures)

People don't have time for destination-oriented activity in nature and don't realize there are opportunities in their own backyards

Equity issues arise in urban areas that are devoid of green space so programs need to recognize the need for parks and open space for all residents

How to be effective at landscape scale across a complex, multi-jurisdictional metropolitan are where there are vital natural resources and 10 million residents.

The regional approach to conservation through partnerships and collaboration is still ahead of its time; it is not yet well aligned with how local and national funding organizations conceptualize conservation work and metrics of success, or with their partnership and support guidelines.

Lack of regional planning capacity to coordinate growth patterns across borders with local jurisdictions. In Illinois, the myriad of local government jurisdictions control land use decisions, which do not take into account the regional nature of planning decisions that can protect, water quantity and quality, landscape scale conservation for wildlife, and recreational corridors. (Illinois' fractured planning system has 6000+ local jurisdictions, more than any state in the nation, and four times more than New York.)

## Discussion Question 2

***Chicago, IL***

***(cont.)***

Fragmentation of habitat and landscapes occurs through unplanned growth.

Lack of technical ability to gather regional information into one comprehensive overview of state or regional (greater metro) infrastructure.

Lack of organizational capacity to educate and provide technical expertise to local jurisdictions on green infrastructure

Lack of funding to make landscape-scale linkages: including funding fee simple/easement purchases, buffer lands and linkages, and funding for site-based storm water practices

Lack of strong recreational liability protection in Illinois for landowners who open their land to the public for recreation.

The ability to secure local groups of government to coordinate with each other and follow the recommendation of the regional plan.

Communicating the needs to land managers, integrating the science research, managing planning, and incorporating research results into planning.

lack of technical ability to gather regional information--specifically integrated GIS/geospatial data information.

The prevention and management of invasive species

Barriers to connecting children with nature are diverse, often varying from community to community.

Parents' and caregivers' own feelings of discomfort with outdoor activities.

Lack of access to safe, quality sites for outdoor play, or the lack of resources for transportation to appropriate sites.

On the program delivery side, a common barrier is the established conservation organizations' lack of capacity and knowledge of how to market and structure programs in a manner that resonates with a diverse urban audience.

Also on the program delivery side, organizational inertia and other factors can often work against the ready sharing of "success stories" and useful resources among conservation-minded institutions.

## Discussion Question 2

***Chicago, IL***

***(cont.)***

We are very bad stewards of the night sky. Light pollution is a great big obstacle that happens when people make careless decisions about light choices and practices. Light trespass and sky glow not only block starlight from view, spoiling ambiance, inspiration, recreation and research, but study after study suggest disruption of circadian rhythm. Artificial light at night is harmful to the environment, nature, wildlife, and human health. A bigger obstacle: failure of many organizations to recognize light pollution is a serious issue that affects all conservation issues. We have a problem when people think light polluted skies are normal. An NPS study shows that, by 2025, less than 10% of people will ever see a starry night in their lifetime.

The land in Chicago (77,000 vacant lots plus vacant industrial land) comes with baggage (contamination). We need federal funds to clean up this problem, caused by businesses, carelessness, and it's making people sick.

Lack of connection, fear of the natural world especially in urban areas and lack of stewardship opportunities, especially via schools

There is so much to be accomplished to protect our environment in so little time that everyone needs to work together on it. I think that if we spread our knowledge and told people of the problems, they will want to help too. In my mind, more kids should be targeted because they are the ones growing up with these problems, and they are the ones best able to change the course of the future. If they are targeted for environmental education, then their knowledge gets spread throughout the family. Everyone wants to make a difference and if we all work together that difference will happen.

I think we need to put more money into acquiring parks in urban areas where there are no parks and increase access to nature in backyards in the form of gardens and native restoration by offering education programs and incentives.

We need to provide more public transportation to natural areas and resources such as a map with bus and train routes to natural areas and a list of activities.

We need more youth programs to get people outside and exposed to natural areas at a young age and at a high frequency.

We need help with authorizing local schools to program in and/or develop course guidelines to allow students access to open spaces outdoors at least twice a week. To authorize hands-on activities in elementary school settings via gardening, nature outings, trails and waterways

Finding funding for projects; Army Corps permitting takes too long

How do we get the lion's roar heard and amplified by federal agencies whose charge is to provide services for psychologically and physically damaged veterans, children in need of healthy outdoor experiences, senior citizens who want to make a difference, youth with more time on their hands than money and others who would benefit from CSI programs?

## Discussion Question 2

***Chicago, IL***

***(cont.)***

There are many obstacles that exist between conservation, recreation, and the connection people feel to their environment. Many forget how the people before us worked with the land and used it as a tool. Today, hardly any people think about what can be beneficial for the planet and us as well, I was told that we live as if we had five other earths. Things need to change; I do the best that I can by volunteering my time to help improve our planet's quality of living. Conservation should be used as way to bring together different people to address issues they all face as a community. Communities should come together and form local recreation groups, to help improve and also get outdoors and active.

In the disadvantaged neighborhoods where my Community Greening program works, it's often not safe to be outdoors, especially for children in unstructured situations. We support situations that bring children and adults together outdoors -- community gardens do this.

Lack of grant funding for trails, natural area restoration, and environmental education

Taks more money for (to support) sustainable open space until programs take hold. The spectrum of government programs for green technology is too small.

Highways, both federal and state are often bordered by miles and miles of invasive plants. These plants cause two harms: seeds that invade adjacent public and private lands. Also, these weed patches that look wild cause those that drive by to think that natural areas are unkempt and undesirable.

Funding -- not just monetary but un-used equipment, etc.

Today's topic of concern is the economy.

People need a place to go and relax, unwind, exercise, and find comfort that they can afford

Parks and open spaces are the place to go.

Amusement parks and entertainments are too costly.

Families need a place to spend time together and be active and have healthy exercise.

Families who cannot afford to have two motor vehicles need to find another source of transportation

## Discussion Question 2

**Chicago, IL**

**(cont.)**

Walking and cycling are the way to go.

Transportation to work, schools, libraries and shopping is needed.

A safe place to travel to work, schools, libraries and shopping is needed.

Walkers and cyclers should not be endangered by motorists who are talking on cell phones and texting their friends.

Trails are the way to get there safely.

Trails need to connect neighborhoods to work, schools, libraries, and shops.

Roadways should not be barriers that divide us from our places to work, play, shop, and exercise.

Gaps and connections need to enable residents to access where they want to go using a trail.

Des Plaines River Trail is wonderful but has a lot of gaps.

Interstate I-80 is a barrier to the I & M Canal Corridor, the Old Plank Road Trail and Wauponsi Trail in Joliet. This needs to be corrected when IDOT implements their new plan.

I believe the economy will improve but in the meantime we can become healthier, happier, and more cohesive family group by using walking and cycling to get somewhere. Meet your neighbor and say hi. Don't be afraid. Things will get better if we make changes and improvements in our lifestyle even with less income. Greenways and trails are the way to get there!

Need to better connect our families and children in the city to state parks and national parks. The government needs to tap into this audience -- they are ready and interested. Chicago Park District strength to learn from -- strong role models to connect people to our nature in our parks.

I recently visited Glacier National Park, Grand Teton National Park, Yosemite National Park, and Sequoia National Park after an interval of about 20 years. I was horrified by the commercialization and degradation of all but Sequoia. Allowing private concessions in the parks is a disaster: Disneyfication rather than light foot-print conservation and outdoorsmanship

## Discussion Question 2

**Chicago, IL**

**(cont.)**

I also recently went on a hiking trip in the UK. Their "freedom to roam" laws allow trails to traverse private lands. This enables walkers to enjoy the countryside, walking from place to place without having to carry a tent, food, water. This is a great way to give access to the outdoors that is not wilderness conservation land. Local, preserve green space as green space: museums, game courts, farmers' gardens, ice rinks etc. are great but should be placed on new lands, not on existing green spaces/parks. These should remain green, not paved over and free to everyone's use.

State and local government budgets are facing incredible constraints. These constraints are severely limiting their investments in conservation and outdoor recreation, which hampers both public and private conservation efforts.

Poor public image. The public must have confidence that parks are safe, well-maintained and readily accessible.

Public awareness, people may see conservation as a middle class luxury

Inability of government agencies to cooperate

Connections, fees maintenance, hours of parks, fear of being sued. Lacking connections, either bike paths, sidewalks, trails for both people and animals (we're cutting off their migratory paths). Fees -- sometimes prohibit use of parks/facilities already in place or deter those newbies. Fees include state parks, recreation trails, boat registration, boat launches. Developers need to set aside good green space.

I work to train secondary biology teachers and teach biology to future elementary school teachers. I see the tremendous need to give outdoor educational experiences to those future teachers. They will touch the lives of many more youth than I, yet they have little knowledge or experience with the outdoors.

I would like to be more informed on where I can apply for funds to create programs that train future teachers and in using nature that is nearby. Like many, I am so busy I find little time to search for grant sources and write grants -- another problem.

The outdoors to many of the students I teach at CSU is their immediate urban outdoor space. They do not have resources to travel -- so creating local educational programs that promote use of urban green space is essential

Today, a big challenge the Forest Preserve District of DuPage County faces is maintaining its efforts to continue to acquire lands adjacent to rivers and streams in order to further protect the region's valuable, irreplaceable waterways and provide additional flood-control features for county residents.

## Discussion Question 2

### *Chicago, IL*

*(cont.)*

Another is to establish new greenway links between forest preserves and other open spaces in order to create travel corridors for wildlife, healthy recreational options for county residents and expanses of uninterrupted natural scenery for everyone.

But the Forest Preserve District is also tasked with finding resources and creative ways to develop new recreational and research facilities that can encourage residents of all ages to enjoy the outdoors as they learn about wildlife, habitat restoration and the wise use of natural resources. Of paramount importance is discovering ways to give young people formative educational experiences that will foster the awareness and civic responsibility needed for them to develop into well-rounded, healthy individuals who care about their own well-being and the protection of the natural and cultural resources that make DuPage County a great place to raise a family, work and play.

...A very visible obstacle to conservation in urban Chicago is the failure of the U.S. Department of Housing, Dept of Environment, Dept of Health to include green infrastructure practices in the demolition of (for example) -the largest public housing development in the United States. Between 22nd Street on the north and 51st Street on State Street, high rise buildings were torn down. Many of the sites remain vacant now 10 years later.

Application of best practices for air quality improvement, green jobs, green infrastructure are obviously not on the radar when deconstruction / demolition is done in Chicago. I remember the vast number of death certificates that came into the office I worked in during the demolition of Robert Taylor and Stateway Gardens. Cause of death was asthma. I have wondered if any one has really measured the impact of tearing down those buildings had on the air quality and quality of life, (high shift of homelessness), crime, employment, etc. in the Bronzeville / Grand Boulevard communities (1999-2003).

NOAA Community Restoration Program itself and its various regranting and other non-government organization administered partnerships have been potent factors not only in restoring coastal river system and benefiting diadromous fish passage, but in developing environmental stewards among the many volunteers involved in their programs. The impetus for community-driven, small dam and river barrier removal provided by the Open Rivers Initiative lacks only depth and significant, secure and continued funding.

Indeed, the success of such programs now taxes and is limited by the staffing levels within the administering agency, the Department of Agriculture's National Resource Conservation Service (NRCS). Farm Bill money also contributes to--and could contribute much more--to staffing of much needed, broader scope conservation efforts and to capacity building within the conservation community through that agency's Cooperative Conservation Partnership Initiative.

Abandoned mine clean up is something Trout Unlimited and some other conservation groups would like to undertake on an even broader scale than they now do. Acidic water drainage and heavy metal leaching from hard rock mines kills fish and taints water supplies. Indeed, mine drainage taints 40% of western American streams. However, the liability risks under current federal law are insuperable.

## Discussion Question 2

### *Chicago, IL*

*(cont.)*

According to a 2007 Center for Disease Control study, Illinois ranks 10th in the nation for the percentage of children aged 10-17 who are overweight. Illinois ranks 4th behind Mississippi, Georgia and Kentucky in childhood obesity. The cost in dollars alone is astronomical, \$117 billion according to a 2000 study by the U.S. Surgeon General. It is now recognized that the number of people who die prematurely from obesity is greater than the number of people who die from smoking.

The administrative burden required to deal with grants is wasteful. "Administration" is roughly 10% of our effort for private sector work, but makes up 30-40% of our budget for grant-funded projects.

It's not that there is not enough being spent on the environment -- it's how it is being spent. The federal government does not solve these problems -- it adds to and perpetuates them, resulting in less going to what matters.

Enactment of protective designations has been hindered and sometimes stymied by divisive battles among the users of federal land. Many have recognized that, where such controversies rage, local efforts to reach compromise plans are valuable tools to secure more designated protected areas. The effort to end Montana's twenty-seven year hiatus in new Wilderness designations through the Forest Jobs and Recreation Act is a case in point.

US Fish and Wildlife Service National fish Passage Program is a model of collaborative, meaningful conservation targeting a collection of the most significant causes of habitat fragmentation for aquatic species and for those terrestrial species with life history ties to stream corridors. In a region with some 15,000 inventoried stream barriers over six feet in height and uncounted impassible culverts and other smaller barriers, Trout Unlimited members in Illinois are acutely aware of this problem. We are equally aware that many of these wounds will never be addressed with current levels of program funding and current partner match requirements.

Access to private lands has greatly diminished during the last half century as Illinois members of Trout Unlimited are only too aware. This State's stream access law is among the most arcane in the nation, it is behind the majority of other states in promoting incentives to landowners for allowing access, and Illinois lags behind all other states in indemnification of any landowner who might permit general recreational use of his land.

Chicago does not have adequate park space to serve its population. Fifty-five of Chicago's seventy-seven community areas do not have a basic 2 acres of park per 1000 population. The national standard of the National Recreation and Park Association for a healthy community calls for 10 park acres per 1,000 population.

What is making a difference for the biodiversity of the nation? I say people. Take the success of Chicago Wilderness, Kansas City Wilds and Houston Wilderness. These efforts work because of people. As a land manager and a regional planner with Chicago Wilderness, I speak from personal experience that several factors are issues for biodiversity in this region and they are, in no particular order: invasive species, climate change, the need to acquire more large core preserves, research of restoration efforts, and the inclusion of children and inner city residents.

## Discussion Question 2

### *Chicago, IL*

*(cont.)*

Lack of perceived large public lands near Chicago (some exceptions are the Indiana Dunes National Lakeshore, Midewin National Tallgrass Prairie)

Perceived disconnect between city dwellers and "nature lovers"

Public does not make connections between urban biodiversity and national biodiversity (e.g., migratory bird pathway)

Disconnected relationship to urban waterways as a place for nature and recreation because of historic use for sanitation and industry

Public transportation linkages to natural areas may be limiting factor for many

The same challenges exist in obesity today that existed years ago. More funding is needed to establish collaborative, cost-effective, sustainable solutions to eliminate obesity. Stop making people aware of obesity (because they already are) and focus on solutions. Use people who are innovators, problem solvers, etc to solve the problem as opposed to organizations.

Protecting public health through cleaner water. People are constantly using Chicago parks and rec., especially the waterways. Chicago is disagreeing with sanitizing 1.2 billion gallons of water as recommended by EPA.

Questions for audience:

Health Care providers in room?: Minority of room

Who has been told by a physician to go outdoors? Not many at all

Better link health care system in public lands.

Current health care providers are trying to get in and outpatients.

Ideas:

Education as physician – learn how to prescribe these resources

Patient needs information – how to ask questions on what type of outdoor activity they need

Need database to tell where to go? Can patient have access?

Very excited about the huge potential for new public health opportunity with great outdoors initiatives.

## Discussion Question 2

### *Chicago, IL*

*(cont.)*

Building a Healthier Chicago

Nutrition in inner city

Partner with dr Galloway

Consider safety in underprivileged area – day to day safety is #1 priority

Large open areas/buildings to move freely in urban areas

New innovative ideas need to be promoted more to inner cities –

Working with police dept in inner cities

Opportunity to take advantage of the current schools – as well as not used land – build small parks in communities

Utilize current resources.

Critical children develop outdoor recreation at a very early age

Create comfort in toddler years – introduce children to nature

Not just talking to kids – talk to parents

Suburbs abused – economic justice

Project they maintain – soft trail lake – not maintained and been ignored

Issues about watershed

Flashiest stream in all NE Illinois

Provides game fish

Cant provide b/c its being ignored

Nature reserve suffers by being overrun by coyotes - No more beavers

Thorton reservoir – world’s largest toilet bowl – no environmental impact study

Urban kids are scared of outdoors, break down barriers to appreciating outdoors; Concerned that agencies don't trust data gathered from volunteers in the field

Concern hearing from staff not interested not increasing partnerships and volunteers; Need to make it easier with staff to get involved w best practices and volunteerism DOI working well with trying to use STEP program to get jobs, how do we want to make things easier to work w

NPS workers say that partnerships are too difficult to manage. Too cumbersome to utilize. Staff say that fostering and using volunteers and partners is not my job.

Recognized that membership & support of youth in conservation is low, try to get youth interested in conservation, exposure at young age. Developed program for schools called Project Webfoot, teachers interested, failed due to cost & funding. Conservation needs to be a part of school curriculum. Need to become partners with school systems, conservation organizations & state & Fed need to s

Resources, many programs around the country are replicable and it boils down to resources. Feds can provide resources. State, local and community programs and NGOs have good programs, based on science and have the ability to be replicated.

## Discussion Question 2

**Chicago, IL**

**(cont.)**

Why is it that no one talks about global warming? How do we get kids and adults to understand this and change their behaviors? How does the government help us make that leap? It is also the churches, etc. It has to happen at a very visceral level.

As a child I was exposed to the outdoors through public school athletics. Luckily for me, I could run right in my neighborhood. Safety was a major factor for that. We need to address a proximity barrier. Or even the psychological barrier of thinking that

I think the biggest barrier is that we lack a clear vision for what we're talking about. Lack of vision will delay America in getting in shape. I think putting gardens in schools, getting them to connect to nature and getting them moving is critical.

Build trails that are shared-use and sustainable. The tension between conservation and allowing uses. Recreation falls into the category of high use. There is a need for science to look at true impacts of recreation on our natural resources.

We have a swimming pool in the HS but it doesn't work. Do not have a playground, need funding from fed gov for playground, and to fix pool. The students want to use it, but cannot. They have healthy food, team have a peace center for Jews, and prevent th

A barrier is a lack of information. People don't have information about what is out there and what access they have.

People do not know where to go to recreate. People could use the phone to get access to information. There is an opportunity to work with companies to get information from their phones (e.g. I phone apps)

When tracking Health impact on students in environmental programs these records become subject to HIPA. The technical expertise required for this records management is a barrier to environmental professionals. For inner city youth of poverty, there are social and behavioral issues that environmental organizations are not equipped to deal with. SCA has tried to balance the societal and environmental expertise of staff to round out experience for the youth.

There are so many competing interests for adults and youth that prevent them from getting people outdoors. We need to figure out how to raise the profile of outdoor activities.

Barrier is that we cannot get our foot in the door into high schools to create awareness. We are a small organization and people from the city

We have lost the way of counting what is useful (i.e. the greater society invests value in built environment and commerce and things that generate money). Figure out how to invest value in the non-built environment.

Crime is a barrier for children whether it is real or perceived. Most activities had to occur indoors because after a certain time period, it was unsafe for children to be outside.

## Discussion Question 2

**Chicago, IL**

**(cont.)**

Funding needs to come from agencies to support initiatives in the community. The community should decide what we are going to do and then get funded. We have encountered a lot of problems to get kids outdoors because of insurance reasons.

Department of Labor dedicated 20 million to workforce investment dollars to support work on our public lands which is very exciting. The technical issue is that workforce development folks don't know how to manage workforce investment act money and it is beyond many organizations.

We need to instill in kids how to go out and discover. How do we light this fire in the kids, Education. Schools are geared to reading, writing, and arithmetic and there is nothing about exploring and discovering, fix this.

Federal government could be more effective if there were more collaboration between the federal agencies that are not normal allies. For example, you should link education and health and human services and national park services to get kids moving and doing environmental activities. The lets move initiative is a good example of how these things can be carried out.

Awareness of parks recreation opportunity

Need info on how to get to these places, e.g. Indiana dunes nat. lakeshore, need car/transport to get

Transportation issues. Silos of fed agencies are an impediment. HUD DOT need to be involved.

Got kids w diabetes in the parks via partnership w Kaiser, 2nd year couldn't get enough kids. Need better communication with health care providers.

Shrinking amt of natural areas, casinos, etc. infringe on natural areas. Road access diminishes the very place you want access to.

Barriers with language

Work in chgo, land not available in communities so kids can walk there safely.

Fed money went to Cook County, but not yet distributed to the local groups. Make the county accountable in how they use the money, make sure it gets to the community/ local groups.

We are competing against electronic games. Need to give a thrill outside. Maybe motorized recreation. Sailing.

## Discussion Question 2

### ***Chicago, IL***

***(cont.)***

Clemson Beaver Pond overrun by coyotes and beaver population; Sawk Trail Lake & dam abandoned by Cook County Forest Preserve for past 50 years, filled with silt and not in compliance with Clean Water Act; Thorton Transitional Composit Reservoir- lacking environmental impact study and will destroy groundwater resources

We work on issues that affect our communities, families, and schools in Chicago. Listening to you today, as an organizer, we walk door to door talking to people on issues, we need to have this information in our communities. We understand and know that in order for anything, no matter what it is, you must go to the source first to find out what they need in order to correct any problems no matter what the problem is. Whether safety, health, education, or family issues. Every step we take is a step toward a better future.

We know that physical activity is an important factor in healthy children and adults. Studies have shown where there are neighborhood parks and trails in close proximity, residents increase their frequency of exercise. Conversely, the same studies show that where there are no parks, residents often go without exercise. In dense urban environments, particularly in low income neighborhoods, parks, playgrounds, greenways and trails are often the only spaces for children and adults to engage in play and fitness activities. In these low-income communities, people do not have access to nor can afford health club memberships.

Chicago does not have adequate park space to serve its population. Fifty-five of Chicago's seventy-seven community areas do not have a basic 2 acres of parks per 1000 population. The national standard of the National Recreation and Parks Association for a healthy community calls for 10 park acres per 1,000 population. According to a 2007 Center for Disease Control study, Illinois ranks 10th in the nation for the percentage of children aged 10-17 who are overweight. Illinois ranks 4th behind Mississippi, Georgia and Kentucky in childhood obesity.

## Discussion Question 2

### *Concord, NH*

Requirements for Rural Enterprise Zone are too restrictive. USDA needs to make this designation more attainable for small, rural communities.

Wood pellet boilers are growing in popularity. I have just installed a large wood pellet boiler in my small business. What will happen to the forest when the economic incentives to cut often and early to meet the demand for biomass? Will biomass efforts actually adversely affect forest sustainability? How do we make sure that biomass production is sustainable?

Furniture industry has vacated low and middle market. Foreign low end design and marketing has been very effective at lowering costs such that our industry can't compete.

Ad valorem property tax has been terrible discouraging for forest owners. The World Bank conducted a study on the ad valorem tax and set up 12 (?) guidelines for an effective tax. Vermont violates 6 or 7 of the 12 guidelines.

I have been with this organization for 30 years and our goal for 30 years has been to enhance the value added capacity of the wood products industry. We are not effectively realizing our value added. We are shipping raw materials to Canada and elsewhere - we are acting like a third world country by exporting our precious resources. This is a lost opportunity.

Regarding energy. NH has a good system of independent power producers. We are aware of the inefficiencies of producing energy from wood chips. We are trying to encourage smaller scale heat only systems. Obstacles are that there are not economic incentives for thermal projects as there are for electrical projects.

Wood product manufacturers will locate in communities that are economically viable. Traditional financing for forestry and agriculture is not currently available. Wood product manufacturing is an "orphan child" for economic development efforts. USDA needs to increase emphasis on Forestry and Agriculture industries to help provide support (financing opportunities) for these businesses to grow.

Four states and political boundaries pose challenges for long term management of forests. Our council has to sometimes make four separate applications for one project - one for each state. USDA needs to standardize forms and regulations so that we can manage across boundaries.

Innovation and multi-jurisdictional approach will have best long term effects. We need to look at all Forest resources, including recreation, is essential. Engage the private sector in developing public policy. We need to accelerate our positive efforts - we don't have time to wait.

Green Building. USDA needs to draw a hard line - BUY AMERICAN WOOD.

Recently received a USFS grant to build on our agriculture "buy local" program. MA is in constant warfare between the wood products industry and the environmental movement. USDA needs to show the environmental movement that cutting a tree is not on par with murdering someone. USDA can help provide information and examples of good forest management.

## Discussion Question 2

***Concord, NH***

***(cont.)***

I am also afraid of federal involvement. I have used federal cost share programs and think I can do a better job by doing the projects myself. Conservation Easements are not the answer. Markets are important, but you must get the costs down. Between taxes, access costs, inheritance taxes, etc, I have not made a profit on my forest lands. We need long term policies that favor landowners.

The USFS must change its climate change plan. Advocate for green building NOT advocate for LEED certification. (LEED is a "brand" and the government shouldn't endorse a brand.) USDA should advocate WOOD>

Engage EPA upfront on all issues that will affect forest landowners. EPA should consult with USDA and viceversa so that both support the needsof

Average parcel size is getting smaller. Who owns these small parcels? New owners. What is the message they receive about forest ownership? The County Forester is the most important messenger to provide educational outreach to new land owners. Our service foresters and cooperative extension foresters are critical for continued forest management on the parcels owned by these new owners.

In MA, we are working with temporary conservation easements. The farm and forestry viability program helps landowners write a business plan that includes temporary restrictions on the land (10-20 years) and allows the landowner the assurance that the forest will remain and allows a timber purchaser to know that the land will be available for forest management, yet it does not confer permanent easement rights. The program has been successful in MA.

Although NH is well forested, there are species that are still in peril. There is still great need for forest restoration and that depends on diverse markets that allow a variety of prescriptions

USDA must help citizens make a more clear connection between their lives and lifestyles and forest management. The wood we use comes from trees that we cut!

Very concerned about economic growth in Maine. We are against the "America's Great Outdoors" movement. We are worried that there is a movement to take over the State of Maine with any sort of conservation easements. We don't like the work "perpetuity" - we shouldn't saddle our children with agreements that we made for things we need today. We are also watching the whole state of maine being sucked up into conservation easements and then the land is not available for future economic development. Maine is broken up into small communities and small woodlots. Maine Woods Coalition supported the Plum Creek Project, but the enviros didn't like it. We are afraid that if the feds get involved, we will lose local control.

## Discussion Question 2

### ***Concord, NH***

***(cont.)***

NRCS established the Technical Service Providers program; many foresters tried to become certified, but it was too arduous. Subsequently, several employees of the Vt Dept of Forest and Parks became Technical Service providers. NRCS should recognize the professionalism of consulting foresters so that they can approve forest management plans without going through the arduous task of becoming Technical Service Providers. (The program is changing to reduce some of the requirements to make it somewhat easier, per Rick Ellsmore)

People cannot readily see the peril of the demise of forest.

Working on a commission formed by the New England governors to develop a resolution ([www.negc.org](http://www.negc.org)) regarding to managing forests across political boundaries. A listening session like this in the state of MA would really assist MA in its conservation efforts.

Land conservation must also include the economic effects of management decisions. Keep farms as farms. Keep forests as forests. Protect coastal areas. Connect people to the land.

We have worked with seven state foresters, managers of LWCF, and agricultural staff and have designed five national demonstration projects and on July 12, all five governors have endorsed these projects. These projects recognize the relationship between the welfare of the environment in small communities directly effects the welfare of the small communities that depend on them.

Wetlands conservation, Fish & Wildlife, etc. North American waterfowl recovery. Joint ventures to implement. Has brought together state, private, and federal. Most successful in the world. We should use it as a model for other programs. Preserves habitat and connects people to it. Continue funding. Continue encouraging private landowners. (How adapt to forest concept?) Has already been adapted. Great Bay partnership. Forested land. (was a valuable partner. [submitted statement])

Board made up of fed, private, non-profit. Work with teachers to get kids outside and learning about the outdoors. Lot of great pgms (Project Learning Tree). Teachers frustrated with No Child Left Behind – teaching to the tests for fed requirements that don't fit. Would love to see federal mandates that cater to outdoor pursuits addressed.

Speaking for private landowners, I've heard overwhelming requests to raise money for education (I support this). Another is to buy developments. Wouldn't it be easier to educate landowners? Tax reduction for allowing recreational use on private land is 20 percent (amounts to about \$35 a year). I can post my land, still get current use, and only have to forfeit \$35. If I enhance rec benefits, pay me for it. Shouldn't be either or situation.

## Discussion Question 2

### *Concord, NH*

*(cont.)*

Oldest interstate hiking trail in Northeast, older than AMC. The 21 mile trail crosses 34 privately owned properties. Two problems with our northern trail terminus: land is designated forever wild, so no cutting or improving trails. Also, MOU with USDA prohibits dogs on trail. A private land owner whose property trail crosses trains dogs and was told that's illegal. Another regulation prohibits jogging. For many years a race on the trail has been allowed once per year. But no parking available at northern terminus. Would like a half-acre for parking there. For first time, a landowner refused to let trail cross property. Had to reroute. Later comment: A unique program is Municipal Trails Act: we fund easement for existing trails and turn over to municipality.

Paid attention to what was attracting people to northern NE. Read that Forestry association had evidence that proximity to trees actually improved health and quality of life. Even being able to see trees from a hospital room is beneficial! From Emerson and Thoreau to our own experience, trees are important. I propose that there's a real power that has the economic capacity to drive people to do something that is healthy to them. But no one is paying attention to that benefit. That underlies all the conversations we've had today. Why they call it a natural attraction. We need to learn more about it.

We depend on private forest in New England. Re Current Use: huge amt of private forest and people aren't aware that this occurs. Need more collaboration. At \$35/year may be more incentive to go another way. I think we could build on relationships. New models south of the border. Make most of fed benefits. Later comment: Two areas govt can connect with: INVEST IN RECREATION. Challenge cost share pgm (50/50) match to local investments in trails. Reduce our reliance on automobiles, find rec close to home. FUNDING! Landowners have liability protection, but still can get sued and have to protect themselves – how to further protect them from this.

No Child Left Behind is a challenge. One of our successes is bringing kids to the outdoors, but need access. We have wonderful places, but schools don't have money to visit these places – busses are obstacle in connecting to tree farmers. Field trips are the first thing taken out when budgets tight. Instead, we have to focus on school yard to learn about habitat. Hard time getting this generation of kids to think critically about things that are complex. We need to get them to look at local issues. What works and barriers go hand in hand.

Challenge is making sure that purposes are upheld. Lives will change/environment will change. Feds should realize that forest legacy program is a great program. Stewardship is ongoing. Funding needed for education and the whole scope of resources. Change is happening, from climate change to what the public needs for rec and what landowners should do to remain economically viable. Agriculture is a challenge – change from 20 years ago. From B/W Holsteins to how can I bring agritainment? (pgm works but challenge is monitoring) Monitoring and Stewardship together, working with land owners to achieve their goal.

If we look at anything as a standalone problem or solution we're going to fail. I would offer that there be a communication strategy that integrates solutions. Growing disconnect with outdoors. VT is integrating schools and environment. We think of the outdoors as an add-on, a separate piece. Integrated solutions or value, impact is lost.

## Discussion Question 2

### *Concord, NH*

*(cont.)*

Reconnecting to outdoors. We have wonderful resources in White Mountains, but we do very little to tell people about the cultural resources. We have historic roads, abandoned homesteads. Need signage to tell people what's there. Signage would be inexpensive. If people know would out they would be more likely to support.

What works. We are nature center and shelter in southwest NH, and a land trust. What works well is that we are in a mosaic of protected lands, created largely by conservation easements and land trusts, and what works is the opportunity to lead programmatic trips to protected lands. A great asset to have these places to show off. Every weekend we have hiking trips with 40-50 people going. Without the mosaic of protected land we wouldn't have this. Need to provide more incentive to landowners for conservation easement, funding to make it possible to donate (many are land rich and cash poor). Also think about ways to connect people and children to outdoors by linking to strategies such as sound health, combating obesity, promoting healthy minds. Target is health and getting people outside.

We are model of grassroots conservation groups. Help six towns talk to each other on shared issues like drinking water protection. Land trust with strong educational component. Ranch and Farmland protection program, along with 600 donors that protect farmland south of the Sandwich range. Hire grad student every summer doing research. Takes us months to get a stipend for them. Need a federal program that would allow us to pay the stipend and ensure we continue the program.

NH strength: collaborating well; only way to get things done. Challenge is what's happening in school system. Passage of No Child Left Inside act would greatly impact what states can do. Supports teacher professional development, also connecting schools to outdoors and supportS field trips. Funding must be appropriate, and more than \$100K/state. We know the benefits of getting kids outdoors – they do better on standardized tests, problem solving, become more holistic citizens. I'm also watchful wildlife coordinator. In 2000 we had funding but those dollars have dried up, and we need a dedicated fund. Look at extension of existing programs. People need to thank their hunters and anglers because they are paying the bill. Later comment: Some places should be left wild, with no human influence. Education is critical; holistic approach needed.

Govt role should be providing consistent funding for various funds and grants. Also community assistance facilitation. Private landowners under pressure to host trails. Govt should do more than just hand out money.

I have 40 acres under conservation easement and am preparing for final 20. Foresters and extension service have been helpful. Keeping connected is to allow people on to see what is going on. But 100 acres abutting has been sub-divided for lots. When I asked for non use of fertilizer, was told OK as long as 50-foot buffer not violated. I'm concerned about what happens to landowner when changes happening around them. Trying to get people to bear the expense is hard. My son doesn't understand the land, wants me to sell to someone who does. Program to match people looking for such an opportunity with people like myself.

## Discussion Question 2

### ***Concord, NH***

***(cont.)***

NH's inclusive nature makes it special, has promoted more harmonious relationships. Work with private landowners to include motorized recreation, often maintaining roads at own expense in exchange for access. Offer donations to landowners for privilege of using land. Often there are restrictions such as prohibiting summer motorized use. Federal government can help by extending RTP (Recreational Trails Program – dollars from gas tax). The greater the amount of motorized trails, the more money received.

In NH a number of state-specific programs to encourage recreation use on private lands. State has hold-harmless law which encourages landowners because it reduces their liability. If you receive payment, though, this doesn't hold true. Another encouragement of public use of private land is incentives from local property tax – more land, more money. Network of trail clubs (e.g. snowmobile clubs), self policing, helps out. Maybe a model at national level. Challenges: simple economics: if I can't afford to own land, it becomes a liability. Government should support local markets for lumber/timber over imported projects, should also support alternative energy (windmills). Expenses: vandalism, management costs, taxes. Sunsetting of estate tax break will hammer private landowners. Federal government should be an example in the management of their own lands, showing public how active management works.

A unique thing we do is stretch federal and state dollars, as well as funding a lot of volunteer programs (Fish & Game and others do this, too). Volunteer programs get the word out beyond what we can do as staff members. Challenge is how do we fund them /support them (e.g., conservation ed, Urban Forestry). Federal funding should be made available for these efforts.

Hidden challenges: The number of NE hunters is dwindling. The result is reduced funding for NH F&G and others. Excise tax on firearms also goes into state and federal budgets. [Submitted statement]

Wildlife Action Plan, funded through state wildlife grants, is celebrating tenth anniversary. We need to plan for next ten years. The program has allowed our game and wildlife programs to thrive. Specific to working forests: public needs to be educated about term clearcuts, needs to understand that a 5-acre cut is important for wildlife habitat. Planning for future, we need to incorporate that notion and help people understand how important to future to habitat and wildlife in general.

Focus is changing from management to stewardship, resulting in less timber harvest. In northern Maine, clearcuts are no longer allowed. Federal government should educate people in importance of harvest, provide incentives to wood products industry (e.g., mills facing closing). Message should be the importance of forest products to overall economy.

Need to build appreciation of nature and connect general public. Experience is exponential – will last a lifetime. Federal government should offer events to encourage this, to promote "ecotourism" and public awareness of pollution (such as Give a Hoot). The Ken Burns series on national parks is a good example of education.

## Discussion Question 2

### *Concord, NH*

*(cont.)*

Company manages 3 million acres in New England, New York, and Canada. Education works – get people outside. White Mountain National Forest is good example of management and research. Challenges include committing to education, especially about working forests. Also to help private landowners with the costs of keeping land open and for trail and road maintenance. Incentives, especially tax incentives for landowners to maintain working lands. Win/win situation.

The poor economy has increased use of state parks; people seeking low cost, nature-based activities. Challenge is how this will play out: private landowners face new expectations from enthusiastic new users who don't want to see cutting, hear chainsaws. Need to educate recreating public on multiple use, working forests.

No Child Left Behind focused attention on testing, not experience nature/outdoors. Money is a barrier to nature-based field trips. No Child Left Inside will go a long way to help. Target should be on the family unit: they come back and bring friends. Forest Service could help with conservation education funds. There is gap in awareness of connecting with nature and understanding working forests. Can't approach this piecemeal.

collaboration at the National Level is needed. Landscape planning regarding conservation lands is also critical.. These relate to strategic conservation goals. Maine gets less money per acre of forest ... than many states with low percentages of forest land... and thus conserves a much lower Percentage of their lands than could be conserved in Maine and NH, and Vt.

Conservation of lands... resulting in loss of tax revenues (PILT) is causing some resistance at State levels.

Property owner who wants to pass on the land and legacy to his family, with the assistance of the government (deduction , etc ) to make an incentive to put land into conservation easement - as opposed to costing money to do so.

Incentives, investments, and partners are about where to conserve lands and whether these tools are applicable in all areas of the country or under all economic situations. Saving special places is not the whole solution to the question of land uses, and the solutions vary from region to region. Market incentives (by policy) are more important thru incentivizing markets - thereby allowing private monies and landowners to work towards this goal. Government funding is not the total answer, leveraging private interests will provide a lot of motivation and results. Easements are not for everywhere, and there is not enough \$\$ to purchase all protections that are needed. Economic incentives and market forces would create the same results for working forests.... The dis-incentivising of private working forests through rules and regulations (of these wood markets in general and the bio-mass market particularly, etc. ) would also prevent natural market driven forces from maintaining these working forests.

## Discussion Question 2

**Concord, NH**

**(cont.)**

We have compact lands with multiple ownership in N. E. With 400 land conservation land trusts - each doing their own projects one at a time - is inefficient. A new initiative is proposed, where by in western Mass.... Combining 72 individual projects was combined into one project purchase (needing about 21 Million \$). But the efficiency, synergy and collaboration approach has huge benefits through combining knowledge's, economy of scale, and individual landowners being part of a larger effort. Another ongoing effort combines 120 land trusts and 400 purchases - but requires a large amount of funding and (hopefully) federal assistance to complete the process. Aggregation and bundling saves money on administration. People like that they are part of a large effort, part of a large conservation effort.

Carbon releases from 57 million acres of pvt. Land if turned into developments.... Would kill any change in climate change that other efforts might accomplish. Incentives are needed to maintain these private lands in forest status. They have to be economically feasible for this to occur. The future needs to be conservation - not fragmentation. Reducing development, and the subsequent reduction in carbon sequestration will be detrimental to the environment. Additionally, increasing incentives for wood product heat sources versus continued increases in oil heat would benefit the climate concern scenario as well. Tax incentives for developing markets and providing raw materials for wood markets will be key.

The value of these lands, acquired through enormous energy and conservation effort, includes taking on a huge effort dealing with government bureaucracy and incentive programs. The government should rather allow for normal market fluxuations (supply and demand) and tax conditions to provide for land conservation, rather than government intervention.

Towns in ME have fallen on hard times, and deforestation in all NE states has doubled - like a second wave - in the recent decade. The need for conservation that can aggregate cons. Lands , and we need a climate and carbon initiative where small landowners can take advantage of these incentives (normally fir 1000 acre lots +) and 3rd. Private landowners and landowner outreach - is not technically up to speed - a method that would connect these landowners is needed. and finally - facilitating landowners as part of a solution to energy issues and policy.

Fed Govt separate programs needs to work together to provide efficient successes at these goals.

Getting kids in the outdoors is important and part of that should be about observing what kind of vocational opportunities there are working in woods related industry (timber and recreation, conservation and wildlife mgmt.

Need policies that will be with us and set the course for the next 100 years.

Private landowners, ready to donate but due to costs are hesitant, due to the costs for land surveys and title search. Fully fund LWCF . quality Carbon

## Discussion Question 2

### *Concord, NH*

*(cont.)*

The working forest is my 401 K, and is so for many other people. Owners need to be able to entrust good stewardship of those lands to their heirs through a conservation easement that can be adjusted, or updated with the current needs such as things (like tax laws, or even resource requirements, etc. ) Situations change over time and could require adjustments, whereas locking into strict easement without the opportunity to adjust to change over time is like having a "mutual fund" or 401 k that has no flexibility. Not asking to break the "core" purpose of that "easement" .

Couldn't get much money for anything: LWCF needs to place more emphasis on forest land and maintain recreational facilities. Landowners are discouraged because the process takes so long to complete.

The challenges for land trusts and conservation easements are in part that each landscape is unique and complex. Lots of variability in the needs and opportunities, and also on the stewardship requirements.

Due to complexities of regulations and limitations, communities find it difficult to get through the process and hold easements in their towns

People with land who want to donate can get some help with costs for donation but no monies are set aside through federal funding programs to fund the 'stewardship' monitoring of these easements. That is a critical absence and need for the future protection of these lands. Funds for Stewardship of conservation Lands is critical.

Rules are complicated, professional and Federal staff often have to wade through a pile of rules, to understand them. Would like rules to be straightforward and workable, and to be brought forward without delays . The process is not being simplified - new rules are merely added, but the process is now quite cumbersome and needs to be simplified and streamlined.

Conservation decisions must be based on Conservation science. There are studies and documents that outline which resources are most important to conserve. Local knowledge, and local entities at the County and state level should be driving these decisions.

Small woodland owners need to have more access to these programs. A small woodland owner acts as a conservator on his property. Regarding easements, an environment needs to be created where land owners are looking more positively toward long term ownership and allowing recreation on his/her property. Problem is landowners " Get No Respect" , so a program that would help encourage them to continue providing these benefits on their land is important. The message that small woodlot owners cumulatively are so beneficial and important to the "conservation of lands goals" is needed, and might then encourage other landowners to do the same.

Full funding for I and C Conservation fund, and forest Legacy fund. These programs tend toward large tracts and smaller <1000 acre sites cannot compete at the national scale.

## Discussion Question 2

### ***Concord, NH***

***(cont.)***

Community space and open forest Bill, (w/ 50% matching fund is valuable but getting the other 50% funds at the local level is difficult, even when people from diverse interests agree on the ultimate goal. But additional funding is critical for these small towns, or increasing incentives. Forest Legacy funds one purchase per state. In the densely forested NE states, there is need for more parcels or purchases to be funded.

Need to create a market for forest landowners to sell their carbon credits at.

Management funding for community forests, which are run democratically, is needed. They are currently excluded from EQUIP and WHIP programs.

Not enough discussed for small tree farmers. Many programs and assistance designed for larger land holders. Obtaining government assistance for stewardship, for tax relief, and to make improvements is tough. The soon to return 45% estate tax (the break on this tax sunsets next year) would prevent many landowners from being able to pass on to their heirs their land, and pay the 45% estate tax as well. This is resulting in extreme difficulty for maintaining working forest lands within families through the generation.

We need incentives for good management and for protection of community and state forests.

Municipalities are easily forgotten in the incentives programs and yet the general population benefits, so they need to be considered in legislation and policy.

Communities are starting to do good forest plans but they need help (incentives and grants), especially now as planning boards are not as busy as in a normal economy. Now is the time to utilize their availability.

Has protected up to 50,000 acres in the area but what is needed to continue this conservation effort - \$\$ is needed.

\$\$ is needed for Maine forests.

It has become increasingly apparent that deforestation is big contribution to greenhouse gases and climate change. We can play a critical role in mitigating climate change by protecting forests and getting people out in nature/forest. It needs to be a combination of education and awareness—if you know something you're more likely to care and more likely to protect it.

## Discussion Question 2

### *Concord, NH*

*(cont.)*

Their area became an Americorps site for land conservation, protecting 24,000 acres. 7 regional land trusts came together (240 towns) with 20 staff to do conservation and stewardship. There is more of an economy of scale with a larger organization of partners. They want to incorporate strategies in selecting projects to help mitigate/adapt to climate change, but are having difficulty finding direction. There should be more connections between local/regional land trusts and the feds, partnering at the federal level to implement policies. We should also be talking more to the public about how what we do in our daily lives affects climate change.

He expressed a concern about the stated purpose of this meeting. Obama said that ideas from these meetings will help better protect our natural landscape and history in the future. People here have not used "natural landscape", only working landscape. Why are we avoiding using this term? He does not log his land, and is allowing it to return it to "natural landscape". He don't sell woodchips, etc. So we should remove the "working forest" from this discussion—it does not belong in a "natural landscape."

The definition of "working forest" is very limited in that it means logging. Forests can "work" in lots of different ways. There are alternatives to a working forest as logging. Response: this particular session was focused on "working forest" and that is why it was presented that way. Lots of other benefits from working landscape—carbon sequestration, water quality/quantity, etc, but we may not convey this well to the public. "Marketing conservation". We need to do a better job of marketing what we really do.

Public utilities are encouraged to have a certain amount of their power generated sustainably--using biomass, for example. A recent study (Manomet) says that biomass is not necessarily sustainable unless there is cogeneration. The government should more carefully evaluate what is "sustainable" when power companies are working toward these incentives/laws, because they may not actually be sustainable. Power companies should not be allowed to do these things if they aren't really sustainable. We don't want to dig ourselves into a bigger hole. People may be trying to "do the right thing" but may not know what that actually is regarding sustainable energy production. As a private citizen, she would like the federal government to step in with scientific knowledge and provide guidance.

Studies in NH show that there are enough NH forests to sustain a certain number of biomass plants, but there is not enough information available to know if this is actually the case. Concern: we are having a difficult time sustaining our state parks. NH is the only state in the country that doesn't provide any general funds for state parks, which are at risk and have millions of \$\$ of infrastructure needs. These parks are a great education tool for climate change and natural resources and they are at great risk. Is there a way in this initiative to help improving state parks.

## Discussion Question 2

### *Concord, NH*

*(cont.)*

With climate change our ecosystems are under greater stress and it is important that government and private folks look at protecting areas and creating corridors for habitat from ME to northern NY. One way would be federal encouragement for towns to buy and maintain town forest. If there were federal tax incentives for managed town forests or federal grants for key corridor purchases, it might help offset the fact that towns will lose tax dollars if they have more town lands.

A carbon analysis should be included with logging proposals and with woodburners in the state. This is not required in state process currently and will be difficult to do because of all the details involved. This would help determine what is actually "sustainable", including carbon accounting for things like trucking, etc. We might find out that what initially appears to be the "greenest" is not. We need to tackle this and hold the public trust that this renewable energy is truly renewable. When NH signed RGGI (Regional Greenhouse Gas Initiative), that is what it was about.

Haven't heard about what the monetary value of carbon is? We don't know where to get information on the value of carbon. This conversation should begin with discussion of the global carbon market. This will affect the value of land in "current use" because if carbon has a monetary value, the value of land will increase if you let trees grow. The government should do something about this.

Challenge 1: We need to better understand forest genetics in order to help forests transition in light of climate change. What species should we be planting? We need help. How are we going to help forests adapt? Challenge 2: Lots of landowners are driven by economics, therefore economic incentives are necessary to keep these forests. Low-grade markets, including biomass, will help and result in more carbon sequestration. The MA study about biomass does not say that it is not sustainable if you look at it from a lifecycle analysis. Another important component is green building—no better building material than wood from a green/carbon standpoint. How can the feds encourage green building? Federal policy to say "American wood first" as opposed to other building materials. More thought needs to go into the green building certification process.

There is a fear factor when people talk about climate. We need to build trust and acknowledge that a lack of trust will hold us back. Another challenge: resources. There was a grant program created in 2008 Farm Bill, but haven't been able to get money in it. Biomass: created program in 2008 to provide \$\$ for communities to buy biomass facilities, and heat schools, etc. Haven't got any \$\$ into program yet. Tools are there but not the resources/money.

These listening sessions are great ideas but are they going to go anywhere given our political situation, partisanship, and political agendas? There is a challenge that needs to be overcome on the political side.

## Discussion Question 2

### *Concord, NH*

*(cont.)*

Most American forests are owned privately. Families need healthy markets to keep healthy forests. They need lots of tools in their toolkits—easements and markets for green building. FSC is not the only certified sustainable market—American Tree Farm system as well, people should not have to go out of state to buy FSC green-certified wood when ATF wood is available. Families need incentive programs to protect their forests and store carbon. At the end of the day, healthy markets equal healthy forests.

Parks are such a doorway for getting people to learn about the great outdoors, continuing funding these programs is so important in showing the value of forests.

The general public is unaware of the role that forests play in climate change--we need to get the information out. People have heard about climate change but don't know what to do about it; they don't understand that keeping land in forest is key in mitigating climate change. We need to communicate without scaring people away and share that the land conservation we're already doing is making a difference.

FS shows real desire to put all the pieces of the puzzle together—"all lands" model is mission critical for success, especially in New England. Updating to federal grant criteria is taking climate change into account, including LWCF. Any program that isn't already updating their program should be doing so. Forest Legacy program, etc. If it still feels like there is a missing tool it would be that we need forest and agriculture carbon incentives programs. This would maximize carbon benefits on the landscape.

The federal government should not encourage wasteful practices such as using biomass harvesting and then burning wood quickly in a wet condition. Burning (and transporting) wood that has not dried is inefficient and wasteful. Focus should be on wood that is harvested close to where it is burned, and is burned in a dry state.

The reason we have forests in the US now is because we stopped burning so much wood and instead burn fossil fuels. Now we are talking about burning forests again--this is not good. A healthy forest: has no invasives (log trucks bring in invasives), is free of logging, is free of species under human management. I take issue with us saying we're trying to get healthy forests—we're trying to degrade the forests we have today.

The National Forest Protection and Restoration Bill, which died in 109th Congress, would have ended logging on NFS lands. It may be time to revisit that, especially if we ever get a value on carbon. Thinks that there is probably more timber harvested on private land than on NFS land. There are lots of forest products coming from private land. Urge someone to take a look at this bill because some things have changed since it first came before Congress.

## Discussion Question 2

### *Concord, NH*

*(cont.)*

We are looking at the perfect storm—intergenerational transfer of private forest lands over the next 10-15 years combined with the repeal of the estate tax—this is very serious for family forest owners. Have to look at value of different forest properties—not a one size fits all solution. Working forests have less of a tax burden. Also--the federal government should play a significant role in helping get kids outside--federal resources for environmental education should not be an afterthought, but a core part of the education curriculum.

In response to a question by the moderator about potential sale of State parks: The state of NH is facing a budget crisis and one option is to sell some state park properties. That is just one idea, just one option out there.

We have small populations and low unemployment comparatively and so sometimes we don't get as much in way of resources. Often the rural areas don't get what they need and that is really important.

Youth Promise Act--being able to engage kids that are in the juvenile justice system in environmental service projects. We are seeing juveniles charged for minor infractions. There are issues with lack of parenting, etc. In many cases these kids are just bored. They have programs called diversion, and are required to do community service. Perhaps build off the SCA programs and develop some opportunities for these kids to spark their interest and engagement.

Biggest fear is that we will get more programs on top of other programs that we don't have the resources to fully implement. Emphasis on building on what is working and incorporate the new ideas with what is already working.

Mr. President: we are in a climate crisis, arctic is melting, more methane is being released and is going to eclipse the GHG effect. We have to re-freeze the arctic and enable farmers and forests to serve as carbon sinks (biochar).

In our society we live on instant gratification, so need to get across the idea that working forests are for the future.

We are in a climate crisis! I don't think any of us will live out our lives without seeing the effects of climate change on our forest.

We have a financial system that is about to collapse and anything involving agriculture and the environment should be long term if it is going to be sustainable. Would like to see strategic banks, instead of NRCS being bureaucratically focused, would like to see the funds spent correctly as a representation of trust. Strategic banks need to be built to fund those starting out.

Reduction of bureaucracy to enable good decisions by EVERYONE.

It is challenging for next generation to take over small family-owned forestry business. E.g., he has lumber, dry kilns, sawmills, etc., but no funds to pay his sons to become involved.

## Discussion Question 2

### *Concord, NH*

*(cont.)*

We need to increase the biological literacy of citizens. Suggest we need to find a way to make parks "destination points" and so individuals can watch them change over time like working forests do, including signage built locally from local materials.

The nation is also facing a shift of race and culture in America. We need a way to connect across age ranges, as well as across all types of diversity--such as youth in urban areas.

Being in a place like VT, is quite a contrast from DC which is so culturally diverse. At the Marsh-Billings Rockefeller site, they have a 200 year land ethic history and that is part of the mission. There are examples of Hispanics preserving land in the SW or native Americans in other places. These stories often get left out-it is important to keep these stories alive. They recently had a program with urban youth brought to the park to camp and participate in a program (cleaning trails, etc.). Felt this program was a success and really brought a hands on and close connection to the natural environment. How do you replicate these programs and secure the funding to keep them up?

Environmental literacy is development and sequential. We often let the bottom numbers dictate what is taught because the teachers may not have passion or education to teach science. "No Child Left Behind" has been detrimental-it has squeezed out science and made it difficult to get kids out for hands on experiences. How do we scale the Manchester SCA program out to other school districts? That works when there is a really interested teacher or an administrator that really understands the importance. We can do huge things to change the experience for kids.

We are asking teachers to take children outside, but the teachers themselves need some help in understanding how to take kids out and mitigate the risks of going outside (some teachers are hesitant to go outside). E.g., program focused on learning more about your back yard.

Would like to increase the ability to work across the Fed. government. It is really hard to work across agencies and if that could be streamlined it would be easier for programs like SCA and others.

She would have nature parties for her son and it was surprising to her that many of the kids had not been out in nature. Accessibility is an issue, e.g., for families that can't reach out to provide those opportunities. Making choices that are smart for our children, such as providing experiences outside, is so important.

We have a generation of parents that are afraid to take their kids out. Some teachers are just as bad. Need to expose the kids early in school--so they go home and ask their parents to take them out.

As a parent, there is such pressure to enroll children in structured programs and pressure to do the best by our kids. Richard Lourve's book was monumental in allowing kids to have free time. Another good book is: "The Blessing of a Skinned Knee." Scheduling a safe outside experience for families has to be a first step to allow them to be comfortable to provide kids these experiences (unscheduled) in the future.

## Discussion Question 2

### *Concord, NH*

*(cont.)*

A lot of the concerns and ideas that have been shared are also going around the historic/preservation community. There is a rift between the preservation and conservation communities and we should work together better. Maybe some different partnerships we could think of more holistically. E.g., hike to ruins (combines the two). In a broad sense, having these conversations, can help with this issue. Also looking at historic buildings in addition to the land that is being focused for conservation.

He gave seminars on White Pine and was called to help with planting density for a program. It was successful-the trees are growing a great rate. If they do the right thing, they should be able to generate \$100,000 per acre every year, but they may not be able to keep it up due to lack of funding.

It would be neat if we could find a way to remove the danger of people being responsible for their selves and taking a look at wildlife that moves and trees (that don't move).

It is important to recognize regional differences; the potential of a particular area may be not recognized enough when compared to species in other regions of the country.

Schools around here do their testing in October and that is during the time that would be good to get the kids out. So it would be helpful to move that testing time frame to a different time of the year so it is not an obstacle to getting kids outside.

School administration be aware of outdoor opportunities close by and connect that to the required school physical education program.

Need to also provide access on a socio-economic level. Having parents that are available to take kids outside is really difficult for some, e.g., single mother working and struggling to make ends meet.

Programs like the Great park Pursuit also have great value. But looking at families, it is also important to have programs that are extracurricular and are not parent let. Kids need to be getting muddy at much younger ages!

Looking at how different racial and ethic communities relate to the outdoors: a lot of communities (esp., non-white) are coming from families that are of a such a broken nature, e.g., single mother, working and no free time, etc... it is difficult to get the experiential, place based education, and they are leaving the education up to the institution. The institutions are busy dealing with issues like gang violence, etc..

Challenge: every region needs something different and there are different ideas that will work in each place. The Federal role is to stay out of that to allow flexibility. Provide funding from programs, but allow flexibility in the solution. If we can "infect" the youth and future leaders that will make the difference. The Fed. gov. role is to understand the individuality and that it is by the people and for the people and stand back so the good programs can succeed.

## Discussion Question 2

**Concord, NH**

**(cont.)**

Idea for an insurance product on a nationwide gov. level that could be created to cover liability for school env. education programs. To allow school programs to take the kids out into nature. Liability is often the reason used for not being able to get kids outside. If the school system is accepting fed. funding--would there be an opportunity to do this nationwide--and utilized nationwide?

Forestry curriculums throughout the nation have eliminated hands on experiences due to liability concerns.

Development - difficult to maintain land in forests. Planning Boards are there for assisting in the development not discouraging it. Development is leading to pesticides etc, no infrastructure to support it. TNC Wilton Community Farm – kids can learn fa

Taxes too high - people being forced to sell land.

Lack of funding source (sales tax, income tax). General funds get tapped into. (LCHiP funds)

Our prime aggie lands are getting development

Development affects hiking trails – new land owners not always allowing access to trails that start on private lands.

Local decision makers' need the information regarding cost of develop so they can include them in their Master Plans and Zoning rules.

Lots of passion for all nature resources. At National level may not see the working together.

Although much has been accomplished. more work remains and more collaboration is needed. In order to build upon this success It will take increased funding to meet the backlog of interest. America's Great Outdoors Initiative will bring much needed attention, funding and cooperation to help protect and restore the important natural resources In New Hampshire, and most importantly, yield critical benefits to Its citizens.

Currently, we have the tools necessary to inform, coordinate and collaborate; what is lacking is long-lenn commitment, in terms of both consistent funding and available human resources, to making a difference, especially when you are talking about conservation at the landscape scale.

## Discussion Question 2

### ***Concord, NH***

***(cont.)***

Given the topic of discussion today, it is appropriate that this Listening Session be held in NH where approximately 84% of the state landscape is covered in forest. Historically, the vast majority of forestland has been owned by timber companies and thus managed for forest products. At the same time there has been a long-standing tradition to keep these lands open to the public for hunting, fishing, hiking and other forms of compatible public use recreation. A Governors Task force on Northern Forest lands some time ago warned that changes in land ownership from the timber industry to property development for second homes and the like, would likely have an adverse impact on open space, forestry, farming and recreational uses on private lands. As downturns in the economy of the forests industry occurs, millions of acres of timber company lands are often offered for sale. When this occurs at time of a strong regional economy, working forest land is at risk to developers and prospectors interested in recreational developments. In the face of growing development pressures, we believe the need to preserve the landscapes that shape New Hampshire's quality of life has never been greater and programs such as the Land and Water Conservation Fund (LWCF), NAWCA and Forest Legal Program (FLP) grants mentioned above: provide federal dollars to assist state and local conservation

Government bureaucracy and red tape continues to be obstacles to effective and efficient partnership response to enhancing conservation and increasing opportunities for outdoor recreation. While adding another layer to the federal bureaucracy seems counterintuitive, collaboration among federal agencies would probably improve with the establishment of an inter-departmental coordinating council or committee. The secretary of the interior would likely head said council.

#### **Making Public Lands Public**

- A 2004 report to the House Appropriations Committee concluded that more than 35 million acres of Bureau of Land Management (BLM) and Forest Service (USFS) land have inadequate access. The Federal Lands Hunting and Shooting Sports Roundtable was created to improve partnership efforts between the BLM, USFS, and U.S. Fish and Wildlife Service and 40 national hunting, fishing and shooting sports organizations to address access to federal lands for hunting and shooting sports activities. Roundtable efforts are coordinated with the Wildlife and Hunting Heritage Conservation Council and the Sport Fishing and Boating Partnership Council. Roundtable projects found that access to federal lands could be improved considerably through an average investment of less than \$10 per acre

## Discussion Question 2

### ***Concord, NH***

***(cont.)***

NWTF programs and activities to reverse the current trends and introduce people of all ages and genders to the outdoors: Inadequate access to land is often cited as a primary reason hunters and anglers stop participating in these traditional sports. Since 1987, the More Places to Hunt Initiative of the NWTF has worked to reverse this trend. To date, the NWTF has spent nearly \$10 million helping to obtain and retain more than 428,000 acres available for hunting and fishing.

Tragically, native grasslands and wetlands-the natural resources that make the Prairie Pothole Region a national treasure- are disappearing at an alarming rate. It is imperative that we conserve enough of this unique grass-wetland landscape to secure a viable future for waterfowl. If we fail here, it is unlikely that we be able to meet the population totals established by the North American Waterfowl Management Plan-an international effort set forth in 1955 between the US, Canada and Mexico, that provides a blueprint for the recovery and long-term sustainability of the continent's waterfowl. Farm Bill programs such as Conservation Reserve Program (CRP) and Sodbuster have thus far played a critical role in preserving millions of acres of prairie grassland that benefit many species of wild life. We strongly urge that they continue and expand.

#### Voluntary Public Access

- The NWTF, in support of its State fish and wildlife agencies and other partners, works to improve access to private lands as well. Private lands are critical to walk-in access hunting programs of many western States. Through such programs, States lease private land from willing owners and open it to public hunting. Implementation of the USDA Voluntary Public Access and Habitat Improvement Program administered by the Farm Service Agency would greatly aid State and tribal government abilities to build upon this success and open additional private land to public access in the future.

## Discussion Question 2

### ***Fort Pierre, SD***

I'm wondering if we can keep LWCF funds from being raided for whoever needs it, and if there's a way for protected lands to stay protected forever?

Is there going to be a report emailed back to the participants in the listening group? Desire to have the notes from this session to the participants.

One concern with government agencies is that we throw money at the problem. A lot of ranchers look at NRCS as a place to go for money for water development, but they don't understand what water development is all about. Educational disconnect between people, the landowner and the people that benefit from the land. There needs to be more emphasis on education than legislation. If you don't educate then you can't pass on what we are trying to accomplish. It's not just about the money but the conservation benefit that it brings. One thing we are doing in SD will see next year, Leopold Conservation Award, we showcase people that are doing good conservation, showcase what people on the land are doing. How do we get reconnected with them. We have an open door at our ranch to show people what we are doing. I was raised that there is not a wetland that could not be drained. Government was paying us to do it. Had help from game and parks to blast wetlands and make them deeper. It is tough to overcome those old ways of thinking.

Why does all the money go to GFP. Nothing in it for the rancher - GFP take all the money.

Few people but population is growing, 39 species of bird flying byways as a kid, but restudy shows only 15 species today. Other wildlife populations diminishing too. Growth of prairie dogs, poisoned in past killed other animals too (coyotes). No longer living in wilderness area, grass not that tall. Civilization crept in. South Dakota is growing. DM&E railroad study of fugitive coal dust, deer migration, hunting will be very little - Virgil became active then. United Farmer Ranch annual convention attended. Wants to become active again, haven't been for some time. Wants to be part of answer, happy to be here.

Protecting the resources defines – children exposing them to the outdoors. Having another generation following. This is taking our children out of the outdoors – computers etc. They worked on getting their match. 2 things that are unaffected. Funding has diminished about 10 fold. State side represents 10% now. States and locals are left with hardly anything. Do contemporary things to get the kids outdoors. Must get them out or there won't be anyone to enjoy it in the future.

I had a question about re-evaluating contracts/easements written 20 - 30 yrs ago. When sold to another party why can't the terms of the easements of the contract continue? What flexibilities are there available to change? Is there a way to change the contract to continue?

## Discussion Question 2

### ***Fort Pierre, SD***

***(cont.)***

Programs can either work or be an obstacle. With these nationwide programs, one size does not fit all. The more flexibility we can provide, the more entities can utilize state programs, the more opportunity there is to be creative while meeting program requirements. We need flexibility on both the state and local levels. Choices are good. What are the needs of local people? NRCS is wonderful in our state to work with. There are very diverse issues across the state. All areas have different issues, different opportunities, so we need to adapt to the needs of the landowners. She lives within 15 miles west of the Missouri River and another producer lives the same distance away on the east side of the river, but she doesn't qualify for a lot of the programs, due to this. It frustrates her because her land produces the same number of ducks.

I am a 4th generation on my ranch, my son, the 5th generation. The real challenge will be figuring out how to pass the knowledge of managing a ranch, and the actual ranch, itself, due to huge taxes through the estate tax. More people are moving to cities because they can't afford the tax, so ranches are being broken up. The Federal Estate Tax is an issue and a real concern. It's an issue we need to deal with. We need to challenge the Federal Estate Tax.

One of the things that are very frustrating is the whole NEPA process. It's very cumbersome, it takes forever, and you don't see results for years. You're not sure what you're going to get. We need your vote to actually count, which the Forest Service is working on. The process needs to be upgraded to keep public interest. We need to streamline the process to fit the faster moving society. It's very frustrating for the lay person. Another issue is the struggle with the many different land agency boundaries. When off-roading, you need to pass different land agency boundaries. Do these agencies talk to each other? The meetings must be in secret, because I don't know about any such meetings. I would like to see and know about the different agencies talking to each other; need to at least witness what they are doing.

## Discussion Question 2

### ***Fort Pierre, SD***

***(cont.)***

I was raised on a farm in eastern South Dakota and have been involved in conservation, and have been fortunate to utilize our precious natural resources, the grasses and wetlands. I am very concerned today witnessing the broad scale landscape changes through tile drainage and the impacts on semi permanent and permanent wetlands. The pressure to drain wetlands is increasing, along with converting grasslands to crop. The demand for alternative options is also increasing, such as easements through WRP, GRP, and the FWS. Through the farm bill all these programs are viable options. I suggest that we all need to work strongly to the best of our ability to achieve strong funding for LWCF funds to fund the high demand of easements. Critical benefits I have enjoyed from wetlands and grassland include flood control, improved water quality, reduction in soil erosion, and providing wildlife habitat. These things are being taken away from our children. It is serious. We need to continue the things we know work and are successful. LWCF funds are needed to provide land owners options. We need to reconnect people to the land. If we can't continue programs, we can't provide opportunity for people to stay connected to the land. The challenges faced are very real. It's not a matter of competition of the programs; it's just a matter of funding. The demand is there. There is a tremendous demand for GRP and easement programs; this holds the same for FWS-they have a very long waiting list for their programs. Interested in these programs continue to promote the part. The pressures to drain and convert are real. We all have our own financial realities. We need to make management decisions so we can improve upon funding. Expand partnerships is critical for landowner to have an option to stay on land.

There are between 800 - 820 landowners on the list that are interested in services in grass or wetland easements. They would like to have options available. Issues landowners are looking at are other way to optimize and manage their land. There are lots of people who value grass. It's out there more so than ever and stewardship is happening, not because it's mandatory, but because it's voluntary.

To follow up on\_\_\_\_'s comment, I'm involved in Missouri River work groups and issues. There are lots of things happening. The government spends lots of money to process things. The funding needs to be reprioritized for on the ground projects. More dollars need to go to program delivery.

If this was carried and manifested, you would gain a lot of public confidence in the government agencies. The public sees the USDA agencies as cumbersome, out of touch; it takes them too long to get anything done. People lose interest. This is perilous. Losing interest and public land stewardship, the land starts deteriorating. There are lots of obstacles, lots of laws to follow; it's too cumbersome and broken and we're losing public confidence.

Farmers and ranchers have changed for the better. They are no-tilling, leaving residue on the cropland; there's less erosion and more cover. Farmers are doing a better job than in the past. It's a business, so when the regulations come more and more it becomes more difficult to pass the farm/ranch onto others. Someone has to be out there doing the farming.

## Discussion Question 2

### ***Fort Pierre, SD***

***(cont.)***

There are a couple of challenges to point out. There is a nature deficit disorder. The last report stated that the average American child spends 7.45 minutes less than 1 hour outdoors, and less than 5 minutes in a non-structured play environment. If kids are not outdoors where does our conservation leadership come from? I live on the Missouri River. The way it is managed there is no natural system to form. Regulation reform with the Corps is giving higher weight to wildlife. I've worked in conservation for 40 years and believe there is a strong need to get a hold of climate change, carbon emission caps, and we need funding to help address adaptability for wildlife. Addressing climate change is the biggest environmental issue that our generation faces today.

If you look at the pressures over the last 8 to 10 years in the public schools, if you go into the school and look at the schedule for the day, it is very much just reading and math. There is a lot less science and social studies. So, the Department of Education needs to be a partner. We are not teaching values, nor teaching science. We need to teach them to value what we have. Nationally we want to see support for environmental education programs. Also need state environmental education standards. I grew up in a farm community. Not even once did we talk about the value of wetlands, what happens if plowed over? We should know about local things. A lot of them (kids she went to school with) grew up to be farmers. I didn't hear about our local resources in school; we learned about oceans. I taught in Minneapolis; there the children learned information on oceans, they didn't learn much about the Mississippi, right in their own backyard, or the 10,000 lakes that were there. We need to put priority on standards, by communicating with the schools, allowing them to do that. Schools have pressures to delete science and environmental studies. Financially and time wise, schools don't take kids outdoors anymore. They can't do that anymore because of other demands put on them. Being outdoors in nature teaching science and environmental studies is the most effective tool that we have.

Problem – no one to help, B&B by badlands. Training is needed – no jobs.

Making sure we continue to listen and more often. Respect others rec passion. Maybe they don't have a passion but help them to get outdoors. Monetary support if we have something they will come. Common good – don't hear very often anymore. Gov't employees are suppose to be taking care of us.

Obstacles – blinders on because we have got our nose to the grindstone. How do we connect the different Gov't and state agencies. We provide for most of the kids – how do we connect to the Gov't agencies. Awesome thing to work for.

Children not getting outdoors – get the active again and if they are it will help with the bigger problem with health.

Respect – all have to respect others perspective. WE can show kids a lot on their ranch – to respect what the beef industry. Respect those agencies but hope to continue to respect the private lands as well and resolve that.

## Discussion Question 2

### ***Fort Pierre, SD***

***(cont.)***

Input the people from the local basis – been a disconnect there. There is only so much the congress can do. Having these sessions on a regular bases would help and relate that the congressional staff. Structure where there would be a possibility would be great. Real opportunities.

Government! Big supporter of Gov't and needed in this country and have a great gov system. Survey the people – to many rules and regs not enough talking between agencies, restrictions on conservation. Need communication and need to say we the people – fairness into restrictions and reasons why it is.

Schools, grade school – looks like prisons – fences (no nature there). Nice if the fed gov (multi agency) get together with high school math/science create a nature environmental center. Staff could be mentors to help get a science group going. Bringing science and math into school get rid of concrete put ponds, grass, trees. If they are not on grass how can they relate to the environment. If we don't educate them about the outdoors - later they might not have any concern in the future to fund the programs. Mentor programs in schools!!

Respect recon, as land owners we recognize to preserve and it is the goal to pass on to next generation. Regulations appear to be not based on scientific justification and get very frustrated. Must be science based.

Funding – National debt is our concern and challenge. We have a lot of great programs 13.4 trill in debt. Keep this in mind.

Tribes are also facing the same issues – getting kids interested in outdoors – hunting. Don't forget your tribal neighbor. They have a lot of things that they could do better and need help on. Bigger benefits for fed tribal wildlife program. 100 tribes apply 40 get funded tremendous need out there only a fraction funded. Those programs are what they really rely on but don't faze them out.

Missouri river recovery project. The river needs things done on the ground not in the meeting room. Walk the walk not just talk the talk.

Hunting and fishing is dependent on the upcoming generations. Access to private lands is one of the greatest concerns for sportsman (for hunting and fishing). Private land owners are key to the success of an access program. Importance of USDA conservation programs, need more incentives for landowners to allow access to wildlife and fish populations. Next farm bill needs to include funding provided to landowners to allow access to their lands so people can have a place to hunt, fish, and view wildlife. Currently, South Dakota rents 1.25 million acres of walk in access for sportsmen (in SD). Need more funding to pay landowners to increase access. Farm bill appropriations important for allowing access. Access is important to CRP, WRP, EQUIP and private landowners cost share important for future access.

## Discussion Question 2

### ***Fort Pierre, SD***

***(cont.)***

People have to be aware of how agricultural technology is improving. Cargill and other major agriculture companies are looking at states from Texas to North Dakota to produce more crops. This area of the United States has the highest potential of increasing the amount of bushels of wheat, corn, and soybeans. This new technology is going to put extreme pressure on native grasslands. We are going to lose native prairies at an exponential rate because of new ag technology. The federal government needs to take money out of production subsidies and put funding to conservation. When corn is \$5 and soybeans is \$11 a bushell, conservation funding currently does not meet those economics. Landowners do not the economic incentives for native prairie conservation or CRP when row crop farming is much more economically sound. Partners for Wildlife Program (USFWS) is important and critical to conserving grasslands and wetlands. Local control is crucial in how conservation programs are administered. Reconnecting people to outdoors can only be done from the local area. Conservation needs to be more convenient and economical. Federal government needs to get out subsidizing production agriculture and needs to move those dollars used for subsidies and fund conservation. Grasslands are threatened the most threatened areas in this country. The SAFE program from Pheasants Forever is important to private landowners and to conservation of grasslands. There is currently not enough funding for SAFE. Private landowners want to increase the acres of land in programs such as SAFE, but there is not enough funding. More demand than the funding available. Conservation has to be on the terms of the landowners.

Invasive species are having a major impact in our ecosystems. Emerald ash borer is a local example and is knocking at the door and going to affect riparian corridors in this area. Need funding to address invasive species issues. Funding is needed to mitigate against noxious weeds. Need to improve weed free forage programs. Invasive species is a significant challenge now and the foreseeable future.

Where are the school representation to this meeting? Why is there nobody at this meeting from the public schools and universities? We are missing those people that deal with children.

We don't know what is coming from technologies of row crop production. Row crop production is moving further west. Federal policy to preserve a way of life, need to understand what impacts the future impacts will be. Nobody in South Dakota wants our lands to look like Iowa. But that is where we are heading. Progress in agriculture is good, but conservation is going to lose. Conservation and agriculture plays against each other. Need to protect multiple uses. Agriculture and conservation is on two sides. Conservation always lose to agriculture because of economics.

Crop insurance is retarded, farmable wetland programs are good. Governments role should not have to choose between agriculture and conservation. Need to re-look at crop insurance program. SAFE is farmer friendly. Crop production always wins against conservation. Conservation has to compete. Acres have to compete. People are looking to U.S. to feed the world. Cargill sees this as profit. The economic pressures from agriculture is reducing what we can conserve. Funding needs to go to conservation

## Discussion Question 2

### ***Fort Pierre, SD***

***(cont.)***

Need state funding for conservation. Unintended consequences of crop insurance. Farming insurance subsidizes sod-busting. Can't be relying on the government to bail agriculture out when the land should have remained in grasslands instead of crop production.

How do we get a realistic result to the president?

The Prairie Pothole Region is the foundation of the outdoor heritage in South Dakota and is fundamental to migratory bird populations that travel the continent.

However, threats to the integrity of this vital landscape are great including the threat of conversion of grassland to cropland and the accompanying loss/degradation of the wetlands.

The sole limitation to protection of these important landscapes is funding. Fortunately, many of the remaining intact tracts of prairie and wetlands are owned by ranchers who are interested in protecting these areas through perpetual easements, but hundreds of willing landowners wait in line for funding of their easements.

We oppose wilderness and similar designations that isolate the land by employing a "hands off" management approach. Areas designated as such have proven unsuccessful as evidenced by the catastrophic pine beetle infestations in the Black Hills wilderness areas and those in other forests across America. Such practices have not "protected" the land, but rather created a situation that invites disease and fire.

The NEPA process is good in theory. However it is expensive, slow and can not adapt to rapidly changing situations (eg. Natural disasters such as fires, tornados, floods, etc.)

Expanding federal ownership of land is inappropriate and can not work in a broad conservation plan. The federal government should not seek to obtain ownership of private lands for any purpose. Our federal government can not financially manage the land it currently owns. Many land management agencies have huge backlogs just to repair and maintain what they have. Conservation funds should be used to improve forest health and infrastructure, not to acquire more land.

## Discussion Question 2

### ***Godfrey, IL***

I'm pleased to say that an overwhelming number of DU supporters are outdoor enthusiasts and participate on a regular basis in activities that bring them close to nature. Whether it be hunting waterfowl over an early morning marsh, boating on the mighty Mississippi or Illinois rivers, or simply enjoying a peaceful moment in a natural setting, they understand and support with their time and money DU's important habitat work and the relationship between conservation and the added value it brings to their lives. It is that kind of connectivity and passion for all things wild that needs to be generated in greater numbers of people, young and old alike, if we hope to kindle the political and financial support it will take to conserve enough of our natural heritage for the use and enjoyment of generations to come.

Need better trails for kids to learn and love horses. Paving trails isn't good for horses. National Forests have horse amenities but there are no local areas for horses. Need to convince people that horses are a lifestyle, part of economy. Greenways that are good for horses are good for people too. Need local help.

I'm against Casino's, but I still don't feel secure in any of our outdoor areas.

Tests water quality at ten sites along the Mississippi River. E-coli are more often than not, bad. USACE oversees more water than almost anyone else and are great advocates for water safety. Would like the government to mandate them to be as equally concerned with safe water quality. St. Louis has combined sewer overflows that were designed over 100 years ago. Raw sewage can escape into our rivers. MSD estimates that this happens 50 times a year on average. Need billions of dollars to fix this or it will only get worse.

Alton residents feel a physical disconnection to the river. How have other communities improved this?

DOI- Los Angeles-feels the same way. One of the rivers has cement sides, so they need something to balance the use of the river. Transportation to the river is a concern that is being looked at as well.

Elementary schools are cutting out Physical education. Keep it.

Turn out streetlights to be able to see stars better

USACE and USFWS manage over 300K acres. Need to fund a long-term program of stewardship for these resources otherwise any success is short term. Reconnection is directly related to the quality of stewardship. Adaptive management does not have to be difficult.

Access needs to be improved.

## Discussion Question 2

***Godfrey, IL***

***(cont.)***

Tremendous framework of local entities already exists here. We don't use this framework as well as we could. Need to use the local communities to reconnect people to the river. Don't focus on St. Louis, but think more regionally. Don't ignore the barges or commerce

We do a lot of commenting on permits and other USACE actions. Kids want to help and they are ready. The challenge they see is climate impact in the future on them. Don't scare the kids and tell them the adults are working on it. We have to improve the out

Losing IL River to sediment. Need appropriations from WRDA to fix this. Planning on how to fix the problem is done. We just need funding to put it into action. This is the most important thing for IL River.

AmeriCorps teams have partnered with state, federal and NGO for invasive species removal, cleaning, studies, trail maintenance, etc. AmeriCorps program is extremely cheap and you get a lot from utilization. The program targets youth and directly gets them involved. This program is already in place, it just needs more staff positions funded.

## Discussion Question 2

### ***Golden, CO***

Bark beetle epidemic, what is a healthy forest is bringing together that have not in the past history. What do we want for the next generated. Now we can look forward for the next 50 years, how do we plan for the population growth (human). Access to public lands is crucial. How to balance it? Collaboration and conversation

Limited access to public lands through private land owners.

Making time to get somewhere

Transportation costs. Permission through school system to get kids off campus. Curicullums in schools. Electronic industries have overpowered the outdoor industries.

Youths are programmed a certain way. Schools, etc, programmed to wake up, go to school, go home and do homework and go to bed. There's not enough time to go outside. Schools should have gardening program to grow their own food and not have to buy the othe

Lack of knowledge, and fear hinders kids from going out at camps or just out to see the outdoors.

Don't have young peoples attention of the outdoors.

Transportation, less polution.

Fear of lawsuits keep people from allowing many to go to the parks and from the desire to go. Convince parks and others to not worry so much about suing over a twisted ankle and hndereing and scaring others to not go out.

Transporation to public lands.

social media, computer, TV, people are unaware of what they are missing, not enough media attention on what is available outdoors

video games are a habit

lack of transportation, parents not getting kids out, money not available, 16+ year olds need license to fish, rides, lunches not available, parents too busy to be around for new outdoor experiences

## Discussion Question 2

**Golden, CO**

**(cont.)**

peer pressure, other kids not into going outside as much

lessons not available

ECO week at school no longer available at school, funding not available in schools, outdoor programs are not available at schools

people don't know where there food comes from, no gardening, not always have to be camping or hiking, needs garden, etc.

clinics mentors need to come to schools

Not enough people recycle

Littering is a problem

Not enough resources and recycling

Too many people do not care enough about the environment

Too many electronics

Drugs are a problem

Parents are working, which makes it tough to get outdoors

Safety is an issue, compared to the old days

The media is an issue. When we were kids, we didn't hear about all the issues as much as we do these days. Movies that are being made are so violent, which are scaring us. It also costs money.

We don't hear enough about the positive benefits of being outside

## Discussion Question 2

**Golden, CO**

**(cont.)**

Lack of access to the outdoors. With parents working, they cannot take their kids outdoors.

There is a lack of funding for outdoor youth programs. This seems to be the biggest barrier in the last few years.

Video games keep kids from going outside. Parents should limit the time kids can play video games.

people aren't motivated enough to go outdoors, too much internet/facebook time, need to spend more time outdoors with friends,

nobody exposes people to the outdoors, not talked about enough

too expensive to use the trails, some younger kids can't afford the fees at the more expensive parks/trails,

kids use phones/internet for everything, even when outdoors... no easy access to many parks

access to outdoors is needed for the youth, too many boundaries

living in apartments, takes too long to get outside if you live in urban environments

kids want to stay home and watch TV, not many folks realize they have the option to go outdoors

can't drive, hard to get to the outdoors if parents aren't willing to drive

some kids aren't encouraged by their parents if their parents didn't grow up in the outdoors

need balance between outdoor/indoor activities for kids, too much homework

too much homework, sun is down by the time he's done

6 hours of homework at night, too tired/too dark when he's done to do anything but watch TV

## Discussion Question 2

**Golden, CO**

**(cont.)**

suggest that homework assignments include outdoor activities

Japanese have more homework, tougher schools so homework is good, but they balance with more outdoor activities

more homework for her son than when she was a kid, needs to be a better balance

too many states have taken outdoor activities off their agenda, too much childhood obesity, agrees with incorporating more outdoor activity into school work.

obstacles is TV, games, computers people would rather use them then go outdoors

Laziness in general

People would rather stay indoors. People are scared of getting shoot

Minorities hard for the parents to focus on getting kids outdoors, they are focused on just getting by. Snowboarding, skiing is looked at as a typical outdoor activity, they don't see some on the less expensive activities

Transportation is an issue, a lot of times public transportation does not get there

Go to the mall instead of the outdoors.

a lot of the places to go becomes developed and no longer available

Single parents have difficulty balancing just the regular live, live style and energy to spend on the weekend to take the kids out doors.

Resource, families do not know what is available, and what programs are out there. There is a perception the outdoor programs cost money. The schools could do a little better getting the information out there about the programs and have more available

Money, lack of funding for youth corps, and complicated requirements. To build trails and enjoy and participate.

## Discussion Question 2

**Golden, CO**

**(cont.)**

People think it is too hot they stay in doors.

Overcoming the barriers (ages 14-18) partnering with other groups to help fund the program. Group of kids have pitch in a small amount per kid and apply to grants. Snowmobiling and mountain biking, with the Rotary Club, REI Etc

SOS outreach go into schools get grants and scholarships to get kids outdoors. They teach kids the skills necessary and the equipment.

Environmental Learning for kids have programs for families and kids to get them outdoors and trips, camping, fishing etc. Free clinics for fishing for city families. To help break the cost barrier

Out doors and nature is a backdoor to nature. Nature is where you live too.

Air pollution may be a barrier

Most neighborhoods have parks. Maybe have neighborhood events to encourage community outdoor events.

Parks are not adequate, the water stinks, there trashed. Parks are well used. People are scared to use the parks with some of the people who use them.

Parks water is full of mercury, you can look but don't touch.

Gang member parks, not very inviting. Not in a safe neighborhood. Only child can not go to the park by them selves. Safety.

Don't learn that in school, that there is a national wild life refuge in the city. Don't see it on the news. People are not getting the message that the parks are out there

In reality teenagers do not watch the news, don't read the paper. The news is focused on the bad things.. Internet is a big thing but there is so much information out there and they are not searching for the outdoor news. There is not people populating

Signs in the buses and the streets people can see in the high visibility places in the city.

Video games keeps kids in all day and they don't want to be outdoors - 3.

## Discussion Question 2

**Golden, CO**

**(cont.)**

Not a lot of public programs aimed at conservation - 3.

The subject of conservation is just not brought up a lot in his community - 3.

People don't recycle. We are imposing on the land that animals use. Misperception about how fun outdoors can be - 3.

Not outside because of video games and watching T.V - 3.

The opportunity doesn't present itself and parents don't want to take them outdoors - 3.

Not a lot done to spread the knowledge about the these conservation programs - 3. Kids don't have the motivation to go outdoors - 3.

People mispercieve what the outdoors has to offer them - 3. You must expose people to the outdoors - 3.

Hard to get the kids from the city into the mountians; transportation going into the public lands needs to be improved - 3.

Not a lot of willingness for people to get involved with clean up projects - 3. Programs need to be more accessable to members of the community - 3.

No can or bottle return program in Colorado - 3.

Street waste, and water run off goes into our water ways - 3.

Some public lands aren't not safe (urban area/gangs/drugs) - 3.

Lack of people to show you how fun it is to be outdoors - 3.

Lack of mentoring both from peers, and adults

No standardized way to promote outdoor activity to younger people, lack of transportation.

## Discussion Question 2

**Golden, CO**

**(cont.)**

Peer pressure, caring about the environment is not "cool" to do.

Our culture has shifted - we used to live off the land but now people don't have the same opportunities. We have to find a way to introduce people to the world they just read about.

People think about how other people view them. In the city other people think it isn't cool to go outside, go camping, etc.

People need that first outdoors mentor - if not parents, there nowhere to find it. Youth corps, jobs are so great, opens a lot of eyes; change transportation, educational programs, Youth Corps, having jobs there, let kids know they can make money doing t

I remember when LWCF was fully funded; getting it fully funded again would be wonderful. We need to take a look at GOCO; we need to make it more flexible so entities that get funding don't have to use it for that purpose for perpetuity. Can take another look after at time to see if it is something you still need-skate parks, or something isn't working, you can reassess.

Need to support public health initiatives. I support passage of the "moving outdoors in nature section of the Healthy Choices Act."

What is really working is a return to a balanced perspective. The federal agency emphasis was on fossil fuel extraction. We need to recognize stewardship and other values, exemplified by BLM's recent plan for the Vermillion basin. It is a piece of the old west, and preserving those things for the long term instead of money for fossil fuel values, over the long term.

Need a stronger push for public awareness, not just physical wellness but mental wellness effects of connection to nature. Amazing what statistics show and how necessary it is for youth to be outdoors.

Fewer agencies and streamline agencies and amend existing laws.

Lot of discussion on getting youth outside, and public lands, but private lands, skiing is too expensive. A program where private sector can create a program or opportunities, lower fees for kids and others if they are a member of those youth conservation organizations.

Agri-business not touched on, if we stop agriculture practices that are not conservation-worthy, would allow more conservation-appropriate use of farming lands.

It's great to have these high level discussions but some mechanism to take this, and have a resource to filter it down so that all the efforts can be put rubber to road, a strategy to take this really good information, and how do you filter all that. I hope someone has an idea about what is necessary to take this info for our own use and even more, funding, grants etc, so we can enhance what we have documented today, how can we do something productive with this info?

## Discussion Question 2

**Golden, CO**

**(cont.)**

Need tools/resources to make sure success stories are highlighted, such a breadth of topics, wheelchair accessibility is important-highlight success overcoming challenges and how. Wilderness on wheels, sustainability efforts, managing what we have, biofuels, untapped resources, plant the seeds to stimulate grass roots level.

Policies still in place from prev admin. Need to reverse the "no new wilderness areas". Concerned that we are opening up wilderness areas to too many uses.

People do not understand what we do with horses on trails and the competitive nature of OHV use on trails used by horse back riders. In some areas other trails are being closed for development of other uses like dog parks. Lack of funds and due to economic times we don't have support to educate about these issues and the benefits/fun of horseback riding in our open places/spaces.

When you are out in the wild/wilderness, and you have other uses (e.g. horses, ohv, etc.) you often get pushed out of the way. We need areas that offer both and do not get "over competed".

We try to teach folks with brochures, etc. But he agrees it really takes mentoring, to get the message across. Need to start with kids, but the problem is that many families do not get that opportunity. We need to build a program of stewardship over time to teach our public and especially our youth.

Inadequate education on impacts of certain recreation types on the outdoors. (e.g. OHV use and other motorized equipment use on trails). We need to have education programs that teach about the impacts of these uses to solitude and silence.

Overheard a lot of people funding non-profits that support outdoor programs. For him, I don't think funding is the issue. I think it is more about the quality of the program and timing. He thinks the greatest solution to getting kids outdoors is to make it part of the school curriculum.

Works with three counties to discuss water use/quality. Need people in the counties (not elected officials) to care about the creek, its quality, etc. Need people to understand its recreation potential (e.g. trail). First step is to get the people to care.

Discussed Project Learning Tree, Project Wet, Project Wild, and Project Food etc. Do a program annually called Camp Rocky that they use to teach youth about a variety of topics related to natural resources and have concurrent teacher workshops. Need to get the "project" curriculum and similar programs like Camp Rocky into schools.

Need education and outreach toward community programs. Access to lands is key to doing this. We would love to have people come to plains to help us build our environmental and conservation programs. We do trail rides, festivals, etc. that we do at minimal cost that get a lot of folks involved. Making connections with other communities, especially in urban areas, would be a key help to those of us in rural areas who want to do more and educate about our ecosystems (their importance and benefit).

## Discussion Question 2

**Golden, CO**

**(cont.)**

Funding is a challenge, but despite this we see tons of kids getting outdoors. It is all about possibility, and how much we do. So it is really important to get these programs going and people involved them.

Teach the teachers about the place. Thus they use a teach the teacher method for the areas which gives teachers the tools to do outdoor education and get their kids outdoors.

We do outreach to our local schools and turn them into feeder schools for our programs. Many of our parks are not very safe anymore so getting kids outdoors is really hard. On top of that parents are not able to get outdoors and many parks are run down.

We need to find that common thread and unite those folks with that thread. A common thread that can unite folks and bring them together, gives the opportunity for developing partnerships and creating opportunities for developing initiatives.

A huge barrier we have is that people are not clear about what their lands are and where they are. We need to do a better job educating them about this.

The great idea America had was setting aside open spaces. We would not have the recreation opportunities we have if it were not for our open spaces, parks, etc. In some places we took amazing wild spaces and developed them. In others we have let them go. We need to keep our wild places wild and not development them to the point of ruining them. He likes areas without signs, parking lots, designated trails, etc. Wild does not need to be manicured and paved.

As a society we have a done good job at setting lands aside. In CO, 16% of our landbase is wilderness. We have to applaud our current successes. The USFS has over 11,000 miles of trails of which only 2,000 are open to OHV. We are talking about encouraging people/youth outdoors. We know that our forests are stretching our current resources. It is a tough go for our land management agencies. We have this desire to get folks outdoors, we have more folks than ever outdoors, and yet our agencies cannot support this.

We are giving away our land for mining/leases/etc. at minimal costs. These folks are making profits on "our" minerals and yet getting them for a song. Maybe they would not take such risks if they were so cheap.

1. Use urban communities as a model 2. Create trust between rural and urban communities 3. Develop ecotourism 4. Create festivals for species 5. Create trust between fed/state/private

1. Mandate environmental education 2. Project Learning Tree

1. Successful environmental education programs--supervised youth education

## Discussion Question 2

**Golden, CO**

**(cont.)**

1. Work with partners to bridge the gap between private land owners and agency partners

1. Bureaucratic rules are obstacles

1. Divide between rural and urban audiences--mistrust, lack of communication

1. Need to have environmental education from early childhood through high school 2. Need to have envtl. Ed. in wildlife and provide transportation

No money for managing forest service land

Cultural resources not to be cut-- Save America's Treasures, Cost Share Program

1. Need access to open spaces--must be a connection between where people live/work and where they play outdoors 2. Lack of access isn't just an urban issue--rural too

1. Ability to integrate between different agencies to incorporate funding sources--including private land and agricultural sources 2. Bringing together existing federal funding sources

Sustainable funding mechanism that generates revenue. 2. Research lab that focuses on environmental education--physical and mental health aspects

1. user fees are an obstacle 2. Look for stable funding for activities 3. Don't build unnecessary amenities

1. Look at successful existing organizations--best practices, engage communities of color and marginalized groups

1. Continue Challenge Cost Share Funding support

1. Support GOCO and CO Kids Outdoor Program

1. Attract kids to outdoors programs--classes should be integrated into schools

## Discussion Question 2

**Golden, CO**

**(cont.)**

1. More \$ for easements through LWCF 2. Cooperation with county commissioners --Yuma County, allow current funding to be utilized 3. There should be more conservation easements-- more \$ for easements

1. Expand the benefits of the Farm Bill to small family operations

1. More monuments

1. Allow everyone at the table 2. Healthy level of funding for partnerships

1. Subsidize volunteer training so they can maintain their work 2. Communication and education for general public 3. Physical tools to maintain trails

1. Reviving CCC models

Some don't feel there should be motorized recreation. Have to fight wilderness designation, trail closures, fewer multiple use trails. We are looked on as the bad guys. OHV Registration program in Colorado puts money back into the trails. 3 million dollars annually goes to Federal agencies to maintain, restore and build new trails. Successful program. Greater demand for motorized recreation.

Funds are scarce. Have to reduce and concentrate on a smaller group of programs.

Same as Kirk. Even with GOCO, funds are tight. Programs that don't generate revenues are lower priorities. Less than 10% of State Parks funding comes from appropriated dollars.

Fears of outdoors (example bears). Support of teachers lacking.

No dedicated funding sources for operations and maintenance (local and state parks). Creating new programs is the priority rather than funding O&M.

Obesity rates. Fitness is a challenge to getting people re-connected with the outdoors. Also, fits with initiative of President to get kids more fit.

Knowledge challenge, don't see the outdoors as part of their lives. Getting unplugged is a big challenge. Understanding how to be outside.

## Discussion Question 2

**Golden, CO**

**(cont.)**

Community level – lack of vision and priorities. Go out 50 to 100 years. Big stuff takes a long time to put in place. Having a master plan with vision and priorities. Resources get re-organized.

Getting youth unplugged. They have conversations with each other. Communication happens outside.

Chatting on line preferred to meeting friends at the park. Invite friends to go to the park, they will find out what can happen there.

Going places where you can't use the technology. Where they have to put it away for a week. I like not having phone for awhile.

Permitting from the Forest Service was a barrier to taking kids with disabilities up there. Requirement for insurance, fees, etc. Fund raising also requires Forest Service permit.

Family has a rule when they go outdoors that kids have to unplug. Some trails closed that have been open for a long time. As you get older, it gets harder to get to some areas on foot. Grandparents are very important to exposing their grandkids to the outdoors.

Heavy use of OHVs is not good for wildlife habitat. Without wildlife, the mystery of being outdoors is not there.

School that she started is a model. School in the Woods, Academy School District 20, near Colorado Springs. A public school that accepts fifty-two 4th graders every year. Chosen by lottery. Nature based schools.

Create more passports (like the Federal Senior Pass). Maybe there should be a youth passport? Make it more accessible.

Trips on the river include geologist, botanist, astronomer. Working with schools is very difficult. Used to do kids trips with Denver Children's home. Now the logistics (number of staff, managing kids' meds, etc.) make it impossible. Build multi-million dollars sports complexes but no tents, backpacks, etc. to connect kids to the outdoors. Getting kids outside is not viewed as part of the curriculum. Each school has to have a staff person who will lead it.

Hook kids with "fire, knives, and dirt". High adventure, fun, etc. is what gets kids interested. Need to attract kids on their own terms.

My sister learned that kids that don't go outside have less creativity.

Get the kids and adults out there but preserving the Great Outdoors is really important. Work of the Udalls in preservation. Conservation is huge. Has to be something there to enjoy. Plan ahead for conservation – look ahead 50 years.

## Discussion Question 2

**Golden, CO**

**(cont.)**

Parents and adults need to train kids.

When there's a desire, it can happen. Took a group of students to SEACAMP San Diego. She had the backing of parents and administration. Hard to get the kids out of the classroom with testing requirements. Teachers don't have the freedom to do the creative outdoor activities with kids. Teachers need support and also more awareness. Networking is key. Sustainability is very important. Not much teaching about it.

Outdoor lab program in Jefferson County

Balarat program has been cut back. This was really fun. Should be more often.

BLM needs more authority to enforce regulations.

These forums should be scheduled differently to provide more participation.

Involving young people of today. There's been some disconnect between young people and the outdoors, need to get programs in school systems, even starting in daycares - recognition of the landscape, what it means, how to use it and how to preserve so is both useful and soul-satisfying.

Involving young people of today. There's been some disconnect between young people and the outdoors, need to get programs in school systems, even starting in daycares - recognition of the landscape, what it means, how to use it and how to preserve so is both useful and soul-satisfying.

Get to know your neighbors, your ranchers and others. They're not your enemies – your friends! Have to understand that person, respect their uses, look at overall planning and involve each other.

Concerns me – costs \$20 to get into national park for vehicle. Excluding large group of people by charging so much. Nonprofits that bring kids out – gotten so expensive for busses that they can't afford to bring inner-city kids out anymore. Out of inner city and into wilderness. Problem – national forests, even non-profits, have to buy \$100 permit to bring groups of people in. Why can't forests get together and have one annual fee to take groups out? If you want to get people out, you've got to make it easy.

Educate kids about surroundings and then take them a step further. Funnel money through non-profits who know how to use it and what to use it for.

## Discussion Question 2

**Golden, CO**

**(cont.)**

An obstacle is that the Forest Service has requirements for us. We want to provide education and motivation to get people out there, but because we're non-profit, it's cost-prohibitive and Forest Service agencies are mandated to have the permitting. That's become a real stopper for us. Need to provide transportation to get people out there, make not so many hoops to jump through.

Important that this initiative, that our lives, try to influence positively citizens to value public lands and resources because they are our life support system. "The lands have to come first – or else." We're not self-sustaining by any means, need to keep our life support system. Natural reserves and connections between them and us. Whatever we can do to heighten the way public values and understands what wilderness is all about – promote designations of new wilderness areas.

Have some sort of vision of success from the beginning – easy to get overwhelmed by details, keep in mind what goal of program is. Develop self-definition of being conservationist, recreationist. Important to conserve the areas that we love. As population, not as inclined to go there if not comfortable with it in our backyard.

Policy where within every 2 miles there's access to a park, if that's the vision seems like an amazing opportunity because then other programs are trying to get people out to places. Effort to reach out to generation in 20s and 30s?

GoCO - dedicated funding, as agencies do grants, should be requirements and funding given so receiving agencies would participate in education programs to let public know that offshore drilling royalties funded programs.

Using landscapes to teach across American West – easy in east, only way to learn about landscape is to be on it, landscapes are ultimate classroom, history, culture, biology, geology, powerful tool build respect for culture, need new landscapes set aside, NLCS provides vehicle for teaching about lands as entire ecosystem. Improved access to lands through government funding that provides classrooms. Provide competent and diverse teachers, need standards for outdoor education from Department of Education – crucial role. HHS needs to be eminently involved in obesity awareness, Department of Agriculture needs to undertake education for relationship food and natural systems, Interior. Outdoor-based curricula, comprehensive inventory of lands, public and private, which can function as classrooms, inventory teaching resources that are available, competent teachers, and link. Do away with public attitude of fear toward access to difficult places. People need to be encouraged to swim rivers, climb mountains, without having every piece of equipment from REI to do it. Teach how land forms and water shape human history. National Trust for Historical Preservation involved in campaign to do what wilderness society did with creation of NLCS, set aside cultural landscapes. Know and be able to teach how people at Sand Creek used landscape to save selves, grasslands shaped hist of Santa Fe Trail, etc. Teach about landscapes from landscapes – will get people out, make them healthier, engender tremendous appreciation for entire planet.

## Discussion Question 2

**Golden, CO**

**(cont.)**

People are programmed to think locally rather than seeing the large picture when working on conservation and outdoor recreation issues. We need to find a way to reach out and educate people on the need for cooperation among many groups, rather than solely in a local setting.

The primary bstacles are with education for youth - youth are not being taught at an early age to have the engagement with the land that is required to love the land enough to promote conservation.

We are not using the Clean water act legislation to effectively manage and protect wetlands areas.

CSAP requirements are preventing schools from teaching the natural sciences. Sierra Club has a program to connect youth with the outdoors which has been extremely successful regarding graduation rates and grades. The expense of transportation for youth in the city to recreation areas is cost prohibitive.

The permitting process is prohibitive due to the fact that youth groups and educators are being charged as outfitters. It would be helpful to redesign the process and give breaks for permitting for educational purposes. Allow easier educator access to public lands. \*another barrier are the folks within the conservation community...perhaps too conservative?

The DOW programs are comendable. The connection with nature creates invaluable influence in the lives of children. Once you make the connection, you are able to establish an interest that they can see and feel themselves. When kids are allowed the opportunity to learn hands on, their research indicates that there is a higher graduation rate, higher math and science test scores, and a higher percentage of college enrollment. Unfortunately, these outdoor programs have been cut from 5 days to 1 - 1 1/2 days to accommodate CSAP requirements.

resources, BLM enforcement of pbulci lands - orv prob lem and lands set aside too little money to educate and enforece what'S CURRENTLY IN PLACE

"Recognize that broad eco-systems are at stake and must be addressed beyond any particular state's preferences. The red rain that falls on the Denver area and covers cars, houses, and my expensive photovoltaic solar panels so that the sun can no longer reach them originates in abusive "historic" land practices---read over-grazing---in the Utah desert. If "scientific management" is the guide, why is this happening? Barren drilling and mining sites likewise destroy the land and water. Have we learned nothing from the Dust Bowl of the 30's?"

Works for conservation. This system of lands established in 2000. Challenge is getting the word out. It is wild and scenic areas. That this land exists. Wants to shorten the name.

Getting kids outdoors. Kids spend a lot of time indoors. How do we get kids outside even in their own backyards

## Discussion Question 2

**Golden, CO**

**(cont.)**

Young people care about what their friends say. "why do you go camping?" People care too much about what others think. It's okay to go camping fishing, hiking

Can't push kids to go the parks. Not enough school shave the outdoor education programs part of their Curriculum. Funding for travel to get kids to programs.

Global footprint of carbon of driving up into the mountains. I feel that it is a sin not just against the country and the forest but against the people of our world.

Inner city issues within the education system: in CA, there is not enough resources to get the kids out, and can not go out everywhere and play basket ball because of risks such as gangs and being shot in different areas and cultures.

Private Lands Conservation---Raising money, but hard to come up with private cash match of the funds. Private fund raising is hard. Wyoming has a lot of private ranch lands which are important. Urban places are a big drive of our economic culture.

Industrialization of our public estate. Disorganized public and state. What my kids see is not outdoors and lands they love. Industrial operations causing harm. Grazing lands, sage brush os in trouble. Ranches have federal pastures taken over because BLM policies are not being enforced. They let people cut roads and ditches everywhere. Public estate is a big challenge. BLM knows they just ignore. Ranchers can work together to keeping the weeds off the sagebrush land. Have a call for sustaining ranches.

We allow million sof pounds of poisons to spread our lands. Changing sex of all fish to female and damaging.

NO big money. Has changed drastically. States are cashflow challenged because of hunnting liscenses going up. We could take money and give more to help recruitment problems and finding good spots to go.

partnership between federal and state. Sometimes the state asks federal government for oppurtunities to explore and explore, but the two agencies are not talking. Communication is a problem between federal and state. National agencies may not have the power to go out and see when the local state agency does. Communication is important

Comunication between agancies is critical. One hinderance is the Heirarchy. Park values are meant to be timeless for everyone, not for local businesses to exploit.

1)FRPPENG- Cash/match is really hard to raise. 2) Land and Conservation fund 3) Conservation wants to be measured in acres not dollars

Finding someone who is truly passionate about the lands

## Discussion Question 2

**Golden, CO**

**(cont.)**

Valleys with no way to get to them. Trespassing because these lands are held as though they were private. More access to local people

Matching funds, cash isn't there.

What is working: Cattleman's and the land trust are moving forward in partnership, and stronger organizational structure. Access for the public to the Sangre DeCristos. What is not working the IRS. They have a strong organization regarding access to the Sangre de Cristo Mountains.

Challenges: with SCORP is wonderful but do not have the funding to implement. SCORP is a problem implementing due to funding issues.

Challenges: CDT - inconsistent direction across the agencies regarding trails that cross jurisdictions. On the ground level is a issue. Find language that provides consistency with a cross country trail. National Forest, BLM and NPS interpret the National Trails Act differently. Hard to get consistent direction. Also, engaging private lands so that interpretation can be accurate from what Congress puts forth. This goes to how different agencies interpret language in an Act. Administration needs to push integration between agencies.

Challenges: Field Offices - Policies and Instruction Memorandums and Instruction Bulletins are not being translated and reaching the Field Offices. Fee structures are different across the country. Special Use permit issued differently across the nation. Information not trickling down. Agrees with Martinez's comments on enactment of Washington policy decisions being put into place by the states, counties, localities. Believes field offices do not volunteer information on changed/revised directives/policies nor even enact changes in a timely manner.

Challenges: Goes both ways. People on the ground not getting the best information and technology to do their jobs. No mechanism to put the students into this pay it forward membership program to help the environment. Getting information from the states, counties, localities up to Washington effectively among the varying agencies. There's no way to get all Federal agencies jointly involved with the same program at the lower levels to get something accomplished.

Challenges: Open space programs have been successful throughout Colorado. Problem eroding sales tax base because of the new internet purchases. The States want the sales tax that are due to them. Local government require sales tax now and the base back to them. Counties are receiving less money than in previous years. Keeps them from being able to buy open space lands. States are getting sales taxes from Federal government, but it doesn't appear that local governments are being given the same help.

## Discussion Question 2

### **Golden, CO**

**(cont.)**

Challenges: IRS fraudulent accusations, encourage outdoor use, increases the impacts and waste disposal on the land. Group size damage, impacts to the environment. Need to educate about what the outdoors are about and preservation. Concerns from San Isabel involve the IRS; Crystal Mountains and problems with massive trash, etc. from people who use and damage the area because some people being allowed to do whatever they want when there while others' accessibility is limited. Educating youth on preserving the area. LEGACY FUND.

Challenges: Office of conservation outdoor recreation coordination need to model the wildfire integrated management system. Create an Office of Conservation, Outdoor Recreation Coordination, which would be an agency to coordinate between all Federal agencies. Too many Federal agencies to contend with.

Challenges: Federal coordination

Challenges: Wind energy developing faster the regulations.

Challenges: Legacy fund with GOCO. Transportation (for children and others) – Make it easier for people to get to/from places outdoors.

Challenges: Transportation (access) Get out side is important to get people to the outdoors. Best use of funding. Design criteria that encourages implementing funding. Encourage flexibilities across programs – private/non – remove time limits on using funding, etc. Consider how landowners work their lands. Ask landowners how objectives can be achieved.

Challenges: Land owner have to be a partners, we have adequate funding it is how it is used. Be more objective direct. Look at the office of eco-services to help. People need to be flexible. Timing and how the objects work and be flexible where you want to be and go out the landowner base. Could do it fiscally responsible.

Challenges: USDA programs that are good, changing cash matching requirements. Funding changes, to make more available. Open up LWCF to private conservation efforts. Pilot program for Colorado administered by GOCO to achieve more local programs. Tax incentives. Conservation easement tax permanent.

Challenges: Funding aspects have to pay upfront and they then get reimburse. Have the funding up front that they can charge against (small non-profits.) Funding aspect – paying for programs across participants upfront and then waiting as long as a year to be refunded by the Federal government. That groups such as hers be given funding upfront and/or refunds much more quickly.

Don't acquire adequately at the FO level, one botanist for huge land masses.

## Discussion Question 2

**Golden, CO**

**(cont.)**

Issue federal land acquisition process, not coordinated and brought up through the public input. Largely politically driven. Not through SCORP. Federal land acquisition process that, to him, is an uncoordinated process that isn't connected with organizations such as cattlemen's associations, etc. Process seems to be too insular.

Challenges: Personnel - quantity and back ground. Region 2 of the Forest Service hired a person for travel management that is not qualified. (let me do it.) The movement of Federal employees into jobs they're not as qualified to be in as someone in the private sector who has been in Colorado, which, she feels, causes programs to be handled inefficiently

Challenges: "Lets move" (First lady) initiative gets integrated, needs public support, the National Forest Foundation. Getting the word out. How do we get it down to the local level. How can the local groups help bring the program down.

Challenges: Effort to get a youth natural resources to the National Level. All agencies and bureaus need to coordinate in the vision. It is about the importance of working lands where our food comes from, conservation, education. Youth in Natural Resources program. Where does it stand?

A lot of money spent on buying land, and when we take it out of a working landscape, but there is no money dedicated to maintenance, restroom facilities. In Colorado we love our land to death. Need help with the maintenance.

Challenges: People in government are not getting the Leasing Reform message. Leasing Reform not translated to the State Direct the FO's. Training. Onshore reforms don't appear to be translating to the Field. It appears that career Federal employees continue doing their own thing regardless of new policies, etc.

Hearing about projects getting hung up. The federal employees are not getting the message on new policy. What are you planning about setting the working action groups about dealing with the new policy. Mentoring, have a forum. What would you like us to do? Reiterated the failure of agencies to move on new directives, and wants to know what is being planned to breakthrough such barriers.

Challenges: How important it is to have the dollars for landscapes - farm and landscape protection. LWCF is important. Tapping into the energy of land trusts. Relationships between the Federal, Local and State Governments. More Flexibility with the Federal Government to have roles that are more coherent. Federal programs that aid preserving landscaping are vital. Ways to tap into the energy of land trust and private citizens, goes a long way. Overlap – more flexibility on the Federal government working to have rules that work across such overlaps. That the Federal government recognize there may be a legitimate need for more protective rules in metro areas than are necessary in rural areas and not trying to have a one size fits all mentality.

## Discussion Question 2

**Golden, CO**

**(cont.)**

Challenges: Diverse country, give local autonomy so we can manage our resources to the local priorities. That there be recognition that works in one part of the country may not work as effectively in another. Federal government should recognize this and help to overcome such issues.

Don't forget Family farm and where our food comes from. [\*THESE REMARKS CAME AFTER WILL SHAFROTH GAVE PEOPLE AN OPPORTUNITY TO SHARE ANYTHING THEY'D LIKE TO SAY.]

Small parks need to be improved. If the places are run down and lack equipment, no one goes there.

Lack of funding stems from lack of interest. As a whole, society is not interested and that is why there is lack of funding. People don't support the initiatives. Need to reengage society as a whole. Without re-engaging youth, less and less interest results in voters and tax payers, have to re-engage.

I second that, LWCF, and we haven't put enough common effort into urban parks, in communities where kids don't have access to parks where they are. Our charitable group has a goal for a safe outdoor place to play 10 mins walk for every child in the country. Another challenge if "landscape view", how to integrate city with mountains, and federal coordination.

One challenge is not being able to fund of the LWCF.

Colorado's treasures are the land and animals. A challenge is policy, with regard to animals, a lot of money is going to the charismatic species, but we need support for the whole spectrum of life. Once we conserve land it's not over, we have to monitor and pay attention to weeds, threats, and misuse of the land to maintain our natural heritage.

we have two dedicated education facilities, our obstacle, is transpiration. Fees for buses and trips are too high for some school. We're working with schools to overcome that obstacle but it is a growing concern. Testing and other obligations take up a lot of time.

Too many programs with different priorities and different rules bring a project forward and a number of federal groups and youth coordinated for that project.

Our challenge is, we own a wildlife refuge, funding is a challenge and being able to serve the communities while taking care of what we want to. We would like to serve more rural communities but funding requires we do Lowry and Stapleton (Denver communities).

One challenge is getting youth interested in the outdoors. Science academics in elementary is being sacrificed for the standards like reading, writing, math. Love for the outdoors comes through science class. Don't take science out of the classrooms.

one challenge is the technology issue, more interest in tech in their world and lack of interest in the environment, need promotion of what the environment has to offer.

## Discussion Question 2

**Golden, CO**

**(cont.)**

not many people know about the opportunities, need someone to show them.

Biggest obstacle is funding to acquire open space. Opportunities to partner with Federal Government have been good, would love to see additional funding for LWCF, would like to see it fully funded. There are also some obstacles around coordination between local and Fed Gov on land swaps that make sense. BLM, Forest Service, could swap and increase preservation of open space, it is difficult to do that and would like to make that better.

Spending time thinking about kinds of outcomes want to promote, putting notions out there as challenges with certain characteristics (highly leveraged, encourage youth, have educational component), create competition and let best ideas percolate to top. Foster rich competition of ideas. Roadless rule for national parks in Colorado, frequent mention of impacts of beetle kill but more forest health problems, won't be effectively addressed unless true collaboration. Need dollars in Colorado to address that issue. Think Colorado is candidate for another national park. Have landscapes that need protection. Encourage continued review and evaluation of a range of possibilities – grasslands are underrepresented portion of national acreage among national protected landscape. Private lands conservation programs through USDA need to be continued, well-coordinated, needs to be an optimization or rationalization of federal funding sources so as user-friendly as possible. Whether pursued by private land owner or NGO, need to be presented and leveraged effectively. Federal government can be somewhat unwieldy deliverer of results.

Bring people to areas of water, especially where don't have oceans, it's central to have clean water to do that. Restore Clean Water Act. Connect experiences from childhood to places, really stick.

issues that come w/ playing in water/liability - legal issues.

non-vehicular access i.e. Clear Creek fm Loveland Pass to the flat; has a lot of bike path. Pedestrian path and funding needed for natl grid for bicycles to get off road due to vehicles - keeping it safe. Create a segregated pass for bicyclists.

big barrier is funding - for kids. Competitive resources. Get funding to reconnect families for Conservation. Technological experience to complete grants -

Conflict btwn public support for species. Issue with Govt allowing wolves to be shot.

w/in conservation often exclusive due to access, program may not be relevant to specific issue.

Funding - wildlife grants. Creativity - place to work

## Discussion Question 2

**Golden, CO**

**(cont.)**

Mom 2 & 4yrs age - programs for kids to participate in. Guidelines written as rules. Be inclusive and cut the red tape.

Public Land Management - for camping overcrowded. Indians Peak Wilderness too crowded, natl campsites are over booked. Managing it for private ranchers not good always.

More exposure for groups; more volunteers that love what they do; more planning/funding/dedication.

Encourage Land Trusts that r wkng on private lands/ farms; Collaborating with agencies but also private lands so we get educated in ranching/farming

Promote Public Transportation - get kids bus passes; teach kids to take other alternatives rtd, etc.. vice driving.

Agencies are under staffed - put \$\$ for positions for staffing. Educate kids and get them outdoors but need funding fm hunting and fishing licenses. Currently no money available.

Funding mechanisms - sales taxes over Jefferson Cty; pretty cool that CO has to offer

Youth core Program - get kids connected to the outdoors. More funding for Americore to help out low income families .

Co is blessed; partnership base. Need all user groups at the table/wkng together.

Funding for Land & Water - 703B contribution to outdoor. Praise federal agencies due to advertising on outdoor activities.

Solar panels & flat roofs? Something needs to be done.

Energy competitive with wind mills - wells; if the tool that govt puts out to educate - on amt energy savings. Looking for people to put in 10% but need to push 100%. US Govt has no goals to set high goals.

As far as fed govt to be a conduit in conservation - the connection btwn the great outdoors and home is critical to our job. When you think of nature people think scary, far away places. How can we market the Great outdoors?

Under the guise of what works, with motorized recreation, the money is allocated formally, but partnerships with land management agencies - they don't have the capabilities to deal with us and our monies

## Discussion Question 2

**Golden, CO**

**(cont.)**

Also really disappointed we didn't show the 7.5 minute video - but it is wonderful and can see online. However, motorized recreation is not included anywhere in the video, though

Has a 14 year old daughter - Am concerned with a "youth need" for us to direct and talk to children about the opportunity and future of land, air, and other important ecological and social issues. It is important to me and my daughter to reflect to: 1.: The Winter Park (northcentral Colorado) issue need to get out. We need educational projects in Winter Park to get kids outdoors in the summertime, and other times. Less fortunate kids should have opportunity. We need to find ways to partner, for education, and to get kids outside.

We need to get kids out with the ski industry, and also year round. Ski areas would be very supportive for camp situations in summer - lodges, parking spots, and other amenities are in place. We have also provided such summer activities for decades, but now there's a bill in congress trying to formalize this. Use of ski areas to shift kids to outdoor recreation year-round.

I have lots of ski experience and outdoor experience. Our Denver area Founders understood the relationship between front range and mountain uses. Winter Park endeavors to get kids out. We approached Denver, but this outreach is stalled. No growth in getting kids to ski areas. Cost of winter sports has created minimal participation efforts. We need to look at President Obama's own upbringing and fostering of value to him for parks and the outdoors. Need to work with families to help them understand these values. Funding is finite, so you need to motivate families and kids. Work with emerging populations to get them to feel more welcome and getting outdoor use. Legacy of public lands is needed.

Vignettes of education are needed. We need to mentor young people in the outdoors.

With horses and back country horsemen, volunteers develop a sense of outdoor ownership. How to do this within budget and without volunteers is impossible. Used to be trail groups. Need to set money aside for trails that doesn't get siphoned off. Enviro studies for trails takes too long. Volunteers need quicker action. Hard to keep momentum if enviro studies stretched out too long. 4-H groups get people outdoors. Helps in urban entities supporting 4-H. National problems (Forest Service has budget issues).

Now there's the bark beetle damage, and most Denver kids don't get west of Weat Ridge. We've done a terrible job in getting kids out.

Families need to understand fundamental value of getting outdoors.

Recently, Colorado was awarded for their outdoor rec. plan. This needs to be recognized across the country! We work as 65 people who meet downtown at the REI store monthly, and this successful grassroots volunteer work can be replicated nationally. Available is Water Land and "Conservation funding for staffing, with initiatives, to continue partnering with many non-profits. We have a successful Landscape approach with our recreation issues (Gave out handout).

## Discussion Question 2

**Golden, CO**

**(cont.)**

I work with over 10,000 kids annually on public lands. Initiatives from Washington DC are not understood and they don't understand how very many grassroots orgs are working with kids. Many hand-to-mouth kids groups have too much competition already for scarce dollars. There are complex urban demographics of this country, and we are losing what knowledge there is about public lands and that is available out there. We need more public message spots on radio and tv saying over and over again this is what we do, and these lands are out there for you.

I come from a 4th generation San Luis family interested in conservation and waterways. Waterways are the arteries and veins of the system to take care of the land. We need to educate our children and get them involved outdoors. A good segment of the urban population has no interest in this. "We need to get people to recreate and enjoy. Then they will spend money, time, and interest in supporting these outdoor efforts. Urbanites may not give a toot about consumption of resources."

We need healthy watersheds and sharing knowledge of lands. Finding how to connect the dots, win, win, win, win. Sustainable funding - GOCO is successful. We need to find out how to create this for rivers and lands throughout thenation. We have an economist working on this for throughout the west and the world. Higher power revenues are the Key to success.

RTP - Recreation Trails Program is out of the Department of Transportation. RTP is on life support now. Like the Federal budget, they keep upping it, but still a number of people benefit from this and work with youth corps. This funding needs to be re-upped or RTP is underutilized. Need to do like GOCO - recdirect lottery and take income stream to create an amazing program. The Snow Mobile ruling was the first funded by GOCO.

At the end of the day, we need constituency willing to support our efforts, or this outdoors issue is moot.

I've raised two kids in school systems - public and private. Unfortunately, neither have any more physical education nor outdoor programs. We need to bring these back in our schools to get kids outside.

There is no need for more 5th graders program to ski for free at resorts. We are at capacity now at ski resorts in teaching kids how to ski. Check numbers on this for accuracy. Kids are now turned away due to full rosters at ski school. Ski areas expose millions of kids to the National Forest. We are a portal to bring kids to the National Forest.

Disagree that many kids do not have the funding to go skiing.

How to get the money out to outdoor programs? Need to play significant roles in applying, etc. Urge Administration to see who they are getting the money to and if they are accomplishing the goal.

transoportation, potential visitor don't have a way to get out to rec sites

## Discussion Question 2

**Golden, CO**

**(cont.)**

funding to provide opportunities for kids, even nonprofits need funding to operate

focal point need to also be on adults not just youth, parent base is also important, too much funding just for youth, when introduce "parents" get kicked out of the funding mix, shooting, one of the most interesting activities to those participating, has very few facilities close to be used for their program and their most interesting activities to their participants, shooting sports brings many into the program

getting agencies to work together in a landscape way

outdoor education integrated with sports in school, hiking, mtn climbing, etc, not as competitive as team sports and some respond better to individual sports, and learn about the environment as part of the sport

LWCF is very successful and needs to be fully funded, but focused on "wilderness", funding should include programs "in the city" to reduce the transportation cost, focus on local city parks

Historic education is part of our heritage and important to our education and environment, many of these sites are local and easy to get to, historic properties are in the grasp of many of us, encourage us to think and promote History, need full funding, all are in the outdoors and

Ranchers are indeed incredible stewards of land, endangered species important in S Co yet they have to fight the take over of land by the Fed Govt', (DOD) Need to keep small family farmers on the land to continue the protection of those important lands

BLM needs legal authorities to establish WSAs

How do we get the kids and parents out on the public lands yet protect those lands with today's funding. Mining Law of 1872 needs to be repealed. One of the biggest problems, we are losing money because of this law. Money used because of this law could be used for other needs.

Mentoring a great idea but US Dept of Education needs to be involved sooner than later

Since most of us live in urban environments, the government should focus improving city projects.

encourage the federal government to get young people to work on the land, and invest in existing programs instead of creating new programs.

We need more cost-effective ways to introduce people to the outdoors

## Discussion Question 2

**Golden, CO**

**(cont.)**

My parents are from Mexico, so they are very uninformed about what to bring when camping or fishing. Kids like me need programs to help get us informed.

There should be full-funding for the Land and Water Conservation fund. We think there is a need for projects that concern the big picture, and will be beneficial for years to come. The CCC effort in the depression has been a great help for many people. Let's get more young adults involved in helping children get outdoors by creating jobs for these 20-30 year olds.

Reduce barriers (fiscal) to partnership, and increase funding for organizations that get people outdoors. Consider youth as assets that improve public lands and solve problems.

To improve the lands, we need more funding. It is important for all organizations to work together, with the same goal.

They need to address water issues more aggressively. Initiatives protect land.

Only has set amount of time to spend outdoors and it would be nice if maps were made public.

REI has a booth of information available.

Non-Motorized trails are available online; [www.fs.fed.us](http://www.fs.fed.us)

Challenge Corp of Engineers to fix problem they created with South Platte. There should be a new way of looking at restoration.

Us vs. Them (motorized vs. other users) all come to table to find solutions, we can all coexist. Every group wants something good and healthy for the trails

She loves the mountains. Agrees with \_\_\_\_\_ that trails are so lengthy and hard for children and disabled, handicap area does not get them where they used to go

Believes it would help to have leaders on handicapped trails.

Would like to see everyone in Govt actually doing something and listening to the public and being accountable.. need to see that the public is taken care of ... doesn't see decisions being implemented. Work for the public, not do what they want

## Discussion Question 2

**Golden, CO**

**(cont.)**

One thing that is a common theme is a funding problem... one thing that hinders me from enjoying outdoors is not being able to support my family.. Carbon footprint tax should be implemented on goods that are imported and put a tax on exported jobs... we need to reduce the amount of jobs we export

40 acres, landblocked by the USFS, abuses and lies from USFS to cut trail in his land. Respect for private and public property. No permission to create trails

River issue, water resources.. having access to water. Dolores River and Pewter.. access issue with Forrest Service.. keep gates locked until July 1. Would like gate opened a month earlier.. local district office wants to follow proper channels ; Dolores, managing spills issue with FS, looking for new alternatives for the way the reservoir is managed... impacts are down-sizing.. losing usable water days

must outline these basic principles: respecting property rights, budget allowing to be good stewards, trail management issues, trash – empowers local govt

Conservation- Wise use, not just protection; conservation is key, conservation is the new protection, good responsible wise use of land. Getting more ppl outdoors, when you develop a partnership, all voices are at the table ( voices from one end of spectrum to the other). Opposing ideas get pushed to side, must work best for everybody. Forest Health Issues, giant fences around our land may mean less protection, President to reach out to broad community.

Stuck in a perpetual state of dynamic tension when there is unlimited demand with limited funding... particularly with so many different interests. Only patchwork things being done.. need revolutionary changes like funding wildlife management.. need adequate funding. Have too many priorities that are not being fully addressed.

All agencies are competing for the same dollar, choose priorities.. do all half way or chose the ones important to us and do them fully

rafting issue bill generated more public participation than any other.. packed supreme court with thousands of people... this is something that creates a lot of passion

Nice lie!

Water quality, what can be accomplished with legislation

we need to focus on partnerships to get kids outdoors. Funding opportunities for counties who do not have the resources to get the youth involved. It is important to market and promote projects, and mobile marketing is the way to go!

## Discussion Question 2

**Golden, CO**

**(cont.)**

We need improved access to lands, and provide competent and diverse teachers, and raise the standards for teaching about outdoor recreation. We need public lands that can also be used as classrooms for the youth. We also need to do away with the public attitude of fear towards accessing difficult places.

it doesn't work for young adults to volunteer their time. We need to create jobs for young people, in which they do good work for outdoor awareness.

There are many problems with the forest, other than the bark pine beetle, that need to be addressed. I think Colorado is a candidate for another national park! The landscapes here need more protection.

In Colorado, we don't have access to large bodies of water. It is important to protect our clean water sources.

It costs too much money to get into a national park, which excludes a large group of people. Transportation has become so expensive to bring inner-city youth outside, that it has become too hard to afford it. Getting people in to schools is not beneficial, because it is still not getting kids outside! Another problem has to do with the permits that national forest service's charge for admission. Why can't the forests get together, and charge 1 annual fee for people to enjoy ALL the forests, instead of having to pay for use each time people would like to get out.

If there was money, more children would be able to take part in the activities. Funnel the money through the non-profits!

There is a link with getting outside + preventative health care! Our insurance companies are facing obesity and mental stresses (war trauma), so they should also get together with the government

There is a lack of awareness about the benefits of getting outside. The government should provide answers to questions: What is there to do? Where will I find it? And how do I do it?

problem solving for trails, shes found there is not enough room to go around eachother; some areas with a diversion

## Discussion Question 2

### *Grand Island, NE*

We're partnering with several folks. Nebraska Nature and Visitor Center which has been reopened with Game and Parks and Hasting College. They are doing a day camp today. Use funding from state and federal to fund this, to get kids involved in the nature center more year round instead of just when the cranes are here. In terms of access issues, the program has been charged with acquiring 10,000 acres over past 13 years. Have gotten about 6,000. Have received many requests from the public on how do we open lands to hunters while still preserving habitat for the birds. We are working on that. We have examples where people have gone out and used TVs for target practice. How do we get responsible hunters.

Tri-Basin NRD and Phelps County Weed Control Association, works. CCPI Nebraska being one of the few states where the cooperative landowner owns the land up to the rivers edge. Nebraska was been hit with influx of invasive vegetation. CCPI put into last farm bill and funds were set aside to encourage landowners to utilize those funds to cost share management of this vegetation..Concerns about CCPI program because it is not continually funded because we know even though Nebraska was granted \$4.5 million, it may not continue to come. We need to see that because there is a learning curve, that landowners don't jump into things until they see what their neighbor does. We need to see this continue because we know that those that don't sign up now will sign-up in a couple of years. They put in money of their own. There is over \$86,000 committed to CCPI. Landowners do understand it and it helps control these invasive plants. This is somewhat limited in Nebraska because it is only for fully appropriated land areas. Over half of state doesn't fall into this area. We need latitude to get it used in other areas in the state in the next farm bill.

Something we talk about as outdoor education . Once they're educated they need access. They need opportunity. When alone they won't have access. They need local opportunities. One thing to help with this stems federal government land and water conservation fund. There is movement to get this to full funding \$9.5 million. One key element left out now is that most money will wind up going to federal programs and parks. We need at least half to go to smaller towns so they can provide to local families. Lots of families won't have opportunity to get to national parks. Needs to go to smaller or any town in Nebraska so once the kids are educated they can get access to do. What kids learn in school, if there is not an opportunity to do it, it is gone.

Answer. Right now for whole state is about \$300,000. That doesn't go very far. In order to raise level, opportunity is here and administration can see what success stories have happened thru this program. Now those things are aged and there's no money to repair it or create new. Now Land and water conservation fund is opportunity.

One of challenge we've faced is balance between ground water and water resources. One of State's AWEPS in central state has worked very well with money from EQIP, Conservation and urban development program? In case of Platte Basin Habitat this is a challenge .

Every year around budget time local offices spend time and energy trying to defend their existence/budget. What isn't working: STOP trying to remove funding from RC&D's.

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

Funding for RC&D needs to be funded. It works. You don't get something for nothing. I've been in this a long time. We are in red zone for level of funding for NRCS technicians. As talk about incentives and education, you're right. Have to have both. Who does education with landowners? The local technicians that work with NRCS. Dollars and workload and amount of time and then still be accountable to taxpayers. Absolute foolishness. Cannot keep increasing the work load and expect the techs to continue the work load. Something has to give somewhere. We are clearly in the red zone. Yet will put more cost share dollars and land into programs but cuts the technicians. We are at the point. We are doing disservice to all other tax payer dollars that has been spent and invested. Because they're not getting done. The point has to be underlined that we can't continue to rob from the local technicians there and still get the job done. Made enormous progress in conservation. Need both – adequate staff and adequate incentives. This is an investment and it's part of protecting water and soil resources for future generations. I'm sure Steve Chick will take me to task for that.

National Park Organization. We have quite a few partnerships. Everything we do is partnership based with funding. Weed awareness group of partners, landowners to get rid of invasive species. Niobrara. Valley Outdoor Education based -- all volunteers get together to talk about Naturefest for 5th graders. Niobrara Council has day camps for local kids kindergarten thru high school We always have a waiting list. Talking about a senior citizen outing day. They would take individuals for sack lunch photo tour New existing program is a camp program for young parents and kids out camping. Families that don't have camping background. If you've never camped you'll be first to get in. Biggest challenge is funding. We spend \$2,500 to \$3,000 for all of those kids because it is volunteer base.

Land owners and owner operators, you know how fiercely independent those people are. You won't get anything done until you get those people on board – conservative conservation minded people. We burn 4-5000 acres of cedar invested acres every year. Until you get the farmer/rancher on board with same agenda you have, you won't get what anything done. You're not talking to the right people.

Perfect example of stepping on each other's toes

not working. Impossible to get. NRCS involved in many. Building road structure, 30-40,000 to develop site and in 5 years may not qualify. What we're looking at doing is purchasing mitigated ground in middle of Lincoln to get something done in rural Ne. How does that work? Trying to do fast track but. Landowners dealing with recreational development but getting comments from EPA. Why is EPA trying to regulate my cattle's gas? As a result set on hands and don't do anything. You can't develop on your own land for your family, grandkids. The tremendous cost to mitigate is too high.

We've talked about a generation in getting them back into the outdoors. None of the people that were outdoors got it from school. They got it from hands-on mentoring.

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

Reconnecting people to the outdoors. Most of the time we think about urban citizens needing to be connected. Sometimes we need to connect farmer to outdoors in terms of habitat. American Great Outdoors habitat programs have actually disconnected the two; farmers to wildlife habitat. In the past wild life habitat programs are either ag land or habitat. We need to have them in both. Grazing and wetland is good for wetland and provides ag use for farmers. The set aside concept needs to go away. Example: Water bank program is no longer a program but the mentality still exists. Under the program the farmer was forbidden by program rules from doing anything to a wetland. As a result wetlands became choked with trees because the farmer couldn't remove the trees. Needs mosaic of wetland habitat. Over grazed pasture may not reflect proper pasture use, but great for shore birds. Government should not be so risk adverse because of under use not overuse. Poor wetlands because of little activity, not too much.

How to connect people to outdoors. No offense but no one in this group is young enough to appreciate the social networking available. Conservation community needs to recognize that they need to advertise this kind of information in Twitter, Facebook, etc. Show the kids a good time and it will be all over the network.

I was on team of people to resurrect this nature center. It went under and lost all of its money. There were lot of federal agencies that talked about getting kids feet into the water. But when I went to them they did not commit to following thru to get the kids into the wilderness. A lot of lip service. Each raised the flag about the issue but they didn't walk the talk. If you have these portals that have a mission to get this done then fund them. If you cut a tree down in Nebraska in the name of conservation you about get lynched. You have to cut trees down in wetlands or you don't have a wetland. Planting trees is conservation but only in the right place. The Arbor Day Foundation might have a public education campaign about "get your feet in the wilderness". The Arbor Day Foundation campaign is very effective.

Intermodal Surface Transportation Efficiency Act is in shambles. Mostly administrative problems with State Department of Roads and also on federal side. Program has been halted. This program needs to be streamlined. The state says the engineering firm that designs the trails can't be the same inspectors as the firm that inspects the trails. Now we have to hire two firms.

Flood control project part of master plan for watershed development. Held up for 2 years. Requirements for Section 404 (Clean Water Act) are so intense. As soon as you get that accomplished they throw something else at you. They've lost the value of the human resource that we're trying to accomplish and over-weigh the environmental project. We have a letter in the file from EPA that said all dams are bad and no dams should be constructed. The lake was about 65 acre lake. Ridiculous regulations trying to get structured created. In two years costs have gone up but not able to move forward. Heard Washington is going to change definition so the ditch I have would be wetland and I won't be able to do anything with it.

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

Challenge—land and water conservation. Offshore drilling royalties. We have developed golf courses, pools, and parks, using land/water conservation funds. Most are matched 75-25. There used to be tremendous monies allocated across the country. Now I feel guilty for even applying for some of those funds as a larger community because smaller communities struggle to get the funds. This has been a huge process that matched dollars that is no longer available that allowed us to do a lot of these projects. The recent history with different highway bills, the trails programs have become 80/20 matching and are very popular. This year the state is not accepting any applications for trails because there has been a free-for-all between federal highway and Department of Roads when it comes to administering these programs. Struggling and making Nebraska jump thru hoops with charges to apply for these grants. Someone's feet got stepped on at national level that have caused a responsible charge. Need to have an engineering background. Must pass many tests, many hours of study. As Parks and Recreation Director, I can no longer manage this program because, for example, of a program that struck a chord with local people. Senator Nelson has been contacted to try and get past the roadblock. More of state/federal issue in Nebraska.

There is a set aside program in Nebraska. There is a guide to allow walk-ons but still need permission. If you see a pheasant in Nebraska you want to name it because there aren't many left. Through the parks and recreation department, if we don't have everything organized to a tee then parents are reluctant to let kids participate. Nature/outdoors is unknown. A lot of parents are afraid to let their kids go out because they read somewhere about West Nile, bird flu, marsh critters etc. We need to get parents to allow participation in non-scripted activities. Our biggest challenge is to get people to not be afraid.

I got certified then was decertified. We had \$250,000 sitting but they put a hold on it. We finally got a local guy to get it done. We only wanted to get safe routes to school program completed. Process has become very cumbersome. Senators Nelson's been contacted to try and get past roadblock. But to be successful we need to not be fighting each other.

Reconnecting all Americans with the outdoors. When I grew up my parents were together and we went out and did everything together. Today is a completely different family lifestyle. We are asking our schools, organizations, government. Somehow we need to have things that involve the parents/foster parent. If we are going to reach all Americans, what programs are out there and can we do this very basic that these kids can go out and do? Used to walk to school. Kids don't walk to school. How to get every kid everywhere to experience this. Pick 1 2 or 3 programs that we can support and put our whole heart into it. Remember the "Got Milk" campaign? What happened to the "Keep America Beautiful" campaign? Everyone identified with that. What is one slogan that we can all identify with?

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

We have the largest reservoir in Nebraska. Lake McConaughy in Keith County, series of 29 lakes and reservoir. Stated purpose is irrigation and hydro-electric generation. The problem I have in working with the farmers and it needs to be stated here on a base level. Ag is Nebraska's base economy. If farmer's get more efficient there is more water for the river, and wetlands. They need to be more efficient at moving from pipe irrigation to center pivots and subsurface irrigation. In a large way they are priced out of the market. Pivots have gone from \$25,000 to \$50,000 in over 10 years. Need NRCS cost share. About 60 percent gated pipe in our system. Would like to be 100% for pivots or subsurface. Ag Water Enhancement Program (AWEP) proposal where we can group our producers together and affect the entire system. Fully funded in 2009 and partially funded in 2010. We would like to see that put in Farm Bill and be fully funded and increased so that we have some water to work with in Nebraska. I appreciated \_\_\_\_\_'s comments earlier about large water bodies. If we have large water body, people will come. We have visitor days where people will come. What I hear that you don't know we would love to have school kids and instructors come to our lakes. Anything we can do to provide free public access, probably need a park permit. Anything is possible at the big lakes. Would love to partner with anyone that has a bunch of kids come with an instructor. Maybe that's something that might work for all of us.

50 years ago could drive across road and see pheasants cross road. Was fun to hunt. Can go to Kansas and get 50 or more and enjoy hunting. Not fun to hunt in Nebraska. Go out, get permission, see 6 birds. In Kansas you can go down there get a booklet see areas, then go to area, find signed areas and go hunting. Don't have to ask landowner. This would be good addition for Nebraska to do this program. I would rather spend my money here.

Piece of property that got 3 acres covered with water. Wanted to dig a pit last spring. All my ground is wetland. Wanted to make pit to catch water, concentrate to keep it off my land. I had to go thru 5 organizations to get permission. Road structure. Taking out Road

I went to coffee shop and mentioned what I was doing. Someone said "You know you're creating a wetland and after two years you won't be able to do anything with it in 2 years."

Neighbor put pivot on ground. Neighbor owns all drainage ditch. Fella wanted to put in pivot irrigation but couldn't cover ditch because it's a wetland.

Has to get permission like he's doing a dam in Lincoln Nebraska when the project is in Nemaha.

The funding availability to do education whether it is to build a web page or to put techs on the ground is just not out there. I know money is tight everywhere but I have personally been surprised to find out how few dollars are out there. This has to start with the next generation.

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

Access issue that was raised .Game and parks does have a long standing program of paying farmers for access but that funding has plummeted and that has suffered. We're more immigrants and more urban dwellers now so fewer and fewer people in state have ties to land. #2 in the country for lowest public lands.. Huge lack of public lands for people to get onto the land. Needs to reinvigorate programs to get public lands for access for people. Need to address fundamental issue.

School systems because of budget crunches are deprived of shop classes and FFA type activities. As a result life time activities are being cut. We have a problem in our education system too.

When created was allowed off-shore money but wasn't demanded. That money has now gone elsewhere. A lot of parks setup with that money but now that it's dried up we're not keeping up. Lincoln Pools shutting down at end of year. Now potential bond issue. Federal money always dries up and then local has to pick it up or it goes away. Lincoln not picking up the funding so they'll close a pool.

In teaching for a long time. It's easy to get a youngster excited about something, but when that kid runs home and sits down at the dinner table and tells mom or dad and they squash the idea. If there's a program that will get kids enthused at age 20-40 that will help too.

As a parent, I know a lot of parents of young children. We keep our kids so busy so they'll stay out of trouble mainly. Between home work, athletics, playing with friends. Only time to get into nature are those close to home. Let's take care of green spaces in neighborhood. Come up with an 8 week long nature type thing or something for kids to do something beside soccer, tee ball.

His dissertation was on outdoor learning theory. Kids learn if they walk in the ruts made by our ancestors more than being inside. No child left behind has put too much importance on tests. My plea is for private ranchers and farmers to reach out to the schools, especially the principals. Don't wait for them to come to you. If you can convince the principal you will find teachers who will bring their classes to your ranch or farm. We are having trouble funding outside activities. Find grants or private citizens who will fund these type of activities for the kids. We have to get the kids out there.

College students are doing far more volunteer service then they used to because there is not enough money. How can we organize college students, high school students, and senior citizens to volunteer?

Liability is an issue. People have said to him for years you cannot do this or that or you will be sued. He did not listen but took people out on the trails, etc.

My family has been here 140 years. We are involved with center pivots. We have water running out of our ears. We cannot put down another well. The government needs to leave us alone. The farmer is the dog that keeps getting whipped.

His farm was established in 1862. A farmer does not have time for mentoring.

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

How about taking kids who need a job and pairing them up with farmers? Someone else mentioned there are regulations on this, so be careful.

He sold vegetable at a farmers market. Everyone likes the corn, tomatoes, melons, but people did not know what to do with the more unusual vegetables.

Has a city not a rural mentality. Some of the audience at this meeting have a stronger tie to the land. Conservation is important and critical. To get an urban kid from a large metro area to the country would be asking too much. We need to get them or their parent's interested in outdoor recreation if for no other reason then to enjoy it. We need to think of recreation as a critical piece.

How do we reach the parents? Do they care? Can we get the parents to take their kids outdoors? Buses generally do not go to the nature spots. Sometimes the kids need to experience it themselves, and then get their parents involved.

We have to go out and experience the outdoors. The streets of Omaha are not like streets of Dallas. What experiences do the kids today have of their parents telling them to go out and play and don't come back until dinner is ready? We probably had older siblings who watched out for our mischief.

A water park may be their connection to nature. Families need to do things together. We are competing against other activities. We need to get stuff in the urban areas to compete.

It is important that we get the kids back to nature. There is research to support this fact that children with ADD are helped with spending time in the great outdoors. Being outdoors seems to quiet the soul (watching an ant hill, looking at the stars, etc.)and teaches children that these behaviors are not odd. We need to get the kids who are locked inside outdoors. Kids who never get the chance are missing out.

She had an organic farm for a while. Need to create pathways between the different points of view.

We need nature areas for people to develop as human beings. Many of her students did not know what a seed pod was. They had no idea where food came from. We are losing farms like crazy and kids growing up on the farms.

We need to get NRCS out in the field instead of shuffling paper. People have gotten away from getting into the field. They are filling the reports out to get money to farmers.

Stated that kids right in Lincoln have never "roasted a hotdog or toasted a marshmallow over an open fire, don't like bugs, etc. Need to introduce concepts to Youth with assistance of federal organizations. Need to partner with Cooperative Extension, 4H and put more emphasis on environmental youth education.

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

Private landowners becoming threatened. Reduce budget deficit. Balance between government and non-government up for grabs. Approaching tipping point – Feels his private land can go away. Need a group to link private and public – LEGACY Project. Build trust. One area is endangered species - how does that fit in to the greater scheme of things; canary in the land mine. Legacy Project is worthwhile. He is working with them. They learn from each other respect each other. Research done on his land but he didn't know it till it was published 10 years later. Gets technical assistance from FSA & NRCS. Turned down some items because of the small print. How to build relationship with private landowners. Don't need to get confrontational

Working with people with Ag backgrounds has its limitations. Ag-based board has to be more open-minded. Has consequences.

Have to get kids outside.....Everyone is very busy; must find time to get outside.

Educate people on how to get on Platte River and other areas without trespassing . Need to let people know we have a great Platte River. Let people know.

Already have the positions in place now. Cooperative extension can do more with environmental education. Cannot add more programs to the schools. Needs to be done outside of class time.

Need to work with landowners to have more revenue streams. The fears of the landowner need to be addressed. Need to do more work with landowner to allow them to make money. Opportunities to work together. Show them there are opportunities as well as risks.

Kids have a basic fear of being outdoors. Biggest challenge is exposing them to the outdoors. Need to work with schools on getting environmental education in the schools.

Send pictures to friends on what work they did on the project. Geo cache. Have to be really smart. We unplug. It is a challenge - we may need to schedule time to go outside. Connecting kids at school is hard. May want to teach about guns but not allowed in school because of Columbine. Try to listen to what people want and need.

Relevancy – need to find out what we have in common; show why conservation has relevance. Show value. Find commonality. Listen to communities engaged in outdoors. Need to market the opportunity.

Agrees with everything said thus far. Ground water is a hidden resource. Hard to get people interested in something they can't see. Parents fear letting their children go out and play - abductions, bugs, critters. Nine times out of 10 we already get parents/children that are predisposed to learning. Need to figure out how to get others to the table. We are preaching to the choir.

The challenge is getting people interested and establishing a single network.

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

Nebraska Game and Parks Commission: Funds needed for operations/management. Push activities that bring in money. Excise tax needed to fund operation and maintenance of recreation areas. Not self-sufficient. Can't make money on trails. Feds great help to get things started. Need help to keep things going. Texas has a good system for taxing recreation. Park permit, camping, cabins/lodging are the three top money makers. Public information - educate.

Stated by: park admissions, cabin rentals, camping, fishing & hunting licenses.

Need to create access for kids. Not much success in getting into schools. After school programs good. Not much success in the school (during class time). Creative teaching not allowed - everything is about testing due to Federal Regulations.

Younger generation has non-traditional ways to get information - internet, face book, twitter. Need to tap those resources.

Funds needed at a number of levels. Socioeconomics – families with resources are more likely to spend time outside. Different levels of accessibility. Money is the number one thing. Private lands have non-profit groups to work with, NE lucky to have that. Socio economics is an important aspect. Challenge to reach everybody. Stroller and wheel chairs can get on a trail. Need to try to include aspects for everyone.

Make relevant. Broader environmental challenge. Inform of the benefits. If people were to get out, passion might be greater.

Very important to get youth involved. Need education and adequate staff to provide education.

Generation Y is missing opportunities. Need to change the way we reach people. If she didn't work for NRD she wouldn't know what is going on, what programs are available.

Connect communities to outdoors. Recreation and conservation are attached to fixed bodies of water. Not interested in hunting but swimming and water sports, canoeing and boating. Corridors.

12 of our easements are working lands easements..they're agricultural easements. In terms of property taxes, they're agricultural taxes.

15 years ago, NRCS, Department of Ag, and the Natural Resources Commission (to name a few) worked together and came out with a three book set telling people how to incorporate environmental education into every school and distributed this information to every school in the state. Now nobody followed up on it and the program died.

Follow-up question: Where is the leadership? Are there any local partners, State, FWS, or any other cookie cutter formulas out there to get your mission accomplished?

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

How many private landowners are here (9): How many people have all the answers? None

I'd like to let people come on my land. We can't make enough grazing and renting that land to pay our taxes. I don't know if an easement is an issue or not. There's a whole dilemma of how do you make the money to maintain it as a private person. If we do a whole bunch of prescribed burns, then we have a problem with leaving a carbon footprint. We have let school children on our land but there are issues of litigation to deal with and you have to have restrooms.

In some counties, tax valuations on WRP are sometimes going up because of recreational uses.

It interests me that we're talking about taxes when it's very important to show the value of conservation easements as a tool for helping people to understand the multiplicity of uses.

It is probably beyond most farmers and out of reach.

It's not only with grants, but with budgets for the federal government. There is a functional part of this that has been broken. The responsibility lies at the feet of the administration and the feet of congress.

Kids aren't getting education about their own back yards.

Landowners can't tie up their lands in conservation. The tax code can be used to apply incentives for land conservation. Creative things need to be done to the tax code.

NO, we don't have enough people to get kids outside. If you have students engaged in env. Ed., they will stick around hometowns, leading to economic development and a sense of pride in the local community.

Sometimes we overlook what small, locally organized groups can do and they may not even be small. They include private landowners. It has to enable local groups to get the resources they need to get the job done. There is always a need for leadership and funding sources.

Teach teachers about their own back yard and they will teach students.

That doesn't take care of the issue of having to make money on it.

The No Child Left Behind Act is a good place for government to get involved if change is to take place in the schools.

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

The pre-service teachers and the whole generation of parents teach not to let kids get dirty or touch things because you are going to get sick.

The schools will not have time to carve out environmental education with No Child Left Behind. After school programs may be a better angle to teach environmental education.

There is a big public access problem, as what \_\_\_ referred to (Nebraska is 97% privately owned), and we need more people to be educated and have a buy-in. We need to find a way to educate people about why to protect these areas and how to get funds. With Ag and ecotourism, we're talking about teaching parents where their food comes from and Agritourism is an answer to that.

There is a budgetary shortfall. State mandates to counties help avert shortfalls and come up with the money. With tightened budgets at the county, federal and state level...how do we take land out of production and off the tax rolls?

There is not enough environmental education that has been going on. Teachers have been taking the initiative by looking for information on the internet, but in so many classrooms today, the way the laws are written they focus so much attention on math and English that the Department of Education needs to look at this from a different perspective. We need to focus on holistic learning, teaching kids how to solve problems. I work with pre-service teachers...they are the computer generation. And they have a different style of teachers. This generation is so driven with technology they don't know what to do with kids outside. On the ground conservation works, but we will end up redoing these conservation projects if we don't teach people why we're doing them in the first place. We need to provide more environmental education in the schools and with the land.

We have funding, but it's not consistent funding. EPA has funding available but it's not consistent and the short turnaround time is difficult to plan for.

We have many natural resources, which aren't apparent to kids growing up. Nebraska has two things to offer, that is energy and agricultural. Let's get back to our roots.

We need money to do these things for teacher trainings, busing, and substitute teachers so teachers can get to trainings. We need money for a full-time mentoring person.

We need to teach people how to be comfortable and be engaged in nature.

We own a hiking trail. The trail could not be supported because it is privately owned. In order to qualify for funding, it needed to have an agency own it.

We talked about youth conservation programs such as FFA and 4H. Are those organizations enough to keep the movement going (youth and conservation).

## Discussion Question 2

### ***Grand Island, NE***

***(cont.)***

What they're looking for...the bottom line is paying the taxes, food, and the same thing that everyone else worries about...we're looking for diversification and not monocultures in our farms. We need to diversify our portfolios.

When we look at the state of Nebraska, only 10% of that is accessible. There are things we can do. Our state school lands, USDA MARC, we own these things as taxpayers but they are not accessible. Things like the farm bill access programs will be good. Access is increasingly frustrating for people, a place where we can get outdoors and enjoy nature.

When we started our SOAR program, a kids day camp program, we did not get any local support from our foundations. One of our school board members, eventually becoming a state senator, was sure that we were going to infiltrate environmental education into our kids. Without funding from the FWS, 19 years of this program may have gone unrealized. How do we stimulate a change in cultural attitude? here is a culture shift taking place. We want a culture that sees the land, sees it all, and appreciates it all (land, water, air). That has to come from within. The answer is us, not the government. When we do have an idea, a little seed money can help. What we need in our own county is this discussion and that's not happening. We sit around and talk about our kids but we don't talk about strategies to show us how to get things done. We do not sit around in our development process and understand each other; we don't strategize based on this discussion. It's just not happening and the government can't help that. If we get to the discussion we can get to the strategy.

Whose responsibility is it or where can the schools and teachers help find resources? If you had extra resources, where would they be spent?

Will I still be inclined to get the property purchased based on an easement or by working the land. Is there a difference in the incentive for purchase? ...is the incentive higher or a disincentive...

With an organization like the Nebraska Land Trust, you have a lot of people you know that lead the effort. If a farmer were going to use an easement on his/her own, how difficult would it have been?

With WRP, agricultural rights are essentially set aside. Through compatible uses, some working lands are in place.

Without experiencing nature, there is no ownership of nature.

Without the Nebraska Environmental Trust, would you be able to do the work you do?

## Discussion Question 2

### ***Grand Junction, CO***

Biggest challenge – sometimes watersheds are protected so much we can't use the water  
Federal permitting process – have fed agencies working together to solve problem – streamline the NEPA process to help water users get through it.

Lack of funding - not necessarily for carrying out specific projects but for support required to do so. Liability insurance is also a major challenge.

motorized recreation not shown as part of the picture

narrow acceptance of motorized recreation - we work for public land access for all people, motorized access is secondary; would like to not be viewed as opposition by people who use trails that we maintain

liability is a major challenge

lots of opportunity to get kids outdoors but can't get them there - transportation and liability are a challenge

lack of flexibility in public lands management process

need transportation to get kids outdoors, more partnerships

1. challenges - always money - GOCO encourages people to collaborate using lottery money as a carrot 2. environmentalists/public should stop blocking the USFS, etc from doing their jobs to maintain healthy forests

lack of funding is a major challenge. Fiscal partnership tools can be too complicated to figure out - simplify. Use agreements rather than contracts between partners.

Education - biggest obstacle - people do not understand value of large, intact ecosystems. Focus should be on value of intact ecosystems.

education - huge urban population with no contact with public lands

balancing act relative to multiple uses is a huge challenge, funding is a big challenge, balancing short term desire to use/access lands vs. long-term impacts which present conservation. Conservation ethic held by federal employees is great but challenge

pollution from O&G industry (5.2 million gallons of oil spilled last yr in CO), want kids to be able to connect to rivers and lands without getting sick. Do not want to see oil shale developed

## Discussion Question 2

### ***Grand Junction, CO***

***(cont.)***

Funding issues biggest challenge

Education

Working together to do a project to see who benefits

Economic benefit of recreation if huge – more restrictions – where is money going

Her students – gives kids opportunity to raise endangered fish - her challenge her kids are raised in the area and some have not seen CO River or Monument – need more than just one field trip to get kids invested.

Funding education

challenge - keep people from encroaching on wild areas - prevent sprawl

Most people don't know why we have public lands in the first place, lack of local control is an obstacle

challenge - funding

Wilderness designation works to protect value of intact chunks of federal land

Federal government's willingness to reverse bad decisions

different programs historically let people know exactly where the money was being spent (CCC, etc)

Partnered with USFS to help maintain roads, trails , etc to maintain access to reservoirs

concerned about the lack of coordination between federal agencies. Cited example of the McInnis Canyons National Conservation Area and the Colorado National Monument where the agencies have failed to coordinate and provide unified "public lands" informat

would like to see legislation that strengthens watershed protection. Cited an example of local zoning decisions along the Colorado River as mismanagement of watersheds

teachers are too focused on teaching to test scores. Schools lack funds to pay for buses for field trips. No time in the school day for additional programming. Kids time is consumed with teaching to the test and sports

emphasized two obstacles to involving schools: lack the funds for transportation for field trips and lack of time because of testing standards

fee programs and privatization of public lands are antithetical to the goals of the AGO initiative.

## Discussion Question 2

### ***Grand Junction, CO***

***(cont.)***

Regulations, requirements, and the strings attached to working with the federal government remain an impediment to many local efforts

Having an accessible walking path and riverfront is the only thing that allows her school to conduct any field trips at all

described his public/private partnership and their efforts to create a continuous greenway along the Colorado River. Has had significant funding from Great Outdoors Colorado but needs more local funding sources. Environmental centers and nature education

Agriculture has a very powerful influence in government -- ruining our natural forest (cattle grazing), power of cattleman is an issue towards conservations, impact mustanges, BLM lead agency to address this issue \*\*\* There are a lot of cattle out in plac

Biggest challenge is having enough funding to even bring students to outdoor field sites, especially the Nudubon Nature Center.

I have an education specialist that covers the whole Western Slope. I need more staff, more money and time to support education and outreach.

Motorized closures not based on science, rather on whatever a manager thinks will help what ever site, or closing an area will benefit a species. NEPA requires the use of science. If areas are restricted to foot travel, only the most fit will be able to

Disturbance and fragmentation of public land is the biggest challenge. Even the best reclaimed lands are not as good as undisturbed areas, from an ecological standpoint. These disturbances including erosion, are a result of recreation user groups.

Funding is the biggest challenge in getting outdoor education to youth. Board of Education does not take outdoor education seriously as suitable education.

## Discussion Question 2

### ***Grand Junction, CO***

***(cont.)***

Sustainability is the biggest challenge. Audubon Nature Center would serve more kids in the Grand Valley, Colorado River is the greatest resource in this area. Work for long-term future. Sustainability should be the guideline for planning. If public la

Use the resources of the Western CO Congress. She volunteers for many things. Volunteers cost nothing, are valuable, provide camaraderie, learn things, service is worthwhile. Need more volunteers, making things better for everyone. Hard to recruit and tra

Land management is fundamentally broken. Conservation is in the eye of the beholder. We cannot afford to waste resources.

Every time our administration changes, our public land managers change directions.

Engaging our children who are watching TV and playing with computers. Outdoor experiences of kids today are virtual. Kids are becoming obese, need to get them out into natural areas. Make areas wild for independent play. What do we do if youth don't

Education about water is needed. Youth are not aware of how water developments work (dams, diversions). Non-consumptive needs given equal priority with other beneficial uses. There is an agency trust issue. There is no trust in government, regaining p

Wishes there was a standardization of the type of education youth should receive from agencies or guidance on what the Youth Corps should be teaching, as part of their program.

Overlooked Native Americans, their culture and history, and how they used the land and survived. Text books should be rewritten.

Lots of good things are happening due to the efforts of good people. Wants to hear more about what problems exist and what caused them. What can be done to provide assistance? What authorities exist or are needed for agencies to get kids to outdoor site

The biggest challenge is expanding motorized use. Areas have been damaged from motorized use. The farthest distance from a road in Colorado is 8 miles. Roads cause erosion and fragmentation. Road building in roadless areas needs to be dealt with. Leav

The biggest problem are the names (NLCS) and national system of public lands. The names don't provide an obvious tie to the public lands and resources. Compare NPS park names with BLM names.

Too many agencies use cookie cutter climbing management plans. They implement plans without input from local user groups. We don't have access to areas. Need to spread more information with user groups. Help to prevent limited access to public climbing

Communication and misunderstanding are problems. Agencies' values are miscommunicated and are misunderstood by user groups.

## Discussion Question 2

### ***Grand Junction, CO***

***(cont.)***

Senior passes allow inexpensive access to seniors. What about passes for younger people to make it more affordable for families on fixed incomes? Consider more affordable fees for younger people, which will encourage young families to get outside.

Conservation should be more focused on the public sector. Agencies have limits on staff and funding. Focus on land trust and easements. Industry needs to stop looking at environmental groups as enemies. Closure of areas precludes use by the elderly and

Appeal 1876 mining law, remove the exemption of Oil & Gas from NEPA.

Pay attention to historic fire regimes, historic stream flow regimes and weed issues. Cheat grass, other weeds are such a nightmare

## Discussion Question 2

### *Helena, MT*

Awareness and funding. Making the future generation aware of what needs to happen to preserve our lands and how to be "stewards" of our beautiful outdoors.

Opportunity for recreational diversity- We're making enemies out of 4-wheelers, motorists, snowmobilers, ranchers, horsemen, bicyclists, etc. by closing off access. They all need a place or they'll have no reason to fight for any kind of conservation. Consider National Recreation Areas (like in OR, CA and elsewhere) to satisfy some of those.

It was great who was there. However please notify who is not there. Where are the voice of the stock, rewers, the farmers, ranchers, mayors, commissioners, mechanics, snowmobiles, ect. The working man cant make a 9:00 am meeting!! The federal government needs to go to them they are the target they need to be included. Also please beware the "evidence of the extreme" This is the scenario where one bad producer or recreationalist is used as evidence to shut down a whole industry, or at least regulate it out of existence. Please resist judging "all of us" by the "worst of us".

Missed opportunities for fed, state, and local government agencies to work together across boundaries to create comprehensive heritage and recreation areas. Further support and promotion of NPS- National Heritage Areas.

1) Growth in human population 2) Increased demand to use public land/assets.

Marginally function public custodians and underfunded agencies who do not have a union for healthy public lands. Politics has demanded and undermined function and historic landscapes. Careful management to avoid damaged to public lands must be re-energized: look at livestock grazing. Excessive networks contribute to sedimentation; water quality problems.

Move as swiftly as possible away from oil and coal use, encourage thoughtful development of renewable energy. Encourage individuals home use do solar and or wind energy. Avoid transporting electricity long distances- use and generate it locally. Focus on healthy wildlife population and distributions- "A healthy environment for man is a a livable environment for wildlife" Keep as much wild land WILD as possible- even reclaim areas back to wild state (good wildlife, habitats) truly road less areas don't contribute to water quality problems or habitat fragmentation, or attribute wildlife species or noxious spray. Apply presidential executive orders to maintain and protect soils and vegetation set up to the plate and apply protective measures to assure that we have functional and healthy ecosystems- they must not be compromised for the sake of pushing people into the outdoors. Introducing people to the outdoors must be orderly and educational so the landscape we are introducing people to are not ultimately sacrificed though our use or abuse. Stop "out" sourcing efforts that should be taken cared by dedicating knowledge, federal scientist/ employees. Take pride in the agencies, encourage them to take action to restore watershed and landscapes. Listen to people and communities but when even more importantly, please listen to the earth and its needs.

## Discussion Question 2

***Helena, MT***

***(cont.)***

Energy! Energy! Energy! Dirty and dangerous oil, coal, and nuclear profiting greatly and destroying our environment

Apathy due to lack of education to lack of exposure to the outdoors. People are not passionate about conservation because they don't understand how they are impacting the environment and/or the outdoors is not an integral part of their lives.

Lack of education and accessibility. The younger population, which is rapidly growing is growing even more quickly away from outdoor experiences available. (sic) Support authorization and full appropriation of the Public Lands Service Corps Act and Youth Corps Act of 2010. Increase and sustain funding for programs that help connect people and the outdoors.

1) Money! Disproportionate funding from federal government to other areas (security, health care) that may provide immediate benefit and results, but are no more important than environment/conservation issues that threaten our future. 2) Awareness and education -- this listening session is like preaching to the choir; there are hundreds of millions of people that are totally in the dark on environmental and conservation issues. They need to become aware/addressed.

Use the good will, motivation and concern for the environment and our public lands on the part of American citizens, especially youth/ children, to overcome some of the work that they long to do and that needs to be done to protect these resources. National Parks Forest Rangers can help facilitate this by partnering with local, non-profit and other groups to get Americans out in the land. Imagine that you could go to a National Park or forest or state park and on any given day find a program, sanctioned by the park, where you and your family could help preserve the park (e.g. paint a picnic shelter, pick up trash, pull weeds, build a trail, etc). Our parks are underfunded and in need of repair. If we can budget the money to get the work done then ask citizens to help. This will get people involved, give them a sense of ownership and accomplishment and ensure that future generations grow up learning how to care for our national treasures.

Rural subdivision is negatively impacting agriculture and wildlife habitat.

Global warming is threatening America's great public natural places. We need to stop regarding these as places that private corporations can exploit for their own profit. Instead, we need to protect their natural character and keep motorized vehicles and industrial activities out of our public lands.

1) Pollution and polluters -- we must hold responsible parties responsible 2) Climate Change

time. Development pressure both from urban sprawl, and energy. Specifically the ill considered new transmission lines to Nevada. Why would we squander MT to support more neon lights in Las Vegas?

## Discussion Question 2

***Helena, MT***

***(cont.)***

Think long term.

Energy development, unbridled motorized travel, lack of information and education, lack of funding for land management agencies, apathy

Rapidly expanding pressure on ecosystems from global climate change.

1) Passing climate/energy legislation and putting a price on carbon. 2) more presidential leadership 3) building on the increases in renewable energy research.

1) Multi-use of natural resources. 2) When areas are closed to motorized or wheeled vehicles, most of the public is shut out. 3) Conserving ranching use conserves outdoor space.

Government take over, wilderness land, road closures, bureaucrats

1) Fund the National parks -- especially science and education 2) Fully fund LWCF 3) Loss of wildlife habitats and critical migration corridors

Big demand, insufficient funding. On the Rocky Mountain front and in the Blackfoot Valley, there is 150,000 acres of "easement demand". Investments in easements on ranches contributes to local agriculture/ rural economics, secures America's beef/food supplies, and keeps wildlife habitat intact.

balancing short-term and long-term costs and benefits. Sometimes, short-term benefits do not justify long-term costs. Note: \$ is not the only cost/benefit!!! Education-there are many misunderstandings and misconceptions regarding the environment. One example-global warming (it is happening-saying it is not happening is detrimental)

Marginally functional regulators and custodians they have been fiscally reduced and politically compromised

Fragmentation, sprawl, and agricultural abuse of our lands.

one- finding sustainable energy sources- fossil fuels and finite!! Two- increasing demands and decreasing supply of clear water three- education real facts for real people and communication.

All areas have different conservation challenges but funding manpower is the largest issue.

## Discussion Question 2

**Helena, MT**

**(cont.)**

Limited resources to get projects/ improvements on the ground. Not enough people on the ground. Government boundaries should be reduced/ teamwork better.

Privatization/Development of lands providing connectivity to adjacent public lands. Loss of a viable/sustainable timber market. Loss of habitat diversity due to both development and emerging insect/disease issues. Younger generations detachment from the outdoors.

People and water: loss of watersheds; loss of wetlands; overuse of water in agriculture; overuse of water for lawn, fountains, pools, landscaped artificial waterfalls in urban settings

Yes, we need to get children and youth back in touch with nature. Along with getting them in the woods, we need to revive the old philosophy of respect for the environment—regard for the plants and animals whose habitat we are sharing. Use of public lands is creating two philosophical camps; public land for extreme high impact recreation and public land for quiet traditional recreation with low impact. This all gets down to a lack of educating experiences and guidance from one generation to the next. Currently, there is a gap in teaching traditional values in how to be a low impact recreationist. Motorized use of access roads brings the hunters and quiet user in contact with the thrill seeker on a dirt bike, orv, or in a loud pickup. A fellow I met last fall during hunting season lost his shot at an elk when a teen on a dirt bike blasted through between him and his quarry. In another instance, two riders leading a pack horse were suddenly set upon by four orv's speeding pell mell up the trail behind them. The riders spooked the pack animals and pursued them laughing and yelling through the woods! The two philosophical camps come onto public trails with objectives that are 180 degrees apart. At my cabin in the Helena National Forest I have seen dirt bikers and orv riders at least twice a week. They come with a supply of "adult beverages" and their firearms and ammunition. They come for rough play. They like risks, speed, flying dirt and mud. They pit their machines and themselves against nature. The trail becomes an obstacle course, a ruckus track, where they can test themselves. For the most part they are males testing their manhood—teenage boys. The latest game is to shoot repeatedly at a tree along the trail 4-6" in diameter until it falls. Another game is to spray insulating foam or spray paint willy nilly on signs, gates, stumps, trees, rocks. I obtained a copy of the June '09 AGO report (GAO-09-509) that suggests "OHV recreation is not sustainable unless we have adequate financial resources and personnel to deal with it." The popularity of OHV use on public lands has grown by leaps and bounds and the Forest Service, National Park Service, and Bureau of Land Management cannot keep up with monitoring. A real problem is the increased use of access roads for dumping and drug "grow camps". A letter from Region One Forest Service Transportation Planning engineer to me, dated Jan 7, 09 states that at that time \$10 million was budgeted for road maintenance with 4 billion deferred road maintenance. Road patrol worked out at 765,000 acres per officer. Clearly some changes in number of roads must be made.

Gated roads, keeping the roads open would allow for "clean up" of forest, helping deter wildfires and keep folks warm.

Greed. Big corporations destroying the land and water. Corporations such as oil, mining, CAFO, nuclear power, and logging.

## Discussion Question 2

**Helena, MT**

**(cont.)**

Obstacles as a citizen: funding, insurance, gaining access, programs to get families and kids to outdoors, parents need to step up, become involved, reconnect with land, if were more users with empathy with what is happening there will be a greater voice for now and generations to come, dual income and single families. •Create programs for state parks for reconnecting to outdoors, funding is the huge component for insurance and getting access, remember the little passionate people in policy making

Reinstate the tax legislation which benefits use of conservation easements, expired 6 years ago. •Fully fund the Land and Water Conservation Fund (LWCF), it allows for MT working ranches to be compensated, keeps open space, USDA should change restrictions on Rocky Mountain Front, not all private owners want to partner with the feds (USFWS) so make changes where conservation easement holders could be non-governmental [private land trusts]

Wetland conservation, for various reasons \$10million of wetland reserve funding was returned to federal government, need flexibility

Don't overlook Eastern Montana, extensive wetlands and grasslands; 8000 year old prairie that is dying a death from a thousand cuts (sodbusting). •Minimal funding to protect prairies and grasslands, not enough money for easements. •Lost funds (\$10 million in conservation funding was turned back last year), lack of personnel to do grassland easements where needed

Funding source is threatened for making multipurpose transportation corridors (SAFETEALU- The Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users) provided funding, legislation expired, renewed on an annual basis. •We need trails in communities for mental, emotional, social, and psychological benefits. •Multi-modal transportation corridors – bikes, walking, etc. : it is about moving people (not vehicles), gaining access, conservation and recreation, health benefits. •Fund the transportation bill

We have a lot of intellectual capital... need a survey of intellectual capital in natural resources work, how decisions were made previously, McKinsey and Co., lost expertise due to retirements and layoffs, need federal money to design a survey. •No academic program in MT for historic preservation matters... has to go out of state for academic training in this field – expand natural resources studies to include historic preservation matters

More is not better, manage what you have. Local control is good. •NPS management is pitiful...overgrazed, weed infested... not enough managers on the ground locally in FS and NPS

Work with grassroots, work with ranchers, he teamed up with MT Fish Wildlife and Parks (FWP) examples were Devil's Kitchen, Block management, fishing access. •Maintain working ranches thus wildlife. •Ranchers can't always get away to participate. •Have flexibility

## Discussion Question 2

### *Helena, MT*

*(cont.)*

WETA represents 21 associations including the oil and gas industry, Dave Gall of the Montana Petroleum Association had to be out-of-town. •35 years of working with state, federal, and organizations, it never gets easier; requires cooperation, respect, find common ground, thinks it is worthwhile to do that, concern for Washington DC is for give and take on all sides. •Difficulties: BLM withdrew Oil and Gas leasing, oil and gas is a bright spot in MT economy; environmental groups and industry - work together to have balance to have the economy to develop resources in a responsible way. •He also has grandchildren, is concerned for the future, work together to reach balance

Challenges: bigger isn't necessarily better, taking lands out of local tax base affects revenues to city and county, services tied to dwindling income, noble to preserve landscapes and wild lands for children, with \$13 trillion dollar federal budget why cannot we better manage what we have now; paying on the interest rate our grandkids and beyond; what we have is beautiful - better manage, then expand after these economic times

Connect young people to the land, that is what is MT is all about. •Each person is a teacher and a partner with youth

Video represented recreation but not those that work in the great outdoors. •Listen to the local people making a living on the land, private landowners. •Public land isn't sacred, take care of what we have state and national parks, do not add more acres. •Help farmers and ranchers protect property for their children

Wants to draw attention to eastern Montana where we have extensive wetlands and grasslands....has 8000-year old prairie that is dying death from a thousand cuts (sodbusting)....right now there is minimal funding to protect prairies and grasslands....not enough money for easements \$10 million in conservation funding was turned back last year because MT did not have the conservation programs personnel in place to deliver the conservation dollar purchasing power to where they were needed

Need sanctioned programs in National Parks where on any given day you could stop in and help with a conservation project...trail building, or other conservation activities....this would be especially good for kids to do and feel they have left a helpful effect in some national park.....national parks are getting too expensive ....\$200/night for national parks hotels...if you can't camp

Has raised 6 million dollars to help purchase 3500 acres of prairie land to give to NPS to keep unwanted development away from Custer Battlefield....but cannot donate land to NPS...takes an Act of Congress to extend boundaries of National Parks Wants help in getting the property they have purchased into the Custer National Battlefield near Harding, Montana

## Discussion Question 2

***Helena, MT***

***(cont.)***

The funding source is threatened for making multipurpose transportation corridors (SAFETEALU) we need multimodal transportation corridors....bikes, walking, etc. The Safe, Accountable, Flexible, Efficient Transportation Equity Act: A legacy For Users – provided funding for multimodal transportation corridors – this legislation has expired though it is being renewed on a year by year basis.

Has big problem with having more public lands....is mad about a new powerline corridor in her area....said it will break up ranches....why not put these on public lands....wants the powerlines buried

National Forest is too overgrazed and the protection program personnel are too few....need more staff to enforce resource management protections NEPA is too cumbersome

More is not better...need to manage what we have now, what is good is because of local control...NPS management is pitiful...overgrazed, weed infested...not enough managers on the ground locally in FS and park Service

## Discussion Question 2

### *Hyde Park, NY*

Where I live in Albany, it's a lack of transportation and influence. I see young kids doing the same thing everyday. They go to school, come home, do homework. If they had the influence to go outdoors.

Number one obstacle would be technology. I can listen to my ipod or I could play with this tree.

I do agree with technology. People have facebook, computers, sidekicks, the Wii. I feel that there are not enough parks, not enough green space, not enough gardens. I think a lot of teenagers are focused on what they wear and who has the new technology. People are not thinking about 'let's go to Central Park'. People are focused on what they have. Teenagers are not aware of it. They don't get information about it. And how critical what our earth is going through, they're not going to care. Teenagers need more awareness about our earth, rather than the media and Hollywood and what is in. Let's love our earth.

Our society has gotten used to things coming to us, rather than us going to things. We have a computer that can bring us any information in the world. We've gotten lazier as a people. People are used to getting waited on; buying food instead of growing. As opposed to us going out there and being the change. A lot of people have gotten into a rut. It's not easy to bring people out of that pattern.

We find that kids love the social networking, ipods, etc. But once we get kids outside, once they get outdoors to a farm or hiking or fishing or doing a nature study. Once they've experienced that they walk away with a positive outlook on nature and the environment. We need to work all together to make kids feel comfortable outside.

I think sometimes it's just the kids themselves. They don't want to go outside – in the summer it's too hot, in the winter it's too cold. They all have sports, but most of it is pretty competitive. There is nothing to it, but what they are doing right there. They don't open up. Like my mom says to think out of the box. When they are on the computer, I think they feel pretty content with themselves.

How much technology is used in schools is frustrating. In half of my classes I'm watching a video and homework is on the computer.

I think the biggest problem is transportation and access. There are kids that don't have the computers and tech, but they aren't being exposed to the programs. The problem is being able to bring those programs that allow access into the schools to recruit the kids. Maybe talking to city council and saying this is what we want – we want our kids to have access. If there are enough young people who say make it happen. Kids don't go outside sometimes they are afraid.

Things that take place outside in the world are things that really exist and things that take place inside the classroom, exist in a textbook. We need to be able to connect, especially in science classes that what we're learning about actually exists. Being outside is a real experience as opposed to textbooks in classrooms

## Discussion Question 2

### *Hyde Park, NY*

*(cont.)*

information isn't getting out there. Violence makes kids afraid to come out.

I go out to schools on LI and educate kids about what's in the outdoors. We go into the classroom and talk to kids. The biggest obstacle is funding. We don't get to go out to as many schools, the schools budgets have been cut so they can't do as many field trips. It's all about funding.

We need a philosophical change of what the great outdoors is. We don't need to go out west or to some far away place. It can be a little stream, out your door, even if it's in the city. It exists where we exist.

Another thing is that the people that have the money to give us buses don't know that we want it. Where I live, they put a bike lane because they saw people riding bikes on the street. They put the bike lane on a part of the street that nobody rides on. People of color aren't saying what they want.

It is about disproportionate funding for the youth .We don't have the community center anymore. That comes down to a lack of resources, a lack of money. We don't see each other in the same way anymore, we don't have the same access. We have a partnership with Clearwater. Our biggest challenge is access. Fresh Air Fund can't take all the kids that apply. What about kids that don't have access to be able to leave the city? There are community gardens in the city, but they aren't provided access. Government and private industry pushing on opposite sides. It doesn't always come out to benefit the people in the middle who lose the garden because it becomes a parking lot or a 7-11.

I think as myself who lives in the city, we all know that organic food is good for us, but it's too expensive. The majority of NYC schools have cut down money and stuff. It's hard for my family when we go to the supermarket, we're going to buy what's cheap. We need more access to healthier food that's cheaper. I think we need more camps. Going to camp with Fresh Air Fund was a great experience for me. It is true that there is a limit on how many kids come there, but there is not enough things for getting young people outdoors. We have a lack of resources and I think it's sad to see. We are the next generation and there's not enough things for us. There are too many restaurants in NYC, everything has been industrialized. Central Park is not enough. We need more places in the Bronx and Queens. I'm Hispanic. I know that blacks and Hispanics are the highest poverty rates. We need cheaper places for teenagers to go. If I wasn't at the Fresh Air Fund, I would be doing nothing. My family can't afford camp.

I think that in the school, our curriculum, science is not as global as history. It's not a big priority. In the school they are not pushing us and telling us to go out and study this tree or this piece of grass and asking us how we can make the soil more fertile. We have a science test once every four years. On a day to day basis, it starts at the school. What kids learn at school, they take home. You take people from Fresh Air Fund and you bring people into the school. Science needs to be taken more seriously in the schools and kids tested more often. I think it would help motivate the kids more.

## Discussion Question 2

### *Hyde Park, NY*

*(cont.)*

What are you doing to prevent hydrofracking in NYS because of the potential for it to do equal damage as the oil spill? Answer: There's a jurisdictional issue with hydrofracking. The federal role is unclear here. There's a potential EPA role with drinking water but it doesn't feel very satisfying. We're trying to figure out what we can do. Because there's some hydrofracking on public lands out west they may be able to lead the way in how to do this properly. I was just discussing this issue at White House. I worry about it.

The LWCF is important, but there are other funding sources we depend on – recreational trail grants from DOT for example. Are you looking at this at a broad enough scope that includes other departments? Answer: Sometimes it feels like the other departments have a lot more money. DOE is an example – they are interested in these issues. Funding for trails is very helpful. Major initiative in DC along Anacostia River. Takes enormous amounts of funding, but there are examples of agencies and funding sources working together. We're working on a trail system. Thanks for your for comments.

At travel shows she attends, NPS promotes big parks out west. How much are you promoting parks here in East? We have a lot of great sites and great railroads. There's a lack of transportation to these sites. There are millions of international visitors in NYC, but not many coming to the Hudson Valley. It would be great for NPS to come to the table with additional marketing and promotion; remember parks in the east; look at partnerships (cross market with state parks and national parks); and make it interesting and interactive for youth. Answer: This is where we need you – for marketing and advertising. Our funding has been challenged. We have to put every dollar we can into operations and maintenance and it's a real struggle. NPS has done a great job at being a brand. A lot of what parks rely on is partnerships with local communities and business partners. Congress doesn't like to see us advertise. Transportation – same category. It's been a struggle to get funding for special transportation in parks themselves let alone transportation to the parks. How can we help bring people to the park? If they're not accessible to youth, then they won't come. NPS is trying to put resources into bus systems in a number of urban areas to get people to parks – need partnerships and need to get creative and get outside our comfort zones.

Comments concern green jobs and sustainable economic development. With all the attention on green jobs in the energy sector there's a whole other area of green conservation and landscape conservation. We need to see how this provides business opportunities. Are there any efforts from the feds on this kind of job training? Parks could potentially be a laboratory for training and pilot projects. We have to change from doing things the old fashioned way. Answer: We don't do a lot of that at Dept of Interior, but we should partner with Dept of Labor. Green jobs has been a focus of the Administration, but it's been more green/renewable energy. But this is important point. Climate change is the elephant in the room in many issues. Conservation is complicated greatly by climate change – all being affected by cc. One important lesson of cc is that natural landscapes have a hugely important role in cc. Land resources are critically important carbon sinks. At DOI we are close to having a scientific approach to calculating carbon storage. Some day we'll have a cap on carbon and an economic value to that.

## Discussion Question 2

### *Hyde Park, NY*

*(cont.)*

In the Hudson Valley we work in partnerships and we do this with the heritage area and greenway. We need to promote heritage resources for tourism – heritage areas help do this. Funding for national heritage areas was zeroed out in the President's budget for FY 2011 and nine NHAs will go away in 2011 after their authorizations run out. What do you think the long term outcomes are for NHAs? Answer: That's a tough one. Everyone agrees that the national heritage area program and Rivers and Trails program and others like it are centrally important to the mix of activities here. The challenge is the budget situation. The president has said we'll freeze domestic spending for the next 3 years. There's a lot of concern about federal spending. So we are not going to be seeing increases. And we are forced to make choices. Some agencies have lots of grant money. EPA has a lot of grant funding – easier for them to deal with budget cuts by not issuing grants. We face tougher choices at DOI. My advice is to continue to build a constituency for these programs. You need to keep at it. Can't assume that funding will continue. You have champions inside the Department and on the Hill. It's so important that the LWCF is mandatory fully funded.

Something about railroads and that in 2016 it will be possible to get on a train...with no transfers. She's fighting to not tear down railroad stations – destroying history and heritage. She wants a welcome center at this train station to let people rent cars (in Suffern, NY?). Would also like a museum dedicated to WPA. She's fighting the development of a condo complex. She also wants an outdoor amphitheatre. Answer: So important to hear these kinds of things.

You spoke earlier about the national heritage areas in the context of grant programs, but the national heritage areas is not a grant program and in fact the NPS Second Century Commission called for national heritage areas to be the expansion of the National Park System, to be integrated into the system and not just a grant program. What do you think? Answer: Great. It's important to talk about NHAs as an integral part of the NPS. The heritage areas represent the historic and cultural side of what we do – there's a huge constituency for this. It's not just the iconic parks out west. Very interested in the Centennial of the Park System.

teaches in South Bronx at a high school for troubled teens: For almost 20 years I've been trying to get kids into the outdoors. Toyota provided funding to get kids outdoors to meet with scientists and environmentalists. These kids didn't want to go to school, but now they are looking forward to it - because of this outdoor experience. How can we create a new narrative in our educational policy – partner education with a love of the natural environment? She talks to other teachers who say they cannot take their kids outside or on field trips because of the demands of state testing. If we want to engage youth and diverse audiences, they need to be part of this discussion. There's no diversity in this room because we haven't reached out to them. We need something big like the 60's to look at this in a whole new outlook. Answer: I think this will be front and center around the country. If we can tackle this it is the most important thing we can do. We need more teachers like you. Everyone needs to make this a personal issue.

## Discussion Question 2

### ***Hyde Park, NY***

***(cont.)***

We've been very successful at protecting rural landscapes, but we realized we weren't serving urban communities so we established community gardens and they needed funding. We had to cobble together funding from many partners and grants and state agencies and many stepped up to fund this. It was encouraging how many people supported this, but this process could be streamlined. We shouldn't have had to reinvent the wheel finding funding sources for this kind of project. At the federal level could there be ways to streamline this? Answer: Department of Agriculture would be a logical source. It's a great idea. Land Trust is great example of how to share resources and partner.

## Discussion Question 2

### ***Kissimmee, FL***

Segmentation, fragmentation of environment

can't get anywhere without driving...sees two separate societies, the computer or sit at home group and the play/go outdoors group

the great outdoors is very American, not much connection to outdoors in Europe....see it as no urban areas touching, very rural.

tourist, greater population....bring noise and pollution

schools are missing opportunities to expose youth to the outdoors...we used to have time made for us, now we must make time to be outside

loss of parks and open space, development

accessibility, lack of school programs

construction/development....loss of habitat

finding/making time....less parks, less organized sports

loss of habitat

work, time, safety especially after hours

pesticides/herbicides....hormones in animals....loss of habitat

school....the fact that many homework assignments must be done on a computer

## Discussion Question 2

### *Kissimmee, FL*

*(cont.)*

Biggest challenge for achieving conservation goals is trying to balance the built environment with conservation. State buys lands for conservation and as the economy tanked, there became a huge opportunity for governments to buy lands. But what happened was that Florida cut out the Florida Forever land buying program to balance the state budget. Obstacle is making state legislators understand that conservation is important and now is the time to buy land. Second obstacle is when we buy conservation land and human recreation is the first thing that is allowed on the refuge/park. Before allowing recreation, need to study carrying capacity for animals, etc, before deciding to open to recreation. Need to do scientific study to determine if the animals will be impacted by the human use, especially consumptive use of wildlife/fish resources. Not getting answers from the agencies about impacts. Let flora and fauna survive first, and then consider if recreation is compatible. Need to keep ORV and Jeeps out of conservation land. There are Jeep people that stay on trail, but once someone goes off, then you have everyone else follows. When managing conservation lands, government needs to consider recreation vs protection.

Osceola County set aside money to buy conservation lands. She is an appointed member of the advisory committee for the conservation lands. Even with the special money, there is not enough money to buy the land that needs protection.

Some people just don't care about the lands.

Highlands county they have undisturbed (natural) areas in county. If undisturbed than the county does not consider it worth anything. The land must be in the middle of something to be worthwhile. Areas that need protection are left alone. Bluehead Ranch is going to be developed into 50,000 homes. The planned development surrounds the WRP easement that has just been bought. Bluehead Ranch needs to be protected

The same thing (zoning for huge developments in natural areas) is happening in Osceola County. 68,000 homes have already been approved, but not built. Dept of Community Affairs stated that 103 years worth of housing has been permitted for construction in Osceola County. The county wants to expand the urban use boundary so that wealthy landowners can benefit from it before the referendum passes in Nov (Florida Hometown Democracy Amendment). Kariena represents an organization that works to balance buildings and conservation. Our system is slanted toward the developer. Five county commissioners have been working on this development plan...general public doesn't know about it and are blind-sided. State of Florida designated this as a priority A land acquisition project but owner of land didn't want to sell. The obstacle is lack of transparency of government planning/zoning. Lack of public engagement from the beginning zoning and land-use planning process.

Data submitted from developers does not get questioned by county planners. Public hearing is the first time the project is presented. By then its too late

## Discussion Question 2

### *Kissimmee, FL*

*(cont.)*

Mottled Ducks depend upon many of these wetlands (including the Everglades) more than we thought. If we didn't study these species, we'd have no idea what area is important. DU works in partnership with refuges and other groups to restore wetlands. Power to vote is important to protecting resources. Freshwater areas serve as nurseries for much of the seafood we eat.

A lot of countries do not have a lot of fresh water. We need to protect what we have.

When government employees can't speak out due to fear of losing jobs, need outsiders to come in and speak for them. Also need to give the environment jurisprudence.

The FL Fish and Wildlife Commission manages 5 million acres of Wildlife Management Areas (WMA) in Florida. The state is out of money. Need to work together to save what is left. Next generation needs to be educated about our environment if we are to have it in the future. Recreation is managed very carefully on our areas. Florida Natural Area Inventory (FNAI) inventories each WMA and creates maps of critical areas before roads or firebreaks are built. Need to have people out on the land to learn to love the land and have voices to speak for the land. She invited the YMCA participants in the group to come out to Three Lakes WMA.

Suing county commissioners and hiring attorneys to attend meetings (but expensive). Mercenary training center planned in Highlands county. The county had backed the plan and the public didn't know anything about it until a public meeting was held. The planned development was going to go through until the opposition hired a lawyer.

If they hadn't hired a lawyer they wouldn't have squashed the plan to build a huge military training center on Fisheating Creek

You have to sign petitions and send emails to stay involved. She wants to learn how to preserve the wildlife, land, and volunteer for conservation.

Every state has its special places. It needs these places

We have an economic model in Florida where construction fuels our economy. Need to change this model or else we will over develop the state. Highest foreclosure rate in the US, yet we are still proposing to build ten of thousands of unneeded houses. We need more aggressive oversight from Federals for land use planning in the earliest stages of planning at the local level.

Heartland Expressway is proposed with all the ranchers impacted supporting this massive project through the central part of the state. Federal government gave these ranchers 93 million dollars to protect 26,000 acres (WRP), yet the Heartland Expressway is proposed in the same area. Ranchers are planning to make money from development and make money from the conservation easements

## Discussion Question 2

***Kissimmee, FL***

***(cont.)***

But development will still occur in this area where the WRP easements (26,000 acres) are going. Ten individuals (large private landowners) will make a decision for millions of people (with regard to developing a large undeveloped and environmentally sensitive area). Government biologists from Dept of Environmental Protection and FL Fish and Wildlife Commission are forced to back down on decisions by their bosses. Federal govt needs to come in with outside, objective view and take a look at all sides of the issue, and then make a decision. We can't fight it ourselves all the time. No way for private people to easily conserve their land. Need a government to come in and offer economic reason to conserve land through easements for private property. This will protect it into the future

One problem is consultants like (name deleted) that tie us up. Need some resource to understand the data used to justify developments.

Need a simpler, easier way to comment on Dept of Community Affairs (DCA) reports on Developments of Regional Importance (DRI). We want DCA to stay in place and be well funded, because they are the only mechanism in place in Florida that oversees the balance of conservation and development. They also need more teeth. They decide if the plan is legal. 88% of land use changes are approved by variances. DCA needs more teeth.

We've got Audubon, FNPS, and other groups working for the environment. These groups are so fragmented that they not are as effective as they could be. Need environmental groups to coordinate and leverage their resources to protect the environment.

Do not need additional development in areas where there is a high level of approved/permitted development already on the books. Federal government needs to lead this mandate to develop a new economic model where construction and development do not fuel the economy. This is one of the most important ideas to get to the president.

knowledge and education key obstacles- too many kids are afraid of the outdoors. Fear of the unknown – makes trips to the outdoors uncomfortable.

Funding, funding, funding. Need more funding for LWCF, grants, trails, allocation

We think that social media is a barrier to natural resources. We have a component on the environment for everything we do – we are now using social media to benefit . Virtual canoeing. If we have to do this to expose them to the headwaters of the Everglades, then we need to do it! Then, we can get them to the reality. Social media will not go away, so let's figure out how to use it.

Kids today think that adults do not appreciate what they have to do now, timewise, compared to past generations.

is it more satisfying to see the virtual environment? No, said kids. Would go if money was no object.

## Discussion Question 2

### *Kissimmee, FL*

*(cont.)*

Palm Beach County – 40,000 acres that is not accessible for recreation. Burn and leave natural habitat for wildlife. Multi-purpose recreation needed.

we have environmental schools – magnet schools – they do a lot of field trips. Use Everglades Youth Camp – now run by FAU and Pine Jog Center. Afraid to come out for overnights. Younger kids – elementary? Transportation hard to line up

quick comment on these kinds of initiatives. Great to do this, but if nothing hits the ground, it's a loss. IF Fed. Gov. is serious on hardline stance, American people need to see this. Pres. Obama has very little time, or he loses face. Gotta walk the talk. People are interested to come to this, but got to do it.

The Florida Trail partners with the agencies. IF there were resources so we could more effectively partner, those are the types of opportunities that the Federal agencies could get involved in overseeing the funding at some level. Federal agencies are not in delivery system. Local agencies are in the delivery system. Fund what works. Way too few Federal agencies to get it done.

USDA Forest Service program Kids in the Woods – did not get enough \$ out.

Race to the Top – standardized testing is an obstacle– if you had the kind of curriculum that met testing protocols, maybe that would work.

How can we wean kids from electronic devices? So much out there vying for time and attention of kids.

I hear a lot of teachers are saying that the way curriculums are structured is an obstacle to field trips. May need to address issue in education. Maybe President's recommendations will have positive impact. Scouts have been mentioned – Rotary, etc., - doctors, established organizations – so, if there is a way to build on existing structures, YCC, stuff your agencies do, with civic groups – to expose young people to environment.

identify common goals and objectives.

Manley Fuller – several years ago, Gov. Crist established “Serve to Preserve” and the idea was to link retired people with volunteer opportunities outdoors. Not sure where this is today. Texas similar program. Look and see what different states have done, what would be compatible for this activity.

Not a lot of opportunity for horseback riding; need more warning about upcoming events on public lands.

## Discussion Question 2

***Kissimmee, FL***

***(cont.)***

Lack of knowledge -Girl Scouts and Boy Scouts – do they know about this program? They would definitely get involved.

used to take kids to mud bog to study. Now, liability is out there. Safer to take kids to large amusement areas. Schools don't want to take that on.

biggest concern is development patterns of the past. Need stronger infill of urban areas and encouraging open space in developments.

maybe parents and teachers don't understand wonders that can be created in your own backyard – bugs, foundations of life. Work on educating on where accessible and that will help lead them.

expensive to get kids to outdoor areas.

they have developed educational materials and websites to download these materials for free. Videos, posters, interactive materials – very good for kids all the way through the university level. <http://usgs.gov>. Work a lot with counties, cities, WMDs.

I grew up in northeast FL. Don't schools have field trips anymore? When I grew up, we went on field trips to the springs. Boy Scouts took me camping every month. Isn't the school curriculum allowing for this? Why are they going to Disney World? Why not the National Forests?

there are some teachers that do want to take kids out, but no funding. Or Principal tells them to focus on FCAT.

education works. Need to get to Moms engaged– they need to feel comfortable getting kids outdoors. Parents don't want to sign kids up because they are concerned about threats outdoors. Kids often come back 2 or 3 times to summer camp, once they are exposed. They will not be eaten by alligators. Access not issue. We have parks right behind the house – no one knows about them. Educate folks to get out.

Currently working with NRC, USFWS, and USFS. Every agency doing their own thing and has their own rules and programs and need to coordinate better and come up with a few things that work and then all strive towards that.

There needs to be a discussion about economics and how it is in the governments best interest to keep the ranches in business, but not their responsibility. If you let us keep doing what we are doing that is conservation.

It is important to have money through Florida Forever and other conservation funds. Need to have people being the scenes advocating and need full funding for all programs. These funds have been cut back and need that back to help the future and seeking funds now.

## Discussion Question 2

***Kissimmee, FL***

***(cont.)***

State taxes are a major burden.

Hard to find cattle rancher who does not have to sell a portion of their land to stay in business. Biggest obstacle is the inheritance tax and is majorly hurting us.

Need some regionalization. There are too many local, state, and feds who don't look on a regional basis and only focus on their own little portion or piece of land. Hard to manage and accomplish conservation without large scale. Maps can hurt what you are trying to accomplish especially corridors and boundaries that are drawn on a map but don't make sense on the ground.

Keep family together and stay in cattle business and do what they do and these items will mesh with food supply, air quality, and water supply and I see no reason we can't all work together.

Challenges with land acquisitions and easements, makes more sense to provide incentives. The USDA already has incentives, and USFWS is considering easements. It is all about timing, there is opportunity today and encourage you to take advantage of opportunities now. Such as Fish Eating Creek, three landowners came together which rarely happens. The state when they had money would tailor easements to landowners needs. Every agency has their own bias, bias is a well intentioned bias which does not include ranches, or trying to them how to manage such as running more cows. USDA doing a good job and all easements should be negotiated to work out terms accepted by all. Show me the money.

Reconnect youth by getting them on the properties and seeing it, food growers tend to get slighted by wildlife conservation agencies. Food growers need outreach activities too.

There is a lack of communication between agencies, all have their own agenda and their own thing they protect such as wetlands or panthers. Agencies need to overcome biases.

Get more people access through litigation reform because of lawsuits tours have stopped on the ranch. Educating our youth is critical and we need to teach our kids about conservation.

Programs attain less than fee, so what options do you have for land if not making it in agriculture? When an agency purchases some of the land, perhaps negotiate sell all if needed. Less than fee programs that could accomplish the same thing and be less than perpetual, maybe something shorter term such as 20 or 40 year to allow the next generation to decide what is best for them.

The property value is high, conservation category that should be high, the evaluations are not good. These lands have been acquired over generations and now just trying to pay the taxes, not getting true value now. Hard to sell your land when undervalued. These lands are way more valuable than others targeted for development.

## Discussion Question 2

### *Kissimmee, FL*

*(cont.)*

Different programs and funding mechanisms do help get goals achieved. To preserve land from development and trying to foresee what next generations will need such as estate planning. Will development make land less viable than conservation land. Only big land works, small pieces compromise conservation objectives. Need combination of short infusions of capital, need some conservation easements, need estate tax relief and let the next generation make the decision. Need those three funding mechanisms. Safe harbor programs could be an effective tool. Although is still hard to trust government and that is why I did not do the wetland program. It is a definite challenge that government needs to overcome. Partnership implies trust.

I feel as if when the government comes around I immediately thing what do they want to do with my land now? These listening sessions and coordination and reporting are good and I hope something useful comes out of this. What happens after this session?

The Air Force is a partner have an interest in maintaining rural lands around them and are conservation agencies. Use tools like cattle grazing, and have lots of partnerships and with cattle ranches. Possible funding could be available to do partnerships and easements.

On coastal trails, paddlers need access to launch boats and primitive campsites. Some in good condition, some are not.

People have such little knowledge about nature- need into curriculum. Need trained naturalist into schools.

There is a disconnect between providers and users. The young generation is missed being asked for input, but they are future parents.

Single parent families need to have vehicle to get families involved in nature. Too much money, they need transportation to activities. Resources dollars, more trained volunteers, to teach life skills. Need transportation to get more young people involved.

Ranchers own 2/3 of FL in private owners. Needs to more flexilbity for landowners. Hard to plan long term for them.

Need money for preventable medicine. Get kids to love the outdoors. Get kids outdoors to have healthier kids generations

The City Apoka has 200 acre complex ballfields. Need walking area get people out need to offer multiple things to do.

Tallahatchee skate park struggle to get in but kids in listened to kids to get differe recreational activities.

Sports are important, but not sustainable recreation. Stop breaking up groups and become one group outdoor recreation group – it can work

## Discussion Question 2

### *Kissimmee, FL*

*(cont.)*

Need Conservation easements ranchers don't have retirement plans. But need to be feasible. Safe harbor agreements programs work good

Conservation easements work. Connect public lands. Onsite interp to new to oriented helpful. Historical sites interpreters has huge lasting impression on youth.

Get kids out when young, they want to learn more and be safe. Need to handle animas and get knowledge. Start young.

local conservation groups work, vol to schools and take groups out on public lands. Teach them about nature. Find out what youth connect to – find conservation issue for the to preserve them. Start in elem. Read Last child in Woods...

getting people to places to do it... give it the area and not out in all area doing

Lack of awareness, people go on vacation and don't see the opportunities in the less known recreation areas, they are actually cheap, but people should have access to off road activities and passive recreation we can't compete with the advertised cruise l

Lack of public access and too many restrictions, more so on water but some land restrictions. 22 year ago the state worked with state to 137,000 acres in Collier County, NPS area is still not open. GMP was supposed to open up the area in two years. Contig

Passive recreation, preserving natural Florida land management and exotic species, youth not experiencing passive Florida not being promoted in schools, experiencing natural Florida, transportation is an issue, the expense need to provide access to natura

Referencing the disconnect with children in outdoors and also with adults, the economy, disturbed land and water quality, we don't want to do anything that costs money as long as it is not in my back yard, referenced article in The News-Pres dated August

Water quality impairs recreational actives, they won't be used if filled with algae, people need to get over apathy for educating people and yes it takes money for ordinances to protect water.

Access issue has to do with liability, example of law suits mentioned that went on for five years. Safety concerns may not match reality due to heighten media attention. Dealing with the multitude of governing agencies working with land owners is a challe

Education isn't what it should be barrier like most have stated. Florida does not have an even output standard that they teach to everybody we are teaching to the test, if it isn't on the test, it isn't being taught. Teachers are paying for extracurricula

Should not be so easy to raid trust funds when they are set up for specific purposes

## Discussion Question 2

***Kissimmee, FL***

***(cont.)***

One piece of the problem is the alphabet soup i.e. all of the entities involved. The second is that you need a PHD to run a business with all of the layering of easement issues. Regulatory régimes at the federal level conflict with each other. Void of th

Understanding what trumps what, water quality vs. endangered species act.

Inability to identify environment regulatory planning council, regulator council lost authority to regulate; planning council uses them for political cover.

many programs for children, youth conservation camps, holding us up is \$50,000 for engineering/financial assistance.

Challenge to get kids out there. Building in transportation. Can't use school buses-not enough time. Schools can't afford field trip/transportation

Marketing parks with media effective if not no one hears about it

Dollars are lacking. All money won't solve the problem that we are a different society-no longer agrarian society. US Dept of education to every school district or money will be withheld refined sugar, candy machines out of school you won't get federal money. This traps children indoors, keeps them from being outdoors, hard to recruit kids that aren't obese for the military. Benefit will be long term, save health care.

Everglades only has so much space. Kids need to experience Everglades in the capacity-not enough staffing to provide this service, show kids the outdoors.

Don't really know the answer...People here don't need to be told to go outside. Most people here we like outside

How do you fund this over the long term as a private citizen. Our conservancy founded over 20 years ago. Started pushing eco tourism in Florida, educated tour guides, low impact, horseback rides. Developing a zip line worked. Pulls in people for one thing and then they see everything else and get interested in other Has to be adventurous that grabs your attention and gets you out there. Summer camp with children very successful. things. Turned ranching operation into a heritage project in terms of cattle and horses Spanish brought over in 1500s.

In high school had Ag programs. Funding not available for it. Children who get into FFA is where conservation starts, learning how to care for their land. Gets the kids thinking. Doesn't wipe out economic value of a township or city with conservation. Needs to be a balance. Sometimes this turns people off.

## Discussion Question 2

### *Kissimmee, FL*

*(cont.)*

Florida farming federal nutrient loading standards-could stop our state's historical industry citrus, winter vegetables, to address nitrogen. If drive very best stewards of our lands out who will know how to grow food-be getting our food from somewhere else. Preverse logic in not having a cattleranch versus a shopping mall.

We deregulated so we can't compete with another market but we will buy it from someone else that we don't know where it comes from

10th generation cattleman. Nutrient load is a huge problem which is destroying the Everglades-needs to be addressed. Competition relates to the cost of labor-can't hire people changed to mechanization. Takes away people working in agriculture. Brining a lot more money in besides just farming.

nutrient loading issue is a problem. Get into freshwater ecosystem and into marine environment (dead zones). Best management practices on the land to reduce runoff in terms of nutrient loading.

need to address real issue-not that many farms. Real problem is us-the number of people-fertilizing golf courses, yards, driving cars-how are we going to educate people in schools about these issues. State mandate no more fertilizer

lot of rivers in Florida were phosphate mines. Creating problems by getting into phosphate banks. In tropical climate either bites you or eats your plant. Can't afford to put chemicals that are safe are so expensive that we can't use

Florida Forever program was working great and now there is no money. Now that land prices are less wish we could have bought more

Louisiana produces fish, etc. more so than Florida. Federal government should connect Red River to basin in southwest LA that would restore it to wetlands and redirect river to wetlands. Value would be much greater than the cost. Salt water intrusion killed rice crop continues to leech because of what we did to wetlands

Alligator alley-additional costs to putting fly overs would be less expensive than cutting off sheet flow has caused. DOT should look at wildlife travel issues and sheet flow and if warrented by science so we don't have Alligator alley.

lot of communities respect their trees-wish we would respect our trees more. Valuable in many ways. In terms of development.

Connected to the water through surfing. A lot of development, lot of beach is private and can't access it. Less and less great outdoors.

Exotic and invasive species. Can't release animals. When things take out the natives there is nothing there to protect

## Discussion Question 2

***Kissimmee, FL***

***(cont.)***

Runoff from agriculture effecting freshwater

Agriculture is a problem to some degree. Some people are cautious of the environment while others do not have a lot of thoughts. Need incentives to protect the environment.

Community park being trashed. Lake and water trashed. If building in residential areas maintain the areas.

Kids are twice as busy with school, extra-circular, jobs

If I didn't have extra circular activities I wouldn't know about the outdoors. I would be indoors. Need to encourage more activities that get kids outdoors.

Don't know where the great outdoors is?

fear of snakes, alligators. Educated about certain fears alligators. Helps to have your parents educated.

lots of parents work. Not a lot of opportunity to get up and go.

Don't like the virtual experience. It is not real. Makes me want to go there.

love for the outdoors can happen later

Balancing recreational use and the environment, as well as with cultural resource sites. Important that use of the outdoors does not destroy precious cultural resource sites.

Some of the waterways adversely impacted downstream of Lake Okeechobee are due to the dumping of water from the lake into those bodies of water.

Some people don't know how to behave in parks and refuges. A certain amount of education is needed so the sites are not damaged.

The users of outdoor recreation are severely underrepresented when it comes to how designated areas are designed and used. Parents must be involved with youth in order for kids to participate in outdoor activities.....focus on family activities.

## Discussion Question 2

***Kissimmee, FL***

***(cont.)***

We do a poor job of properly designing public lands.

The cultural view that parks are dangerous and contain bugs and snakes.

Many of Florida's waters have become impaired due to excessive nutrients. Outdoor activities that are on polluted water bodies lead to a poor experience.

Massive cutbacks in parks to maintain infrastructure...ability to collect garbage, provide decent restrooms, etc.

Huge inventory of lands and a golden opportunity to acquire additional easements, but limited public funding.

Public agencies charged with maintaining public lands have received more lands, more responsibility with decreased staff and funding. Finding additional volunteers can be difficult. Not offering enough of a variety of activities for different age groups and interests.

Many public agencies buy lands, but little is set aside for maintenance.

Many organizations depend greatly on volunteers. It is difficult to find enough people.

There are already enough federal programs for us to take advantage of to keep us solvent. All the agencies have different programs and they should try to coordinate with each other. Each agency has all these different programs. You have enough. What doesn't work for us in the long run is the estate tax. We need some relief to enable us to hang on to what we have

Welcome, I am happy to have federal, state, and good cattlemen here. I hear nothing that is in conflict with keeping ranches and family together. Our interest is in water conservation, environment, and family and I see no reason why we can't work with these agencies to make this happen.

We have to figure out how to help land owners. We need to talk about economics as well as conservation. We need to talk about how we can help ranchers, etc., stay in business.

What's important is having the money thru Florida Forever and the LWCF so we can have people advocating for the funds and asking for full funding of LWCF. There used to be more funds for environmental education which was used to allow children to come out to ranches to learn and it is not happening now. We need to get back out there.

## Discussion Question 2

### *Kissimmee, FL*

*(cont.)*

If I had to choose one obstacle to overcome that could help keep us on our ranches and help our family hold onto the property we've had for generations is relief of the Inheritance taxes. It is getting harder and harder, ranchers have to sell off a portion of their premises to pay for inheritance taxes, lawyers, insurance. We are land rich, but financially poor. Ranchers can't afford to expand. We not only need ways to keep helping our environment but to give landowners a break.

We talked about regionalization of our efforts and this is good, but part of the problem is that the state and counties do not always think that way, with their building codes etc. There are problems with some of the maps being produced that show corridors and once your land is on a map it makes it hard for owners to work within those boundaries. We can't do preservation with whatever else you have left.

I have represented several land owners in their challenges for 20 years. We have to have the funds if we want to preserve property, timing is crucial, tomorrow we may not be able to do this. Just get it done, provide incentives, the State has 6 or so easement programs, the feds are considering more. The time is right, in two years there may not be as many chances. At Fish eating Creek, 3 land owners came to same place at same time and the state had the money, they bought conservation easements and tailored them to the land owner's needs. Every agency comes with its own bias, usually against working lands. Somebody at DEP says we don't want pasture lands, but want the woods around them. Some agencies want a plan to regulate cattle, but ranchers will not run too many cows on their lands. Sometimes agencies forget the fact that they are dealing with working land. As we develop easements, we must consider what the land owner believes makes sense. I realize that is difficult though, it much more challenging. As Jerry Maguire said "Show me the money", and you will all have lots of opportunities for easements.

Reconnecting America's Youth to outdoors is a well meaning program with younger kids, but by acquiring lands and getting kids on the property, food suppliers take a hit. The slant is made that animals are more important than the land owner and food suppliers.

In order for them to give more public access to their lands is litigation reform. The used to do a lot more tours but were sued. After 5 years of litigation, they no longer do tours unless people sign their lives away. If you don't teach them when they are kids they will grow up and listen to everything under the sun, and they don't learn anything. A lot of the things the kids learn are negative against ranchers.

Deseret Ranches of A lot of government programs offer less than fee, but what options do owners have once they sell off their development rights? Can you commit to owner that you would buy the remainder if the rancher needs to do that, if the rancher can't be successful in running the ranch. Florida

## Discussion Question 2

***Kissimmee, FL***

***(cont.)***

In my mind, in order to make this work, the valuation of the land needs to be realistic. The true value is higher than ranch land. There should be a conservation category that is the highest use. Some of the state appraisals that were way low. Families acquired their lands over many, many years. They paid their taxes and tried to make ends meet. If program does not give true value it is very bitter pill to swallow. These lands are more valuable than lands just to be used for development.

Another tool would be safe harbors. Sometimes because you stay in agriculture you may be penalized if some near you has not. You may have so many gopher tortoises, you should not have to worry about dealing with more penalties of having more if your neighbor left ranching and developed. nation

: I am appreciative. This has been refreshing. Now once you have listened, coordinated, and reported, what happens next? Answer: We make report to President and with recommendations, and he makes decisions regarding the youth programs, conservation, etc. There will be a long list and a budgetary section, based on feedback. We want to change how we use budget beyond 2012, which might be things like fully funding of LWCF, things we want the president to get behind. But Congress has to do it.

Rails to Trails program is working really well, state parks didn't want any part of the trails going through their parks to connect to the county parks. They overcame problems with state and now have it. They've worked with folks on the State Cabinet and had to basically force DEP to agree to it. The bike trails are not going to be harmful to the bears or other critters. The point was to connect state, county, linear parks. You have to connect recreational opportunities for people.

Again, they can fully fund LWCF and state can fund Florida Forever. They need to stop holding back funds needed for maintenance because if the land is not maintained it becomes less hospitable for people to use.

Grant access, access, access at places like Big Cypress and other federal lands. I've been working on a hunting management plan for more than 20 years and nothing has happened. Fed's need to stop doing all these road closures, those of us on ground aren't allowed to make suggestions, they need to listen. Local forestry people feel that their hands are tied and can't work with the public.

A lot can be done at a federal level to get businesses to help by using tax incentives. Businesses don't know what to do. They have to work for the long haul. Can't solve big problems when you don't know what will happen. Are there ways government can take a longer view so things can be solved? There needs to be long term consistency of tax programs, etc., so business can plan accordingly. If it is so chopped up by different administrations it will never work.

## Discussion Question 2

### *Kissimmee, FL*

*(cont.)*

We are constantly battling with the Corps of Engineers (who permit destruction of Florida), if society is so ok with paving over everything, what is that message telling our children. An organization like the Sierra Club then needs to duke it out with them in court. The Corps need to explain how things work, rather than using avoidance use mitigations. The Corp needs to design around wetlands so we could have better communities. There used to be a lot more woods for people to play in.

There has never been a stop put on development. Developers should have more criteria to keep things more natural, should be more greenways and natural plantings.

Everyone needs to educate the legislative folks.

If you donate 500 hours of volunteer time, you can get a free national lands pass, but some places are not honoring. Not consistent with all nation lands.

Conservation must go back into schools.

People need to learn about special places nearby, every community has some kind of park or refuge and kids need to go there and learn about it. Expand refuges in the state and country (especially at the Florida Panther refuge)

Children are not learning about these places. It is not taught in schools

Schools could promote Youth Camping. Kids in Florida don't even know the kinds of wildlife that are in Florida. People don't know why they need to protect things. Let them know what is out there.

Just a question, are their plans for any additional national parks? There is a greater need than anticipated. Want ANWAR made into a park

For school field trips, getting kids outdoors is main obstacle. Our biggest challenge is the school system. Our education department needs to encourage and fund trip. Our kids are at the mercy of school bus, once the kids get to where they're going and start to learn what we are teaching, it's time for them to get back on the bus because the buses need to pick someone up else. In poor areas, the kids don't have enough money to even bring bottled water with them so Around the Bend provides water for kids. There is a disconnect between educators and teaching kids. A lot of principals won't let even let kids get feet wet. Things with the environment are not encouraged.

We need to fully fund LWCF and we need to get the funds to the refuges to get people out on the refuges. The only way to get to the Tampa area refuges is by private boat or tour boats. We need to find ways that are inexpensive for families, maybe school kids could go free.ay Refuge

## Discussion Question 2

***Kissimmee, FL***

***(cont.)***

I've noticed that so many children can't even go into the wilderness because they could get stung by bees or amoebas in the water.

That is typical with people, if you say there are rattle snakes on a property, parents are afraid and then the children get afraid. People are just afraid to go outside.

If we try to publicize a boardwalk all of a sudden it's not so outdoorsy because the people are a step away from nature. It's a little more sterile.

The sporting industry can't go along with all the new restrictions regarding lead gunshot and taking away ammunition, that is a big obstacle, and if I don't say this, many other groups will be upset. By doing these new regulations, the feds will basically be putting a ban on traditional hunting. EPA is trying to input these regulations by November.

FWC does pretty hard core work with its volunteers. An issue that we come up with is incomplete acquisitions with property still in private ownership. It makes it very difficult to manage the property and the bigger problem is they can't do prescribed burns. Agencies and non profits need to complete their acquisition projects. When you're out there working, you can't tell what is publically owned and what's not

It's important to get kids outdoors for longer periods of time. She has shown pictures to kids and there are three deer in the picture. Only those kids who have been hunting can find all the deer in the pictures.

Access to public lands is the biggest hurdle. Have to be able to get there. Accessibility to private land included.

Awareness. Websites are not user friendly. Look at improving websites.

Intergovernmental regulations on manatees. Local USFWS staff make their own regulations and create inconsistencies. There needs to be an understanding of realities of microenvironment vs government making broad regulations.

Promise to fully fund Land and Water Conservation Fund. Help landowners and farmers by funding existing conservation programs through the Farm Bill. Adequately fund refuges and parks to be able to maintain them.

There's no landowner incentives to keep land in conservation.

Fund the landowner to manage the lands for exotic species and water conservation so they can stay intact. Everybody wants the open landscapes and we need to work with the landowners to protect them.

## Discussion Question 2

### *Kissimmee, FL*

*(cont.)*

How do you make the land valuable when you have a global economy of food production?...for example, we import exotic apples from China.

Everyone wants a piece of FL and everyone wants a piece of nature in FL, but landowners want a lot of money.

This is a problem, especially in Orlando, with so many tourists, you see a lot of trash on the ground and in the lakes. They don't know where to recycle. General lack of places to recycle things outside your home.

kids and adults are more interested in animals and plants – kids have pets. Learn how to care for other living things. Lack of interest in the natural world.

People have to pay to go into park, pay for parking. Just driving there is a hassle. Would like to be able to walk to open space. School indoors, homework in doors. No free time to be outside.

I agree with the whole money thing - \$ to cross into Sanibel and you go fishing and you have to pay to get into refuge. 40 minute drive. It's hot outside. I don't mind in the winter.

There is a lack of interest in local animal and plants. I could go see lions at Animal Kingdom and most people seem to like that instead of the local.

Locals don't grasp that they have amazing animals right there. Lack of knowledge. Lot of wildlife close at hand.

As a parent, I am going to say "fear." I did not have fear as a child. Fear of other people, not wildlife. Remoteness of it.

on crew team so we are on the lake everyday, rowing on lakes and rivers. Being in Orlando, not much open space, which is kind of sad. We like to be outside – I have 4 little brothers.

part of that is I could go out and I had woods around me – now I know I was trespassing – but it was just the outdoors for me. We would make paths, trails and we would get home eventually. We would go clamming and scalloping, mullet fishing – swamp buggy in Big Cypress. Dad would run the boat or build a camp. Outdoors = outside. Going places with families.

pet peeve – lack of people recycling – very few people put out bins – behavior problem.

I think it's lack of education. I've grown up in a different country and seen different sides. Everyone was educated in the importance – Germany – didn't happen overnight. If you go to any public place, will be different bins to sort trash. Teach the kids and why it's important. Would hit you in the pocket to get folks interested. Resources in Europe are more expensive, so recycling and conserving more important.

## Discussion Question 2

***Kissimmee, FL***

***(cont.)***

HOMEWORK

HOMEWORK

TECHNOLOGY, HOMEWORK

TRANSPORTATION

TRASH, LITTER, RECYCLE

WORRIES ABOUT STORM RUNOFF

WORRIES ABOUT WATER POLLUTION

Kids play so many video games at such a young age

Studying takes up time but try to study outside.

Schools don't put emphasis on outdoors play.

Degradation of habitat, trees being taking down, worries about eagles, worries about aquifer.

The sea turtles, trawlers are dangerous, TED's not effective enough.

The way that society evolves, it's busy.

Oil Spill

Acquifer; all air pollution seen and not seen; pesticide in environment and septic/water tank pollution of water

## Discussion Question 2

### ***Kissimmee, FL***

***(cont.)***

can and bottle litter in water; lack of recycle

rampant development; air pollution by car; evasive plant; bottle water drinking is excessive

climate change; boating hazardous to manatee; strip mining

soil erosion

cool video games xbox

too much tv; technology keeps kids indoor

traffic pollution/gases; no physical education in school

cost to enter park/recreation not able to bring in items; no access to nature or the beaches

Air Conditioning (turn 'em off)

Safety

more encouragement from family and adults

lack of access to public lands

water management district establish recreation groups; water quality and water compliance which are not compatible to each other; too many regulatory agencies making decision;

lack of access; no money; boundaries limits property not within a specific boundary to add federal government

people not knowing they are part of nature – people think nature belongs to them urbanization people are being disconnected from nature

## Discussion Question 2

### ***Kissimmee, FL***

***(cont.)***

lack of understanding of how to conserve habitat land; better collaboration with private land owner; land and conservation fund should be fully funded every year; access is a problem;

conservation government does not work with the Education government

biggest issue is access; no respect for the land; exotic plants and animal is a huge problem in the State of Florida; better management of federal lands; not enough funding for public accessible lands; no hunting and archery in schools; water levels keepi

emerging the Boiler MACT “Maxima Achievement Conceivable Technology” from EPA no internal consistence within the government with changing of regulations; the government EPA cherry picking of data.

works with the lake advisor board here in Florida – pollution is a huge issue; local government restrictions (limiting access)

Beach erosion and trash, the oil spill.

Over development, over populated areas, habitat fragmentation, water quality concerns.

Human ignorance, pride and carelessness.

Sprawl, habitat destruction and fragmentation, general disconnect with anything natural.

Trash and litter, pollution.

Urban sprawl, fragmentation, general disregard for natural areas, people take natural areas for granted.

Classroom time and activities, busy schedules.

The economy, cost of driving to remote locations, cost of gear and equipment.

High cost of equipment, perception that you need to have a certain level of equipment to be “outdoors”, perception that being outdoors is not entertaining.

## Discussion Question 2

***Kissimmee, FL***

***(cont.)***

Since youth don't spend much time outdoors, there is a lack of understanding of the outdoors and associated safety concerns; many other interests that don't involve the outdoors.

Any free time is spent at home or in neighborhoods due to lack of transportation.

Indoor entertainment options were not available several years ago. Years ago, the entertainment was being outside and doing things outdoors.

All students can be exposed to some outdoor activities. Walk out the door and see what is there.

## Discussion Question 2

### ***Lawrence, KS***

Sustainability and sustainable living - learning to live outside of houses and off of the grid with fewer resources.

Protecting sacred sites and return trust lands to the Native people for them to manage on their own. Return sacred lands to native people so they can manage them and educate others on how to live off the land.

Education- environmental and resource education outside instead of in the classrooms and talk about health concerns- all three can work together.

Eliminate trash. Clean up day once a week and get groups in different locations to clean trains, roads, highways, etc.

Enforce laws, educate people about not littering and instead recycling

Changing laws- making it free or more convenient to recycle and charge for trash bags

Require businesses and corporations to recycle

Need to make businesses and business people more responsible for their actions- not recycling, not conserving water, not having good environmental practices

Has to start at home by mentoring kids and getting them out- outside classrooms should be one time a week (depending on weather) and mandatory. Otherwise it will never happen because there are too many other distractions

Recognize that indigenous people already live outdoors- Provide more educational ways to bring these people back to their culture and give them an attachment back to their communities

Media needs to promote respect for land (a lot of land is trashed and media should portray nice lands)

Funding- on tribal lands that goes towards gardening for younger aged youth so it can become a way of life for them and fund programs that teach kids about where their food comes from

Mentorship for younger generations and get parents involved in children's' life and provide education and healthy eating, gardening and healthy activity outdoors.

## Discussion Question 2

***Lawrence, KS***

***(cont.)***

haskell campus has buildings that are run down, food systems where we don't know where the food is coming from, water systems where we don't know where the water is coming from, and waste issues so there is the potential to use Haskell as a symbol of using better practices to improve the community- like having a windmill that creates energy and gives it back to the community

Overconsumption of resources/too many trees being taken down

New regulations are taking land/resources

Forest fires decrease air quality

Health issues due to fires & pollution, certain commodities adding to obesity

Dangerous atmosphere/sunburn

Too much development (businesses, roads, buildings etc.)

Large degree of litter in National Parks

Pressure or making money, job competition. Rise in offic jobs

Videogames/TV

Too dangerous to go outside, scared for safety in unknown places

Too many convenience items (air conditioning, technology, cars)

Preservation

Sustainability

## Discussion Question 2

***Lawrence, KS***

***(cont.)***

Solar energy

Teach more outside activities and benefits, use our resources to get people outside, currently not many programs are available

Teach youth how to hunt/fish

Increased education of outdoors will lead to better understanding and appreciation

Develop programs to teach cultural ways and practices/work with tribes/nations to develop programming

Incorporate native traditions and culture into schools

Give more funding to local schools and organizations for education

Utilize technology better/develop a videogames

Increased diversity of teachers

Better outreach to tribes

## Discussion Question 2

### *Los Angeles, CA*

Outdoor recreation must include off highway recreation. My family and I recreate off-road in the deserts of Southern CA. My 3 sons are 3rd generation desert motorcycle riders/racers; much of what they have learned as life lessons. There are currently 4 open areas where we are allowed to hold competitive events, Johnson Valley, @ 189,000 acres is the largest area and is being targeted for takeover by 29 Palms Marine Base. We must have an equal amount of open area provided to replace this lost acreage. 1,000,000 OHV's operate in California. 500,000 in Southern California if we lose areas to operate OHV there will be OHV operation in illegal areas, doing damage to sensitive areas.

We need a national resourced Area designated to include the San Gabriel Mountains URBAN River Corridors. To achieve this, I strongly believe that the Emerald Necklace will be able to transform the densely gray and urbanized San Gabriel Valley Region into a vibrant green landscape. The Interconnectivity of parks and trails have the ability to improve communities and will give residents greater accessibility to local and regional resources. Here are the many benefits the Emerald Necklace can bring to the San Gabriel Valley: it will bring green infrastructure jobs to local communities (water resource protection, urban forestry, sustainable landscaping careers) Emerald Necklace can be a valuable public asset it serves as a public park space and many youth adolescents in the San Gabriel Valley, It will help expand and preserve natural habitats and wildlife, It will also establish a more efficient transportation corridor for humans and native animals. Connecting with the San Gabriel Mtns. to the beach via natural and urbanized waterways. We have the following support: 25 cities, 3 HOAs, 3 school districts, 1 environmental group, 1 trail group, 1 state conservancy group and 1 county board of supervisors

Bicycles: Green transportation: Benefits of cycling are enormous. Healthy, less consumption of oil. Reallocate space for bikes in LA. Not taking away but sharing roads with Bikes. Increase 3% for Transportation bill to extend bike trails. Provisions to include bikes, give space, National complete Street Policy.

Most parks and Recreation areas do not have knowledge of the Insect Biota. Plants and Animals depend on insects this influences the habitat. The Habitat influences land use. A greater understanding of insects is imperative. Invasive Plant removal and control is important in maintaining habitats overuse of land destroys habitat and carrying capacity needs to be monitored resulting in promotion of more land to use. In other words if land is overused you need more land.

Allow the USACE to use credit and funding from different funding sources to be used on the same projects e.g. Flood control vs. ecosystem restoration. The USACE prioritizes projects in part on a \$ per acre criteria. Due to the cost of urban development this puts urban projects at a disadvantage compared to projects in areas where land is less available. The USACE typically requires a 35% total match which does not allow the match to be met from another federal funding source. This local match requirement should be modified to facilitate collaboration between federal agencies. Funding for land acquisition should be available. Increase funding for the Land Water Conservation Fund for urban projects.

## Discussion Question 2

### *Los Angeles, CA*

*(cont.)*

Challenges: Getting all of every groups ideas and efforts coordinated (shen possible) and eomminicated well. The sharing of information is a key! If we can work with toher groups that we didn't know about before, we may help each other solve some of our own challenges. Get the kids outside!!! if they are in school all day, they think (are taught) that it is normal existance. What works? Get kids outside!!! Not only will they enjoy it but they will want to retun outside. Getting thme out and involved also will create a new generation of concerned activie citizens. 3) Federal Government Role: Require cooperations that have land leases on public land, to give bakk in a way that benefits the public (in the long term). Repair the damage caused, not take us out for a Latte! 4) Tools: Funding of course!! But getting the funding to each groups pet project isn't feasible so get into the schools to get the kids involved, have them go on field trips and camp outs and "day projects" to work on some of these grass roots organizations. They want to get their hands dirty.

Scale of Parks: Redefine Park system. Fund Non Point Source for Urban Park system. Developers should incorporate Parks, maintenance of parks is an issue. Maintanance for parks.

Landscape Architect: JPA-Joint Power Authority, we have in CA. A way to facilitate Government. JPA can't access funding, compromise the mission. Don put transportation in the open bill spaces- Empowerment zone % of land used for kind of open space. Need to expand, bike pads, bike paths, usage of combining trails not a good idea.

How can the Feds help??? In CA a landmark environmental legislation, AB 32 & SB375 are in jeapordy of being appeald in November 2010. The senior leadership here today should be more visible in CA and signal to candidates the Administrator support of these initiatives. Support Federal incentives to induce in basin/Urban Solar development to offset out of basin development such as solar feed. Visit website: [www.solarfitylad.com](http://www.solarfitylad.com) to learn about the LA Business Council's campaign to induce urban and in basin solar generation.

Share Wilderness Areas with EVERYONE!! Off-rode, Horses, Bicycles. We have enough Wilderness. No More

Engage the individual: sustainalbe landscape@home/local activities neighborhood parks 2) Redirect current funding away from "old" thinking projects like expanding mass transit, rail systems. Will work to alleviate port traffic our of the LA urban area. Rail the cargo-expand the metro rail for commuters. Look to other urban areas for creative solutions to urban sprawl and pubic transportation.

Preserve more natural areas, please, within urban environments. Arroyo Seco\* area in the Southern Pasadena and La Canada. Please allow for the natural to remain as it is for a refuge for so many. Parks manicured into aonther category. We need more natural areas to the be preserved desperately. \*It does have defined areas set aside for specific type of recreation- golfing, etc, but it has a large swath of natural area that is faily well connected as well. The Arroyo also has a water filtration system that was a good example of intergration of varied use, conservation and preservation.

## Discussion Question 2

### *Los Angeles, CA*

*(cont.)*

I truly hope we can recognize wild life not only in open spaces out in the wilderness but in the inner city too. Many disasters happened and the last thing that is inventoried or paid attention to is wild life and/or domestic animals. Please look at the grassroots level. I used to be a Director of a beautiful inner City Part that was a dumping ground for illegal sports such as dogfighting and cockfighting. These are issues overlooked. I could name many, but another one is the fact that many cities and our state do tree trimmings at the worst time of the year for the tree and utilities the state and fish and game codes 3503, 3513 and The Migratory Bird Act have all you have to do, because a mother to leave the nest and you have violated the act. Please look at assisting domestic pets-spay/renter's initiative, adopt, educate about animals at shelters. The link between animal abuse and human violence, etc. These are needs to be addressed because it is all connected.

Increase and fund urban park programs in the National Park Service. Funding should prioritize low-income urban areas.

Challenges: Inter Office/Agency/National/State fighting each other over land (Competition driven), BLM Land used for drilling (Redrocks, UT), Urban sprawl, the deciding factors over conservation 2) Getting kids involved, use of transportation, used of school programs 3) Take some ideas at TED.COM/Federal Government Role: Stop being a corporate sponsor, Local land trusts and non profits we live here, we will watch over the land/Solar, wind power, No more OIL and GAS Fossil Fuels

Challenge: Retain consistent funding in LWCF and UPAR. Retain a State side funding level with 60% federal and 40% State side. Funding level of \$2B for LWC and \$300M for UPARR

"No Child Left Behind" in taking away opportunities for children to learn in their classrooms about environmental issues. There needs to be a federal mandate that would require students to have environment/conservation training including hands on, field trips, community service, to visit wild spaces, mountains, beaches, deserts, parks. Environmental Science camps should be a regular part of curriculum, once in elementary once in middle school, once in high school. Working on an environmental project and reporting on it should be requirement for graduation. Children need to be educated because they are going to carry on our passion. 2) Federal Government needs to fully fund the land and water conservation fund. Have a common sense, methodical plan for renewable energy that involves a variety of stakeholders. Plan renewable energy closer to urban centers where it is needed most. Get developers to NOT BUILD or develop - give them incentives to develop urban areas already built-rehab houses empty or up for rent. Fund community gardens, school gardens-kids need to know where their food comes from. More collaboration between grass roots agencies to work together-user friendly websites, kids' sites, that they will want to go to learn about environmental issues. More youth involvement.

## Discussion Question 2

### *Los Angeles, CA*

*(cont.)*

NPS Service: Fund Urban Park Program, Prioritize low-income areas, land water conservation fund and increase funding for urban projects, school gardens and community gardens. NEPA/CEQA are required allow CEQA to suffice for 2 reports, as CEQA is the more stringent and includes NEPA requirements. Interagency Strategy Coordinate EPA, HUD, USDA, Task Force in LA

Restoration of water ways, forest damaged by fire and human damage. In restoration concerned of the wildlife is important. Ex. Keeping or providing, corridors for the wildlife. Educating the children and adults to the importance and enjoy the great outdoors. State Parks have been closing due to lack of funds work with States to keep these parks open. Work with organizations such as local conservation groups, to build projects. Develop a cops similar to the CCC that can help resotre and maintain our parks and forests plus provide jobs. Build our solar panels and wind turbines closer to where the energy is used. Help local governments in the development of capture of water run-off

Wild and Scenic Rivers Act-It was wonderful to har about the Federal Government's commitment to protect our rivers in today's presentation and look froward to seeing more WSRs designated her in the Eastern San Gabriel Mtns, So Cal, Cal and the rest of the US! It's a great tool and we need more designations! Thank you!

Environmental Educator less and less Environmental literacy, no transportation for the kids and Nature works-Help get kids out to parks.

Gulf of Mexico? BP Oil Spill? Where is Salazar? That is one of our American Great Outdoors? Clean it Up!

Wilderness back country not being maintained for Families

Clean up? Where can I go to volunteer, I want to help?

Why has it been excluded off AGO Video? OHV activities? Don't exclude OHV include all recreational groups. Windmills took over our Valley (City of LaVerne) they took our beautiful areas for what? Energy Source? Is that Green?

Include all recreationa users in this agenda. Wilderness designations don't do this. They exclude many uses. Windmill farm destroyed wonderland, D.C. More damage in a year then what OHV could do in a lifetime. This Farm was for theuse of the City of LaVerne.

## Discussion Question 2

### *Los Angeles, CA*

*(cont.)*

As secretary of the Interior Ken Salazar mentioned early this afternoon, "Historic Preservation" is part of telling America's story and getting people into the great outdoors". We need to embrace our national as well as our historic and cultural resources as part of this initiative. A big challenge to conserving our historic and cultural resources is the lack of full funding of the national historic preservation fund, which is the sister fund to the land and water conservation fund this gentleman in the audience just mentioned. The Federal govt can more effective by fully funding the historic preservation fund and increasing the capacity of local agencies to preserve and protect our historic sties through technical assistance and federal incentives

Work with NGOs, Land Water Conservation Plan we are very interested in what Mr. Salazar is proposing on funding programs. How do we improve effectiveness of fund program. How do we increase ceiling of program fund. Message to Fed Reps: Failure to look at local success stories, Humbolt County resident, phone call to BLM-CA Office to know about successful stories OHV Community, Road decommissioning-not exclude OHV Community.

Challenge: Involving DOT and local transit agencies in increasingly the amount of bikeways and their safety in urban areas. The Federal Government could be ore effective by changing some of their procurement processes to allow organizations to work with the Federal Government to implement programs (rather than implementing it themselves)

Challenges-support for responsive renewable energy development in the CA desert. It needs to happen on private disturbed lands closer to urban load centers, NOT in the treasured, pristine, untouched public lands in the core of the Mojave Desert. 2) The Federal Gov't needs to take the pressure off the BLM public lands in the CA Desert for renewable energy development by looking at ways to make it easy for cities and counties to have slolar/wind development on private disturbed lands&solar panels on commercial buildings. 3) Fully fund LWCF and AB811 program funding 4) Whats working: Private, local, non-profit land trusts. We are able to purchase & protect & then manage large landscape level chunks of land that the federal gov't doesn't have the tools/resources to save. We (TWC) through private donations and grants are able to save critical habitat "islands" between already protected lands National Parks to protect ecological corridors so we dont end with islands of biodiversity and unhealthy ecosystems. Help us to get funding so we can continue our jobs & mission. (ie: UCF stakeholders in federal process,

In the LA Region, Water is among the most critical issues-Both Water supply and water quality. A century of misguided Development decisions exacerbate floodking and water pollution while conveying a precious supply to the ocean unused. What has been working in the LA Area is the slow but steady move toward multi-bnefit capital improvement projects taht capture water (both rainfall and dry weather rainoff) close to the site whre it falls and either allow it to be absord into the ground to replenish local aquifers, or stored in cisterns or rain barrels for later use. These projects are best conducted through public-private partnerships between Government Agencies and local entities including NGOs and business. there are excellent exmaples of these projects in LA, including LA's newest green street-Elmer Avenue in Sun Valley. In order to make such projects status NGO we need Federal funding and mandates for mult-benefit projects.

## Discussion Question 2

### *Los Angeles, CA*

*(cont.)*

Global Action Research-Pro: Huge grant awarded to address water pollution to UCSD. We must look at watersheds. I am coordinating a bike ride from Vancouver, Canada to Tijuana to promote sustainability ideas and connections. Watershed Urban Research! Go with it!

High Desert multiple use-Drove to be part of this licensing session process. Others have not forgotten, should not be forgotten -OHV/Wilderness/Equestrian users. Motorized sports, local astronomy club need access. Land Management-over 25 years. Now they want a Solar Plant for Ridge Crest? Don't Want It!!! Will use too much water to provide energy for LA! When does it stop!!

Solar Desert issue: Build Coalition, wilderness, recreational groups-S2921 provides to stake holders. Heritage of story telling, use websites to disburse.

To throw a wrench into the ideas of open space is that Endangered Species in fact. Wild Birds/mammals/reptiles/are more likely to be found /live/seed/feed in areas where people are not allowed the Forest Service Support a paper finding that more wild species live where people can not go

In order to ensure that the connections we help people make to the outdoors are lifelong and life-changing education must be a core component of how we make that connection. Getting youth out to our National Parks as part of residential environmental education programs, such as nature bridge field science programs will build a generation of environmental stewards who will make responsible decisions and take actions to protect and preserve our environment. The connections to nature young people make through residential environmental education programs such as NatureBridge Field Science Programs often light a spark in students that turn into a lasting love of the outdoors and lifelong stewardship. The Federal Government should work to spur growth of NatureBridge and similar programs to increase the scale of these programs and number of youth that they reach. Invest dollars and resources. The Federal Govt: could be more effective partner by having more flexibility in the kinds of partners it works with and should work to remove obstacles to partnership or growth or partnership for nonprofit organizations. Provide resources to nonprofit partners to allow them to house and educate students in national parks.

1) Stop closing land to people who wish to use the trails and roads 2) Less Federal involvement 3) Cutting the Fed. Gov't 4) Tools-Chain Gangs use to work Fed trails and lands.

Need assistance from federal gov't integrating curriculum and physical education standards so teachers can justify getting children outdoors in parks and exposed to nature. Need outdoor education programs

Children are being denied opportunities to connect with nature the way they should. Physical education is not required by many districts. Students are overweight. They score better on tests if they do physical activity outdoors. Students need a connection to the natural world.

## Discussion Question 2

### *Los Angeles, CA*

*(cont.)*

Her organization works collaboratively to build gardens and parks. It is difficult for non-profit organizations to get federal funding. Look at mechanisms to make it easier for NGOs to access funding – they can help accomplish federal goals.

Took kids on field trips last year from El Centro. Each busload of kids was \$1000. The program involves science in motion. Part of problem is that there is no money to pay for buses. It cost \$18,000 to take 400 kids on a field trip. Busing kids is a huge problem that doesn't have the visibility of other problems. It would be nice to get some funding from foundations. USFS has good student oriented programs, but it is difficult to get students to them. Once her program got funding from the local water district.

Speaking as an educator, he thinks what works is not having pressure to pass standards. It is important for kids and adults to have fun so they get a "Huck Finn" type experience. Then they are interested in field guides, etc. Students and adults need immersion experiences e.g. getting dirty, hands-on. There is a need to connect people's hearts through direct exposure to the outdoors. Don't get too hung up on meeting curriculum standards. Experiences are the seed to passion for the outdoors. Challenges include too much administrative paperwork.

People are interested in recreation. Laws focus more on conservation. Regulatory focus should include motorized vehicle access. People need off pavement access – fishermen, off road vehicle enthusiasts. These type of people are often stigmatized. Many are willing to volunteer. These folks are a large untapped resource. They feel that some gov't employees are hostile. The federal gov't should allow more back country access to unpaved road systems and existing systems should be allowed to continue. Such roads can also be used by bicyclists and pedestrians.

Trash in public areas is horrendous. Hopes teachers and others taking children outdoors will teach them not to leave trash. Fires – wants to know who is responsible for fires. How many millions of dollars does the USFS spend on predator control? Feels that predator control only benefits ranchers. The money could be better used, especially when we are talking about getting children outdoors.

He welcomes renewable energy. But there are tremendous costs associated with it. Not much public land left for energy developers. They have to mitigate for endangered species. Tax base is being diminished by land being put into wilderness areas and public areas. For example a huge number of acres were lost by San Bernardino County. Even if everyone negotiates around the table, lawsuits are a big problem.

Lots of funding is locked up, especially in CA. She wants to see enhanced funding for land acquisition. No local land trusts are in San Gabriel Mojave area. Should focus on existing infrastructure rather than destroying habitat.

The Station Fire consumed forest and funds. Parts of the forest are closed for an indefinite time. They have an office in lower Azusa. Their office helps guide visitors – more than a million per year. The forest is severely underfunded. More visitors per year than Yosemite.

## Discussion Question 2

### *Los Angeles, CA*

*(cont.)*

Worried that working to get kids/people to visit public lands might become an inappropriate advertising venue

A component of education not discussed is the influx of people into remote areas. There is an increase in rescues of people who go into remote areas without sufficient water or survival gear. Also noticed graffiti in remote areas. Yes, we need to get more people out, but we need to give proper education.

LA has the largest equestrian population in the country. People purchase burros and horses from the BLM. Very few wild horses remain. Roundups are inhumane. Methods for roundups need to change. Consider birth control for wild animals.

Works with LA Mayor's million tree program. Link kids to nature by turning concrete in front of their homes into trees. She talked about urban forests. She related a story about a young man who didn't conform to neighborhood mores. Neighbors worked together to plant trees. They included the nonconforming young man who became part of neighborhood. The experience changed the dynamic of the neighborhood. Tree planting helps connect and reconnect people. It is good for kids that can't get to parks. They need money for the maintenance of trees. Could employ kids if there is money – from federal gov't? Urban forestry is too expendable in public budgets.

Get to something local not just places where you need buses. Create local parks that are close.

Countywide master plan for more green space for recreation to help with ADT with kids. Need is to create a thin ribbon for parks and how do you get people in there and maintain.

Education needed for what we currently have. Challenge is to get people to the mountains. What access could be provided? How do we get urban core to mountains via "access." Shouldn't have to drive to get to mountains. Need Better access via bikes and mass transit.

Create free youth bus to mountains and parks.

National scenic trails but missing urban trails. Urban trails exist the issue is how do you spread word about (challenges by county) Trail developed but need to create map.

Lack of support from parents. Public schools should enforce greater volunteerism with their kids to the outdoors. Challenge public schools do not provide field trips to parks but they attend indoor activities.

Challenges to National Park (Glacier) its disappearing animals and plants. Need help with Climate Change. Work on solar and wind not nuclear, could not have oil spill with nuclear.

## Discussion Question 2

### *Los Angeles, CA*

*(cont.)*

People have opportunity to connect with ecology. Use art to help create balance /envision and connectivity.

Need buses that are close to (free for those under 18) where people do not walk a few blocks to catch. Use students to help maintain plants.

Problems viewed from multi-use not silo. ACOE only view flood control not recreation. Need watersheds Councils as they work at viewing multiple facets.

Whittier Narrows would keep kids out of gangs and the education there works.

Develop cultural systems at Whittier narrows based on the Tribal Nation who owned land before. First mission was build by the Tribal nation and they would like to be recognized by having a place for them to meet and be buried. (Need federal government support).

Community school parks are needed at local schools. LA has worst percentage of neighborhood parks based on population. Parks Save kids lives.

Need more connection between mental health and parks this does not exist in LA.

Lengthen school days to incorporate outdoor activities for kids.

Colleges provided greater example of kids to outdoors and we need to start this at a younger age.

Tremendous leverage opportunity with high speed rail. Underground rail/collaborate with putting culverts in the tunnels. • How to integrate the rails into part of the outdoors? Need Joint line items for agencies and more collaboration: E.g. ACOE does not do clean up of toxicity and can be cost prohibitive for local gov. ACOE cannot spend other federal money for cost share. Only their own and local funds. EPA provides money for clean up.

From limited number of studies—scaffold’s experience to get folks out to the rural park areas. Staffing will be a large issue for the parks. Parks should be able to add wildlife habitat to urban areas.

## Discussion Question 2

### *Los Angeles, CA*

*(cont.)*

Lack of integration in agencies for offstream amenities. Risk management vs. recreation needs. Recreation and access opportunities are not recognized by federal partners as a mission because of risk issues. Need to provide a method to allow for outdoor experience and accept risk at the same time. ACOE does not have money to provide for recreation near the flood control projects. Federal agencies need to look at watershed management approaches. ACOE does not have granting authority or the authority to enter into agreements with local jurisdictions for maintenance agreements/joint powers of agreement to allow their projects to provide access and recreation beyond flood control.

Whitewater Preserve/Palm Springs Public cannot access lower portion of the Whitewater River ½ of the year because of fire closure. • Federal Role: No staffing is available by the BLM, so no public access. Upper part is staffed by the Wildlands Conservancy. Lower part should be staffed by BLM. • Challenge: Spent > \$40M to partner with Feds to purchase 650K acres in the Mojave and gave it back to the Feds for preservation. The same land is now under threat of development. CA Desert Protection Act is supported by the WC. We need to protect lands first before we can restore them. • Tools: Push for solar energy in the desert. Legislation brought different stakeholders together for protecting the Mojave Desert. CDPA 2010.

Challenge: Our efforts often feel like “drops in the bucket” compared to the needs of educating our youth about nature.

Challenge: The environmental issues that her clients deal with are in a negative context because of fines etc.

What has not worked: BLM said they were going to monitor, but they have not.

Greatest Challenge is identify federal \$\$ to fulfill requirements in unique LA situations where land acquisition is expensive! Non-pristine lands.

Linking green areas together is a challenge too.

Challenge: We do not always have control of land, so we cannot qualify for certain grants to develop the parks. For example, one brownfield, could not be improved because of owner’s liability. Owner did not want to take the risk. Also, LA cannot compete with pristine lands for grant monies.

How do we get resources for multiple agencies to work on joint projects?

Lived next open space with irresponsible OHV use. Challenge: how to figure out how to allow access and appreciate natural resources simultaneously. Companies that build OHVs should pay for places for people to go to for offroading, so pristine areas do not get destroyed. Need a method contain the bad actors of OHV use.

## Discussion Question 2

### *Los Angeles, CA*

*(cont.)*

Part of partnership for all National Historic or Scenic trails. National Trails system. There are 11 national Historic trails—5,343 miles. Only 1/30 of these trails is fully open--The Appalachian.

Need funding for these trails as well as parks.

Working in collaboration is a difficult challenge. Need a strong focal point, such as the San Gabriel Mountains National Recreation area. Would require the NPS and USFS to work together. USFS could provide technical support to the effort.

We build new parks, but we have nobody to maintain them, and they become taken over by gangs. Once people see the LA river as a river and not a drain, it is amazing how they change their perception.

Sometimes thresholds for grants are too high to meet the funding requirements for our projects.

SAFETY

time/work

transportation

field trips = exposure

Reach out to schools

transportation

school programs (clubs, popularity, engagement)

motivation (GET OUT!)

better safety standards and regulation

## Discussion Question 2

### ***Los Angeles, CA***

***(cont.)***

make EE part of the curriculum

advertise parks and make them accessible (media)

Exposure and awareness of the outdoors

safety in the outdoors and a way to get there (safety and accessibility)

use technology to reach out to young people

Trash

air pollution in Pasadena

South Central needs more trees

Oxvard construction is cutting down environment/outdoor spaces

Community Gardens

make something of your land and own it

South Central has empty lots with trash and waste in it

West Couria is tagged with graffiti as well as South Central

Greater accessibility for public transit to park spaces

Green jobs

## Discussion Question 2

### ***Los Angeles, CA***

***(cont.)***

Greater security at parks - utilize more park rangers, especially in inner city parks

Transportation

Crime

Busy schedules with work, school, family obligations, etc.

Technology - we have become a faceless society - we spend a lot of time online especially on social networking sites

Drugs

No vacation time

Lack of education about these wonderful park spaces - many do not know that they even exist

Litter

Smog

Pollution

Not enough trees

- Trash-So Central-need more trees
- Pasadena-air pollution
- Oxvard-construction is cutting down environment

## Discussion Question 2

### ***Los Angeles, CA***

***(cont.)***

- So Central-empty lots, plant more trees, do community gardens, make something of it

- Angeles National Park-lots of horse poop with flies

- West Couria-fight graffiti

- Fight graffiti by doing a mural instead

- There is so much graffiti-we don't even see it anymore in So Central

establish programs and continue to fund

open opportunities for more open spaces

Too many factories/buildings, presence of civilization in the "outdoors"

dirty streets and bathrooms, minimal maintenance

we need to start taking ownership of the land - promote programs on public lands

start community service programs

campus clean ups

teach each other to help out and don't add to the problem

conserve water

more trash cans and recycle cans on public lands

## Discussion Question 2

***Los Angeles, CA***

***(cont.)***

more tree planting

availability

technology is a distraction

Not enough education about where to go

Laziness

Lack of encouragement from families

Provide transportation to parks and forests

Trash

Graffiti

Lack of understanding of how actions impact environment

Limited space and crowding

Not enough parks

Dry terrain

Not enough money to clean, maintain, and keep parks open

Peer pressure by the "wrong crowd"

## Discussion Question 2

### ***Los Angeles, CA***

***(cont.)***

Safety

Transportation

Technology -- video games isolate us from society

Procrastination

Lack of nonprofits to take kids outdoors

Forest fires

Rose Bowl

More camping

Wish we knew more of what was available

My parents didn't even know what opportunities

Lack of info. Restoration needs to be looked at from all angles before any work is done.  
Transportation systems need to be beefed up in restoration process.

More public info on National parks

San Gabriel Mountains

We just worked with what we had.

Air pollution

## Discussion Question 2

***Los Angeles, CA***

***(cont.)***

Trash

Safety

Need trash cans

Recycling bins

Over use

Homeless people

Pet waste

Transportation

Gangs hang out at park

Need more funding for field trips

Not enough organizations (e.g. outward bound) to outreach to community

School education doesn't promote outdoors

Not enough exposure to opportunities

Need more buses and public transportation shuttles

Distance too far

## Discussion Question 2

***Los Angeles, CA***

***(cont.)***

1st time in mountains was with work

Lack of advertising of what is available e.g. Santa Monica Mountains Recreational Area

Shuttles should go to schools, shuttles shut down due to lack of use

6/14 group members have camped

10 minutes

Around the block

30 minutes

15 minutes but closed down, no park

Only 3 members can bring whole family outdoors

7 cant access

Not enough transportation

Takes too much time

Working / Tired

Provide outdoor jobs (e.g. internship for F.S.)

More programs (outward bound)

## Discussion Question 2

***Los Angeles, CA***

***(cont.)***

Funding for organizations to get more programs and outreach

Restore parks, improve aesthetics

Make parks bigger

More accountability for funds that are available, see that money is put into action

Maintenance of parks

Money for school outings

Construction at parks should focus on greenery and grass and trees, not half completed buildings

Handicap accessibility

Clean bathrooms

Sport field only available for organized sports, should make open for all

Swimming pool, water features

More info and outreach

School gardens, community gardens, botanical gardens

Funding and accounting

Jobs

## Discussion Question 2

### ***Los Angeles, CA***

***(cont.)***

Maintenance – keep it clean

Trash – big problems

BLM Open Space works. Concern with closing some sites.

Historic treatment of cultural resources is in question; adding the LA River is challenged; and federal funding is needed.

fragmentation of land is a challenge.

series of connections, environmental health, empathy lacking, kids education, challenge to integrate oceans, geology, and habitats.

General attitude "what's in it for me"; and charging to access lands is a big challenge for some.

Stated permitting process is a challenge, gave Yosemite as an example.

information on local recreation areas is lacking.

connections to people's own backyards can be a challenge.

Halliburton loophole; fracturing for groundwater mining is a challenge; and so are trans-boundary water issues. The Delta is broke.

Four national forests within the LA area and not appreciated

communicating the zone, the history of off-road vehicle use is challenged.

land use not fundamentally used or understood. Keep open spaces open is a challenge for the future.

applying science and applications to lands can be a challenge.

## Discussion Question 2

### ***Los Angeles, CA***

***(cont.)***

territorial challenges exist. No communications, no collaboration, and no resource sharing.

recreation on public lands is phased out. The forest service has no explanation.

## Discussion Question 2

### ***Minneapolis, MN***

Pollutants (“bad stuff”) in the Mississippi killing the fish

Mercury and iron in the river

Litter and graffiti in our neighborhoods and local parks

Invasive species – it’s overtaking the green space, seeds spread quickly

Picking up trash, and trash on the bike trails

Stray animals are common and dangerous

People are ignoring the problems

There is a lack of knowledge because issues aren’t consistently in the news media and people aren’t outside that often.

People don’t have the knowledge or resources to respond to issues

Kids don’t realize how easy it is to get outside; they don’t have to take an extreme trip

School and social time takes up so much time that there isn’t free time for them to spend outside, and schools have stopped taking them outside for coursework.

Bugs and outdoor allergies are excuses people use

It’s dangerous and so parents don’t want their kids outside when there is criminal activity or gangs

Clean water – Having the experience to be able to take a dip of water to drink, swimming, tip the canoe, knowing it is OK to eat the fish

Wilderness areas

## Discussion Question 2

### ***Minneapolis, MN***

***(cont.)***

Pollution, example given of a glass bottle that someone broke along the Mississippi

Garbage/trash

People throw it out of the cars

In taking care of plant planters near a fast food chain in St. Paul, they are always filled with trash

The environment looks worse with trash/garbage

It does damage to ecosystems

Difference in countries – some have very little trash compared to other countries

Polluting Water

Effects on wildlife

Consciousness of people that litter – how do we get them to stop

Disposable products – example that McDonalds wraps food items even when people are eating indoors

Chemical in the environment, need to educate the public more

Service learning: Addresses a lot of issues both indoors and outdoors, provides the opportunity to learn about chemicals, connect with other classes, and affect mindsets

This is an overwhelming question

Legislative policy issues

## Discussion Question 2

### ***Minneapolis, MN***

***(cont.)***

Opportunities such as the National Youth Leadership Council and Minnesota Alliance with Youth

National Parks Conservation Society - Advocates for parks in Washington, the Regional office is in Chicago

Reduce consumption and packaging

Evaluate personal lifestyle choice

Learn more about what is going on so you know what to do/not do

Talk to family members

Too many class projects/school work

Picking up trash, and trash on the bike trails

It feels overwhelming because you are just one person

Safety and the perception of safety is a big concern for both kids and parents.

Adult leaders are needed who can be mentors, examples, address the safety issue.

Need for gear to camp and do other outdoor activity

Organized sports takes too much time and makes kids associate all outdoor time with sports activity. Need to allow unorganized activity as well.

Need culturally appropriate programming. Not just a language issue but a connection to older traditions with the outdoors found in some cultures.

Transportation to remote locations is a big issue. Even transportation to local resources can be an issue because of cost and safety concerns.

## Discussion Question 2

### ***Minneapolis, MN***

***(cont.)***

Self-definition of some kids as “City Kids” who don’t do the outdoors keeps many kids from trying things they might like. There is a need for programs that help “City Kids” get past their fears and identity issues to get to the experiences themselves.

Need more fun things to do in winter as it is cold here for much of the year. Outdoors can’t just be in summer.

Funding is an enduring issue, but especially important in the context of state and local budgets going into crises. Federal programs that are trying to leverage a local match may have a challenge in finding it from shrinking local program budgets.

Understand the scale of the audience need and build programs to meet the need. This will take bigger budgets, but these should be seen as investments that payback with an educated and healthy population that cares about the state of the natural world.

Without getting hysterical about it, move to develop programs that help young people to understand that we are dealing with global systems under great stress and that we have a crises at hand. Don’t just approach interacting with nature as something tha

In my neighborhood, a Somalian community, there is too much pollution in the air around the University of MN, Children have asthma. South Minneapolis: people looking for a cheaper place to live but have to suffer from the pollution. The history of the area was a dump for trash need more funding to clean and regulate the pollution in this area.

Getting kids transportation to parks and outdoors

I come from East Africa and it’s tough to live in Minnesota! The snow, you don’t know how to walk, how to dress, it is a very tough environment in MN. We should work together as a community to support and encourage each other. We should work together and help each other we could achieve great things.

I don’t think my parents would be able to pay for my whole family to go out its too expensive to take my whole family

I think there is a desire to go outdoors, but there is a lack of priority for it when people are so busy. In their time off they don’t want to spend so much time to make the commitment to go outside. We are all so busy that we don’t have time to get out anymore

Now that there is more and more technology available, parents have even more challenges to get their kids outdoors. They need to take responsibility and take their kids outdoors.

There is a lack of knowledge about where our National Parks are and where our State parks are especially in an urban environment. We need more advertising to tell people where places are and how they can get there.

## Discussion Question 2

### ***Minneapolis, MN***

***(cont.)***

When we were kids we didn't have iPod Touch or PS3. Now it is even harder than before to get kids to go outdoors and be active.

Algal blooms

Coal companies, standards on pollution and regulations with what happens with the stuff after it gets burned

Could kind of have to do with treaties and how the land should not be trespassed on, the importance to the Park Service is that the land is worth a lot of money but they need treaties to protect it.

In our Native American community of about 1,000 people, poverty prevents them from going to the city all they have is a muddy basketball court so they turn to video games to entertain them. Need money to get the youth outdoors, they're open to going outdoors but don't have the money to do it.

It is also very important that television and computer waste is properly recycled. That is a secondary issue from technology. There is always something new and better coming out so we have all this waste. If old electronics are not recycled, it becomes another source of waste for the environment

It's hard to know how to stop it. People want their green lawns; a viable alternative is necessary, maybe like rain gardens.

Lack of funding for this kind of care.

Lack of funds, funding goes to large corporations and doesn't make it to the Native American communities

Need help from the government to lower prices on local food

Now we see such a great difference everyone is on their cell phones, hanging out peering around their MySpace, around urban areas you lose your identity because of technology

On our land things are taken out of the ground, toxins in the land and water causing cancer in young people lately

## Discussion Question 2

### ***Minneapolis, MN***

***(cont.)***

On the Reservation as a child on open plains, after technology and electronic entertainment hit, it didn't matter. There was no cell phone reception when I was a kid, we had more time to play outdoors and get in touch with nature, and we created memories and stories. Now that we live in the city it's a lot worse, no one has the money to go anywhere and everyone wants to be online and playing video games.

Steam boat tours but the steam boat burned down

Still stuff being dumped into the Mississippi, like garbage or other wastes.

Water milfoil problems

Why is technology preventing kids from getting outdoors? They need to be more in touch with their roots and their environment; everyone is disconnected from their ancestry. People that are in touch with their ancestry are more easily connected to their environment and their outdoor spaces.

Litter in parks or in the water, lakes, Mississippi

Air pollution because he has asthma.

Are there other ways one can engage with environmental concerns?

Plant more trees. Removed for buildings and important for oxygen in yards or parks.

Leave no Trace, leave places better than you found them. Includes parks or city street. Pick up trash. Leave a smaller imprint.

Have more education so there is less to deal with in the first place.

Easier when schools teach about invasive plants and other related subjects.

Family restrictions due to safety, gangs and fighting

## Discussion Question 2

### ***Minneapolis, MN***

***(cont.)***

Trail building is hard to do on your own and friends who are interested work a lot

No car to get to some places

To many other things in the way, jobs, school

Are you okay going by yourself or do you not want to do it alone?

Some people don't want to go because friends are busy, watching TV is more important

Some things like canoeing or tennis take more than one person, a lot more fun with someone else.

Some things are team sports, soccer, football

Equipment is an issue, if you don't have a canoe or boat

Are facilities an issue?

Transportation again. Most state parks take a car to get to.

Are fees an issue?

Licenses are expensive and time consuming to get.

Need to build more parks and playgrounds close to peoples houses, especially for small children.

Larger equipment for taller, larger kids at playgrounds. (teenagers)Shute's and ladders park is great but 40 min drive.

A place where larger, older kids can play with younger siblings

## Discussion Question 2

### ***Minneapolis, MN***

***(cont.)***

How far are you willing to go for park or trailhead?

10-15 miles biking

feels a little out of reach (out of touch) because in a classroom too much

need to engage the parents since parents influence young people,  
find a way to instill personal responsibility - some of her family members say it's too trashy to go to a park and they wouldn't want to go there and they want something to be done about it but it's not necessary for them to necessarily do it  
create more nice place where people could come and enjoy without all the trash  
getting the younger people to see what the outdoors actually means (not just forests and stuff) but what's around them here  
More youth programs (kids love to play outside) love parks and the outdoors; try to get them to see what they have around them and how to protect/save it or restore it

invasive species - trefoil  
not enough planting native species that have roots grow deeper and are more sustainable  
learn places other than yours is hard to do, it would be nice to be able to get out more for school trips

not enough small steps to help the environment recover  
one of the biggest issues is lawns – over-watering and the use of pesticides, if every lawn could cut down on those two things could make a big impact

invasive species  
pollution and biodiversity (micro-organisms) even though they didn't find anything to be a huge problem when testing the river for school  
ponds are really gross (filled with garbage)  
not enough regulation on big businesses like Monsanto,  
too many special interest groups getting what they want from people on the EPA board  
lack of a bigger (more aggressive) and faster steps to a better energy policy  
a need to cut down on big business – put more restrictions on them

invasive species  
ponds have trash near where she lives  
not enough native plants - birds using the native plants they've planted after removing invasive, bald eagles that they see when they are out working that they didn't see before  
a company along the Mississippi River pollutes the river but they pay for the Green Team to clean up the environment, conflict of interest, they shouldn't be allowed to pollute in the first place

## Discussion Question 2

### ***Minneapolis, MN***

***(cont.)***

invasive species like thistles

sweeping up grass clippings before they end up in the surface water, it's a small step that an individual can do  
education is a huge aspect - everyone here has an environmental background – we need to share that knowledge with others

access, it doesn't seem like a lot of places that are accessible without a 45 minute drive - to get away from concrete or maybe I just don't know about the areas close to me

The ad culture and image obsession as a by-product of capitalism. It needs to be combat by making kids care early about what's really important by engaging them in hands on activities, especially outdoor activities.

never taken a bus to swim anywhere  
would like to be able to swim in a lake closer to where she lives

access is right around where she lives so that's not a problem but the space is trashy  
lack of responsibility in helping clean up, she jogs in a regional park and there was a dead animal washed up and she wanted to clean it up but was afraid of disease, she was very sad about the environment, we polluted, that may have caused the animal to die

Litter, even when trash cans are readily available

Litter along roadway medians and shoulders

Litter in rivers, lakes, and farmland

In Madison, WI there is coal dust and ash everywhere. It dirties clothes, hair and all things outside. A once swimmable lake can no longer be used due to coal ash pollution

The Mississippi River is unswimable due to water pollution.

Oil spill in the Gulf of Mexico

TV, video games, computer, cell phones

## Discussion Question 2

### ***Minneapolis, MN***

***(cont.)***

Facebook, social media

Safety concerns: nearby parks, such as Hollow Park, are not safe a night. There are no lights and people are scared to go there. I will not go there alone.

Lazy people

Traffic is too dangerous to allow kids outside. There is no park close enough.

The world is not safe enough to let children play outside, they might be kidnapped

Hazardous waste and pollution concerns: Will not let children near places such as Harriet Island and old printing facilities for fear of toxic barrels and radiation in the area. Parents err on the side of caution and do not allow kids to play pell-mell an

People will model other's behavior. NPS Ranger explained the Mississippi River is safe for swimming and felt if some kids started swimming in it, other kids would join in. Same for other activities, there is a multiplying effect once an activity is initia

I recently relocated to the area and do not know anyone to play with.

My aging mother cannot take me to parks.

Through the Audubon Chapter of Minneapolis, I recently worked with Audubon Adventures in an urban charter school of 5th and 6th grade girls in Minneapolis. To augment their classroom lesson, a few chapter members offered a field trip to a local Minneapolis park. The students and their teachers walked the mile to the park only because there was no money to pay for the bus. There were complaints about this, even though it was a warm spring day. After eating their lunch, the girls were reluctant to throw away the remains in the trash recepticle for fear of what might be in it. Was it a monster, bugs or some undescrivable creature hiding in the depths of the trash can? They screamed with relief as they slammed the can's small lid and ran away from any trouble. Clearly, these girls were less interested in bird identification or the binoculars we offered and more in need of basic outdoor experiences. None of them had ever visited the park, yet it was near their homes. We need opportunities to bring young people outside.

## Discussion Question 2

### *Missoula, MT*

We need land management -- don't close off the forests -- they won't be here for future generations -- they will die out. There needs to be a balance -- all things in moderation. Thanks!

Beetle kill in our forests. Allow logging and cleanup. Keep jobs available for Montana workers.

Manage the land: don't just forget them. Make use of local resources and small groups available in each community.

1) I believe the Federal governments (sic) need to consider local, rural Americans before developing National Monuments. These individuals are some of the most connected to the landscape and are already working to manage the land. Instead of supporting programs that would take control away from these individuals, promote programs that provide incentives to them for conservation. In my experience, locals are conservation minded but also need to provide for themselves and their community. 2) Expand programs such as NRCS's Conservation Innovation Grants program and make them more accessible to ranchers and landowners.

I think the most critical conservation challenge is simply moving people outside, encouraging with a full on local media (to tailor to that areas need) to get their hands dirty to build a sense of pride. Throwing money or votes, or just a warning will die without active hands.

The service-learning model that is currently being incorporated into public ed in many of our nations' schools systems will be a valuable asset in providing youth with outdoor experiences and personal investment in conservation. Service-learning should emphasize public lands and/or private local farms, nurseries, and other outdoor usages in order to create a culture that is not driven by technology alone. It is a necessity to have this type of individual engagement with the lands/outdoors/natural environments in order to harbor a community that will contribute to their conservation in the future.

Enact legislation that holds those who challenge industry in court to pay their own legal fees and to pay all costs when they lose in court. Loser, pay.

I am elated with the "know your farmer, know your food" -- type initiatives springing up all over the nation. I would like to see programs as well that promote local natural resources. I am active with a group called "Local Wood is Good" which is trying to promote use of locally harvested and processed wood products. It would be neat if we could replicate efforts like this, modeled after Know Your Farmer Know Your Food, around the country.

Conservation requires secure funding. Aittmaro(sp?)-Robertson and Dingell-Johnson is an excise tax on sporting equipment (sic) that has worked very well. Need to expand approach to include other species through a mechanism like the teaming with wildlife initiative of the 1990s -- try again!

1) Protection of public lands from motorized abuses 2) Protection and restoration of intact ecosystems including fragmentation 3) Noxious weed invasions 4) Protection of water quality

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

The scientific fact of global warming means that we don't know today what we will be conserving for tomorrow. Our habitats are changing so quickly that fighting to save a piece of land today doesn't guarantee that it will be protected. Saving land may be an obsolete idea.

Support for local products to sustain rural communities and providing opportunities to keep folks on the landscape being working (sic), active and good land stewards on their lands. Make good choices economically feasible.

There is a need to balance conservation and people being able to make a living. Timber Industry, mining and farming and ranching must be a consideration. Thank you for listening.

getting families out camping -- free recreation use on our forest lands. Supporting education for youth of all ages about the outdoors and the environment

Slow down and stop the global warming. Change the priority from resource exploitation to resource sustainability.

Availability for people in more urban areas. Outdoor experiences are not within reasonable distances and those that are are not communicated. Unless individuals have the means to travel, they can't be experienced. Partnering with regional programs/parks to give people incentives to participate in parks/outdoors.

Get support to local level, \$, agency authority, tax incentives. Allow latitude to agencies to make local decisions.

1) Getting youth into wilderness, I think my generation is not as connected with the land as previous generations. 2) Keep working farmlands available for farming and not development.

Conversion of agricultural lands. Unplanned (sic) growth eating up important conservation resources such as wildlife habitat, scenic open space, clean water, cultural treasures, family farms and ranches.

Loss of agricultural land, specifically sustainable family farming operations, this includes loss of soil to intensive industrial agriculture. The changing climate and the loss of snowpacks in headwater areas of Montana. Loss of habitat and farmland to unplanned development and sprawl, which is supported in part by automobile centric transportation infrastructure.

Water! Montana Trout Unlimited applauds NFS for their efforts on Reserve Water Rights in Montana. However, three of BOR's Montana facilities seemed to be managed at odds with fish management on three Blue Ribbon fisheries in Montana. Specifically, Yellowtail Dam on the Bighorn River, Clark Canyon on the Beaverhead and Canyon Ferry on the Missouri River.

Keeping open land intact. Maintaining family farms and ranches. Ensuring water rights are adjudicated on federal and tribal lands and water in streams and rivers is seen as a beneficial use. Rehabilitation of forests and grasslands.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Climate change

Stop promoting oil use -- start promoting clean power. Stop subsidizing oil use -- start subsidizing renewable. Stop using oil! -- Start using renewable. Simple eh?

Water quality is critical for healthy landscapes. Water quality is compromised by the 30,000+ miles of USFS roads in MT, about 1/3 of which are unmaintained, unneeded (sic), and unwanted. The legacy road and trails initiative has been funded by Congress at 40, 50 and \$90 million in the past 3 years. Yet over \$10 billion in uSFS road work is needed. Continue to fund the legacy road and trail initiative and increase annual funding to \$100 million.

The fundamental issue is to get people to interact in a sustainable way so we have open spaces for future generations. This means long-term educational programs in the formal and non-formal setting that provide awareness, understanding, problem-solving skills and participation (action) and connections with their local place.

Preserving our open-spaces. Connecting people with place.

What strategies work: dam removal, administrative land management and travel plans, land purchases/acquisition, project partnerships with early collaboration, restoration efforts. What are obstacles: adequate federal funding of agencies, difficulty of removing inappropriate uses such as motorized vehicles, fossil fuel development. the agencies should use the NEPA appeal process more seriously to avoid litigation. Ability to hold polluters accountable.

The emphasis put on youth, society at large, on materialism over experience and sustainability -- i.e. the tendency of profit driven enterprises to demolish wilderness resources for financial gains, when the essential value of these wild places is the transformation of individuals that takes place in the presence of unbridled and unmarred nature.

Understanding of the scope and impacts of not protecting and preserving our lands and waters. Incentives to preserve. Opportunities and access for children and low income, particularly in cities.

It is fine to hold listening sessions, but where and how will this information be utilized to encourage a grassroots movement to encourage and motivate the public and agencies to focus on the "Great Outdoors"?

Public schools need to enforce a conservation ethic. More school trips should be to state parks, instead of cities. Both are important but there needs to be a connection between the nations youth and their natural environment.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Bug killed standing timber is not able to be harvested and used as a resource (see smallwood) for buildings and bridges construction due to the fact that liberal based "conservation" groups appeal timber sales for these resources tying these sales up in court until the resources are no longer usable because of decay and "blueing" in the case of lodge pole pine, one of the main species susceptible to bug kill. A solution is to use these standing dead trees for biomass for energy and building materials rather than letting it burn, which is what is happening now.

1) Open the debate and scientific study independent of politics and liberal (or conservative) agenda!

US population needs to get in touch with natural ecosystems

1) climate change, 2) growing disconnect between today's youth and the outdoors

pollution and diminishing of our biotic factors (soil, water, air) upon which our plants & animals depend; stewardship (appreciation for, connection to) the great outdoors is not a priority at the personal, state, regional levels; obstacles to effective conservation or connecting people to the outdoors: value system putting money, shopping malls, computer games, prestige/power, "getting ahead", etc. in front

1) Allow fed agencies to coop & work with state & local groups easier, 2) Developers cutting apart lands for \$

Balancing increased use of public resources with a largely accepted public conservation ethic

climate change; sprawling development; lack of collaboration between Fed, state and local agencies; lack of awareness & action on part of citizens regarding conservation

lack of individual responsibility & concern

The American idea of entitlement to land, resources, & access without responsibility to others & the conservation/sustainability of our society

Politicians running natural resource activities

Establishing conservation stewardship across socio-economic spectrum; Citizen involvement for on the ground conservation efforts; Incentive based conservation strategies are often not sustainable for the long term if we see increased conflict or conservation needs

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

How do we manage our public lands? -(I know, big & eternal question); Loss of working, family owned forests; Loss of environmental education in urban areas & how it applies to their lives, i.e. natural resources used in living - houses, etc.

1. Early-on education/interaction with outdoors & wilderness to develop social responsibility; 2. Hiking & biking trails to easily connect with outdoors; 3. Volunteer programs to assist educ. & preservation - activate seniors (lots of educated baby boomers need something positive in life); 4. Awareness - promote, publicize, subsidize - zoning, etc. & wilderness mgmt; 5. Public & Private organizations working together

We as a population have a huge appetite for natural resources, yet no leadership of how to meet our demand.

1. Lack of youth knowledge about conservation issues; 2. Park pollution

Building individual responsibility for conservation by introducing youngsters to outdoor activity. Solve it--don't lock it don't close it.

Need healthy landscapes, managed lands including forests. End lawsuits that block active work; Must maintain access & improve where limited; Declining hunters

I'm concerned about keeping our wilderness pristine. The fissile fuel industry has had a profound impact on our wilderness and urban environments. From water pollution and air pollution to contribution global warming, we need to keep the toxic and risky fossil fuel industry out of our public land!

A generation of young people growing up without a personal connection to the natural landscapes/ environment. Kids today spend a great deal of time indoors and have lost interest in playing, exploring, hunting and fishing outdoors. Conservationist land stewards generally base their passion of working for the environment on a personal connection- typically established in their youth

This is not from the bottom-up. This is Agenda 21 UN from top-down. Loss of land rights by way of environmental land use law which circumvent the public process. ie= SB131 = The tools to shut down the economy from y to y.

Lack of connection between children and the outdoors

More education and access. In schools, trails and parks funding for internships and outdoor programs in the wilderness

The quality and amount of water in the future. Saving the lands from development.

## Discussion Question 2

***Missoula, MT***

***(cont.)***

Americans don't know enough about their public lands and the different management strategies for them.

The next generation seems oblivious to the necessity of wilderness

Kids in the Woods! Water! Energy!

Climate change. We need pass good climate change legislation or there won't be any conservation left to protect. Also we need to focus on K-12 outdoor education. Let our youth outdoors.

Preservation of productive, privately owned agriculture and forest lands. Maintenance & expansion of national, state, & local park systems

Education - we need to provide more opportunity through our public schools for children to access public lands and learn and develop a connection and responsibility for them

Loss of future stewards of the land.

growth of government land grabs

Preserving working agriculture lands and connecting people with the farms of their food. The land and the people the agricultural heritage.

Engaging families in Outdoor Recreation. Maintaining Rural character in the west.

Lack of public land

we need to make it as easy for people to get outdoors as it is to turn on the TV. Access and communication is an obstacle. There are several non-profits out there organizing and doing great things, but they have limited funds for adverting or new media communication to get volunteers involved or youth active we need a told for communication and funds to get our message out. Partnerships with the state, local and federal governments could help communication efforts. also partnering with private sectors would be beneficial. How do we connect parents as well? we cant rely on education to do it all.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Interested in tying into issue of child obesity and getting kids outdoors, also Michelle Obama's efforts. Would like to see more effort in getting kids interested in cultural resource efforts and opportunities in MT and getting volunteers involved. Difficulties in getting resources (e.g. state park funding – need basic maintenance)

Need a strategy where conservation & connecting people come together through restoration. There is an opportunity for restoration work to provide multiple benefits, such as connecting people w/ land, engaging people in caring for the land. Need a heavy investment from the Administration in restoration (e.g. Clark Fork restoration work, Mill Town Dam removal). Lots of opportunities: abandoned mines; timber road restoration; forest health issues; bank erosion & water supply. Rewards will be measured in jobs, connection, and care for places we love.

Working to get local food into school cafeterias. Teach kids where food comes from by having hands on activities; working w/school gardens, class room activities. Getting school kids to see chain from garden to final product

Addressing all questions; restoration where it's at. Trout conservancy working w/ many landowners and partners at long term restoration; applying science (how streams work). We have plenty of biologists, need people that can put it to use on the ground. Knowledge has increased, but problems are same – collapse of habitat and land relationships. Best strategy is volunteer work – planting native plants, hands on projects; satisfaction of long term benefits; Obstacles – Restoration is where it's at. List of work goes on and on – mines, roads maintenance, culvert replacement, roads put to bed; agricultural impacts. People want to know what they can do to help – need projects & money to be ready (e.g. Clark Fork project). Need more of these types of projects. Interest will wain w/o restoration activities. Need more than one-shot stimulus – need longer term commitment of resources. Make sure environment will be there through stewardship.

Working on oil and gas issues. Friend has son that was affected by air pollution. Their group has had conversations with over 7500 people across the country. Oil drilling affecting many parks in the NPS; public needs to know this, and we need to pass strong legislation to protect these areas.

Resources for action – there are many foundations and grant sources for available to the community for projects at local to national level. Also at federal level – need more incentives: how to give tax benefits to landowners for supporting this work; also land use planning (e.g. setbacks) important to coordinate federal & State land use management.

Need parents and families to be involved – They have a pilot program reconnecting children w/ nature (Park Service) to get adults comfortable in nature. Federal govt can be involved in getting parents connected and over their fear of the outdoors, and enabling them to pass on to children.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Montanans usually think conservation. The Montana Conservation Corp. is alive and well and put hundreds of high school age youth out in the field: performing trail construction, trail maintenance; fuel reduction, other construction projects. Employ high school students throughout the state. Develop and implement education curriculum. Foster stewardship and support for leave no trace ethics. Feedback after term of service term ends: can't retain; no jobs available to go from seasonal to year round employment; chasm from seasonal conservation corps program to permanent employment; no bridge. MCC is committed to young people in outdoor field ranks but no way to get them into system.

Agree with Ken – Landowners need to make a living. There's 1 million acres in the Lee Metcalf Wilderness and much of our time is spent outdoors. I've also spent much time in Libby. The Timber Industry is almost gone. Unemployment is 17% - the highest in MT. Something must be done. In Libby, 60% of the school aged children are on free or reduced-cost lunches. They're trying to get a mine started. It's been permitted by the state, but the USFS is holding back. For every person working there are 3 more out of work. We need ways to put Montanans back to work. All need to have the chance to work.

I have concerns about catastrophic fires. We've gone overboard not taking care of forests properly. We need to put people to work; help forests and help animals by creating jobs. Husband and she went to public and FS to do something about catastrophic fires in Montana. Thought was to do sensible thinning – not clear cutting – if trying to clean up air then consider that air quality after forest fire is hundred times worst – we have gone overboard as far as not taking care of forest properly with woods that have over abundance of small trees. Need to put folks back to work to help forest, animals, create jobs.

Accessibility is important. What has worked in childhood - family camped all summer long. Want to promote free camping. In 50 and 60's there were station wagons, coolers, camping tents, and access to camp sites all over. As a citizen in MT – hunting and fishing accessibility was based on an ethic – ethic started with family camping with group of folks that know how to do it right – also had camp fire and girls scouts that re-enforced concept on how to behave – finding a way to bring an ethic training is crucial – maybe no one told them when they were young not to throw trash. Need to educate – this is key. She was lucky to have ecology teachers. We don't have these now because we are teaching to standards and are losing concepts of outdoor field trips and outdoor education. Want to see promotion of education and need to prioritize to educate on the outdoors. Field trips when young and youth conservation core – these put her life on outdoor trajectory. At 15-18 yrs.old, youth were paid you to work in outdoors – plant trees – build trail – and it included environmental education. We should re-instate these nationwide. Need training in classroom and outside classroom. In Missoula, MT flagship outdoor program is funded through mental health program. Want to facility flagship to educate on outdoors – use programs like this in place – e.g. like afterschool programs. Maybe also support teachers in environmental education training. Need to build ethic that grows through youth. Help them be comfortable teaching outdoor education. What Works – rural assistant committee and FS partnered so school can be accessing an outdoor sport – FS folks came into school – they facilitated field trips to the space with the school. Need to fund gas in tank to get them outside.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

I'm a rancher – landowner and a neighbor of a forest. I appreciate the USFS. We have the same issues. The MT legislature is working with us. I think they understand the need for a win-win scenario. Family forest owners are all about the outdoors. We promote family forests for a win-win. We work to sustain the forests. There needs to be wood products thinning around communities. We need to keep the timber in America for made in America products. This will sustain wood locally instead of it being shipped elsewhere and overseas. The Montana legislature has a really good policy. In 2007, their proactive approach was needed.

Insurance on private land to access for education programs is expensive – eg. Class room group coming on land – but need to get insured – super high cost – so fear of liability keeps them from granting access.

I also see the need for and support for environmental education (EE) in classrooms to get kids reconnected. Most houses around here are timber frame. The EE help kids know where wood products/houses come from. People react to 15,000 board feet for a timber frame; it's not that much, but it sounds like a lot. I'm a Resource Conservation graduate from UofM. Projects are made to sound like they are clear cutting the entire forest. Not true. Kids don't know what it takes to build things. Wood can be sustainable. We've got to manage the land. For whatever reason, we've got to do a smarter job or we're going to lose it. I support EE in classrooms and the public investment in conservation and restoration. We need legacy projects to have working management plans on public and private forests. Regardless of size, all forests contribute to the whole system. Programs out there can use existing infrastructure. The State of Montana does a great job of managing forests.

My focus is on the North Flathead River Basin/catchment. I Want to point out: water quality so important, should support local efforts to manage. Densely populated areas should work to support those efforts. Concern about wilderness – Montana is one of two states that have not completed its roadless areas review process. Headwaters are in those areas. Montana needs to finish that process. Need sidebar riparian areas in general. Much benefit to all when protect riparian bull trout and other sensitive species. Feds need to think big. Work on Crown of Continent ecosystem level. In order to capture watershed issues, must look at that large, ecosystem scale. Education is crucial. In my work in water, it's complicated the way little things make such a big difference. Once changes occur and resources are altered, it's harder to go back. Montana is blessed with high quality and we need to preserve that quality. We should have the foresight to protect water quality.

Echo more energetic approach is needed to get forests back into sync with fire regimens; current imbalance due to lack of thinning.

Have concerns about access for people who can't get into pick up; can't walk up stairs; can't get on horse; can't get wheel chair under gates.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Agree need to manage forest – we have lots of developed lands with roads and support continued timber management in areas where we have roads – But remaining roadless lands were roadless for a reason. Condone continued protection of roadless areas – these are not good timber lands – that’s why they were not developed – controversy now is not timber management of these roadless areas but motorized recreation. Uncontrolled motorize is one of threats Chief Bosworths. Now have unregulated motorized use. We want use to look back at the 1970 designation of these areas. Off road enforcement of unauthorized use is not working. Outlaws are rewarded they - have control on wildlands. They have impacts to water/wildlife and displace other folks who want to have quiet experience away from motorized. So, motorized folks are rewarded by having that use exclusively because folks avoid them. Need better communication between judicial branches and admin to have better enforcement. (Aside- what works well – Teddy Roosevelt – courage he and partners had in establishing national forest. This was highly controversial at time and not a collaborative effort. It was visionary. We need courage when designating special areas. Special area designation has been controversial - but is has been celebrated afterwards. We urge administration to be courageous despite the controversy.)

Avoid wonky language. Provide a forum to allow dialogue. Should be no threats for sharing opinions. Collaborate on local levels. Be careful about how. I care about Big Bend just as much as I care about Glacier National park. Public lands are for all. Obstacles: must be more agency funding. Firefighting must be separate – it’s draining agencies. Agencies a hindrance or not helping because they don’t have resources. More hiking trails, trailheads are needed. Need stronger enforced travel plans.

Need more hiking trails and tools. Need stronger and enforceable travel plans. So two things government needs 1) more funding 2) protection of watershed for quantity and quality of water – no matter what we do and want, it won’t matter unless we have clean water.

Avoid wonky language. Provide a forum to allow dialogue. Should be no threats for sharing opinions. Collaborate on local levels. Be careful about how. I care about Big Bend just as much as I care about Glacier National park. Public lands are for all. Obstacles: must be more agency funding. Firefighting must be separate – it’s draining agencies. Agencies a hindrance or not helping because they don’t have resources. More hiking trails, trailheads are needed. Need stronger enforced travel plans.

Need more monitoring (fund it) of backcountry rangers and enforcement on ground. Need science based data not political

Obstacle to consider - need more agency funding – fire firefighter money needs to be separate. Agencies need funding to help reconnect with wild areas.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

On topic of how federal government can be better partners – one of things is to use appeals process more effectively. Don't let the process go until we force them to go to court. Instead force stake holders to come together before go to court. Other idea – FS needs to create forums that feel safe for public discourse – lots of polarity on issue. In this polarizing climate it's intimidating for average citizen to come in and speak. So atmosphere needs to be better controlled so everyone feels comfortable to come to microphone. People should not feel intimidated in democratic setting. As to strategies for conservation that worked and enhances conservation and makes feel connected, road and dam removal is working. Some of collaborative models work well – but encourage to be cautious because collaboration is at local level – but lands are owned by all folks across nation not just local folks – people care as much about Big Bend NP as Glacier NP even though he or others don't live there – so caution to local collaboration.

There is legislation pending to help air quality and help employees. We need the means to keep slash piles from rotting or burning. Sen. Tester has introduced a bill to build refuse burner around areas of Montana. Example: Seeley Lake last trash burner. If a furnace were available to remove refuse safely, could generate power...more power than all windmills on Rocky Mt Front. Eureka's burner is out of business, but if they'd had had a way to remove the slash, they could have been kept in business. Need generator to turn turbine and make electricity.

Seeley Lake has 1,000 miles of trails, but the Bob Marshall doesn't have one mile for ATV use. Lots of USFS roads, but at the same time many want roads closed off. This situation has eliminated any form of getting back there. I could get back into the forests when I was 20. Now that I'm 70, I can't get back there. I think all USFS roads /trails should be opened unless they are closed for grizzly protection, etc. ATVs are not that noisy; could start one here in this room and folks wouldn't clear the room. Enforce laws. Arrest the violators.

Why having meeting for younger folks – as older person he feels that he is one of the group too – feels not include when have a youth listening session and not include older folks- - young people idealistic – things are not perfect – so young session will be jaded.

I can't believe that the USFS can't allow access. I say, turn the land over to the state to manage. The State of Montana will provide jobs, access, and other opportunities.

Connect youth with landscape and increase scientific literacy. Environmental education opportunities are critical. Give boilerplate training to local employees and teachers so they can make connections for and with students. Providing training and resources for local educators is critical. Training is essential to connect with land managers and how they can understand and be a part of it. Recommend – encourage relation between FS and other land management agencies and schools and private land owners. Folks in urban areas need to have better connection – need science background to make informed decisions. Also give land managers training, time, and resources to provide those connections and local teachers need that time and training too – need to inspire kids for active role.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Connect youth with landscape and increase scientific literacy.

Focus on specifics in realm of federal authority. Agree with \_\_\_\_\_. Focus needs to be more than just federal lands.

Given climate change need to focus on conservation. Not just on sportsmen but on the resources, too.

One of things attempted a decade half ago was Teaming with Wildlife Program – excise tax on backpack and other camping/recreation equip (backpacks, binoculars, birdseed, etc.) – money funneled back to states – instead of pitman robinson tax – the teaming with wildlife tax would be for states for use on nongame programs and other programs that are inadequately funded – there was opposition to that but admin at the time supported it – but has been replaced by state wildlife action plans – but these action plans come with annual congressional appropriations of that money and they decide where money goes. Instead the Teaming with Wildlife would focus on species and wildlife that are currently not addressed. Wildlife draws people to outdoors – not all use on big game – shouldn't put all burdens on hunters and fisherman. The administration supported the legislation, but it met with opposition. Now, programs are not guaranteed. Annual appropriations & allocations are so limited, there needs to be a different way to fund these needs.

I want to mention something that was attempted decade ago. It involved teaming agencies with wildlife. Back taxes were funnel back to states. Like the Pimman-Rokeson Act (?) that directed an excise tax on backpacks, binoculars, bird seed, etc. and would have funneled funds back to the states. It would be directed to non-game other programs which are sorely inadequate and underfunded. The administration supported the legislation, but it met with opposition.

Need ways to make it easier to volunteer without liability for organizers

If ideas run too far afield, there's always the nuclear family option. There are local, good programs – make it kinetic/physical and it sinks in. Volunteers for preservation. Work, hit liability wall. If ways for Gov't to make easier, would help. Excite them. Parents not much different than kids. Own experience and stories. Best way to convince. Bring down to local level.

Obstacle to consider 1) catastrophic fires. Small diameter timber and beetle kill, need to act – but cant because of litigation – need to slow down ability of env from stopping forest service – 2) how to get rid of small diameter timber; fund gasification process for fuel at local level. Can bring private funds to help with this – but need to stop litigation – put good science in place – not talking about clear cutting – but using new methods. Create forest where that fire is healthy.

With regard to biomass initiatives on private lands; not sure what is currently going on. Need to look into how/whether private lands included in biomass bills? There are numerous climate bills in this session. During the last congressional session private lands were included and public lands were not.

## Discussion Question 2

***Missoula, MT***

***(cont.)***

Need to get a handle on noxious weeds. Need to have statewide program.

Very cautious in our approach to conservation because people need a place to live. Need to have homes and places to raise kids. Need to give communities a place a grow – don't have places to grow because of conservation easements– need to be thoughtful that we don't have a negative impact.

people on the ground need to be empowered, if agency personnel are not empowered you run into roadblocks. Agency people need to be supported. Farm and Ranchland Protection Program is an excellent example of a tool that works. Represents the interest on the ground; garners public support.

important to not just focus on youth but on all segments of the public. A significant portion of the population go out and trash the outdoors and shoot the signs. Education needs to be more broadly based.

We are working in a changing landscape. At one time people thought that plum creek land was public – didn't know it was private. As changes in ownership occur – access is changing. He manages over 1000 miles of motorized trails. That infrastructure is greater than a private landowner can support. Liability is very scary – really worried that trees will fall on people or people will get hurt. Important for folks to understand these issues. There are children in Seeley Lake who don't go hiking, fishing, don't go outdoors. His wife created an adventure club and taught them how to go outdoors, ethically, safely, at no cost. It doesn't take a pile of money to get kids outdoors.

gets over 1000 kids a year outside in nature. Liability question – originally it was forbidding but there are a number of insurance agencies. In Missoula – there are a lot of kids who get out in the landscape – this is a great place where people actualize what they want to happen. 1) If you want to get more kids out we could use help at state level in the mandated curriculum – need a mandated outdoor curriculum. The states that have this mandated have great programs. Federal encouragement outdoor education would be helpful. 2) Funding: EPA Environmental Education grant program – a great program but woefully underfunded. Can't be used to sustain programs – his group can get it once but can't use it to sustain the program. 3) Making national organizations more aware of what's going on the ground. Nationals have lots of workforce and funding – nationals come in with a great idea to do the same thing that the locals are already doing.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Regarding his involvement with 4H - it doesn't always take DC to get money – important to realize that the local timber companies have been very generous. As we lose these industries we lose so much money and support. Regarding access: He is a backpacker but when he wants to take out his 90 year old grandparents to hear wolves he used to drive – but now the roads are closed. He heats his house with firewood. Used to go up roads with family to cut firewood– it is a family activity and gets kids outdoors. But now people can't get out as a family to collect firewood. Also lots of families camp in non-designated areas – when the roads are closed they can't do that.

He's 29 and he finds it weird to be called a youth. Since not a govt agency can move quickly and give youth opportunity to make decision and be empowered. They can make decisions that make a difference on the landscape. Changes lives a lot – getting emotional. Give young people an opportunity a chance to have responsibility. Young folks dug a trail on Mt Sentinel and every day they can look up there and say – wow I did that – and everyone uses it and likes it.

Success – Travelers Rest State Park. Mt Conservation Fund initiated the beginning of the park. Needed someone to take on ownership of the park to use the Conservation Funds. They formed a non-profit organization to run a State park and the non-profit manages the park. Have grown from 15 to 50 acres. Challenges – needed to acquire additional parcels. Were able to use the stateside LCF funds but they have run out. The Non-profit is continuously challenged with getting operational money – how to continually fund the site. Have successfully used stimulus money but they don't know how they will manage with the stimulus funds go away.

\_\_\_\_\_ works in the Blackfoot, partners with BLM, counties. Sometimes partnerships are cumbersome because of different legal mandates with different agencies. To streamline: fortunate in the Blackfoot because the BLM has been flexible and has the latitude to deviate to accomplish things on the ground.

Important to maintain successes like BFC but important that the big projects don't overshadow the smaller projects. Important to remember that the most successful projects start small so want them to be able to compete. Many rural communities are not able to compete for rural development funds. Scope and scale are important. Funds for schools projects are great but again a scale issue because those projects work best for larger campuses – k-12 but there are smaller schools who would like to take advantage of this.

Important to recognize the workers on the landscape and how important they are. Stewardship Contracting Authority is about to expire – Under the federal contracting system the contracts are getting bigger and there is a need to right-size contracts to fit the local workforce so the locals can keep working.

For them – liability issues aren't a big issue.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

The cost of being a partner with the Feds is becoming increasingly expensive. National Park Service are putting them into contracting instead of Grants and Agreements. They have to build an infrastructure to be able to do what the Feds can't do. Then they have to compete – are not being treated as partners. (PERSONAL ASIDE FROM THE NOTE TAKER: we have had numerous partners complain about the difficulty of working with the grants.gov system. Some of them have stated that it makes working with the BLM more difficult.)

regarding Biomass: the State and Private Forestry money for schools for fuels is going away. Regarding an experienced workforce: people think about recreating on the forested lands so it is important to keep an experienced workforce so we have the ability to manage the land such that people want to recreate on it. Regarding Bonds: whenever work occurs on NFS lands the operator needs to have a bond – but there are only 2 or 3 companies nation-wide that will cover the bonds – a huge barrier.

some success is top down but some are bottom up. How we deal with our public lands is also important. Don't want oil and gas wells on the Rocky MT Front.

Rode his ATV – trespassed on a lot of Federal land and he had a very good time but there's no way he could walk to the M – because he's beyond that. Need open roads for people to be able to enjoy the outdoors.

not associated with a conservation group – born and raised in MT – his parents were homesteaders – issues not being addressed in this session – There is a move in DC to designate lands in MT as national monument. His Dad couldn't walk but he had a jeep and he could drive all of the FS roads to hunt. Are moving towards roadless areas and access by foot only and that takes a lot of people out of the ability to recreate. Need to make the land better and one of the ways of making it better is to make it accessible. In past FS treated land as a renewable source of energy and products. Letting trees grow old and die is not using them wisely. Also observed that local agencies and local people do a better job of keeping things in perspective than the folks in DC. The bureaucracy of Fed govt keeps things from happening. Things really happen from local knowledge and local funding. The further DC stays out of MT the better.

Boyscouts of America: totally led and funded by local people – no government funding or supported. Boys and Girls club are also funded locally. He wants to put a plug in that there are young people and organizations that go into woods and don't need federal govt to tell people how to do it. He understands why plum creek closes the roads but it didn't use to be that way. Now private and public all close roads. Now if don't backpack 20 miles you can't see the roads. NO MORE roadless areas. Let's log the forests and keep the roads as trails.

Land use patterns that are disparate impact agriculture & recreation. Suburban development. Agricultural lands are changing to suburban. They are working on a collaborative effort to address. Open discourse is important. Communal solutions. Parks & trails plan: have to have a larger view but local tools to be effective. Lack of funding. Lack of political consistency in support. Would like more commissioners to take this topic as a #1 priority. It is hard to implement good ideas on a governmental level

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Most of the young people in the Montana Conservation Corp (MCC) are not from Montana. It provides an opportunity for people to come here and cultivate an outdoor ethic. Montana Conservation Corp incorporates work and conservation education components to draw people into an outdoor experience.

Conservation easements. Go back to existing easement & lessen restrictions that are not productive. Wetlands & watershed restoration, for example. Make these old conservation easements work better—better science.

One of our greatest challenges is partisan politics, changes in administration. We had an initiative when Bush was president, now we have this one. The administrations keep changing. What will be the lasting legacy here? Ex. Roosevelt or Aldo Leopold era. How do we as a local community and a nation get past the partisan politics where things change so fast. Budgets are tied to military and disasters. How do we as the conservation community make a conservation connection to jobs, the economy?

She feels like most of us are preaching to the choir. There are so many Conservation Corps members here; we need to take what we think and bring it to an urban setting. It would open the floor to more ideas.

Many Montana Conservation Corps members are here and SCA as well. The fact that we're here says something. The reason there is a big group is due to ARRA money. That money may or may not be there next year or the year after. If we need more seats at the table then it needs to be funded. These kids become advocates. Darren coming from Massachusetts goes back home and becomes an advocate.

I have a thought on how the federal government can help. We need some kind of censorship on advertisement. The aesthetics of location: there is almost nothing uglier than a highway billboard. They go against every notion of nature. Nature provides beauty at every single angle. People are inspired by nature – the trees are just right, the clouds are just so. Once they discover a sentiment for nature, they don't regress; it's probably a lifelong sentiment. He is big on aesthetics

Groups working to protect NLCS. Bringing kids at risk out to natural areas. BLM Restoration projects. Contributing thousands of hours. Because NLCS is so new; inconsistencies in partnerships. NLCS has not been solidified. Salazar needs to better define what NLCS is & build in accountability with the managers of NLCS units.

Challenge Cost Share program should be reinstated. Important to partners- gets people on the land.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Message from farmers & ranchers- we need to get the schools back to agriculture in the schools. Educate kids where their food comes from. She takes kids out on her farm/forest. Her interest stems from 4-H. Conservation is a big part of what farmers do. Farmers get a bad rap on what they do. We need to educate young people about what happens on the farm/ where our food resources come from. Education to the children. Farm Fair- touches lives 5 & 6th graders. Explains farm conservation & stewardship

Ag college-need to keep funding in this. Federal government introduces programs – conservation programs- government officials look over ranch- these programs are so restrictive- not efficient guidelines/ rules. Would have to hire another employee to carry out all the stipulations of these programs. Have to have leeway that is efficient and works for the rancher. Flexibility to make the programs work.

Multiple Use has taken a back seat to development, this concept has been lost.

Madison elk working group; diverse group addressing elk population. Key is to open groups to all people. Forest Jobs & Rec effort was hand-picked & doomed to failure. Groups must include those from the bottom up & not be hand picked.

National Trust- Problem is shortage of funding in the government. Make the best investments possible. Goal-keep our rural population in place in the sites. The National Trust Main Street program & Preserve America program helps small communities to create livable communities/ preserve heritage. These programs bring in a 50:50 match & produce jobs. This is a good long term investment in communities.

Mountain biking is growing in numbers nationally. A gateway sport for kids-encourages them to get outside - 494 miles have been closed to mountain bikes, potential to close 2000 more miles; single track trails that have been in place for decades. At the federal level, bikes are considered" mechanized"... Defined- powered by non-human source. Mountain bikes should NOT be considered mechanized. At the national level, would be good to consider mountain bikes as non-mechanized. There should be distinction between bicycles and motorized bikes.

Northern Rockies has huge ecosystems/ large parks & wildlands surrounded by working landscapes. Agencies should look at the landscape level for climate change- Antiquities Act/ collaboration work. Agencies should set sideboards & guidelines for outcomes. Implement this quickly. Forest collaboration work has been successful, but sometimes then sits on the shelf. Collaboration projects should be prioritized & move forward to implement

These organizations & vo ed are often cut when funding is cut. Agricultural funding goes down when environmental funding goes up. Young farmers and ranchers groups help kids get started in ranching. Ranching is interrelated to conservation/hunting. FFA has helped finding jobs & speaking skill.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Agenda has been more & more federal control. Makes it harder to make a living. Ranches have been sold in western Montana. People forced to move to Eastern Montana. Estate Tax is important. CRP program- if you cut out government subsidies & give ranchers authority back. CRP program is inefficient. Let ranchers do their job without government regulation. Government should put more funding towards education in schools. MSU Ag. Department took a hit.

In addition to bike paths why don't we design communities so cars weren't the only option? We are thinking about this in Missoula County but not as much at the State level in general.

Thinks it's a wonderful idea to develop lands (for public gardens, etc. Anthony Rivers talked about earlier) for better usage. Would it involve planning boards working to get the community involved and gardens approved or should we use another method? We need public education to get support for gardens

We're a small group in attendance; how do we promote the interest in what's going on today instead of having people sitting there and waiting until something happens and then complaining about how it was shoved down their throats

We don't have agility to get money to support and back conservation efforts. When an opportunity is there, we need to know that our backs are going to be covered. Need agility in funding. Sometimes it takes years to find a funding source. We have lots of opportunities right now, such as connecting Yellowstone to Glacier and this is an amazing place to get huge protected landscapes. Need federal support to accomplish this. We have an opportunity now to protect some lands, we have some breathing room from development because of the economy. We need to have agility to be able to backfill other conservation efforts. Let's dive in and protect lots of land now. We could connect many public lands. Montana is a great place to get huge amounts of conservation done. We can do it here.

We need to connect people (to the land). We need a good education program and after school programs so we can get youth outdoors and tell them more about our environment; it's a good way to connect people

In elementary school I received a good education in this but in high school they dropped the ball. We need to do more outside in high school

I agree with what \_\_\_\_\_ said; our agency is not aligned. We need to reinvent ourselves. I'm a District Ranger in Idaho and my staff gets this works accomplished. Community involvement isn't a priority – we don't walk the talk. Employees put in too much of their own time – due to their passion for the job. The biggest benefits are at the grass roots level. Bring in diverse interests. It doesn't filter down from the top

I have a boring, non-visionary suggestion: AVUE. It's your introduction to the Forest Service and it's a nightmare, it's gridlocked. Last year I got hired to work for the Forest Service and it took 5 weeks before I was offered the job. AVUE doesn't seem to work for anyone.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Preservation of Historic Landmarks is important. Should balance natural and historic resources & funding. Preserve important landmarks. Save America's Treasures grant is important.

Getting the voice of youth is really important since we are inheritors of the generation before. It's up to our generation to break the cycle. It's not just an idea we hold in our heads but to get the youth voice is to empower the organizations that already exist. But have it be the Voice of America – not the Youth Voice of America. Empower organizations that already exist. Give that respect the voice deserves; give it more credence. Not 'what do they know?' but really respecting it.

I'm not from Montana. The National Forest I live near is close to town but there's no connection to town. There are no announcements of activities going on – 'town' and 'out of town' are completely separated. We need to build bridges between the two and get people out from town. I know there's a Forest Service office in town but they don't seem involved. We need more outreaches from that office to the community

Winter. Public Land management focuses too much on the summer months and not on the winter. 6 months winter 6 weeks of hiking. More strategies to address winter

I think we should look at the public schools, younger kids. We need to make more of an effort to get kids out to field trips, local areas. Some place they can grow and love and feel safe in. Outside experiences when kids are young are really important. Agencies should use no child left inside and connect to kids through public schools and get them out, even to local places. Maybe then they would take the step to work outdoors.

Key to making all of this work is top down leadership/ effective policy/ . Huge development pressure/ increased population. Need strategic planning to knit all of this together. Would like to see Administration develop a National Strategic Plan for Development and Conservation. Need to address what we are actually intending to do with development so we can make decisions. Resurrect old 701 Planning Grant for councils of government. The greatest challenge we face. Federal Gov't used to have a program for planning for area wide systems in the 1970's. Then there was grant money. We should go back to the Federal Government encouraging joint planning

Local working groups are the future-the model for the future. The Federal Government needs to get behind this & provide federal funds to support. Help preserve & sustain what we have now. Genuine working landscapes- sustain these-buffers & supports rural working communities. Conservation stewardship program –NRCS- voluntary incentives needs to be expanded. Term easements need to be considered ( versus perpetual). These may be more palatable than perpetual. Sustaining genuine working landscapes- need tax relief. Administration needs to get behind this

More efforts toward youth, especially city oriented youth. Target high school. Be careful with large organizations like PPL that take resources away from the public

## Discussion Question 2

### ***Missoula, MT***

***(cont.)***

Not from area. He didn't grow up with parks. We are being taught to appreciate the arts- should also be taught to appreciate the outdoors. Many groups here in Montana to promote the environment.

Connecting people to the outdoors. Working with people with ALL abilities to connect them to the outdoors.

When the first open space bond passed, people were not aware of the public access issues that went along with it. But five years later we passed the second bond on open space. People want to protect open space on private land whether there's access or not. He personally allows hunting and fishing on his land but he doesn't think we need to dictate to landowners that they must allow public access

Agencies have the authority to work with students to bring them into employment and if they come to work for the NPS the agency can provide relief to college debt, we need to use it!

What are the kids' reactions once they come here and participate in the MCC? Is there anything we can do to facilitate more of that? How can we bring more kids?

Agencies were structured around military models and moving people every 3-5 years. It is not working for local communities and probably not serving federal employees well either.

DOI-regulations make it difficult for private philanthropy to do good things in the parks. Grand Teton VC required all money up front before they could begin. Park said all funds had to be up-front. Ended up paying an additional \$3 million. These regulations need to be update to encourage private philanthropy.

Trails are a great way to address global warming/ childhood obesity/ & getting kids outside. Trails are difficult to build after the fact. Need policies that treat trails as traditional infrastructure. Easier to address ahead in planning, instead of trying to retrofit.

I was an NPS brat and grew up in Yellowstone. I am a Landscape Architect in Missoula. I have counted at least 10 federal agencies involved in recreation, conservation/preservation. Need to have one agency with oversight or better coordination between them. Need to address local land conservation on a national basis and create the culture to do that. I am involved in a project on Kootenai reservoir which was built by the Corp and now managed by Forest Service. There was an article in the Missoulian today that discussed it. Missoula has environmental awareness because people came to University of Montana , liked the environment and stayed.

I think in Montana the lack of zoning is an issue; it affects our ability to have open spaces. There are social and environmental problems related to zoning. Maybe state level laws would work by being stricter on development. There could be incentives for proper development.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

There is a role for Federal government to plan in Environmental Education. Her kids are not interested in Yellowstone/ visitation is dropping. Need to connect kids. MOSS- gets kids outside. Government can play a role in the schools in E Ed. National Park should promote technology/ learning/ merge new technology

He likes what he's hearing today. I think one of the hardest parts of getting youth to the outdoors is to provide a reason to go there. The Education Award is a good thing. He participated in a Career Fair where they got to talk to kids face to face and the kids got excited seeing all the tools they brought with them. Developing leadership skills is important; youth can then carry it on further into their lives. You need to probe what motivates those kids: is it cranking out 10 miles of trail? Or being better speakers? or more engaged in community? Find out what motivates youth. Youth will motivate youth. It's like a baseball team – someone tells a friend, who tells a friend, etc.; the ripple effect. The YCC focuses on leadership – but the Forest Service doesn't do this. It's so important to your community.

This speaks to the future – the 21st Century in Conservation, Kids in the Outdoors, etc.: Federal agencies were organized and located 50–100 years ago under a different paradigm. Look at how agencies are organized now. We need to change from “doers” to “conveners “. We aren't funded that way. We are organized under a different paradigm that needs change

Large scale conservation planning. 2/3 of Montana is made up of plains vs mountains. The plains provide food & fiber & possibly domestic energy production. Asks that Fed Gov't take a large scale view...we need renewable energy...but we have much biodiversity in this landscape. Don't direct new energy resources to where we need to do conservation. Rural communities in the plains are suffering. Loss of population/ schools closing. We need to look for new opportunities.

Northern Great Plains. We have overlooked the grasslands, as evidence by decline in grassland birds & species. We are focusing on North Central area of Montana. CCPI program with farm bill is effective; working with ranchers on conservation measures to protect grassland birds. Need regional NRCS people to deliver these programs on the ground. Meet with ranchers and discuss opportunities. Science based organization that works with BLM/ FWP on research related to grassland birds. Leveraging of public/private dollars is effective. CMR-largest grassland reservation. Better integration between DOI agencies needs to occur. CMR managing for ferret. Not effective. BLM trying to find incentives for landowners to allow ferrets. DOI agencies need to do better at working multi-jurisdictionally.

Administration priorities on funding- Invest in the United States & the programs NPS/ Americor- look at local food systems and recreational opportunities. Learn from the Roosevelt administration and prioritize spending here at home. Funding is not being spent in the best way. DOI & NPS advocate for funding....LWCF. Americor, Parks

Wilderness management: we need more of it at less cost

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

He works with wolf conservation. What he has seen that doesn't work is incentive based compensation to ranchers. We need to look at non-incentive based strategies in the future. Concerning conservation on private land, we need to figure out some more strategies. Project Wild: it's really interactive and cool even though it's not outdoors

I am with a 4-Wheel Drive organization. We have been working with the Forest Service on Wild Bill Park near Lakeside, MT. One of our issues is the turnover rate of federal employees. We keep having to start over explaining issues, establishing relationships because federal employees get transferred and then we have to start over it is very frustrating. Then you have to start over with new people for 10 years, than another 10 years and over and over.

NOA(H?)- Coastal areas & estuaries are being left out of this effort. NOA needs to be included. Sen Tester Jobs & Rec bill is a collaborative effort.

Grizzly Bears: we have to be able to manage them. Wolves. 60 % of elk herd is diminishing. Self-sustaining. We need to overhaul Endangered Species Act. Eliminates rancher's ability to make a living. Needs to be financial restitution

We do have sprawl & no mechanisms to deal with. No land use planning mechanism in Gallatin County. Climate change will affect all public lands, until congress acts. Poor public policies from previous administration- no new wilderness- can be overturned by new administration. Don't be afraid to use Antiques Act.

So many men and women are graduating with tremendous debt which affects the kinds of jobs they feel able to pursue. There should be a program for kids who work for federal agencies that reduces or pays off their debt.

It's important to remember that just because children live near the woods they will be engaged. She grew up in Alaska, but thinks she was the only kid at school who spent the majority of her time outside because her Dad was trapper. They won't go out there on their own. At school, the Tongass National Forest was surrounding it but they weren't allowed to go outside the playground. Their teachers never took them outside the playground. It's important to not assume kids near the woods use it. On same note, she thinks her classmates were not engaged, they did art/music instead. She later had a job as an education coordinator in Alaska where she used art and poetry to connect kids to the outdoors.

Many ranches are transitioning from working ranches to private estates. Not many ranches now allow hunting & fishing. Access is a big problem in Montana. Wildlife goes to private land. Access needs to be provided. Block Management program is effective in Montana. Provide incentives for private landowners to provide hunting opportunities.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Climate Change. Administration should look at vulnerable and valuable landscapes. Native trout & the impact of climate change on these species. Gets at economic issues/ anglers bring in \$\$ to Montana. If we want to preserve this economic stream, we have to protect watershed and riverways. Admin should launch a larger, broad scale restoration initiative in relation to climate change. This area could be a pilot area to protect native fish. There is limitless restoration possibilities out there...many potential projects. This would relate to climate change- watershed restoration

Appreciates everyone protecting land. Interested in protecting water. Primary concern is with global warming. Unless we get a handle on this issue, all our efforts at land protection will be in vain; get warmer/ forests burn up/ biodiversity down the tubes...if we don't change our ways. Federal government should not do cap & trade; we need to focus on cap & dividend or carbon tax- return the profit to the public.

We need to learn the lesson of history in Montana and watch the big money. Note the situation in the Bitterroot valley. Big money and developers have been coming in while the locals have worked to determine what good land use is. There are a lot of people coming in to make money and pollute and don't like these community processes that protect land. Our state legislature is heavily influenced by big money. Local folks need to hold the line. We need to be sophisticated in our advocacy and we need to be just as tough as big developers are and mobilize people to fight for the public interest. We have the local people who can say no to big money and development. Good planning protects private property rights.

One of challenges in the National Park Service is congestion. Ex: Logan Pass in Glacier National Park. Need to institute more public transportation in National Parks. National Park Service should set up and provide huge leadership by eliminating cars all together. Glacier could be a leading example. Glacier already has bus fleet. There is already a historic connection to Glacier NP and trains. Imagine Glacier without cars. I realize there would be resistance from local business. This might have some local support.

Ranching families-senior members are retiring. The next generation is taking over, but there is always a funding problem. Full funding of LWCF would make family transitions easier; purchase easements with LWCF funds- let younger generation keep ranch together; help older generation. As these valleys begin to unravel, find funds to help next generation take over

How to pass on to kids- ranches- wildlands. Ranch settings/ wide & free/ Inheritance taxes! To pay these, often need to subdivide. Challenges with inheritance taxes if you want to preserve ranches.

Need more incentives to 4 & 5th generation ranchers to allow hunting and fishing vs incentives to out of state ranchers.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Public land should continue to be multi-use managed but energy development needs to be better scrutinized. Montana is a very energy intensive state. She doesn't want to see things similar to the Gulf spill happen or the mining deaths in West Virginia. The administration should look into what kind of energy development can be done here as well as alternative energy. We need a solid energy plan. Public lands will be looked at for solar, wind, coal, and natural gas. Look at the pros and cons of each. We need a 20-year plan along with multi-use planning.

Conservation of open lands. Society has now taken the leap to understand that development is the greatest threat to our open spaces. The forest legacy program in Montana works really well. There are a lot of issues. How do we pay for all of this? Limited funds available in federal grant programs to make open space pay for itself. Having an environmental ethic begins at a young age. I got involved with agencies as an SCA. We need to build on these programs to better connect youth and kids, like the Montana Conservation Corp. Great things could be done cheaply by employing youth. Agencies need to look at climate change more holistically. How can we manage our lands to mitigate climate change, how can we do things in our operations like shifting to a better vehicle fleet? I hope they (agencies) will look at those things as well.

Kids don't have any clue this exists. This needs to be advertised.

Provide people with information as to what is available. Provide adaptive equipment so people of all abilities have access. This is a model.

successful orgs that enable a coalition of interests to work together. Come to the table and talk about what to do with a particular place. Working together on all places, not just focus on what's important to me. Need to be willing to listen carefully, willing to give, and agree that you're not going to be able to agree on everything.

80% of the population lives in cities. Need to work with US bicycle organizations, try to build and advocate sustainable travel. Focus on taking urban walking and biking networks and connecting them with suburban landscapes. Invest in the link between the two. Bicycling reduces pollution. Promote sustainable travel thru parks. Connects nation parks, state parks and local parks

2 things that keep people from coming to the outdoors. Facade (not Disneyworld) or fear. Govt needs to provide a mentoring program to conservation groups to reach out to publics and get them interested in the outdoors. Teach them that risk is ok, and could actually be fun. Yes, there is risk in going to the outdoors, but it's worth the experience.

2 things that keep people from coming to the outdoors. Facade (not Disneyworld) or fear. Govt needs to provide a mentoring program to conservation groups to reach out to publics and get them interested in the outdoors. Teach them that risk is ok, and could actually be fun. Yes, there is risk in going to the outdoors, but it's worth the experience.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

economy important. Need to see groups working together, dovetail natural resources and cultural resources together. Tamarak festival held at the same time as the brew fest, provides several types of groups all working together to focus on natural resources and bringing community together to combine all interests. Economic value is brought to the community.

don't feel we need to focus on new programs, but need to coordinate what we've got. Need more opportunities to provide connections with the groups we have here today. Making connections and establishing coordination.

NRCS has good incentive programs for private lands. Need to work better on the outreach to those land owners.

agencies have not been able to do the work we expect them to do. They are not paying attention to the landscapes for the sake of doing business. Agencies need to be consistent with the communities and take note of how some of the projects they back are not what the communities want.

focusing on working landscapes. From a conservation standpoint, need to provide a linkage between public and private lands. There's a misconception that private lands are not important. Need to change that thought. Private lands need to be included and considered high importance. Need for incentives to private landowners to give them the backing to want to be connected. Need to get word out to those landowners, provide unbiased info, to get them to step up and be included.

Use green practices in the agency buildings, like composting waste and using solar panels. Set an example for community. If you can do it in the agency buildings, then the community can see how to do it.

I have a wish list, 1. better planning strategies across the board, 2. Incentive to save conservation areas, 3. More information and advocacy, 4. Increased collaboration between local and federal agencies. More gets done by the locals than the feds.

Regarding the energy policy: Revise entire transportation infrastructure. Buses, trains, roads, etc. That would be ok. (Big laugh from the group.)

With issue of conservation we always hear that we have to choose between economics and save the landscapes. I would like to see more working together. That's why this event is here in Montana, because we get along so well. We import of 40% of our lumber. Are we serving anything when we outsource lumber and British Columbia levels all their forest? We need to do what's good.

Youth involvement doesn't have to be through service organizations. There are other ways. For me I worked outside. That's how I learned.

## Discussion Question 2

***Missoula, MT***

***(cont.)***

Wilderness is too stringent. I love wilderness. Wilderness is unpalatable because it too stringent. That's why there are so many exceptions in the wilderness proposals. Otherwise people won't support it. We need to make new designation all together that is less stringent. A "Wilderness Light" concept. It will get more support.

I like to see more grass root things with government to set examples like sustainable living practices in building plant or use of native plants in all diff regions. Gardens or cooperatives in military and camps.

Forest Service having native grass around buildings. Where I work now, I'm told to water the lawn. It uses tons of water to water grass around buildings. There is prairie all around. If you use the right grass you don't need to water. Nobody would care that it was prairie instead. I stopped at a FS rest stop yesterday. It was so warm in bathroom and it was at night. Why are the heaters on in these facilities? Practice sustainable ways. Fund advertising use of green practices and local land. Put word out so people get interested.

Provide funds for leadership, schools and camps. More AmeriCorps. All of us will go home and tell 30 people.

Agencies should adopt things like when the health craze health started and agencies funded people to take walks at lunch to get healthy. Agencies can adopt outdoor activities so white collar can see blue collar people work like farms, trails, and farm communities.

The biggest obstacle is lack of awareness. It seems reclamation is backburner. It takes one life cycle for a vacant lot to develop an ecosystem. Drive through any town. It probably has a vacant lot. Make an incentive for the owner to donate use of the lot to the community in neighborhood fashion like community gardens. When there is a neighborhood garden you can feel the neighborhood. There is less trash, its cleaner. The people are more neighbors. In my community there is a year long waiting list for the garden. Need many, many, many, many more gardens. The gardens put the conservation effort at the forefront of daily life.

I want fixes ASAP. One idea is mandatory public service for environmental clean-up, study of natural science, or community activities that focus on betterment of neighborhoods. Fixing road shoulders, garbage cans, gardens, etc. Have mandatory public service for one or two years after high school. Stagger it so everybody isn't in it at the same time. Every time I bring it up people agree it's a good idea.

We are here because we care about mother nature. There's not debate happening here. We all agree. If I was in your seat, what I would leave with is that priority 1 is expansion. You need more of us (young people). I will spend this summer in Bob Marshall Wilderness. It will be great experience. There are only so many seats. I'm not giving up mine. We need more seats. Advertising is important, but don't forget the main point is to make it accessible. The more of us there are the better it is for everybody. Don't forget this is the main point.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

My background is in outdoor education. Connection with nature is not working. The book "Kids in the Woods" agrees that the connection is broken. Lack of outdoor experience is a problem. It is the root of a lot of situations. Kids don't get connection with woods. Many don't live near woods. Every kid who goes through school needs time outdoors. Whether it's through the teachers or take them out and have it outside the class. Not every kid is receptive to getting into nature. But give every kid a chance to experience it.

Long-term strategies so many people want to help take care of pub lands. There is not a good enough interface right now. We need conservation leadership. How do citizens contribute? The funds we are talking about are all federal. Federal part is a black box. Everything else outside of fed black box is available through citizens. We need to work through the citizens. Things can be figured out at local level and so much good will happen. Do the local piece and it will feed to the big strategy.

Attitude towards public lands. We are intent on our right to use public lands, which turned into a right to abuse public lands. These ecosystems create benefits for humans: clean air and water. These lands and creatures have right to their own existence and quality life. It is not all about use. It's about taking care of these lands. Pushing more use and people intensifies management. We lose touch with outdoors after awhile. We are not in dominion over these lands. We are part of them. Public agencies can help instill the attitude of being part of the land. It starts with bringing it into the schools at a young age. If kids have that exposure to land they are more likely to care about it. Waiting for people to start abusing and then dealing with it is a backwards approach.

There is a lot of pressure on agencies to add things to wilderness areas like cell phone tower or poison fish or kill weeds. Remember the ethic of restraint in wilderness. Wilderness is the highest designation. These lands are the barometer in climate change. Leave them alone. We will need to know how nature will react to 2 deg change. We need a base.

Trying to get community based environmental education group going. They are building a monthly passport program, with monthly events from various organizations. All the individual groups create events, but they are so isolated that they are like little strings that need to be brought together to make a rope, to make a strong event. All these great intentions and good ideas and people who want to do it. There needs to be more organization and umph. There needs to be a non-profit or government or other way to bring them together.

I get to work with all four land management agencies. There is a lack of internal communication between agencies. Facebook and you-tube are blocked from agency computers, so agency people can't communicate with young people. Need to look at that before you can reach out to young people.

The generations before us built many roads: highways and in forest. I think we should protect roadless areas. There are not many left. It is special to walk into backcountry area and not hear motors or hear ATVs. It is important to protect what's left.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Supporting local communities: Agencies can show commitment by using local resources. If you are building a building in New Mexico use adobe, in Montana use wood from Montana, rather than from another country. Be mindful of where resource comes from.

Getting people connected and kids outdoors is important. Federal agencies were created under a different paradigm. A paradigm where congress allocated funds and agency went and did work. With people being more involved there needs to be a change in the federal agency organization. We won't be the doers anymore. We need to be reinvented.

Our organization does well. It gives an opportunity to lead and gives ownership of their experience. The kids come to be outside and work and to not be at school. Participants take ownership over the direction they go. They work in projects in woods and make decisions on how to shape the environment. It creates a sense of self work creates leadership opportunity. It bonds people to woods and creates leaders. I don't want to knock the Forest Service, but some of my friends just sat through the entry training. The Forest Service entry training is horrible. The instructors have 30 years experience or more, but they can't teach how to use a chainsaw or cross cut saw. Its exciting stuff, but they make it dull. Keep the youthful energy going.

The agencies are good at inventory and monitoring on public lands. Extend inventory and monitoring onto private lands in the large scale conservation model. With that in mind we need public access. Access is based on consumptive uses. Focus on non consumptive uses. Would be more palatable to public.

about high schools. On national news, there is a high dropout rate in high schools. Some schools are letting them move on. They say it's ok if the kids leave. Revamp high school. There is a crisis in the high school. Maybe have an option or alternative for high school kids to get into the outdoors. Make them part of the solution.

Bring outdoors into the city. Many city people spend time indoors, it may be better to get them outside in the city. It can be intimidating to do an internship with SCA in the woods. It can be intimidating if you can't cook at home and then go out in woods and have to cook outside. There needs to be more bike paths so they can experience outdoors without being intimidated.

Get kids outdoors. The book "Kids in the Woods" sets up the problem well. Lewis and Clark Trail teaches kids conservation out on a trail setting. It is an important developmental step to get outdoors, not just in yards, on lawns, but in the wilderness. We are at a time right now, and people say the Lewis and Clark Trail is over. But it's wrong. It's a terrible thing to just drop the ball and not follow up with what they saw at Travelers Rest or wherever. Get them to look where we are and the history that we have here.

Growing up in Bozeman, I got to visit Berkley Pit and learn how much money is being spent to clean it up. Reckless use of the environment has effects on the community and watershed. This has had an effect on my ethic. A way to get the message out could be tied in to the superfund. The superfund could contribute to an education program or to the schools.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

How to keep people involved. I'd like to see a task force or task team that young is involved in. There are so many ideas that are all involved in. We will be the leaders. We see a need to change sooner rather than later. We want to be involved now. Create a method for us to get involved. A team or something.

RMF Heritage act is great. Roadless rule is not final answer. We need more designation besides wilderness.

Climate change— there is no greater environmental effect. Land management agencies can effect not just on ground but can influence others. DOI can have an impact on others.

Restoration is a buzz word. The governor has pushed it hard. I think you need to harp on it more at federal level. Obama said "Let's restore forests and watershed and put people back to work doing it." That's what we need to do.

I resent to be told that we (the youth) have to deal with the problems of our forefathers. The Downtown Association says "These things didn't work now it's your turn to fix them." They say this to empower youth. The enemy of the past approach doesn't work well with me. We (the youth) want to do it together rather than ask us to take over. We don't want to step on toes of someone who's been there for 30 yrs. We want to work together. Incentives don't always have to be money. Incentive may be a title or being part of a group, it doesn't have to be money. Don't write a ton of bureaucracy or policy that we will be tied to forever.

Thinking about corporations—one aspect is corporate responsibility for environmental damage is less than what it should be. The funds they have coming in could be focused differently. There could be bigger fines for violations. There could be effects on their charters. Stockholders don't feel the effects. Like BP in the gulf. The effects don't necessarily come back to the stockholders. Make it should come back to stockholders somehow. They will make better investment choices. If there were effects to the corporations, they would use their funds for the environment.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Getting more Children Outdoors – This is one of the biggest and most important challenges for this generation of children who have the highest rates of obesity and health problems related to being over-weight, such as diabetes. - Pass the No Child Left Inside Act (HR 2054 & S. 866) – This Act would provide funding for expanding environmental education in schools in order to get kids outdoors to learn and care about their environment and have the opportunity to be active and enjoy the outdoors. - Children in Nature – Many local, state and federal agencies are working separately and together to develop programs to get kids outdoors to connect with nature and be physically active after school or on weekends. Greater coordination and funding from the Federal govt could substantially increase these efforts. - Increase funding for the Recreational Trails Program – The majority of this funding goes to construct trails that connect city residents with parks and open space, providing more opportunities for children to be active and enjoy the outdoors. - Increase funding for Safe Routes to School – This is one of the best ways to reduce children being driven to school each day – provide a safe route so that they can walk or ride their bikes instead. - Help create more opportunities for both volunteer programs and paid work – 1000's of young folks are connected to the outdoors by volunteering for local, state and public parks, but many local govts don't have the resources to either create or expand upon volunteer programs. Assistance from NPS or the USFS could make a big difference. Also, help increase programs that assist college students with paid internships or paying back college loans in exchange for working outdoors.

Getting more Adults Outdoors - Support Social Marketing and Social Norming – This is one of the best ways to inform leaders, parents and children that getting outdoors is healthy and positive. Social marketing has changed the way we think about litter, forest fires, seatbelts, recycling and more. - Increase CTEP Funding – This is one of the major funding sources for constructing bike/ped trails that are used for commuting and recreation by adults of all ages and abilities and children. Such funding is often used to build bike/ped trails that are completely separate from roads in beautiful greenways, which encourages more adults to ride and exercise when they feel safely separated from auto traffic.

Lived by a national forest in Tennessee. The local school system didn't take advantage of the local forest. The local Forest Service office really isolated themselves and you never saw them in town. It would be great to put the local office in town and combine the town and the agency to increase education.

Website for finding jobs for the Forest Service and National Park Service is terrible. If we go to a web site that's not well put together we are turned off and we don't want to work for them. It's hard to get a job for the FS so why not put links on your site of alternative ways to work in the woods that may not be as good as pay but get us out in the woods and work experience.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

His roommates recently got a record player and you can't skip a bad song easily. When you deal with a job site – the kids are used to skipping past bad songs easily so when you're dealing with a web site need to make it so that there are not bad sites that youth will skip. Make it fast – the youth are used to operating really fast. Use of social media facebook and twitter is really important. The NYC people who aren't in the woods use FB and Twitter and that is how we can connect with them. Also remember that use of social marketing technology skips over the young folks who aren't on facebook yet. Keep in mind that when using facebook you are missing elementary and middle school kids and we need to get kids into the habit of using the outdoors.

It would have a huge impact to move the Forest Service out from under Department of Agriculture because when you view trees as a crop it makes a big difference in how they are managed. The way to set policies should be based on watershed health as the basis for all management because, for example, drinking water will be one of the primary problems of the next century.

He brought seven people here all of which can't come back because of the limits of the program. This creates problems and also brings in new ideas. He's seen Forest Service people getting comfortable in their jobs. He'd like to see the agency have rules where employees would have to move on – for example they could be a GS-4 for a number of years before you move up or move out. This would help the younger people move in and would keep the government agencies fresh.

Two issues: Sustainability in the timber industry. There is a way to use these renewable resources. There's a way to use the trees without clearcuts – use the woods at the same time as keeping them growing. Land use ethics: he moved to Kalispell thinking he was coming to a little mountain town and instead found out it had six grocery stores and two Walmarts. He'd think it would be huge if people understood the land that they're destroying by building on it.

He would like to see the FS change their stance on mining and international Forestry.

This group is not representative of youth in Montana. She is a 5th generation Montanan and there is a need to take this to more rural communities. It would be good to have smaller groups, led by youth and get in touch with more youth groups.

You asked how to reach out to the youth. The way to do that is to treat us as the new and upcoming voice – do not marginalize us – don't just see us as a group of young people who are upset and have too much time on their hands – instead see us as leaders – we are concerned about national security - we recognize that the problems going on are not just problems now but will be problems for the next 30 years and we're going to have to be the ones to deal with it. Recognize us for that.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

1. Lack of money is the critical issues. The forest needs to managed to generate money to do a lot of the recreation development and restoration work. Letting wildfires run and the money goes up in smoke. Harvesting creates roads and access for people to use, it creates jobs and can make the land healthier while generating revenue. Plum Creek Timber Co lands allow access and it creates lots of recreational use, unfortunately it also ends up with people dumping refrigerators and couches. Money is critical issue for managing the land, it needs to be generated from management not appropriated from the government.

One is going back to grad school to work on climate change another really wants to work in the forest not in an office. It takes \$10k to pay for these types of positions and experiences. The agencies often don't have the capacity to do the training of volunteers so we miss opportunities to use this labor force, the agencies don't have the NEPA completed to implement projects. The agencies don't have the organizational staff capacity to engage the way that has been expressed today.

a huge barrier is the potential for catastrophic fires with our overcrowded forests and beetle epidemics. We need to get forests thinned. Tools needed= fund biofuel energy developments – it will be cost effective and provide jobs. The private money will not be invested until lawsuits that stop thinning can be stopped. The private sector needs enough lands to be under contract so they can see their investment being amortized over time.

The government can be a better partner by stop hiding the grant opportunities – web sites to find this information. Need to have simpler application processes.

Both within FRPP - LO's get to work with 3rd party of their choice - a strong selling point for that program; when LO puts property under easement; it's \$ out of LO pocket - wants more recognition of LO contributions

Grizzly bears

Strategically think about fracture zones and linking the protected areas for interests of grizzlies, etc

Eastern Front -- protect North Fork Flathead

\$s, jobs and Mother Nature

No longer checker board land pattern

Whole thing is what's next - biomass project

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Thinks what's happened here can be exported but they need help - facilitation, etc - NGO's have helped and so have some agency folks who also love the front

130,000 acres of easements - another look ac waiting

Oil and gas

Good place to do this development and others not so much in Rocky Mountain Front

Forestry 700,000 state-owned, more land owned (next to feds) then private -logging will be able to continue into future

EAJA -lawsuits creating big \$ for radical environmental groups; some conservationist groups you can work with \$, others are just litigious.

NEPA sufficiency and hard release language is needed - costs \$m to create these documents and they're litigated like crazy - need to get rid of litigation.

When approached with the idea of purchasing A- 300k ac for~ why that incredibly complex, etc, but that they had to do it - will never be successful in conservation unless it can work for people who live and work there (\$250m is what Baucus apparently came up with); happy with full funding of LWCF.

an organ in Missoula, inch Hell's Anglers ... in 1975, a mine blew (or something) it killed river, now restored there are 500k such abandoned mines out there -. 1 ~ law -local community ~~

Abandoned mine cleanup fund (not what he called it) should be created to give

needs solar and wind as alternative to oil, but needs discussions on where best place is for these and associated transmission lines; likes full funding for LCWF

Historic preservation fund (National) created at same time as L WCF and it's not talked about so much; Government took small amount of ARRA funds and put to historic preservation. The conservation and preservation community should be tied closely together

on a per capita basis, Montana sends more folks to Iraq and Afghanistan than any other country - partly out of patriotism, partly because of jobs

FS over last 11 years has worked hard to reclaim the mines near the edge of Yellowstone -last week or so, Baucus got funding to finish it - Crown Butte Mine

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

You don't get from part A to B overnight; serious problem - inappropriate use of seashores, marshes, coastlines, floodplains; may not have known at the time, but we can't perpetuate the mistake; disaster funds help them, but the ability to get insurance affects peoples' willingness to build there again - doesn't want taxpayer \$'s going more than 1 time to the same structure/piece of property - need to encourage development

200 Lo's on 600 projects

It's about the collaboration, but need to keep red tape \$ bureaucracy to minimum

FWS partners program - keeps L6 agreement simple

Prerequisite to using conservation easement - appraisals affected by outside folks moving to Montana for environmental amenities so the after appraisal values are very high – this doesn't make it easy for landowners

But tribes don't qualify for Pittman - Roberts funds in most cases

No 6 EAS funds

No multi state conservation grants

No state wildlife

Block mgt program needs help. Very stringent rules may discourage some landowners from participating. Some don't want become block mgrs due to regulations, program needs to be more flexible. Plum Creek gets a huge tax incentive. Motorized traffic does not apply in block mgt, overall great for hunting access, some pitfalls to blk mgt area that are constrained by FS in DC. Especially time of year motorized access, some farmers and ranchers are restricted to what they can do, today's economy the restrictions may not allow participation. Need more flexibility and incentives. A state program, MT citizens should try using bond issues to allow purchase of more private lands, example we have purchased lands for public access in the Potomac Valley.

Many community meetings in Darby to discuss FS potential road closures and travel management. The concern that 1000s of miles of logging roads that we utilize with 4wd, horses, jeeps, access by older americans, don't close our logging roads, lots of people want to close to help elk habitat, long time residents disagree with this, the elk are doing fine with public access as it is and has been for a long time.

## Discussion Question 2

### *Missoula, MT*

*(cont.)*

Big city school kid, grew up with problems of getting kids out to the wilderness. Most city kids are exposed to the goal of attaining material possessions v. wilderness values, difficult to be inner city kid and beinvolved with outdoors. He would fish around the lakes , qtr acre of public lands v. huge private land holdiungs. he bought a houseboat to av oid ownership boundaries. sieer club atv access talk they are for keeping logging roads for atv use, issue is when they jump off roads and creat new trails, damages resources, oil leaks, personal responsibility to avoid wetlands, drivers need to bemore responsiible. wants more freedom to avoid other people.

One thing nobody mentioned is CRP Conservation Reserve Progrm involves private l os and public acces, obstacles we face, diff los with adjoine pieces of property emphasize their diffs rather than common, work thru comm and concensus emphasizing the points in common

SHOULD BE A DIRECT CONNECTION TO SCHOOL CURRICUM, NEED MONEY FOR OUTDOOR ED

Movingon to obstructions, 4th gen mt, two obstructions FS is mandated by rules and regs from dc that don't fit here, FS says that it needs to be restructured and maqnaged a different way. NEPA MEPA Travel mgt program is outr of dsate, takes too long things are taking too long. things change updating need sto happen mroe quickly. people need to pressure legislators, not rocket sciens, just talk topeople. 2. the professional "terroists" anyone can walk in a file a n injunction all the programs that people wnat topo p ut together to tmake something work, for \$100 people can hold up progrezss for 5 yrs, need leg to req people to put more money down to file a complianbt, project money os goinmg to litigation

Large landscape coiord res mgt to address climate change, orgs that are successful in bringin people together to, real obstacle as simple as travel funding ands adequate staff time toand agency support to allow need to have amandate in fed govt to allow a space inthe employee workload to outreacha dn woirk with people. State needs to fund travle tio meetings to allow greatewr partiucuiopation. Local orgs Lincoln Inst and policy inst in UM coivwenine a round table with los and local govts, to allow better communcaition across larger scales.

DU has raised over \$2.5 billion over the last 73 yrs for waterfall and other wildlife habitata in US, Canada and Mexico. ## Discussion Question 2

### ***Missoula, MT***

***(cont.)***

Vast amounts of public land matrix of mult uses, core is large protected areas, NPS tourism economy drivers, quality of life need to acknowledge the reason for success in conservation in this region because of large protected land areas. FS, NPS is not the problem, is what has allowed this occur, obstacles are the success of these areas too many people moving here, how can fed help solve this, teach residents how to live in this env to allow the success to continue, Eastern Mt there are efforts to help create large areas Prairie Foundation to help restore bison and to help create and diversify the economy, rec quality of life, hunting fishing other areas of the country

There is only one safe trail at Grand Canyon for access to and from the canyon, the Bright Angel Trail. This trail is highly unpleasant and unsafe due to the heavy use by hikers and donkeys. Trail improvements are needed as this is the only safe route into the canyon.

A controlled burn at Yosemite National Park got out of control and cost large amounts of federal dollars to contain. The federal government should pay young people to clear brush to alleviate the risk from controlled burns. Any controlled burn in tender box conditions is a mistake.

## Discussion Question 2

### *Nashville, TN*

www.walkinonranch.com concerned that these comments won't be read, doesn't like the idea, he is private business man, served in Viet Nam, has some land near Cookeville, they have a horse business, he has PTSD and doesn't like to be around people, wants to know what to do to get help and support, invited to equestrian world games as breed representative for TWH, the small grass roots people can do things, small person can make a difference, looking for help in representing the Tennessee Walking Horse, the various websites are not giving him the assistance he needs in getting help he wants, he wants to get help in representing the state of TN, small farmer and rancher can contribute but need help in figuring out how to get assistance. Don't focus all assistance just on organizations, make it easier with less red tape for individuals not just organizations. Make it easier for people on bottom end of it to contribute.

make it easier to get grants, most of these folk are volunteers with day jobs, make it easier

challenges: Conservation and greenways more \$\$:

Challenges: grants not enough \$\$ to cover grants and request for funding.

challenges: Kids connected to nature. Every Kid getting access to outdoors. Classes, greenways and parks, field trips, Teacher training no knowledge for them to get outdoors, lesson plans for teachers,

Challenges: TN # 8 in tourism. Preserving America Program: no \$\$ in budget for this program in 2011. Sustainable tourism will suffer if this stands

Challenges: DU Kids in the outdoors. Education parents. Find ways to do this. We missed a generation so the kids are suffering

challenges: Childhood Obesity, media partners telling people to stay inside during heat. Find another way to provide a healthy message

challenges: Land owners may be interested in Conserv easement. Expensive appraisals or donation of \$\$ to monitor lands. Match up people who have lands and money. Maybe set up trust funds to help facilitate this for people who have \$\$ but no land

Challenges: State Mandate for State Wildlife conservation plan, federal agency use same tools to set up consistency btw states. EX no net loss policy for wildlife conservation

challenges: Lack of fitness. Get out and walk, eat healthy, ect: To do this area must be safe and education about fitness and healthy eating

Challenges: Consistent and full funding for the USDA's Resource Conservation and D... Fund (RC&D)

## Discussion Question 2

### *Nashville, TN*

challenges: recreation in forested areas is threatened by insects and diseases (trees) Threats to forest health on public and private lands. Land use change loss of forested lands. Work with our policy makers to make them aware of the importance of our forested areas.

Challenges: Create opportunities and demand for kids to be outside. Convince kids that it's great to be outside.

Challenges: Forest fragmentation housing and commercial developments need more local regulations to manage land use. Keep best farm land in production

Change the perception that it's not safe to be outdoors. Address it if it's real or dismiss it if it's fiction.

Challenge: Change the perception that it's not safe to be outdoors. Address it if it's real or dismiss it if it's fiction.

Challenges: Trouble for private sector to meet matches for federally funded programs. Prioritize or coordinate the funding programs.

Challenges: Get our message out to a more diverse group of people instead of the same folks. Engage every member of our population

Continue to evaluate areas of opportunities to get more kids out doors.

Success in bridging gap btwn preservation and conservation community. Preservation community is more concerned with buildings and conser. = landscapes. Need to integrate these ideas. TN Civil War Natural Heritage Area administered by University. TN farms that have been in same family for over 100 years These areas are important to many more partners.

tn organization, challenge they have release schedules , from tva they hold lots of land concern hawassi river, river turns on at 11, want recreation on the river. Wants white water rafting with more releases. Before and after labor daily

lands set aside, and we struggle to maintain what we have, maintenance and upkeep.

- help people to love something to get them outdoors. TN children we have lots of parks and trying to get children outdoors.

con easements 06 07, easement enhanced. Extended 08 + 09, 2yrs success, want perm tax code(revisions). Chattn cons farm land Farm to school program good benefits, child nutrition act hard to serve food, had more funding and buy from the local farmer.

## Discussion Question 2

### *Nashville, TN*

*(cont.)*

grant money criteria to be looked at- pking lots a waste of money requirements need to be looked at.

policy cutting into the NF, on board of tn parks and greenways, reassess the resources of TN, look and not cutting into the NF

we observe wildlife no hunting on it, raising money for land, money is hard to get. LWCF land acquisition money

we created your going to fix it ( as he tells his youth group)

Release schedules of water levels are controlled by TVA need to be aligned; engage partners and hold stakeholder meetings regardless of controversy or differing users in order to best regulate water levels.

young people reconnection minorities. Working with Dept. of Interior is a nightmare vs NOAA. NPS superintendant are too hands off, better coordination of youth programs.

Get kids outdoors- find practical ways to get kids outdoors in backyards. Basic everyday things such as raking and mowing are not done parents overworked. Fontenel Sies with. Integrate nature activity with normal living opportunities such as outdoor concert.

set lands aside and struggle to maintain and keep up lands. Dedicated funding for maintenance and upkeep of lands and use other initiatives to bring kids and people to lands.

Help people love something Every child outdoors TN bill of rights for children walk in woods possible because of partnerships subscribing to this bill. School curriculums recesses and outdoor activities are cut and field trips are limited. Challenge is outside activity is limited because of testing requirements.

challenge of conserve. Easements 2006 and 2007 enhanced tax incentives caused lots more people to enter into CE program Needs to be permanent part of tax code. Help small scale local farmers farm to school programs where schools purchase foods from local farmers Child nutrition act makes it hard to serve quality food and program specifies exact quantities and lends itself to processed large quantity. More funding for Child Nutrition Act.

Access is issue, no mass transit- how do you get urban people to open lands? Difficult to get youth out to areas because of transportation.

Schools, community groups cannot get to park because there is no bus stop.

Concerned about land not being acquired, purchased and developed for private purposes.

## Discussion Question 2

### *Nashville, TN*

*(cont.)*

No equal protection for state programs in local communities.

Dealing with what I do with my land is my business and no one else's zoning needs to be in place, to make smaller footprint and preserve more open and green space.

Money unavailable to buy inholdings because funds are committed elsewhere.

Special use permit process is dependent on whoever is in that job. When it takes one year to be heard, isn't there something wrong with process?

rethinking cutting in NF if trees store carbon maybe we should reassess if we should cut in NF. Reassess logging laws in NF and licensing. Do not harvest because of carbon and

Problems we face will not be solved by the minds that created them. DOI needs more coordination to get more young people involved.

RTCA Program. There has been tension over budget allocations between RTCA and park unit.

Wonderful to have initiatives but don't have staff/time to educate public/youth. Not enough staff for field trips. How can we get excited for educating youth if we have no funding/staff?

Land managers have been accommodating users and resolving conflicts—NOT WORKING—trying to get access to NATR for mountain biking at no cost to land managers to building mountain bike trails—has horseback trails for users but would like mountain biking trails—would not become eye sores—wants consideration for mountain biking

challenge—get all districts and all levels to realize under one regulation—realize people trying to help—Federal agencies need to listen more to legitimate ideas from local agencies

Partner with economic development to help conserve the landscapes that attract tourism. Not realistic to tell rural communities to stay rural with no development. Provide the incentives and work together. There are so many government agencies, TN department tourism works to designate byways, then TDOT puts rip rap along the road...not working together, government needs to be pulled together. Need balancing of environmental and economic. Hierarchy of gov't. Need economic purposes for recreation to make rural communities more viable.

Blue way concepts working well. It gives people access. Not a big investment that can make a difference. Misconception about BIG government taking private land. NRCS programs, there's a disconnect. Locals do the paperwork, but the process fails to get the actions/expectations to met. The small grants are not the effort, work and paperwork! Not going to waste time on a small piece of pie. Need a critical mass to make it worthwhile.

## Discussion Question 2

### *Nashville, TN*

*(cont.)*

Real estate land broker. Couldn't find anyone to tell him how to get land donated to public. Realtors are not at the table when conservation groups get together or when opportunities present themselves. Success would increase if real estate persons were at the table. Could government help identify the key lands that are needed for conservation? So when a farmer is ready to sell, conservation advocates are ready and responsive.

American Rivers. Request for funding to allocated specifically for blueways in urban areas. Focusing on local urban streams. Allow for more protection and cleaning up the rivers, i.e. Wolf River. Signs posted for no prolonged human exposure. Kids can't swim in the creek. 319 and State Revolving Loan granting programs are routinely unfunded.

There's a disconnect between people needing funding and the funding sources. People aren't applying for these funding sources.

Discovery Center Murphreesboro. I do a lot of environmental ed with inner city kids. Challenge is kids are terrified. How do we get them over the fear? We need to get their parents to say it's ok to go outside and climb a tree or get a teacher to take the students outside? How do we breakthrough to parents and teachers?

TN off-highway Association Turkey Bay, LBL, and state area above Knoxville (Royal Blue). Supply is challenging. Lack sufficient access. No public riding areas in Tennessee, but thousands of registered riders. However people don't buy OHV's because there's no place to ride on public lands. People have to travel out-of state to ride.

a farmer perfectly honest, there's a lot of mistrust with environmentalists. You can't be sustainable without a profit. Let's work together. We need strong, viable farms so the lands don't get sold and parceled out. Regulating farm dust, is this really an issue? What's worse, working lands and forests or development?

Underlying theme is finding out what the needs are in a community and funnel funds to them. Need to piggyback community needs; ie. Provide day-care with Environmental Ed. to help kids of single moms to get out outside.

\$5000 grant is not worth the effort to apply, we only apply if it's at least 80-100 K.

trying to get people outdoors SAFETY and CONNECTIVITY are the 2 biggest challenges. Culture of stranger danger keeps people indoors. Too difficult to get across the state, just as hard as it was for the pioneers! Too many obstacles in perimeters of cities. Some cities may have good connections, but that all goes away in rural areas. Perception that if someone on a bike gets hit by a car, it's the bike riders fault.

Civil war focus. Need some kind of channel or network that various groups can use to work together. We share common interests but don't work together, nor know all the interested parties involved.

## Discussion Question 2

### *Nashville, TN*

*(cont.)*

Public school access and connectivity is being lost because housing developments don't allow through traffic. Fences are going up and keeping kids out. There could be regulations that tell people to allow access and open for use. Federal government should buy key parcels to secure public access. Federal regulations on mortgages have changed in the last few years; these regs could incorporate land use to accompany better connectivity in neighborhoods (not allowing fences so kids can cut through yards). Can't use utility corridors either.

Equestrian, RTP should be constant funding and cut the red tape to get the funds to the ground.

lucky to get one Forest Legacy a year. There's a huge need for very little funding opportunities.

Need to provide better incentives and push for benefits to put farm in an easement.

Make a requirement for field trips.

I see a lack of willingness for educators to bring kids to places. Teachers tend to think it's the parents responsibility to get kids outdoors. Williamson county trend is taking less and less field trips each year. Less movies! Take kids out.

Board of land trust. Tried for 20 years to get my grandkids to my farm with limited success. Try to get the parents, grandparents outdoors too. The competition is tough with sports, video games, etc.

from Oregon and familiar with working with Forest Service. The access shut down, don't maintain roads, and charge a fee under Clinton Administration. Less access for fire suppression, higher cost of fire suppression with federal money/tax payer dollars. Less Roads = less jobs.

park enthusiast. Tremendous lack of young park employees. It's difficult to get in. Cumbersome application process. Younger generation are not veterans making it difficult to get employment. Recruitment lacking.

One constant thread is everyone is seeking funding. Got accustomed to the government providing cash for their program. Government act more like a business and not a bureaucracy. Government should look as itself as an investor, not a benefactor.

## Discussion Question 2

***Nashville, TN***

***(cont.)***

private landowner His small town has purchased in town 27.4 acres for a community park. He sent out postcards to towns people listing asking things they wanted in their park. These people wanted to go back in time. The things they wanted in the park are sledding areas, place to grill out, places to ice skate outdoors. They basically wanted to slow down and return to past recreation activities. These people just want to relax. His park has many different habitat types. They will connect their park through a hiking trail to other areas. The challenge is funding for parks. They can get matching funds, but they have problems raising that much. Grant process is 157 pages, very complex. If you really want to get to the people your really need to go to the grass roots. You also need to have a simpler process to get the money to these grass roots process. He qualifies for the grant, but they can't get it because of the arduous process.

The amount of money it takes to administer a federal grant is high. Some NGO's don't go there because it is such a hard process to deal with federal grants.

watershed NGO they connect people with the resource. They also work to connect private and public people together. The boat day is a great event to get people connected to the resource. They work to educate local governments, and education community about serving their needs but also serving the conservation needs. They work in local communities to be ready for Climate Change. They focus on forest and water conservation in climate change. They work at a local level in communities building conservation teams. The challenge around that is getting grants. She will never do a federal grant again, it was a horrible experience. The administration of the grant is a big job to do. It would be wonderful to have the government to look at foundations and help them because they can distribute the money easier. Give them general support, and expect reports, but don't overdo the administering portion. Non profits can distribute these funds so much better than the federal government.

clinical psychologist, retired Been trying to form a Tennessee Naturalist program. Worked on a grant proposal for two years, this grant with NSF was unbelievably ridiculous. They finally got the funding, but by the hardest. She will be in the first group to train with biologist. Do not limit your work to only children. She is 76 and she believes they need to develop their relationship with nature. Many older folks don't like nature. She read a story about an older group that went off into the wilderness. They were going to study how that effect their brains without electronic equipment.

NGO comberland region tomorrow works with developments of lands in constructive ways and with community development. The current policy works against land conservation. We are set for sprawl in the current policy. What the Fed. Govt can do is to connect their efforts sustainable communities partnership initiative that will help communities with better development of their communities and infrastructure. The other thing you can do is work with natural resource partnerships with state agencies and provide them with ways to partner with NGO's. Fund communities to help provide comprehensive plans for these community development.

## Discussion Question 2

***Nashville, TN***

***(cont.)***

Blueways program Challenge on access points to trails. She would like that state and federal can help in getting private landowners to give access to these trails. For them to work to help educate these private landowners in their views on this. She wanted to thank (name deleted) for his wilderness program.

There has to be an umbrella, to organize the groups to qualify for grants in partnership with other similar groups, they will qualify for more grants, grant process is difficult.

TWF (also hunting and fishing guide, member of board of several groups) - challenge because losing numbers of hunters and fisherman, need to get word out to all the organizations and public that hunters and fishermen are not the bad guys, don't want to be on a pedestal, but want to be acknowledged for their contribution to grassroots conservation efforts historically, they want to save green space, etc., they are often treated badly, groups trying to take away hunting and fishing rights, need to bring the sportsmen together in partnership with more of these organizations acknowledging common ground.

## Discussion Question 2

### *Philadelphia, PA*

communities have a connection to water, blue trails program – new program but challenge is making sure connection to clean water and use history to make that connection. It's a slow effort (too slow) in changing how we spend money on our infrastructure (roads, utilities, etc).

work with student conservation, bring programs into the urban areas

West has different problems, so few people and lots of acres, federal role is there is not enough of presence, staffing, and communication

advocates for diversity, Benjamin Banneker monument, staying the course is challenging because national memorials are privately funded, economy makes it difficult, and have America refocus on diversity. There are no monuments to African American on the National Mall

fighting a gaming commission on Casino development in Gettysburg, inconsistent message from federal government

challenge on helping protect the battlefield - Neither NPS nor Elected Officials will take a position to stop Casino Development proposed directly adjacent to Gettysburg National Military Park

Surrounding communities don't understand what the National Park Service does, NPS could do more to get that message out

bring underserved urban minorities into wilderness/parks. Example of Opportunity: We brought 15 young urban women on 4-day rafting/camping trip down Delaware River they took that experience back to their communities. One became a paid intern at camp. I can get no funding from federal government for rehab old building, only money for new building construction – this is antithetical to sustainability

historic preservation professions do NOT pay well (Most professionals do it out of interest and passion).

vandalism is a problem (especially in remote areas). Must make it cheaper to rehab existing lands/buildings than to build new development and encourage sprawl. Put Land Development cost premiums on development of "virgin lands" and incentivize redevelopment and reuse especially when it preserves historic fabric.

Need to have comprehensive and consistent goals at all levels of government and across initiatives –For example: Preservation is unnecessarily taking a back seat, in the name of conservation and job creation, to unthoughtful development of Solar Power Infrastructure being developed in inappropriate locations that impact cultural resources.

funding is an issue, federal role can leverage funds, matching funds from local level – example Highlands Conservation Program where federal funds have had big ripple effect and been matched in big ways with local funds.

## Discussion Question 2

### *Philadelphia, PA*

*(cont.)*

in Rural areas currently need vehicles to get anywhere, public transit doesn't exist, need funding for alternative transportation ideas. Prohibitively expensive to get urban population to Delaware Water Gap, for instance – Bus goes from Philadelphia to a bus depot that is many miles and a \$50 cab fare away (and, by the way, there are only 2 cabs available)

cultural landscapes, when federal government takes over historic structures there is not enough money to restore them, funding is always a critical item and administration has cut out historic preservation funding. Need to emphasize how Historic preservation = economic stimulus. NPS publications are invaluable.

Predatory development is destroying Gettysburg brand. There will be devastating impact on heritage tourism if the Gettysburg Casino goes through. Also, Jobs gained by casino will be lost in tourism.

Serious Consideration should be given to rethinking the name "America's Great Outdoors" initiative - - it does not convey the interconnectedness of Culture and Nature.

Challenge – there are bureaucratic hurdles in getting help from NPS. One is promoting our brand in our community. NPS has its own particular brand; limits its ability to play a particular role.

Graveyard at 4th & Pine (Philadelphia) ceased being a graveyard years ago; people planted trees, now we're an urban park, this is causing all sorts of problems. It costs thousands of dollars to fix heaving gravestones. Our iconic fence is ready to collapse on Pine Street.

We desperately need to raise money.

Existing federal legislation such as Section 106 must be followed by all the agencies that are affected by that legislation. Department of Energy, for example, doesn't follow.

Pinelands Commission no longer does cultural surveys although they are supposed to. Re-development is going on, following no requirements (Section 106 nor cultural surveys). They don't let anyone speak at meetings. Go back to the Comprehensive Management Plan that was done by the Commission. Enforce laws and CMP.

We should get the Pinelands geography into local curriculum but there's no room because of "No Child Left Behind." Curriculum is so structured & strict, teachers can't even teach about the local environment and heritage; so there's no passion for it [being cultivated in the children]. They're teaching to the test.

Teachers don't have time to teach this in the classrooms any more. Maybe we need to pick up the gaps. Work more with teachers to develop programs. We've had some success in Germantown (Philadelphia). Teachers are incorporating local heritage into Social Studies.

## Discussion Question 2

### *Philadelphia, PA*

*(cont.)*

I get a special feeling every time I go in to Independence Hall. But I think many local people know it's there & don't visit. I think it's an acquired taste. Our trading cards go like hotcakes. But people don't come for that reason. Need to develop a desire to visit in the first place.

In Germantown (section of Philadelphia) – challenges with blight & crime, getting visitors there is a challenge, so we focus internally & get community involved first. Make the green spaces of cultural sites available, this brings people in. Building affinity groups such as brewers group, jazz concert, through these you build appreciation of the cultural site, people begin to understand it's important & they come back.

In Washington, DC, challenge is finding enough \$\$ to get schools out to cultural sites. NPS & public-private partnerships. Get the money for school buses to get kids there.

we raised an endowment for that, people want to support it. But it is an obstacle, getting kids out to the sites.

East Coast – such a long-term colonization. Pinelands is exquisitely preserved. Amazing resources there. Pinelands Commission no longer requires archaeological surveys, so areas just get plowed over. Woefully underappreciated on east coast even though NJ has such a rich Indian history.

tribes – no distinction between natural & cultural environment. Would be a good model for all our parks. We have divided natural and cultural.

West Coast example -- park formed in 1860s on land occupied by Indians for thousands of years. NPS telling story of 1860s period is inadequate given timeline; there is plenty of room to strengthen the interpretation. Room to grow the story of the tribal experience in most of our parks in places like Yosemite. I seek it out but it's not easily found. We are often missing the thousands of years before park was established.

a lot of history has already been lost. NPS is trying to reconnect people but it's not the same as being able to re-visit your tribal homeland. NPS and NPCA (National Parks and Conservation Association) – we tend to think we know how to protect Indian lands better than Indians do.

32 states have historic tax credits but they're all threatened every budget cycle.

In PA, Historical & Museum Commission gutted, really a problem for historic sites like my own. Always the stepchild & first thing to be cut, even though funding is so minimal in the first place. It's always "arts & culture," not "arts, heritage & culture." Advocacy is something we don't do well as a group. We could improve.

Jewish community started in Pinelands in 1880s. Pinelands Commission trying to put sewer projects on this land. State says it can't help because it's federal. State laws don't cover national preserves. Create partnership between state and federal. There is more protection outside the Pinelands than in.

## Discussion Question 2

### *Philadelphia, PA*

*(cont.)*

Business sponsorship is the wave of the future, I don't know if it's good or troubling. Are we going to have "Microsoft National Park"? We have Director's Order 29. In all the categories – we need to do a better job of talking about the mechanics & the framework of historic preservation. People think that buildings preserve themselves & historic documents just appear in little plastic envelopes. How many people know how small the federal funding is? It's chump change & always threatened. Talk to residents in communities; teach that it's more economical to re-use a historic structure than build a new one. Get people to understand there are alternatives; there are programs in place. Things need to be thoughtfully preserved.

Get local, state, federal politicians interested in the passions that we all share. They seem to be off in a world of their own. We're pleading for money while other things that don't make sense to a lot of us get well funded. Political aspect is a big one. Put them under a magnifying glass. Accountability

administration is looking for new ways to make historic preservation even more successful than it has been. What is it that's too stuffy about it? What should we leave behind or re-package?

land and water conservation fund, lack of funding for program

chronic lack of funding, even to do basic survey work. Historic Preservation Fund programs in federal government have never been fully funded.

National Underground RR Network to Freedom program – really neat, still underfunded. Provides expertise & resources to people in communities to help them tell the Underground RR story. NPS was having difficulty engaging African Americans in community. Underground RR Network to Freedom – success story.

Challenges: lack of relevance of historic sites to people in communities. People didn't think historic preservation applied to their stories. Underground RR Network to Freedom has such great staff – they were able to break through that, help to engage people where other agencies cannot. Doing well but needs more resources.

Lack of Diversity is a problem in Historic Preservation professions, especially in archeology

youth were not aware of the job opportunities in these preservation and conservation fields, one thing that need to do is increase the knowledge of the job opportunities in diverse communities.

technology is a great challenge (Need to find a way to get youth off their gameboys /i-pods/computers and into real places), engage youth through iPod video and have them tour the Pine Barrens in NJ, guided tour through village.

## Discussion Question 2

### *Philadelphia, PA*

*(cont.)*

need a consistent message, NPS has said that historic preservation is not a core mission, inconsistency with federal governments message, actions have to follow words. Tribes want to do more historic preservation and there should be more federal money to help them.

challenge is us, we've been talking about this (Diversity)for years, change the paradigm and start taking steps to change it, very few pathways that youth ( and especially youth of color) can get into (preservation & conservation fields) professionally, we need to own it and change it

people ask what is there to do here? They expect people to interpret. People WANT to connect to the past; looking for a Williamsburg type experience. Expectation of being told stories.

web isn't all. It is the beginning. Still need signs, interpretive panels. Kiosks with educational features

Heritage areas need to have solid base of legislation at the federal level. Each Heritage Area has its own legislation. We need congress to approve an act that unites the heritage areas that forms a partnership with NPS.

Help regional tourism. Regional tourism helps develop products - develop marketing. Biggest challenge: taken severe cuts in the state. The states don't have a budget for historic preservation and have been hit hard.

funding disparity. At least in NJ, lots of community NGOs fund environmental efforts but not in historic preservation. Must bring in the foundations and boards to energize as well as state legislatures to remedy the disparity

challenge- make sure not only talking about NPs and best of the best but broaden to communities. Ex: Cumberland, MD- western terminus if C&O canal. Canal as a national park is an attraction but town revitalized through fed programs such as tax act is the context and the community is as vital as the park itself. Importance of programs to assist all levels of preservation

Another form of help that would be useful is legal help. Not sure if any legal help is available for preservation. Citizens are putting up their own money to fight against a developer that was using money from the state to fight a law case. If there is any way communities could try and get support to enforce laws that are on their own books that are undermined by backroom deals, it would be helpful.

Even when we talk about "green" buildings, don't talk about landscape outside. There are a lot of disconnects and need as diff agencies and disciplines need to come together and integrate all of these things

so many people don't know what resources are in their own backyard. Get the information out there in the local community and tell your neighbors what is here and why it is important. Challenge- educating locals about resources at their disposal

## Discussion Question 2

### ***Philadelphia, PA***

***(cont.)***

full funding for HPF. In historic preservation area private entities make things happen but SHPO offices set guidelines. With federal historic preservation program, SHPOs do the implementation. Last few years, 40% cut in staff but larger increase in sect 106 cases. Need to do better

engage local groups, municipalities to what is going on in their backyard. Need to have overarching effort on federal level to bring larger regions, groups together to bridge the divide. Bottom up and top down at the same time.

great losses in the 60s. how do you provide check against contemporary enthusiasm so don't later regret what was lost. build a video game where villain is destroying historic buildings

connect "no child left inside" to AGO

Youth see a benefit of having connections to their heritage. Their concerns were – they didn't know much about their heritage. There needs to be more information about where sites are and what there is to do, they can't get to the sites once they know they are there, What are your concerns about engaging young people?

Our youth are sending the message there is a strong interest in preservation as a career but there aren't many opportunities.

NPS needs money to purchase in holdings.

Lots of people want to start working for the NPS but there is no way to do it. The federal hiring system isn't ideal. Needs to be some intake program or easier way to break into the NPS. More emphasis on hiring structure.

Acknowledged the challenge of understaffing and underfunding of CR programs. Acknowledged the challenge of CR preservation mandates being viewed as secondary to environmental protection mandates.

There isn't a place in this country that nature and humans have not interacted. It is one in the same and you cannot divide it.

Cutting federal funding to heritage areas is a challenge, along with Preserve America and Save America's Treasures. Lack of funding at national level at BLM and Forest service.

Recreation in NJ: In the state every bit of open space needs to be built upon with soccer or ball fields. There needs to be a focus on green spaces and natural areas, not the suburban treatment of parks.

Two challenges : 1) lack of communication among each other 2) lack of education. Need ot get next generations of young people out.

## Discussion Question 2

### *Philadelphia, PA*

*(cont.)*

Battle lost against casino (sugarhouse site) had more Native American artifacts than other sites in PA are now sitting in archives. At Fed. Gov't level tools like NEPA and USACE could be deployed at these sites would be helpful. Legal structure – there is a weakness in public interest law. Casino bought out law firms and no public interest firms got involved. Citizens groups had trouble finding law firms that were not being paid off by the casino developers. Campaign finance abuse – casino developers were contributors to campaign funds of the governor.

Don't see Cultural/Heritage tourism being addressed at all levels of government.

The history has to motivate the kids – which they can relate to the history. Nobody would come if it didn't speak to them. Eastern State Penitentiary would be a great place to train students in historic preservation techniques

Need to add environmental component to historic areas. There won't be recreation if there isn't preservation of the environment. i.e. if the water is polluted, then the land around it will be polluted too. Add protecting viewsheds to areas that need more protection/energy. Viewsheds should be considered the same as watersheds. Need to put history back into historic preservation. People have disengaged from preservation. Preservationists don't have a clue as to the history of the site they are working on, they are just focused on fixing the roof.

This administration has turned its back on historic preservation. There was one reference to historic resources in the AGO film. You can't deny the relationship between land and people. We need this administration to acknowledge preservation. When you look at all the materials (AGO) there is nothing. Yet we are the only federal program to protect the historic resources of this country. Save America's Treasures is an economic engine. If SAT goes away that is the end of the federal program for the preservation of our historic resources.

It is essential to have a listening session that is more streamlined for Native Americans.

Many constituents are unsure of issues that deal with their local NPS sites. People don't realize that these sites do face pressures. Simple public outreach can get the public engaged. If the public doesn't know that parks are there and for them, parks don't have a purpose.

policies & incentive programs that perpetuate the notion that built environ is expendable but natural environment is not. In reality, bldgs are millions of tons of materials that if not saved would be put in a landfill. Demolishing & rebuilding says we have all the building materials we need when in fact lumber is coming from forests that we need. Need new paradigm the message out that built environment and natural must work together

## Discussion Question 2

### *Philadelphia, PA*

*(cont.)*

In her experiences with inner city youth, she has found that it can be hard to connect these youth to historic places and the outdoors. Sometimes they don't know that they can access these sites (residents said they didn't know the places were for them to enjoy too). Historic places don't always know how to connect with the communities that they are located in. These connections require funding and it's difficult because the funding isn't permanent.

My site is within the Marcellus Shale are – our site is threatened by potential drilling. We will not be able to raise money for an interpretative center if our water and soil will be contaminated by drilling. Preserving our natural resources will save

When trail work is done for a multi-use trail, the trail designers don't understand horses and we have surfaces that are not suitable for horses. USDA published a book for multi-use trail design; we ask that it be used. We need trails to ride on and we need to do better to accommodate the horse.

Heritage Education – we need to keep in mind access and relevancy. Who is the constituency, how do we reach them, and what do they need to know? Many people are not finding their place in our history.

problem: why aren't people visiting? What kinds of experiences are we offering? Thematic like in crossroads in NJ- get excited about all resources

Sometimes partnerships are challenges. Money is a challenge – we rely on public/private partnerships, which is in jeopardy now.

challenge- get people to appreciate archeological resources. If can't see it, assume it isn't there. Arguably, greatest amt of resources are below our feet. Ex: Phila. President's house. 300K visited archeological site in 4 months. Telling visitors that there are archeol. resources elsewhere and can revitalize interp.

SHPOs and TPOs are under-funded. The Historic Preservation Fund has never been fully funded. We've never experienced our national historic preservation program in its full glory. The administration said that Save America's Treasures and Preserve America don't align with the mission of the NPS.

Neighbors don't know how to access a park. Lots of people drive through Delaware Water Gap National Recreation Area but don't know how to access it. NPS should fund parks because friends groups can't run everything.

## Discussion Question 2

### *Philadelphia, PA*

*(cont.)*

Pennsylvania is having trouble w/ finances. PA has large number of small, municipal governments – things are important locally. SHPO has had some success going into local communities to help historic preservation. Need to take care of places that already exist. Need to make historic preservation a priority – instead of funding other projects (sewer systems, etc etc). Incentive programs work – and not having them is a problem. Re: Historic Preservation trades – difficult to get students, easy to place students. Could collaborate w/ Habitat for Humanity to rehab old buildings instead of Habitat for Humanity building new houses. Need to address people and engage people where they are – they may never get to huge park – so need them to know what the great outdoors are locally.

Delaware River is the natural resource linking many cultural sites and since those sites are oriented toward the river but the last 50 yrs have turned us away, lots of sites are abandoned or less used. Example: Fort Mifflin owned by city of Phila but run by a nonprofit. Lazzaretto south of the airport is also in need. Preserve these sites and link them together along the river. How do we have a federal role? how do you promote, fund and preserve these sites along the river across these 3 different states?

focus on recreation element: breaking notion that you have to travel to a destination to recreate. Transportation can be recreation by insuring access pts are accessible by auto, biking and are connected to nearby places where people can stay or live to allow recreation en route to destination and not just when you get there.

Federal funding, and state and local funding, is being cut. Funding to survey properties so that we know what we have. Administration's lack of support for preservation programs. Section 106 not taken seriously. Mistaken perceptions that inner-city youth don't have opportunities to use parks (they do, for example, Central Park).

Need to get people to care – people don't feel that history happens to them/affects them/is part of their lives – same for the outdoors.

We need to connect our parks and forests with our communities in a closer relationship. We shouldn't think one-dimensionally; need to look holistic at projects.

(Conserve wildlife foundation of NJ) - natural resources & biodiversity- issue we have : wildlife watching is growing. Would like o tee biodiversity afforded protection it needs and address the backlog of listing of endangered species that has been stunted over the past 8 yrs. Second, private land stewardship issues. Not land acquisition but land STEWARDship.

Obamas in Acadia visited historic sites and went hiking so they got the balance. We don't have that in NJ- great divide btw natural and cultural. Visitors will have a much richer experience if natural and cultural are unified.

## Discussion Question 2

### *Philadelphia, PA*

*(cont.)*

Lack of funding for programs, lack of education for local jurisdictions that don't recognize value of resources (example – Wilderness Battlefield in Virginia and Walmart), Community is not aware of historic preservation benefits/efforts, need for Superintendents of national parks to help local governments see/know how the NPS can be of value to local governments.

Youth are at risk getting to outdoor spaces. Don't have funding for transportation to get them to open spaces. Schools are a good way to get the message to kids – field trips – but it is just getting them there... programs are available, but only takes care of a limited amount of children. Also some of the grants dry up and funding disappears. Young people don't want to walk, so that creates need for bus transportation. Historical initiatives are cultural and socio-economic, and when dealing with neighborhood renewal historical sites can be destroyed to “clean up” the neighborhood. Educate and learn about community before tearing things down thinking it is being made better – can sterilize a community and make them apathetic. Need to educate people of color about historic preservation.

Land & water conserv fund –need dedicated funding fully funded. Another challenge in PA is incredible sense of parochialism. Everyone wants their own fiefdom and not willing to work regionally. Suggest better preservation effort if you look regionally, beyond your borders.

perceived divide btw natural & cultural resources- telling that the AGO sessions are called out topically rather than talking about the great outdoors holistically. Cultural & natural environment are interrelated and need to be dealt with collaboratively

Tax incentives for weatherization of housing is at odds with historic preservation/preserving historic places and houses. She does not believe that these are mutually exclusive missions.

Need for special funding (public funding is not flexible). Funding for conservation and preservation should be broadened to include marketing.

difficult to see where funding for historic preservation funding is in the AGO initiative. Distressing that funding for Save America's Treasures is no longer a fund source. It's difficult to fund historic preservation projects

So often the enthusiasm of protecting the land gets ahead of recognizing the cultural resources that exist on the land. The SHPO doesn't have the funding and staff to keep up with the inventory, which is needed. The effort by Congress to exempt a large project from Section 106 would set a bad precedent

Missing: access to local history. People have very little identity with the places in which they live. DRVPC does environmental histories that can be better used by teachers in classrooms

Industrial areas- how can the government transform lands of abandonment into land that can be used for recreation, open space?

## Discussion Question 2

### *Philadelphia, PA*

*(cont.)*

Tax credits are not working in those communities (outside of NYC) because no investors, difficult to get the word out to investors more effectively.

Places are being bulldozed, our history is being destroyed. We need politicians on a local level to stress that preservation connects us to where we came from.

People don't make the time.

Valley Forge, removal of invasive species - trying to spread awareness of the dangers of invaders like rusty crayfish and kudzu. Keeping ecosystems intact.

Someone to go with. Don't like to hike alone.

Money. Don't have money, can't go. With unlimited funds, would visit all of the historic sites.

Need to share information that the park (INDE) is free. Tickets are free, need to get the correct information out. Communications. These places exist and they are free.

From Arizona, take the outside spaces for granted. They are seen as permanent and don't make visiting a priority.

People don't know where these outdoor spaces are.

School

Too many distractions, technology is good but keeps people out of the outside world.

It takes a lot to engage kids and have them understand the importance of historic sites and what do they mean that would be better accomplished on a park by park basis since the approach is individual.

Invasive species - People are actively planting invasive species which are some of the hardest things to contend with and they are only being brought in out of ignorance, not malice.

A lot of parents just don't care. I just took a 15 year old friend who'd never been camping in her life. I have friends who have never seen snow or gone skiing. Depends on your family. If they don't care, you will never get the chance.

## Discussion Question 2

### ***Philadelphia, PA***

***(cont.)***

A main problem of getting people to go to parks is being outside is nice but can't compete with big and flashy and that is more immediately gratifying than going into a park. Harder to go outside than turning on tv. Much more accustomed to do the easy thing.

Accessability to and from site

Access - hard to get to cities and rural sites

Another issue is cost of transportation budget.

Available resources. Motivation.

Better access to information

Better access to transportation

Buses aren't part of a suburban culture, although you can take a bus to get you to a mall.

Casino near Gettysburg Park, desire just for jobs is shortsighted and conservation can also create jobs.

Comfort zone, fear of trying something new.

Communicate opportunities (internships, youth employment, volunteerism)

Coordinating among NPS sites with other cities, organizations and visitor bureaus - more maps and visibility - share things to do in the area, not just in parks

Develop youth oriented programs

Disheartened by Stimulus Bill because we didn't use the Depression era model where we improved existing places. "Shovel ready" is ridiculous way to choose projects.

## Discussion Question 2

### ***Philadelphia, PA***

***(cont.)***

Don't want to go unless my friends are there.

Festivals, carnivals - "National History Day," reenactments, but you never know when those things are happening.

Focus on interaction with the public and put less focus on reading signage

Get the word out that has information on all of the things that are available to do in your community. Don't have one place to look for information.

Getting students out into parks and historic sites every year. Field trips with follow-ups. (Not a great idea to force everyone to do an activity because they may react against. If it is a requirement, it will get negative energy. For example, I have to do service hours but it is a requirement so I don't want to do it. Make it positive rather than negative. Give options - natural or historic park or alternate).

Hard to go; we're in a crew

Hiking for a reason like cancer research. That would appeal to some.

Historic sites are not relevant youth

I go to school in lower Manhattan and we gather in the open spaces but it is passive activity being outside but not active. It is nice to be outside but not as much benefit as if something is going on.

I have a friend whose attitude is "I'm just one person; it's not my problem; what can I do?" She doesn't understand and that makes the problem worse. Knowledge is important. Learning about the environment - make the environment a reality in daily life. We cleaned up a beach and I saw the kind of trash that washes up on shore; it made the connection real.

I lived on Lake Michigan and there are kids at my school who have never seen it.

I never see ads about National Parks or anything.

I went visiting a bunch of national parks this summer and it seemed like only one out of every five people were speaking English - it was mostly all international visitors.

## Discussion Question 2

### ***Philadelphia, PA***

***(cont.)***

If there's a Megabus for \$5 to Buffalo - then why can't you run cheap trips to parks or historic places?

If you go bike riding you will get hit by a car. I live near the beach and trails but if the only way to get there by car, who's going to take me?

If you live in one area, you need something nearby in order to learn about what people are talking about. Otherwise your attitude will always be "why should I care?" - need that exposure and experience to understand.

Importance of parents bringing kids to these amazing places.

Important to understand your own community - in LA, kids who live 10 miles from the beach have never been there.

Information - about where to go, what to do, programs, volunteer packages, funding, etc. Would be great if there were a place online that you could go find it all

Is it a big scary world? Challenge of a single female feeling safe.

Labeling system, trail or recreation directory - where is someone in a park - how do you get from point a to point b on trails. A ranking system that will gradually introduce people to outdoor activities and can contribute to awareness.

Lack of engagement and interaction by the public with the youth

Lack of information of what's there, how to get there.

Lack of recruiting from NPS. I went to a government job fair and the Department of X was there, but NPS didn't have a rep. Finding internships is hard. I went to volunteer.gov and that led me to another search engine. You really have to look. Need a clearer, easier way to get involved. Never heard of SCA group before today.

Mobility once arriving at site

Money

More people to give information (interpretation) rather than signs / wayside exhibits

## Discussion Question 2

### ***Philadelphia, PA***

***(cont.)***

More programs and less expensive programs. Young man hunted the internet - community serve teams for \$4,000 plus \$1,000 for stuff. \$5,000 to go volunteer?

National Parks are not the first thing I think to do. Wouldn't think to go hiking but if there wan an open field, I would play sports.

No place for kids to go sit. No gathering places.

No safe way to get to urban parks, smaller historical sites are not always in saf enighborhoods or you need to go through rough neighborhoods to get to them

Not protecting the irreplaceable we lose our identity, destroys physicality as well as who we are as Americans and how we unite.

Not youth-friendly (\$, access, etc)

Park passes are expensive. Is there a youth pass for NPS? What is "youth" cut off? Is it 18 years old adult or youth?

Parks should market less as schools / learning, more as recreation and fun, more activities, less passive visiting

Partner with schools and educators

Physical Accessibility

Programs / packages that make it easy to visit or volunteer. Alternative spring breaks - in parks, service-oriented. Hard to find programs like the one Habitat for Humanity has. Programs that include transportation would be good. Big thing is once you're there - so many other places you can go for leisure that have cheap places to stay. Connecting through schools / colleges, that stuff is already set up. But other programs, it's not all set up. Not easy. Lodging and stuff for volunteers and interns. In a place like Point Rey Park - if you don't live near the park, there's no access to lodging. Could camp - but what about cost of camping equipment! Showers? Storms?

Programs offered at parks are not fun for youth/ programs dumb down materials for youth

Provide internships and summer jobs for youth. Youth want to be in the parks, but they can't find the opportunity to contribute and stay engaged

## Discussion Question 2

### ***Philadelphia, PA***

***(cont.)***

Provide more opportunities for educators to use the parks as classroom

Sites are ruined by others, graffiti / defacing is unattractive

Some places in NYC - no loitering, police come kick you out. Assumptions it's about drugs or something.

Television / media - excuses not to go see the real thing

There's this mentality that the world is scary and it's a liability issue if you take kids away from school for field trips.

There's this Purell vs. dirt mentality now. Everyone worries about accidents, predators, etc.

Time and money - expensive to visit, can't afford fees, transportation, cost of programs

Time, single mothers are parenting most under-served audiences and do not have disposable time or money to provide experiences for their children

Time. I don't use my free time well enough to choose to go outside in parks, historic sites.

Transportation - cost, distance to sites, availability

Transportation for youth - Fisha and Wildlife buses kids from cities and having that be more widespread would be helpful and would facilitate awareness and experiences.

U.S. residents just don't think of going - we'll go to Mexico on spring break before we'd think of going to a National Park.

Want more flexibility, less structure with scheduling

We can't say what would interest us because we are already here. Need to get the word out to people who are not already interested. Convince your friends to go who wouldn't already. Enticements work. Like to an event like this - bribe people with free food. A niche group are interested in this and you need to expand it to a broader audience. You are preaching to the choir.

## Discussion Question 2

### ***Philadelphia, PA***

***(cont.)***

Where I live, they don't like high school students to loiter; they built a sitting park, but you get chased out if you sit. They made a skateboard park and put it on the edge of town, but it's so far away, the kids can't get to it. You have to be driven there. Stuck in the suburb; can't get out. There are strip malls we can get to. After nine when everything closes, the kids would go skateboard in the parking lots, but the cops chase them away. Skateboard park is pretty, but you have to be driven there. It's pointless. Can't use what we have access to, can't access what's been provided for us.

Work to attract high schools and universities - through special student admission / student events with a well known name to attract them.

Young woman tells story of trying to go for a run in a park; the police stop her at the entrance and tell her to go home. Some negative activity there that they can't control. Single woman is not safe.

Young woman who attends Environmental Studies High School in NYC gets opportunities to go hiking and scuba, but a lot of people don't want to go out to the park - broken glass, people smoking. Too much effort that's not worth it.

Youth do not know about historical sites and recreational parks in their neighborhood/area

Youth from outside Chicago asks are there buses that go to Valley Forge or Hopewell? Youth answer, no there aren't; buses take you from one part of the city to another part of the city.

## Discussion Question 2

### *Poughkeepsie, NY*

I'm a Hudson River navigator and through American Heritage Rivers Initiative. Also works here at Marist and represents local community groups. Bringing people out are surely things promoted by the grass roots, local community. Opportunities to partner with federal government. Every local community has different needs and it could be recreation or natural resource conservation. But we need to stress connecting people through the rich sites that we have, cultural, historical and environmental. Additional resources that would help our efforts? Coming from the American Heritage Rivers Initiative – 14 rivers that work together. Tools we need from federal government is for federal government to be engaged, but not just through one agency, but inter-agency task forces. It's not once size fits all. We worked with an interagency task force. Can be such a tremendous tool, because if I go to USDA and I'm not talking about farm, it's not a part of the USDA priority of projects, if we could crossover and USDA is partnering with the American Council of Historic Preservation or NPS is involved, then they will recognize needs of local communities are not one size fits all. We need to work across agencies. We also need to re-engage what the federal government has already invested. We constantly struggle with where we belong, because the American Heritage Rivers is not part of an overarching organization. Where do we evolve? Maybe what we do is partner with some of those local initiatives to reengage them and make them part of the project. The challenges are, of course, money. We need to see the federal investment across all agencies. The role can be great. We've seen across our history much investment and it is a golden opportunity.

What works to engage people are community gardens, school gardens, theme farms, fresh air farms, things to get kids out and experience their environment and to understand the food system. Community gardens are a fabulous way to get people even in small spaces in urban environments to connect with the outdoors, to preserve that land. Tools/resources – public land trusts, protection of land rights for community gardens, assistance of soil remediation in brownfields and urban areas, sites that exist and are neglected, mini-grants, funding to get school gardens going, efforts to bring fresh food to children. Challenges – state and local regulations that are seen as barriers right now. Lack of incentives, short term goals for development that fragments the land and takes land out of production as a green space. Green spaces or community gardens being sold. Maybe if they are sold could have some percentage of the fund be put into a coffer – when public land is sold, to put some of that money into a coffer to use for other public lands, soil remediation, etc. Food modernization act is an opportunity to amend that in certain ways not to overburden small producers. Can't be one size fits all, right now it's five hundred dollar blanket fee for every farmer that participates. We need to mitigate that and make it more flexible for small farmers or a variety of farmers.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

I'm here today as an independent professional fundraiser who's worked in parks, gardens, arts related. I want to second what \_\_\_\_\_ said about interagency. Inter-agency approach is essential. When you are dealing with a park, you are dealing with a designed landscape. It can't just be seen as grass mowing. I work for two different Olmstead parks. One has challenges just to keep the trees trimmed, to keep the design intact. Needs historic preservation money and recreational tourism money. As far as activating this, I think that what works is to plot activities to connect people through various methods – slow food, future farmers, etc. Get kids out of the classroom and on to farms and in farm areas. There is no excuse for not getting kids out of the classroom more. Water is also very important and kids haven't had any experience with water and it's very important to educate them about water safety. Every year kids die because they don't know how to swim.

I work for the NY state office of parks, recreation and historic preservation under \_\_\_\_\_ as a community liaison. One thing that really does work is to link the many programs out there. Many times we are working in bubbles without connections to others. What we do in the state historic preservation office is provide an awareness and a protection of resources that lead to an incentive for preservation. Farmers have to make money. Money goes where the opportunities are and where the path is clearest. But we have an amazing amount of infrastructure that is already established in historic sites and towns and we need to reinforce what we already have. We have a federal-state program "Certified Local Government" that the federal government stepped up to the plate to provide assistance to communities to incorporate preservation. We provide grant money to those communities to do the preservation work, training, and planning. It needs to be fully funded. if we keep our infrastructure and our historic communities viable, people want to live there and we leave open space alone. Speaking under my parks hat, we have enormous number of parks, we pioneered the CCC effort here in this state. All these things that were built that need cash. Cottages, cabins, admin buildings, that important for families to get out. We are so behind in our capital investment because we can't do it anymore. I see all our historic resources and parks, we have any interesting hinge part between communities and parks that are economically important. It takes funding. It takes cash. Land and Water Conservation Fund has gotten so much attention, trying to keep attention on Historic Preservation Fund.

independent consultant in historic preservation. The good news is that the increase the state office would get from the Historic Preservation Fund would go back out to the communities. This extra money would be going for more projects. Money to do these important projects, the grass roots needs the money to do that. My concern is that the state being in this position financially, there will be short term decisions that will have long term detrimental impacts. Alternative energy for example. Wind farms, gas development. This is an industrializing area. When you have farmers that are not making money, landholders that have no viable means of earning, they are very vulnerable to practices that may not be the best, like hydrolic fracturing. In terms of developing these rural landscapes, making rural roads accessible to high volumes of truck traffic or collecting lines for the electric power grid, these things all have major impacts on our landscape and diminishes people's connection to it.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

attorney and involved in Walkway over the Hudson. Most people thought I was nuts to try to turn a railroad bridge into a walkway. It's become the 3rd biggest tourist attraction in NY State. We've had 600,000 visitors. I think it's popular because it's very simple – it's a way to get people outdoors without cars. Shared for bicycles, skaters, runners, walkers, small scooters. It takes about half hour to walk across it. Until you get out there, you can't understand the beauty of it. It's quiet, it's peaceful and people just love it. It's going to connect with 25 miles of traffic-free trails on both sides. I've been pushing for a number of years with the Dept of Transportation not just to concentrate on providing motor vehicles access, but on bikes and pedestrians. Not enough attention to sidewalks and traffic-free lanes. There's no shoulders, sidewalks, traffic free lanes. I think that's the reason for the obesity problem because there isn't a safe way to get out and walk around. We've concentrated on motor vehicles for too long. Dept of Transportation needs to take into account and consideration the impact on bicycling and pedestrian traffic. Maybe some incentives that every project they do, they take into account the impact on biking, walking, take that into consideration. Even with the project we did, we had transportation funding and it took us 3 or 4 years to use that. We had to get most of the money through other means. In the Hudson Valley in general, we are the original great outdoors. It's the most beautiful area in the world and I think the federal government should concentrate on this area by making it accessible to people not just in motor vehicles. Railroad transport—one of the problems we had, csx a new freight line, not really cooperating in helping us use old rail trails. Trying to get commercial interests to buy them, but the federal government could help. The feds could take a role in providing incentives or leaning on CSX. Senator Schumer helped with the walkway. We are working on other things. CSX owns a key piece that we need for the trails. It is all coming into fruition except for the one piece we are trying to buy from CSX. We're within close proximity of 10-15 million people in New York City. Local people can't get out West, but by protecting the Hudson Valley we helping people get outdoors in an area that's close to a concentrated population. We were overwhelmed with the success. By word of mouth we're getting people from all over the world. You just have to go talk to people to see they're coming from everywhere. We're still working on parking issues, an elevator, benches, but it's been a remarkable success. Until you get up there, you can't understand the beauty of it. With those trail connections, we could make a trail from here to NYC, but there is a lot of resistance to it. But if we could get the federal government to help us lean on the railroads.

One of the other issues with access is getting people from the city. Metro-North has been very good about promoting our region and if there is something special going on they have been very good about offering deals. They have helped support tourism in our region. I think the education system should address that as well, getting the young people from NYC up here.

## Discussion Question 2

### ***Poughkeepsie, NY***

***(cont.)***

Great example about the partnerships and working together is the Walkway over the Hudson. It's our newest state park. It was also an historic preservation project as well, it's a community resource, it's sustainable because the iron was forged in the 1880s, we didn't have to mine for it. It was already constructed and we put it back to a new use. It's kept a landmark of the Hudson Valley that's already constructed and in good order and put it back to working order. One point of access to the outdoors is historic urban parks. There was a huge park movement in American city life started in 1860s, too many of those are languishing. They have mature landscapes, beautiful buildings, and the state cannot put money into them. The cities cannot afford to put the money back into the parks and provide the maintenance. So in the urban areas, there experience of nature can be pretty lousy because the parks aren't kept up or aren't safe. We have those parks all across NY State. We're called the Empire State, it's a nice name, but it'd be good if it meant something. We have these great communities, everyone needs help to keep legacy alive.

GIS Director of Highlands Institute. US. What works? The USGS and the USFS. I can't say enough about the scientific work those organizations have done, their diligence in organizing it and their increasing ability to make that publicly available. The Rockland County Water Resources spread new light on the water treatment plant, for example. Getting solid science about how the entire water cycle works allows us to be informed, will have impact on generations. In the U.S. Forest Service, Martina Barns and her colleagues, they have done studies (Forest, Water, and People Study) that analyzed several indicators of water quality so we now have the information and data. With this data set I can help individual municipalities establish targets, impairments, threats to that water and actions. What are the best water sheds, what are the challenges? The work the at the U.S. Forest Service is invaluable. In terms of natural resources, Harriman State Park has a long tradition of group camps for less advantaged children. There is a balancing issue between recreation and biodiversity. Recreation does have a significant impact on biodiversity. In Harriman state parks we have many visitors, but if something isn't done we will have no forest in 40-50 years if we do nothing. The management is the issue. Establishing of base lines and ongoing monitoring. More study and management.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Small grass roots group working in Putnam County. Being an advanced senior, I will read my comments. (Written comments were submitted.) The great swamp of eastern Putnam and Dutchess County is a different type of river system – 20 mile length encompasses two major river systems. The Housatonic and the Hudson. The East branch of the Croton River also is part of the NYC water system. The great swamp is known to supply about 20% of water to the Croton system. The great swamp is the 2nd largest fresh water wetland and the largest red maple swamp in the state. Many thousands of acres are included in this area, fresh water swamp habitat and critical resources that provide areas where children and adults can get out and engage in science in the field by tracking turtles or simply enjoying the joys of being outdoors. Hunting, fishing, kayaking and canoeing are possible. Many species live here, many species of birds, major breeding population of turtles, amphibians, reptiles, etc. Over 25 species of mammals, rare plants are numerous. Eight natural communities support rare plants. Success – the answer is a coalition of partners led by an entirely volunteer organization. Friends of the Great Swamp (FROG) that has been able to obtain Recovery Act funds, with 11 partners as well as local land owners have all come together to preserve over 600 acres in the swamp and more acres in conservation easement. Major challenge – funding. Potential for new homes and development in the great swamp watershed. Demand for open space has driven prices beyond which feds are willing to pay. We need more open space lands in the Hudson Valley. Land prices and taxes are exorbitant here. There are few other grants for open space preservation. What can the federal government do? Now is the time before it's gone to create unique and valuable open space. We support that creation of the Hudson Valley as a National Park. FROG would like to propose that the federal government acquire additional acreage in the Great swamp to create a national wildlife refuge to protect the habitat of the wildlife in the great swamp to protect habitat of waterfowl and songbirds and rare reptiles, amphibians, mammals, and butterflies. This refuge could also act as a biological research station as well as preserving water quality and provide public education. The addition of a north woods element is a thought. The northeast would then have a national refuge and a national forest similar to what is out west. People cannot connect to the wild world, if there is no wild world out there. Preserving the great swamp is an important first step. We look forward to partnering with the federal government.

zoning commission for town of Taughkonic, town is rewriting its zoning code and an area that the federal government could connect with. I'm reaching out to find resources to help the town's feel empowered and to understand the importance. We are the front line of conservancy with a 36-year old code where the word conservancy doesn't even appear. And of course there is funding. We have \$10,000 to get us through a three year process. Feds could reach out about these issues. We need funding for planners and helping organize. We are the front line to educating our townspeople and we are losing our population. We've had dairy farmers taking their own lives because they can't face the debt they are acquiring.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

The Hudson Valley is the birthplace of the modern environmental movement. We have partnerships and incredible collaboration through the government, organizations to help provide food to our incredible farm stands, tourism. Great opportunity to build on what we have here as a great resource and collaboration. One aspect of that collaboration is "Saving the Land that Matters Most" 17 land trusts are working together. 65,000 acres that we estimated cost about \$500 million dollars to implement. There are other estuaries around the country, but the idea that in 5 years we could preserve that green corridor of the Hudson Valley is within our grasp. We think it can be done through a number of exiting funding sources with a collaboration with USDA, DEC, etc. If we all work together to fight for full funding of existing initiatives is what we need. We have the Land Conservation Fund, the Highlands Conservation Act authorized for \$100 million, the National Estuary Program – full funding is essential for these. We've asked Governor Patterson and Mayor Bloomberg for funding. USDA farm and ranch protection program is miniscule amount of funding. I would love to work with the Dept of Ag to identify other funding sources because we have land trusts on the ground, working in our communities with the farmers and land owners. We need a federal partner here. Working with NRCS, USDA, land trust community to protect what is a great source of food for the valley and for NYC. Many of our farmers are trucking their food to NYC. If the land is lost at the rate, Hudson Valley agricultural sector is one of the 10 most threatened nationally. This is a time of real urgency and a great opportunity for collaboration.

Captain of the Clearwater. I believe in conservation. The sloop Clearwater is a large sailing vessel and part of the mission is protecting the waters of the Hudson. We do on the water education. Our standard sail is three hours, a field trip for students. The boat is a replica of the cargo vessels that would have been on the Hudson. So the kids are getting an all-encompassing experience on the Hudson – learning about the history and the environment. But these kids are 9-22 years old. Everything we're talking about in terms of conservation, recreation is going to happen in the future. If we short change a serious understanding of how to work the outdoors into the education system, especially for the kids in urban areas or in isolated rural areas, it might be the first time they've slept outdoors or been on a boat. It's a very intensive program to give these kids a place to put their enthusiasm and we must get them while they are young. We heard from the youth yesterday – one girl said that we don't think it's good to mandate what we have to learn. But I do think it makes a difference in the attitude that you have from the top. Value outdoor education, but not necessarily mandate it. Some resources that would be good would be to streamline the grant process. Many small organizations need help applying for funding. Giving those small organizations the opportunity to get money – it doesn't need to be millions of dollars. (Beczak in Yonkers, Rocking the Boat for example). It can be a local place that can't fill out 150-page grants but can handle smaller grants. Facilitating that grant process is important. And setting the example of early education is something that needs to be done.

The problem isn't the government it is us and the nature of the beliefs and values which determine our actions that are important

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

In effect what I am saying is that we need a transformation in values. Without a transformation of our cultural values we are not likely to be successful in achieved what is best in the long term.

My question then is do you understand how the growth in size and density of the population has transformed the beliefs and values that constitute our culture and how these beliefs and values have created the problems we have. And that it is only by transforming these values that these problems will be solved? It is not laws and regulations, nor is it money that will transform our values. It is we. It takes each of us and all of us.

I ask you, how much time do you spend with your children and what do your actions convey to them about the nature of what is right and wrong, good and bad? Do you teach them that character and virtue is of central importance? Do you take your kids out in nature so that they can experience the beauty of the nature? How much time do they spend on computers, on cell phones, and watching TV. Are your kids disconnected, bored and suffering from anomie? If this is not you, then who is this we to which you refer

We know that if we pollute our outer environment that pollution will eventually pollute our internal environment. We also need to realize that if we pollute our minds we also pollute the world. If these fundamental issues, population growth, and the change in our beliefs and values are not addressed our problems will not be solved. This is not a problem that money or technology can solve.

I attended the listening form at Marist College. It was quite apparent that the audience consisted primarily of people who worked for and/or directed various environmental organizations, historical organizations, educational organizations, or park services. And every one of them seemed to say the same thing. "The Government needs to give us more money to do our job." Clearly what is important is the "our jobs." Their appeal sounded more like an appeal to save their jobs, that to promote a public good. Now many Americans are saying that they do not want to pay more taxes (even though their taxes are the lowest of any industrialized country). So I find it difficult to see how the government can satisfy these appeals while holding taxes down. Federal taxes revenue has been relatively flat the last several years while spending has continued to increase. This cannot and will not continue, as all levels of government are going broke from doing so. But I did not hear any suggestions that would resolve this dilemma.

They problem isn't with the government it is with us with the beliefs and values we hold. We cannot blame the government for the beliefs and values we hold as it these believes and values that are internalized and determine the structure and action of our governmental institutions. We cannot expect the government to transform these beliefs and values if we are unwilling or to take steps to address them ourselves.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

The question is what factors determine the nature of our cultural beliefs and values and how do they in turn determine the nature of response with regard to the natural environment? It turns out that the primary determinant of our cultural beliefs is the size and density of the population of which we are a member. When populations were small and scattered the primary social unit was the family. As the population grew it brought us in contact with strangers and thus a way was needed to transform strangers into family.

Where family members are genetically related strangers are not and thus a new type of connection was needed. In response humans developed the ability to transfer their affects to non-family. These affective bonds were what held society together. But as the population continues to grow affective relationships are insufficient. We then learn to manage our emotions and relate rationally. In a rational society relations are routinized and secularized. We interact with others as objects and not as subjects.

The problem is this process has separated us from the natural environment, from others and ultimately from ourselves. Thus a rational society has a high incidence of mental illness, addiction, and suicide. It is what led de Tocqueville to state that in the midst of great material wealth we have a great spiritual angst. Instead of having religious freedom we end up with freedom from religion. We teach more about technology than we do about ethics and morality. We teach more about science than we do about art, more about math than about music. And our lives are less rich because of it. Things have been turned upside down. Instead of being people of the land it is not the land of the people. Instead of living in physical intimacy with the natural environment we live in privacy in separate abodes.

Secondly, there was an almost complete absence of the general community of the people we supposedly are serving! But for the most part they were not informed of or invited to the meeting. And even if they were invited attending a Friday meeting would be difficult if one is employed. And even if it were manageable I doubt many would actually attend. So what does this mean? At the least it certainly says something about how much value we give to something.

If we were to put a user fee on access to these places I suspect that use would decrease. When Stonykill Environmental Center was threatened with closure there was an outcry, but not one person stood up and said let's raise money to keep it open. We turned to the government and appealed to you to keep it open. What we want is for others to pay so that we can get it for free. (a clear example of the maximization of one's self-interest in a rational society). We want others to do what we can't or won't do ourselves. Even though it is less costly to it ourselves than to have the government do it. As the government has grown in size the administrative costs of collecting and redistributing the taxpayers money has increased significantly. And in general the wages and benefits of government far exceed the average wages and benefits of the community they serve.

## Discussion Question 2

***Poughkeepsie, NY***

***(cont.)***

Thirdly, I feel it is ridiculous to speak out about increasing open space in the face of an increasing population. Or perhaps I don't quite get the new math. . Land is a finite resource! It cannot provide for the needs of an infinite population. Now clearly by building vertically and by clustering we can increase the amount of shared open space. But this seems to run counter to what most people's desire, which is not to increase open public space but to increase one's own private space. This is a direct consequence of the size and density of the population. We each want more space and to own mini-estate. Developers understand this and this is why suburban sprawl occurs. Developers generally build what people want and value the most. It seems that the new environmentalist is one who lives in a 4000 sq, ft home set on four acres with a neatly landscaped yard, and drives an SUV with a sticker on the bumper which says save the whales. How ironic!

We can't expect the government to change this is we are unwilling to change ourselves. Our values are screwed up. Our egocentric self-interest appears in the Nimby principle. We also believe that freedom rights are more important than restraint and responsibility. We are strongly individualistic and minimally communitarians. Today socialism, the joint action of the community as a whole, has a negative valuation attached. But freedom without responsibility leads to anarchy just as responsibility without freedom leads to slavery. Freedom must always be accompanied by responsibility and accountability.

We cannot increase the good without accountability for the bad or adverse consequences. In fact one of the major responsibilities of government and the justice system should be to hold people, corporations, and government officials fully accountable. We don't hold developers accountable for the full costs of additional services that need to be provided. They make 30% profit while costs are transferred to the tax payer. It is not just a problem in defining the good, it is also a problem is how that good is distributed. We should all ask if the distribution favors a few over the many or the many over the few. Kids learn from us that they should hold others accountable but others should not hold them accountable.

If we give money but do not hold others accountable for how this money is used there will be a problem. This lack of restrictions on the use of money can be seen in the money government gave and loaned to make education affordable. But the universities did not use this money to lower tuition but rather used it to build and become larger which then resulted in an increase in tuition such that today even with loans the cost of education exceeds any benefits that individual will receive after they graduate. The money was distributed in such a way that it benefits the university and not the students. How can a child of a lower middle class succeed if they must borrow \$60,000 to pay for education when after graduation they either cannot get a job or when they can it pays only \$20,000 the loan payment would be greater than half of their salary.

## Discussion Question 2

***Poughkeepsie, NY***

***(cont.)***

I would also say that it is just about money its also about time. How we use our time. I made the decision that spending time with my children was more important than all the material things I might give them if I worked longer and harder. If we had the time we wouldn't need the money. If we wonder why our children don't get out in the environment, it is because their parents don't get out in the environment because they don't have the time. Because many of them work long hours and commute greater distance they don't have the time. But we fail to realize that the choice is ours.

The Reason people work so hard is do to our Calvinist heritage and do to the fact that as social groups grow in size hierarchy increases and thus we must work harder to stay in the same place. The real wages of blue collar workers has fallen over the years. This needs to be corrected. A country where the rich get richer and the poor get poorer is headed for civil war and destruction. The middle class is being destroyed and the country is being split into the haves and the have nots.

Growing up on a farm my kids learned that cooperation was just as important as competition and that altruism was as important as self-interest. I also taught them that spiritual growth (development of character and virtue), was more important than acquiring lots of material things. But today I find that people are frequently willing to trade virtue for value, including individuals, experts, corporations, and government officials. Should we all become prostitutes? Is this what we wish to teach our kids? Why do we imprison those who act out of a moral conscious and not those who do not?

Certification serves to protect corporate producers even when their produce is significantly inferior. Should we continue to reward quantity over quality? For the life of me I can't figure out why anyone with any sense of morality would want to do this. Well if we can't control the population growth perhaps that is what we need to do. But there is a cost for doing so and it is incurred by those who have had a child get an E. Coli, Salmonella, are antibiotic resistant strep infection severe enough that it may result in their death.

We need to understand how the size and density of the population determines the beliefs and values we hold.

And we need to understand how these beliefs determine our response to nature.

We need to understand that all short term good is ALWAYS accompanied by adverse consequences which over time if left unaddressed with eventually overwhelm the good that was produces. The man made environment has produced good but it is associated with adverse effects which we see in climate warming.

We need to act to improve the good of the many and not just of the few.

## Discussion Question 2

### ***Poughkeepsie, NY***

***(cont.)***

We need to teach our children that spiritual growth (virtue) is as important as acquiring material wealth (value).

We must teach them that the end does not justify the means

We need to teach them that altruism is as important as self-interest.

We need to teach them that it is cheaper to do something yourself than higher someone to

We need to teach them that cooperation is as important as competition

We need to teach them that freedom is always accompanied by responsibility

We need for them to understand that an actual lived-felt experience of the world is better than a cognitive distant and disaffected view of the world Nature isn't something you can experience on the nature channel but something you must enter in to fully experience But we have substitutes a virtual reality for reality.

We need to teach our children that what is outdoors is as interesting as what is indoor

We need to teach them to value time for this is the most precious resource we have and thus how we spend this time is of the utmost importance.

But if we don't have the time who will?

I used to live in the city. Moved from city to suburbs . The city environment is limiting people from seeing nature. Parks are not being kept up. No use if not kept up

Upkeep of environment. If it is dirty you would rather stay inside. If you are from city you are not used to being out in nature the first experiences are not good experiences because it is new.

Technology is a big reason people don't go out. They are worried about getting the best technology like the newest I Phone.

One obstacle is that people don't know where things (good outdoor spaces) are. People in city are often far from places.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Culture is not helping. Parents are afraid to have kids outside. They think and are told it is not safe. Everyone needs to be so connected all the time and youth is looking to this. We are not bringing people to nature.

Lack of education. Adults and children don't know there are areas you can go to be in nature. Common Ground Farm at Stoneykill was almost shut down. Kids and Families can go out and run in fields ,etc.

Education structure prevented me from being outdoors. Get up go to school, sports, etc. No time for outdoors. There is no extra time for outdoors except night, and going outside at night is not as much fun.

Parents raised me hiking biking etc. Others don't do this. It is a cycle. If you are raised in touch with the environment it is easier to pass on. Parenting and exposure are important

You yourself are the biggest obstacle. If you leave your society for 3 days you would collapse. Kids kick and scream for what they want but they don't so this to go outside.

Parenting and education at same time keep people from environment. You have to look out for yourself to get out. A lot of kids don't know about compost in inner city. If parents and kids don't know it will not be passed on.

Communication is big obstacle (I am from Harlem) my mom won't leave me outside. Don't have the community base. Moved up to this area but still don't have that community. Neighbors don't talk. People would feel more comfortable in environment if communication was better.

I am a Local Farmer in Dutchess County. I just wanted to be able to bring to your attention some of my concerns as a livestock farmer in New York.I currently operate under a USDA exemption with a USDA inspected plant.

This limits me to 20,000 birds per year.I think that our numbers should be doubled. The reason being -

these numbers were arbitrarily established decades ago. All farming expenses have more then doubled since these regulation were first implemented.Even with the doubling of numbers to 40,000 it would still just be a part-time operation. You couldn't successfully operate a slaughterhouse 5days a week with 4 employees and justify paying a full-time inspector.

The most significant concern is to be allowed to transfer our working farm to future generations " WITHOUT ANY TAXES".

But there are many challenges. (Paper) We are all aware of the pressures on the municipalities to develop these historic properties – for taxes, and ratables. Developers are no doubt looking at this small, but significant property for housing or storage- a tempting though. But I think, just as Poughkeepsie has before – we can come up with more creative uses of this public property to keep our historic sites and park and make it sustainable for the 21st Century.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Our heritage shouldn't be something we leave behind. It should become part of a sustainable Hudson for the 21st century. Thank you.

It is my goal that this newsletter will be the first of many forms of communication between this historian and others interested in beginning an allied effort to establish a Dutchess County historical community. A unified group communication ideas, support, and research in accomplishing historic preservation and providing education on the history of our communities.

Prior to becoming Poughkeepsie City Historian I was engaged in collecting artifacts, researching Dutchess County's industrial history, and presenting historical displays at the Dutchess County Fair. In 2001, I wrote a book entitled Poughkeepsie Potters and the Plague. While in 2005, I wrote a research article for the scholarly journal *Ceramics in America* entitled "A pot of Butter for the victims." Over the last two years my focus has been on Poughkeepsie and the Quadricentennial; researching, presenting historical displays, writing short articles, designing historical promotional material, and utilizing state grant funds to educate and promote tourism of our historic community. Along the way I discovered significant information on the history of Poughkeepsie and Dutchess County that had been overlooked, inadequately researched, and virtually forgotten. Let us begin a communication network that can benefit our individual communities through an allied effort to recognize Dutchess County's history as our mutual historical link.

Hoffman House stands today paying homage to the industrial advancements it witnessed, paying respect to the people it housed and protected during their live times of vision for the future of Poughkeepsie, Dutchess County, and the Mid-Hudson Valley. Please join me and the citizens of Poughkeepsie in support of historic preservation, promoting an educational museum for all of the Hudson River Valley community, and a vehicle for learning for future generations at the foot of our "Walk Way Over the Hudson."

Investment in New Technologies: Creating the Smart Park – In this era of rapid environmental change, solutions to ecological problems rest on people understanding how the state of the Earth's land, air, and water is linked to their everyday lives, health, and well-being. Parks, nature preserves, and other protected green spaces offer opportunities to capture data on the Earth's systems and then to "translate" it into information that helps people connect with nature, strengthens and supports scientific research, and informs policies to improve environmental conditions, but need assistance to take full advantage of green technologies that will make this information more accessible to researchers, scientists, students and citizens.

Shifting Demographics – The Hudson River Valley is a National Heritage Area with a population of 2.2 million. Ulster County, in which the Mohonk Preserve is located, has a population of 180,000 and an over-65 population expected to grow 62% by 2030. Currently 150,000 persons come to Mohonk Preserve each year. This number is expected to grow as the 22 million residents of the NY-NJ-CT-PA area spend leisure time closer to home due to economic realities and a trend toward "staycations". The Preserve must be prepared for increases in the numbers and changes in the needs of the visitors it serves in order to properly steward the land and maintain the organizational capacity to meet new financial and operational challenges.

## Discussion Question 2

### ***Poughkeepsie, NY***

***(cont.)***

Full Cost Accounting (FCA) and Triple Bottom Line (TBL) – FCA is the process of collecting and presenting costs as well as advantages for each proposed alternative when a decision is necessary including both direct costs and an allocation of indirect costs. TBL captures an expanded spectrum of values and criteria for measuring organizational and societal success: economic, ecological and social. These approaches should be implemented more widely in both the public and private sectors.

Finding people to do the work or creating the jobs where the people who want to help can work or make a living doing these things

FEDs should put more money into these organizations that fun institutions but the turn around a patent research that sustain life. (Land Grant Colleges).

Funding sources pose a big hurdle.

Interoperability between the agencies that have the power to implement any of these changes required to bring about the America's Great Outdoor Initiatives, the ease in converting farm land into developments.

Train teachers to bond with student in these areas.

Getting word out about these partners or initiative out there who are doing what they are doing  
Ways of bringing all these initiatives together.

Transportation to get people from the urban population to some of these outdoor adventures (getting boats back, rebuilding docks).

Planting trees and vegetation to prevent erosion and sediment runoff works; Forest Service has work very well; Forest Service has also done a lot to quantify benefits of environmental mitigation efforts; large scale planning that would take into account t

Synergy between the agencies – how to do you connect people with these outdoor activities; where can we place these community gardens; complete streets and safe routes to schools.

FED should take a more active role with people who bring together these people.

Efforts to create more green space; improving or building more docks on the Hudson River.

Local land trust are the most effective means for protecting open spaces and watersheds, renewal of the extended federal tax incentive for conservation is critical.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Connecting people with the land by showing them how food is produce works.

As a lifetime member of Girl Scouts and someone who attributes my strongest positive qualities to my time at camp I can tell you that the outdoor experience is truly vital and irreplaceable in the lives of young people today. And yet it is one that has been consistently neglected as our culture shift toward more superficial hyperconnectedness. It is during these turbulent times when kinships are most paramount. So rare now are opportunities for youth to unplug themselves from incessant electronic stimulation that to lose the service of the land would be to comply with this trend and deny the importance of nurturing these bonds in efforts to promote healthy minds, bodies and spirits.

It is vital for us all to act as stewards of the Earth by learning about and taking part in recycling and composting, as well as coming up with other ways of reducing our impact on our planet. As part of a larger conserved landscape it is our duty to facilitate an ongoing appreciation and interest in land conservation worldwide and promote a consciousness about the Earth and our role as stewards.

While many camps and after-school programs across the United States offer intensive programs with organized sports and activities, there should be more programming that gives children, families, communities and other groups the opportunity of free play and exploration in the outdoors and the freedom to create a self-determined experience within a familiar and comfortable routine. This self-direction encourages creativity, builds decision-making skills and helps people take responsibility for their development; in addition, it offers a chance to explore and build respect for nature.

I urge you to step-up federal commitment to our estuaries as important habitats, recreational areas, and working waters, by including national estuaries in the next big conservation initiative, America's Great Outdoors.

Based upon our more than two decades of working with grassroots groups and all levels of government, we wish to present some challenges we have recognized along with some ideas that may help the public reconnect with the outdoors through the use of our country's magnificent parks and trails.

Challenge: Persuading people who are not comfortable with the outdoors and not attuned to the benefits of physical activity to view the outdoors as non-threatening, enjoyable, and convenient.

Challenge: Parks and trails must be acknowledged as an essential and mainstream element of local community infrastructure, much as utility lines and sidewalks are thought of today, in order to ensure that all citizens can safely and conveniently access a park or trail within minutes of their home or work, especially in the historically underserved areas - rural communities and urban neighborhoods

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Challenge: The usage and economic importance of our local parks and trails is largely unknown and generally not regarded as significant making it difficult to obtain funding and galvanize public support when resources are scarce. Concerns with safety and property value impacts also often derail proposed park and trail projects.

Challenge: Grassroots constituencies make a significant contributions to park and trail development and maintenance, can be effective advocates for legislation and funding affecting parks and trails, and are best suited to motivating their neighbors to reconnect to the outdoors but these groups often lack the tools to expand their reach, leverage resources, and adequately get their message out.

Yet, while much has been accomplished, the need is still very great. As an example, in the last six years we have received more than 100 applications from communities seeking assistance with trail development through our Healthy Trails, Healthy People program that could only select less than a third of the applicants.

In the enclosed package we have offered you brief descriptions of what is happening here in the Hudson Valley followed by proposals for action by the federal government that can boost our efforts to new heights. Here in the Hudson Valley, we have created inventories of the top priority lands that must be preserved, and we have a cadre of 17 land trusts working together with limited private and state funds to save them during this period of low real estate prices. We have an action agenda for restoring the health of our Hudson River National Estuary and connecting people with the river, reflecting broad consensus among key governmental and NGO stakeholders. To be blunt, the missing ingredient in most cases is money. We would urge you to work within existing authorizations and programs to bring funds to bear to implement these conservation initiatives.

Hudson Valley farms are the primary source of fresh produce for New York City, representing 80 percent of the vendors at its GreenMarkets. They contribute \$530 million in direct economic benefit while supporting a \$4.7-billion tourism economy. Land trusts are leading efforts to ensure permanent protection of the valley's agricultural lands - 20 percent of the region's overall landscape. Farms protect our forests, wetlands, and watersheds; they also provide scenic backdrops for many cultural and historic treasures. Despite this, the American Farmland Trust has designated the valley one of the country's 10 most threatened agricultural regions. The state loses 10 times more farmland to development than it protects annually. State support for purchasing development rights has been slashed to \$5 million a year - 16 percent of 2009's level - despite a \$70-million backlog of approved transactions. Federal funding for New York through the Farm and Ranchland Protection Program (FRPP) averages \$2 million to \$4 million per year, just 3.2 percent of funding over the program's history.

## Discussion Question 2

### ***Poughkeepsie, NY***

***(cont.)***

The Hudson Valley has one of America's largest National Historic Districts and myriad breathtaking parks, all located in a state-designated scenic region that attracts international tourists and provides residents with outstanding quality of life. Land trusts and stewards of historic sites have jointly protected buildings and surrounding lands, but they face a formidable challenge: suburban sprawl that undermines the valley's scenic and historic character. Scenic Hudson's Saving the Land That Matters Most campaign has united 17 land trusts and state agencies to conserve the vital scenic, ecological, recreational and agricultural lands in the Hudson River corridor. This collaboration is hampered by the state's fiscal crisis; its commitment to land conservation has dwindled to 30 percent of 2009 levels.

The Hudson Valley ecosystem faces unprecedented challenges. Loss of farmland and forests to sprawling development is fast diminishing valley habitats; roads and subdivisions are separating wetlands and rivers from upland habitats. Climate change will exert tremendous pressure on productive tidal wetlands and signature Hudson Highlands forests. While damaging everywhere, these trends are especially destructive in the Hudson Valley, where species are concentrated in a narrowing arc between the edge of the Highlands and their natural range limits south of Albany.

While strong collaboration and effective programs exist, the region is changing. Population is rising, with much of the growth focused in the urban centers where young people do not have the same opportunities to experience the great outdoors. Many academics note a growing disconnect between youth and the natural world that sustains them.

On May 15, 2009, the historic, long-awaited cleanup of PCB's in the Upper Hudson began. But this battle is far from over. After the first phase of the dredging of PCBs was completed this past spring, General Electric has been trying to backpedal on its commitment to clean up the Hudson, raising concerns over dredging impacts and proposing to leave more PCBs in place rather than removed from the river.

Oxygen levels in the Hudson River are decreasing because of increases in temperature and other nonnatural causes such as sewage overflows caused by outmoded combined sewer and stormwater systems. As wet weather events are the primary trigger behind pathogenic overflows into our waterways, environmental regulators and planners must focus on reducing stormwater flows before they reach the sewer system in the first place. Implementing "Green Infrastructure" designs such as green roofs, permeable pavement and rain barrels can dramatically reduce stormwater pollution and "green" urban areas, providing a double benefit of reducing pollution and improving city dwellers' quality of life.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Energy and water management are two of the country's most pressing problems, especially in urban areas. These problems have been exacerbated by the growth of suburbs and the decay of our inner cities over the past several decades. However, uncertainties in energy prices and concerns about the environment are now causing many to question the merits of living in the suburbs, which could lead to re-growth of inner cities as desirable places to live and work. This provides an exciting opportunity for the design of buildings in inner city neighborhoods, where clusters of buildings in close proximity can achieve radical improvements in efficiency of operation through shared services. This project will develop a framework for the design of urban buildings that accounts for ecosystem services and greatly reduces the environmental footprint of neighborhoods. Consideration of buildings and infrastructure as components of a sustainable urban ecosystem, located within a watershed, will result in a transformative change in the way buildings are designed and positioned in inner cities. There are three objectives: 1) to characterize the built and natural environments in blighted urban neighborhoods to benchmark existing conditions, 2) to develop alternative methods of achieving significant reductions in energy use and improvements in water management in buildings and clusters of buildings in these neighborhoods, based on creative renovation and new construction, and 3) to rank order the methods of achieving the reductions in energy use and improvements in water management, based on an integrated assessment model that incorporates building and ecosystem data, economics, and the preferences of neighborhood residents. We will achieve these objectives in two test cases: the Near West Side section of Syracuse, NY, and the Borough of Wilkesburg, PA, adjacent to Pittsburgh. The new framework will be applicable to clusters of buildings in any U.S. urban area, and will provide a vehicle for collaborative efforts in other cities as community leaders and government officials develop plans to transform their neighborhoods. Examples of activities to be conducted include collection of data on existing buildings from local agencies and field measurements, collection of ecological field data, organizing and facilitating community visioning sessions with residents of the neighborhood, and developing integrated assessment software to account for the multiplicity of factors influencing community decisions for change .

There are several themes common among older industrial cities in the Northeast and Midwest. First, the majority of these manufacturing belt cities grew very rapidly during the industrial boom of the late 19th and early 20th century. Unfortunately as these cities developed, a healthy tree canopy and greenspace was rarely incorporated into the urban expanse. As scores of forests were cut down and huge swaths of land were leveled for neighborhoods, factories, roads, and rail lines, little, if any, consideration was given to replacing trees or preserving natural landscapes. During the rapid construction of these communities, the most notable sectors devoid of trees and greenspace were the dense, quickly constructed neighborhoods of the working class—neighborhoods that were within walking distance of the soot-covered brick, steel and concrete industrial sectors of the city .

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Today, with our nation's severe, half-century long decline in domestic manufacturing, the social and economic landscape of older industrial cities has changed dramatically, but the treeless physical landscape has seen little change. Even after more than a century, trees are rarely seen in low or moderate income neighborhoods and the crumbling structures of idle industrial and commercial sites are surrounded with acres of treeless, barren parking lots and roads. As jobs left the region, the population of older Northeast and Midwest industrial cities has decreased an average of 30 percent over the past four decades. Even though the exodus of people has resulted in countless tracts of vacant land, generally speaking, very little has been done to plant trees and create esthetically pleasing park space. In many cases, zoning trends that were popular 30 to 40 years ago actually made agricultural practices illegal within residential neighborhoods. Cities like Baltimore are only just now overhauling such zoning regulations and officially legalizing urban farms .

As the cities' populations grew, new drinking and waste water systems were constructed to accommodate the new citizens. Major water infrastructure systems last roughly 50 to 70 years. Not surprising, most of these cities began to see the shuttering of industrial facilities and sharp population declines as the water systems were approaching the end of their lifespan. Decreasing populations and reduced productivity rapidly eroded the urban tax base and the cities have been left without the financial means to replace archaic water infrastructure systems .

Third, another example of mutual concern amongst older industrial cities is low property values. Again related to a lack of traditional employment opportunities and decline in population, older industrial cities have relatively weak property values when compared to the rest of the country. An overstock of housing and relatively low wages created market conditions that led to high foreclosure rates and excessive urban blight long before the rest of America witnessed the deleterious impact of the recession and housing crisis of 2008–09. Low property values also attract low-income residents, a demographic often without the means to easily access fresh, healthy foods—a problem compounded by the fact that low value neighborhoods are rarely served by major grocery stores or fresh food retailers .

Strategic greening projects and urban gardens cannot solve all of the problems of older industrial communities, but healthy greenspace and well planned green infrastructure can certainly help offset many common struggles. With the factors stated above in mind (and for multiple other reasons not yet discussed) the Northeast-Midwest Institute proposes to develop an initiative aimed at improving the green infrastructure of older industrial cities

Collaborative land conservation efforts between NGO's, Local, State and Federal entities

The need for Navigational Dredging for commercial vessel use and heritage tourism ( the lack of a navigable channel is stifling economic development in the upper Hudson River Valley water front)

Contribution of agricultural land holdings in; drinking water protection, wildlife transportation corridors, cultural landscape conservation, national security relating to grow food in this country, local food production and agratourism

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Make Rev War battlefield sites eligible for LWCF funds (as Civil War Battlefields are)

Improve the amount of funding and federal cost share portion of the Farmland and Ranchland Protection program (USDA NRCS- Cost-share is currently 50% and no transaction costs are covered) As the fastest growing county in NYS with the largest industrial de

Make federal grants for transaction costs and for building stewardship endowments to provide ongoing stewardship of conservation lands and easements

Make LWCF funds a dedicated fund and make them available to nonprofit land trusts, who do the local community's conservation work.

Make the enhanced income tax incentive for property owners who conserve their land PERMANENT.

I invite you to stay the weekend here in the Hudson Valley, and experience I-87 anytime after 3:00 on a Sunday afternoon. Traffic crawls to a snail's pace and, clearly, too many people are accessing the Great Outdoors using their car. If you want to drive to Minnewaska State Park on a weekend- and you're going to have to drive, because I don't think there are any public transportation options- you better get there before 10 am, because the parking lots will be full.

The answer is not to build a bigger parking lot, as Minnewaska will soon be doing. With 80% of our population now living in urban or suburban areas, and less than 50% of the residents of New York City owning cars, Tri-State Transportation Campaign asks that the Administration consider public and sustainable transportation options as key to this initiative.

There is ample evidence that cars and roads are contributing to climate change, water pollution, and landscape fragmentation- issues that are serious challenges to our natural resources. It is therefore incumbent upon our leaders to assure that our attempts to connect don't destroy the very thing we are trying to connect to.

Currently, the Secretary of the US Department of Transportation is not listed as a leader in this initiative. While it is clear that there will be interagency coordination, we'd like to emphasize the vital role that national, state and local DOT's must fill.

Transportation is an equity issue. Many people can't afford cars, and there is evidence that younger Americans are choosing not to own a car. The challenge that the Administration must consider is how to do we get all people connected, literally, to the Great Outdoors.

## Discussion Question 2

### ***Poughkeepsie, NY***

***(cont.)***

A major goal of the Canal Corporation is to provide landside access to the NYS Canal System through completion of a continuous multi-use trail adjacent to the Erie, Champlain, Cayuga-Seneca and Oswego Canals. The 365-mile Erie Canalway Trail is now 75% complete. Limited funding opportunities exist to develop additional trail segments. The Canal corporation has completed engineering plans to construct four Erie Canalway Trail projects that would add over 20 miles of new trail to the existing 272 miles, but lacks the funds for construction. Additional Erie Canalway Trail segments are, feasible, but require funds for design and construction.

Restrictions on the use of funding sources, including those that require a property interest for actions on publicly owned right of way.

PCB contamination in the Hudson River hinders access to the River and prevents the full use of its resources. The current EPA-GE cleanup will not fully restore the river's resources and PCB contaminated sediments will remain in the ecosystem for generations. In addition, PCB-contaminated sediments in the navigational channel of that prevent the NYS Canal Corporation from dredging the River. Consequently, navigation of the River will continue to be impeded. A 2006 report by NOAA, USFWS, and NVSDEC addresses this very issue and asserts that the navigational resources of the Hudson River have been adversely impacted by PCBs.

You have asked us today, as a part of this process, to tell you what works and what can be improved. One answer, to these questions, is accountability for Federal capital grants. This past spring, in the midst of a budget crisis here in New York State, state parks were placed on the chopping block. Over 50 state parks, including Schodack Island State Park, were slated to close. Many of these parks contain facilities: buildings, roads, boat launches, swimming pools, and other capital improvements that were paid for, in part, with Federal funding. There was, as you have likely heard, an outcry. Never before, even in the depths of the Great Depression, had a New York State Park been closed.

**AmeriCorps (U.S. Corporation for National and Community Service)**

For the past four decades, conservation and service corps have demonstrated that young adults engaged in stewardship projects make significant contributions to their local communities and develop crucial skills and attitudes needed to become productive citizens. As pressures on our nation's land and natural resources grows and youth unemployment soars, an enhanced AmeriCorps program provides a holistic approach to addressing challenges faced by communities, natural resource agencies and families alike. Expanded funding of the AmeriCorps program will not only ensure completion of a backlog of needed conservation projects; it will help train and support the next generation of environmental leaders.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

AmeriCorps support has also been provided for crews to complete much needed stewardship projects at DEC environmental education centers and on state lands. Western New York AmeriCorps crews removed invasive species and made trail safety improvements at Reinstein Woods Nature Preserve near Buffalo. The Headwaters Youth Conservation Corps provides trail maintenance and habitat improvement services to Rogers Environmental Education Center and state forests in central New York.

The state's fiscal situation has eliminated funding for these two important partners recently; federal waivers for reduction or elimination of partner matches would help restore these important stewardship collaborations on state lands.

Wastewater infrastructure investment and green infrastructure incentives

New York's wastewater infrastructure is in decline and needs at least \$36.2 billion in funding over the next 20 years to address the needs of aging, failing and new facilities. [See DEC's report: "A Gathering Storm" <http://www.dec.ny.gov/chemical/42383.html>] An enhanced, consistent commitment of federal funding is absolutely essential to protect this vast and essential infrastructure whose failure will result in irreparable harm to our waters, imperil the health of our citizens and ecosystems and cause havoc to our economy. And as we work to upgrade these critical facilities, we also need to think of new approaches to protect our waters. New York has been working closely with the EPA to (1) make our state revolving fund (i.e. Clean Water SRF and/or Drinking Water SRF) more sustainable by examining how it could better support smart growth, energy efficiency, and asset management, and (2) support better wet weather controls and the need to adapt to a changing climate by encouraging the wider use of so-called "green infrastructure" projects to protect natural resources.

On the first point, DEC and the state's water financing Environmental Facilities Corporation have been working to ensure that projects funded through the SRF do not promote sprawling, unsustainable growth, setting priorities instead on repairs and enhancements of existing infrastructure and support for downtowns and historic town centers. The SRF can be an effective tool for promoting wise local land use planning, and to the extent feasible, finance projects that are consistent with existing land use plans. It also can and should promote wastewater treatment facilities that maximize energy efficiency.

New York State has encouraged the wider use of the Clean Water State Revolving Loan Fund provide financial support to local governments to implement comprehensive green infrastructure programs. NYSDEC's vision of an enhanced green infrastructure program includes assistance to local governments and NGO's to identify and incorporate green approaches into plans to address water infrastructure needs and to develop local programs to protect resources through landowner incentive programs, sensible land use regulations, conservation easements and best management practices. The requirement in ARRA and Federal Fiscal Year 2010 appropriation that 20% of the Clean Water State Revolving Loan Fund appropriations be used for the green project should become the norm in future SRF funding determinations.

Funding and coordination of complex, coordinated, big picture effort.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Our major challenge has been limited funding. The potential for new homes and commercial development in the Great Swamp Watershed...a bare 60 miles from Times Square. The demand for open space has driven land prices beyond what federal agencies like Fish and Wildlife with NAWCA funds are willing to pay--they prefer to purchase lands in the west where it is less expensive for large acreage's and there is already a Federal presence in the form of National Forests and National Parks. In the Hudson River Valley we need open space lands near where people live in the large metropolitan Tri-state area. Land prices and taxes are exorbitant here. There are few other grants for open space acquisition. The Land and Water Conservation Fund is rarely fully funded unlike this year! Congratulations.

35000 acres of Parkland n NYC. It is the backyard to many children. Urban areas need to be included. Problem in urban areas is alienation of parkland. It is too easy for land uses to change and it is not preserved as open space. Urban areas have natural areas too. Our cities and council people are selling our historic and natural areas. Oldest part of Poughkeepsie settled by the Dutch. As mayor I acquired the property to access walkway over the Hudson. Can't make these types of areas inaccessible to people. Friends of the Upper Landing with partners hope to build a bridge (taken from Dutch technology) and help restore old buildings. Need to pursue global projects to boost tourism.

Part of organization to bring back the night sky. Full cutoff lighting promotes tax savings and gives view of night sky. Incorrect lighting changes life cycles of some animals in sound. They move to the Town lights rather than to the moon light. Web site: [www.darksky.org](http://www.darksky.org)

Many grass roots agencies already work together. Need feds to join. We will have a US travel office thanks to the President. We need Federal partner help with having tourists come up river from city to see the Hudson Valley. We just got a grant but the pre-approval application alone was 115 pages. No public transportation to get from train station to farms and parks and trails. Tourism in HV is \$4.7 billion dollar business.

Have seen good and bad of conservation actions over years. NY has over 14000 public/private recreation areas. Each State has unique goals. Local needs are different than out west. National goals not only goals. They may not fit every state. Need to look at needs over the country. NE has more open space than bi areas out west. Needs across NY are all similar. Groups need to communicate across the state and the country. A lot of innovative ideas are out there. Don't re-invent the wheel.

Making first whisky in NY since prohibition. We are a farm. The biggest disconnect between people and farms is that they don't get there. Tourism helps bring some people to the farms, but we need an education program to get more people to the farm. Farming in NY is a difficult and dangerous job. Feds need to help the state understand the importance of connection.

The City of Yonkers has only 50 yards of access to the Hudson River. 4th largest city in the state. We see over 15,000 kids a year and they never see or get to the water. Education is an important component. Don't forget the kids that need to touch the water. Stop Hydro-fracking from happening.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Purpose is to connect people to natural resources and history and culture. Please include Americas Byways as equal partners with the park service and others in this initiative. Make sure funding programs are not for just bricks and mortar. Have some for grass root organizations that bring people together. Volunteering is an American activity. These people in these groups can spend funds wisely.

374 acre learning center for arts and nature. Connecting kids to nature by bringing underserved kids into the environment to give them hands on learning. We get kids there for 3-5 days. It is enlightening for them. Kids learn about history and importance of conservation and perform better on testing when outdoors. Need a stronger educational component.

Put emphasis on hands on learning rather than tests. We can't pay for a bus to get 5 miles to get kids outside in nature. Kids in rural areas don't get out either. We need to build a passion for outdoors.

Working on statewide agenda. Pass not child left inside. Make sure every kid gets outdoor education for every year they are in school. I work with little kids and see the benefit. Test scores go up, illnesses go down. Teachers aren't trained to take kids out. Transportation is a huge issue. Encourage outdoor jobs for youth.

Signs off for environmental education aid for state. Disconnect for administrators at schools. They need to be educated on value of outside hands on training. New teachers are trained on pass tests. The teachers who are retiring are the ones that had the hands on experience.

We discovered a revolutionary war monument. Had kids who had gotten in trouble with the law restore it and they didn't go away. They kept coming back. Convenience is needed to get people out. As a physician we need to get people out. This is a public health emergency. 40% of sophomore girls were overweight who were going out for sports 5 years ago. We need to work on this.

Land grants are recommending the wrong type of feed/chemical for cows.

Have an idea. Raise your hand if you believe that anything is possible. We always hear we need more funding. What if what we do is profitable? All the groups that are here. Small gardens in the Bronx can't produce enough. But if all the groups work together we can produce enough to sell and make our own money. For example Rockin the boat builds boats. They are not for profit but they don't need money. They are making their own. The Carpenter School in Maine only gets a little bit of funding. They sell what the kids make. Think Profit.

Parkways, protect plants that are growing. Education important.

70 acres of historical property was going to be developed near a soldiers grave yard. His project would hopefully protect the value of a battlefield. The Hudson Valley grassroots effort is made. funding is needed

## Discussion Question 2

### ***Poughkeepsie, NY***

***(cont.)***

Trails, bridges need to be connected. Transportation needs fundng. Highway design should incorporate walking, biking trails for Cities and Parks. A better way to transport.

Beacon - make transportation an important part. The Hudson River is America's River. Funding needed for transportation costs and being connected to the River.

1. Elevating our national estuaries to the same status as national rivers in this program. Here in New York they include the Hudson River, Long Island Sound, the New York/New Jersey Harbor and the Peconic Bays.

2. Maintaining the Northern Forest as a designated Treasured Landscape.

Preserving and restoring nationally important habitats in our estuaries and their watershed lands and the 30 million-acre Northern Forest which stretches across new England;

Recommendation 1: Elevating our national estuaries to the same status as national rivers to protect New York's waters and connect people with nature. Waterways in urban and suburban areas are treasured by millions of residents and tourist who use our clean and healthy estuaries. Here in New York they are the Hudson River. Long Island Sound, Peconic Bays, and New York/New Jersey Harbor. These estuaries are used for boating, swimming, fishing, shellfishing, and wildlife viewing. Their economic contribution to our state is significant, Yet, protection and restoration plans are not being implemented due to lack of funding. We urge you to give New York's contiguous national estuaries- the Long Island Sound, Peconic Bay, New York/New Jersey Harbor- the Treasured Landscape status they deserve.

We also recommed you use the AGO initiative to improve existing federal programs to prioritize national estuaries. AGO presents an opportunity to develop a cross-cutting federal initiative to leverage greater protection of recognized national priorities- estuaries of national significance- by focusing and funding existing federal programs.

Maximizing existing federal LWCF program: Expand federal-side LWCF's eligible project areas to include the watersheds of nationally recognized estuaries, such as those designated by the National Estuary Program and National Estarine Research Reserves. This would give National Estuaries the same status as National Rivers, and enable accessing federal-sidw LWFC.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Recommendation 2: Northern Forest Treasured Landscape to protect local jobs and critical habitat. Stretching 400 miles, from the shores of Lake Ontario, across New York, Vermont, New Hampshire and into Maine and Beyond, the 30 million acres of the Northern Forest make up the largest intact forest ecosystem east of the Mississippi. The breath-taking and rugged landscape is shaped by lakes, rolling hills and wetlands and includes all of the tallest mountains, and the headwaters of all the major rivers, in the northeastern United States. Ecological resources such as wild forest and critical habitat are only one part of what makes up the Northern Forest, as the culture and economy generated by the region's two million inhabitants are also among the oldest and most vital in the U.S. Per capita, the 237 Northern Forest communities enjoy the lowest crime rate, the most cultural institutions, the most historical societies and the most independent businesses in the nation.

Recommendation 3: Investing in public and private efforts to create jobs and connect young people with nature. In today's increasingly urban and digital world, many young people are growing up disconnected from nature. This trend poses a serious threat to the future of conservation, the environmental sciences and environment-based jobs. The more disconnected today's youth are from natural areas, the less likely they are to care about nature later in life. If left unchecked, these trends could rob the conservation movement of its future leaders, and rob our future generations of experiences of our natural world.

Unlike remote parklands in the country's interior, our national estuaries--the Long Island Sound, Peconic Bay, NY/NJ Harbor--Have thriving cities and suburbs of millions of people, along their shores and in their watersheds. Protecting and restoring the health of these estuaries directly benefits millions of Americans. Yet, significant federal funding has too often passed by these places for less expensive and more expansive places!

In the enclosed package we have offered you brief descriptions of what already is happening here in the Hudson Valley followed by proposals for action by the federal government that can boost our efforts to new heights. Here in the Hudson Valley, we have created inventories of the top priority lands that must be preserved, and we have a cadre of 17 land trusts working together with limited private and state funds to save them during this period of low real estate prices. We have an action agenda for restoring the health of our Hudson River national Estuary and connecting people with the river, reflecting broad consensus amount key governmental and NGO stakeholders. To be blunt, the missing ingredient in most cases is money. We would urge you to work within existing authorizations and programs to bring funds to bear to implement these conservation initiatives.

However, we still haven't achieved the act's goal of a "fishable, swimmable" Hudson River, where water quality is regularly tested and reported and the public can safely recreate in a Hudson that is free of sewage from outdated storm water and wastewater infrastructure; where Hudson Valley residents can once again eat local fish without health concerns, and sustainable commercial fisheries can thrive.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Sewage pollution from aging infrastructure, toxic PCBs that General Electric dumped into the river in the 1970s and declining fish stocks due to overfishing and power plant intakes remain as our most persistent environmental challenges.

Up and down the banks of the Hudson River, power plants dot the landscape, many of them continuing to use outdated technology known as once-through cooling. These plants withdraw billions of gallons of Hudson River water each day to produce electricity. While generating record profits, they are extracting an even larger cost on our river's aquatic life. This enormous water use needlessly kills billions of fish, eggs and larvae each year, an impact that could be almost entirely eliminated through the use of closed-cycle cooling systems.

On May 15, 2009, this historic, long-awaited cleanup of PCBs in the Upper Hudson began. But this battle is far from over. After the first phase of the dredging of PCBs was completed this past spring, General Electric has been trying to backpedal on its commitment to clean up the Hudson, raising concerns over dredging impacts and proposing to leave more PCBs in place rather than removed from the river.

Oxygen levels in the Hudson River are decreasing because of increases in temperature and other nonnatural causes such as sewage overflows caused by outmoded combined sewer and stormwater systems. As wet weather events are the primary trigger behind pathogenic overflows into our waterways, environmental regulators and planners must focus on reducing stormwater flows before they reach the sewer system in the first place. Implementing "Green Infrastructure" designs such as green roofs, permeable pavement and rain barrels can dramatically reduce stormwater pollution and "green" urban areas, providing a double benefit of reducing pollution and improving city dwellers' quality of life.

What's working well is land trusts working with landowners to get farmland back in production. But people coming to valley are new farmers, don't have experience, want to do a good job, need mentoring, want to take advantage of markets – dollars from USDA to do training at the community level between experienced and new farmers. Then can keep them on the land. New farmers come, take 1-2 yrs, fail and then leave. Training and mentoring new farmers so they stay, such as through an "incubator farm" to train new farmers. USDA to take more progressive role in assisting.

Looking at processing infrastructure – value added processing team that is doing work from 5 different states to create interstate dialogue to find commonalities, best practices and how to communicate to others. There is also an initiative in Vermont that leveraged ARRA funds in state legislature to create 10 yr strategic plan for farms to market ag products – Farm to Plate Initiative. Involved in agricultural innovation center – investing USDA funds that congressional delegations pulled in to support value-added production and incentivize organizations to partner and seek innovation. Big opportunity to identify organizations, such as Fair Food in Philadelphia that bring production to urban areas. Glynnwood Center has great model for educating community. CAVE doing value-added for processors.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Great partnership between NRCS and SWCD to bring conservation programs to local level – but when rules are written, regional equity doesn't come to play making it hard for farmers to participate in programs – please consider this for next Farm Bill. Tools available, such as EQIP, WRP, CRP, etc are working for farmers, but finding lack of technical assistance (TA) and NRCS is strapped to help. To get programs on ground, need more technical assistance to farming community. Challenge is that tools are not available to entire ag community. Moving from large farms to smaller operations with vegetables and fruits that are more specialized– don't have tools to help new diversified farming. Small Farms (5 to 100 acres) aren't having stewardship on land like larger operations are. New farmers don't have understanding of land and water to be able to do it. To provide TA to these new farms is something we need to look at and some of the practices need to be adjusted to fit these small farms as well as on large farms.

Urban farming creates social awareness, creates better community because creates sense of connection to land. Need more funding in this area to land trusts and support for community gardens because current funding from CDC is gone.

I am a new farmer and in favor of more training and TA but biggest challenge is not being able to rent land; need more long term access to land. I have a contract for 5 yrs, but this is not enough time to make long term investments in soil, etc. Conservation easements is great, but still can't afford land in his town (sells \$20,000 per acre). How are we going to get young people on permanent farmland? There are tools on smaller scale in Vermont and California that prevent sprawl and protect farmland and open space where there is option to purchase farmland if farmer is working. But there are restrictions because farmer must be producing and must sell land at ag value to another working farmer. Make sure there are working farms available to next generation.

Barriers to access for young farmers is big deal – large proliferation of CSAs in the valley – small farms connecting people to communities and works. Have seen huge increase in people applying for apprenticeship programs for new farmers. Many interested in farming for their community. For example, 3 yrs ago they had 5 applicants and this year 70 applicants for mentor program. Need more mentoring and business training. But what happens after they leave their program is that they still have real barriers to access to land. Easements mostly help existing farmers; young people can't get there. Here land is \$20,000 per acre with no ability to seek financing if they're a new farmer. Having no income and collateral plus being a young farmer is hard. Need some kind of loans. With aging farm population, young farmers coming in are providing public service. There are loan forgiveness programs for doctors that work in rural areas, why not for young farmers? 90% of intern/apprentice applicants are college educated.

Change ag census to better reflect farming in Hudson Valley. So when they go on census they wind up in "other" category because they don't fit in category for type of ag in this area. It's hard to tell the story if there's no data. Need to have accurate numbers to provide necessary funds and programs to farmers.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Isolation is an issue for small farms; providing services and repairs are difficult for companies because of long distances to travel to small acreage farms. Also friction with municipalities - farmers finding themselves surrounded by suburbia that did not exist before and municipalities don't understand and don't support farmlands. SWCD's formed the Resource Conservation & Development Council (RC&D) that is doing a barge project to get Hudson Valley products to NYC. These farmers don't have employees to transport products, but will have access points to get products on barge.

Big threat from energy development and transmission lines targeted to be put on preserved lands. If EPA could talk to DOE and target renewable energy project sites for Brownfields and old mining sites, old malls (many in NJ) – why use “greenfields” for renewables after we have worked hard to protect these lands and pay taxes on them. (applause from group)

Real challenge to make small farming more viable. What is needed is aggressive regional supply chain development. In NYC there is a severe disconnect between city and rural areas. Reorient programs and resources. USDA could partner with organizations. Need for aggregation and warehousing, severe lack of processing and distribution for farms in regions. In NYC, the Dept of Education buys \$300,000 of lettuce from Maryland each year because there is no place in NY to process these products. Wholesale farmers market in the city is dying. Not lots of fed interest in that.

Difficult battle to maintain critical mass of farmland in populous parts of the country. Need to leverage money as intelligently and as soon as possible to get to hands of farmers. Distinguish that protecting farmlands isn't always protecting farmers, but sometimes does do both. In county have been able to get funds to landowners who then invest in their business and an example is where an orchard could build cold storage facility.

A challenge is that climate change will change face of ag and climates. We are not ready at local or fed level to start to address these issues now. We need to have tools in place to address this. Haven't seen changes in NRCS field office tech guide (FOTG) to upgrade conservation practices. Not costly for feds to start this. Through Long Island RC&D and NRCS should soon be putting in field mobile pelletizer program to assist farmers and homeowners to get away from fossil fuels. These types of projects need to be looked at to get project on ground and provides new means of income to farmers.

There is a great beauty and diversity of the State and it's very different from other areas. In federal programming, must understand it's not just about population size because standards might not match needs of community. Allow communities to identify their own needs - like HUD program does- require the fed agencies acknowledge great diversity of communities they serve.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

Local people know what they need and difficulty of funneling the funds down. It shouldn't be as hard for a small farmer to access money as it is to run their farm; but it is. We can't function without the local land conservancies. The fact is that the land conservancies, whose goals are a little divergent, have allowed us to establish the partnership. They have the connection with communities and individuals. The feds need to trust the people are going to spend the funds. If there were a way to streamline programs so funds aren't taken out for agency staffing and instead go to the local areas. It's a complicated business to spend federal funds, but to give some of the money to land trusts is good- they are nimble and have staff. They also have information. Money needs to get to the people who need it.

In Hudson Valley with advent of small scale farmers, there's interest in doing sustainable forests. NY is over 60% forested, and 80% of that is privately owned. Most folks with forested land have no idea of the stewardship role they play or resources available to them. Not a lot of info on how to manage that land sustainably. Ag and everyone depends on water that comes from uplands. Folks need to understand this issue. Resurgence of valuing local produce, but not local forests. We can't put everything in easements.

Lots of funds need to be targeted to young farmers. It's totally different mindset for these - they are conscious of sustainability issues, etc.

The Hudson River watershed is a community with many different local governments. What doesn't work is a lot of different parks that charge their own admission and you can get one pass for all the non-state parks for each park in different towns. This discourages recreation. There are great parks, but they Bay way is identifying wonderful spots to kayak and routes. Resources are not available or known to people. Wants a pass that is good for lots of parks.

\_\_\_\_\_ agrees with other commentators, especially regarding the lack of funding for DEC. She is concerned with the impact of untreated sewage on streams (combined sewer overflows). There needs to be more funding for infrastructure. NYS has within its jurisdiction ways for fine money to go back into the community and that should be done. Municipalities need to be fined if there is water quality violations and have that money go back into the community.

\_\_\_\_\_ grew up in the Bronx 30 years ago and had lots of outdoor recreational opportunities. Indian Point used to be a park. There are less areas for recreation in cities currently. We have to change the political discourse so that the public language has to be more inclusive. Everyone needs to pull together with people working together regardless of political affiliation. Sea level rise is a national security issue. He would like to see an increase in EPA and NOAA budgets.

Need more real time monitoring (Beacon Institution is doing some of that). Would like to see a model of what is happening on the river. More funding is needed for real time monitoring. Science education is needed and training for teachers on how to teach kids to learn science hands on.

## Discussion Question 2

### *Poughkeepsie, NY*

*(cont.)*

\_\_\_ wants to commend the federal groups for holding this session. Kids need to know how to swim. 69% of African American teens can't swim. 42% of white teens can't swim. We need to do a lot more to teach young people to swim. The CCC provided infrastructure in the 1930s that is still used today. NYS closed parks and the Feds stepped in requiring state to keep open fed. funded parks. Please build in accountability in federal grants. Write in assurance that parks using fed money require that they remain open. Build in enforcement that money is spent in compliance.

Lack of funding for DEC prevents DEC from investigating violations. Local planning boards don't take into consideration cumulative impacts which affects the Hudson River. SEQRA has no enforcement arm.

AGO is also in our back yards and ecosystem services should be a top priority. Funding and research on new education initiatives, and infrastructure.

\_\_\_\_\_ wants view shed protection for the Hudson Valley. When federal and state parks are involved there should be a way to protect viewsheds. Things that are done on a local level affects people in a region.

All river and estuary programs-make all of them one program and give them elevated status. Combine federal designations to work better together. Make them all eligible for federal money. Better coordination and resources among federal agencies. If you want to connect people with nature put nature where people are. It has to be accessible to people in urban population centers. Federal money needs to go to urban center parks. Concentrate and prioritize on national estuaries.

Allen is NPS hydrologist. There are national parks in New York, but few people know of them. We need to get NPS information out.

Reconnect people with landscapes and connect landscapes with each other from headwaters and tributies to main stem. Provide additional funding to remove dams. Support legislation to increase F&W service programs. Find ways to provide federal incentives so farmers don't have to sign natural gas drilling leases.

The Hudson River estuarine research reserve is part of a little known partnership program. They have something to contribute. Use science based management practices. Get people to connect with the resources from youth to policy makers and how to plug for the program. Please fund and connect to other initiatives. We have to keep climate change and sea level rise front and center. Relates to public access, wonderful array of public access site, a lot of those will be under water with sea level rise. Keen interest in seeing energy conservation.

## Discussion Question 2

***Poughkeepsie, NY***

***(cont.)***

It is important to understand it is the kids that are going to carry this work on, kids need to be involved in river activities and kids love to be on the river. The more they are on the more vested they get. Kids like being on the river with their friends. They are more invested if they are with their friends for longer periods of time. Just need a strip of beach with nothing else on it. Kids don't know you can't be on the river after a hard rain because of CSOs. River keeper is working hard on this issue. There isn't timely knowledge of bacterial levels in the river.

Would like people to have access to water quality information. Infrastructure investment is desperately needed. We need a water quality (sewage system) infrastructure! Needs enforcement of laws. EPA has a role. Waste-water treatment budget has plummeted in EPA. Need to have a robust presence so permits are more strict. Wants fed government to invest in infrastructure and enforcement. Hydrofracing what is EPA's jurisdiction? Leaves drinking water supplies contaminated. EPA needs to get involved otherwise the states will have conflict. EPA needs to make sure NYDEP works on infrastructure investment and economic opportunity. Send more EPA staff to more public meetings.

It is worth reminding ourselves that we have globally rare freshwater wetlands in the Hudson Valley, we need to conserve the ecosystem, need big picture plan of attack (this is work here-Greenway program). This would be a great test case. We have the resources, plan and people. We are all invested in this plan and would love a federal partner. Expand NY & NJ harbor Estuary program should expand up the river. \$52 million dollars requested to President to expand funding for EPA. Combine 2 programs to combine the harbor program with the DEC program. Sea level rise will travel up the Hudson. A green ribbon of protected space along rivers is a great idea. Federal government needs to provide more science on sea level rise and more interpretation and outreach about that data.

I remember playing with my son and the water was terrible. Children need to have clean water where they are playing. Concerned about too many services because taxes go up.

## Discussion Question 2

### ***Prior Lake, MN***

Thanks for coming to listen. "Long over do." When Washington policies affect his tribe he listens. Sacred teachings are important. The wish for president's initiative on the Great Outdoors is a blessing. We are losing our sacred things. We are losing our wild rice. What the heck are Asian Carp? We need to protect our natural resources. We need to do this as a group. (A 30 million \$\$ fish farming project failed due to (regulation delay), took 5 years to do and they are still waiting for return on investment.) We are the sacrificial goat. We need input on development and policy. He sees this in WI and on fed level. Need consultation with Indian tribes. Tribally driven policies versus Washington developed. Natural Resources shouldn't be regulated in DC. Lack of input from tribes is a concern. Tribes need to step up and do something in addition.

She talked about reservation boundary issues. By act of congress they were given tribal boundaries. Need long term planning. Projects don't work. They don't have infrastructure to implement. She highlighted the issue of identifying cultural resources and then the difficulty in protecting that same information. Working on IRMP, Integrated Resource Management Planning, identifying resources and defining cultural/historical resources. Need to beef up management and get business/management plan, get water resources, trying to give back to the youth. There is a concern of losing cultural and language. The goal is to start with the young, teach the language and then they gain connection to natural resources. There are water issues with the (use) (of the Aquifer) and (River) water rights. Why do they need the water, except for irrigation? They are working on zoning. Don't want their resources just taken. There is a need to identify important resources to be preserved. They have issues regarding agricultural/range leases. We need to improve our management plans with NRCS for land use.

In regards to resources, he was an electrician and was forced to leave the reservation. He knows the problems on the reservation. We all have the same problems. Talked about BP oil spill, needles washing up on shore /international dumping in our waters, preserving our Cultural Resources, and losing the language. He mentioned smog at the Grand Canyon. He highlighted that a white guy is teaching their language at UNL. Lincoln. The language is his mission. He also mentioned a museum that is in the works and that the Smithsonian is (holding some of their cultural heritage/sacred pole.)

What works? They have a New Director in Natural Resources that is working, a Green Thumb program, elders beautifying the community and they are stocking lakes with fish, they are acquiring GSA surplus equipment and work cooperatively with State and Fish and Game. They are a small reservation with a small land base. They have buildings on dumping grounds. (A Middle school and a former housing unit that was torn down 18 months ago, which is not cleaned up yet.) Since it is not cleaned up people are getting hurt, there is vandalism, and it poses a hazard to the members. There is not enough law enforcement on these sites. They must protect the aquifer on their land. They also have Chippewa Tribal Industries, which is performing home inspections and energy audits. They have Community gardens. Another challenge is they are losing the willows for basket making. Would like to see more tribal, state, governmental teamwork on these issues.

## Discussion Question 2

### ***Prior Lake, MN***

***(cont.)***

What works? What fits this is CCC. Civilian Conservation Core with youth doing natural resources. (Rails to Trails program, projects such as trails from WI to MI., campsites and deer surveys) This got the young into the outdoors. This all ended when (name deleted) became Governor. They only receive funds to build, not to operate & maintain these parks, ball fields and trails. Doesn't want other programs to be fleeced in the process. Wants them to be 638 so tribes run the program. (MI mine to be destroyed) Get young away from crime and into traditional sites/values. Doesn't want sites open to the public. (Mention of Monuments /site where they collect pipestone where there was graffiti. He wants no graffiti on rocks.) He cited GLIFWC as an example of off reservation cooperation to protect resources. Can we purchase off reservation and close it to the public?

Thanks to Obama for this initiative. Our economy and culture was destroyed by this government. The agencies have helped. We, as tribes, do not have the infrastructure to help with funding. He had an issue with OSHA winning administrative jurisdiction on the reservation. Issue with Unions. Many tribes are poor to begin with. Pow Wow winning are now on the 1099. The IRS and taxation/1099 take too much. IRS is a disservice to the tribes. Tribes win little money. Land into trust. Menominee feels they were ripped off. Connection to congress resulted in MIT ripped of (Legend lake) acres. Legend Lake landowners have a covenant to stop land into trust. The youth is in crisis. New law enforcement (funding) will help. Drug problems are a big issue. We need to utilize the resources available to us and the Agencies. Need assistance with infrastructure so that they can utilize the funds that they receive.

The youth focus of America's Great outdoors is great! Our assets are our children. The greatest gift is a world where they can sustain themselves. We are losing our moose population, seeing raccoons and wood ticks, which they have not seen before. Their ceded territory saw their first Turkey hunting season last year. No one knows how to hunt turkeys. Concern: Treaty rights as they relate to subsistence which is important to the tribe. Mining is a big issue for them. Asian Carp & VHS (fish disease) is big problem for them too. Don't do enough implementing; instead they do too much studying. We did the same thing with the lamprey. Now they are managing them. We need quicker action on invasives. Partnerships are important; both sides must have total honesty. Need every one to come to the table with no hidden issues/agenda. We need more direct tribal contracts. Hopes this initiative doesn't stop.

Thank you. How do (we) keep tribes input happening? He directed everyone to the web site for continuing to make the issues known. <http://www.doi.gov/americasgreatoutdoors/> He asked, what does the forest of the future look like? Should we be looking to new ways? Liked the second generation forest mentioned by the Stockbridge Munsee tribe. The CCP program and youth can become the new natural resources care giver. Community gardens and USDA can be of help. The Forest Service has learned how to manage forests from studying Native American practices. They are struggling on how to manage forests to anticipate climate change.

## Discussion Question 2

### ***Prior Lake, MN***

***(cont.)***

You need to listen to the children and Indian country. Appreciates the effort in them being here. He stated that they must spend a day or two here, not just a few hours. Tribe's resources are "they need the money". Tribes expect the government to live up to treaty rights, funds, and provide technical support. He noted that the president said that Indian Country has always been underfunded. We/tribes need to maintain what we have and find other financial resources. The treaties don't say "subject to budgets".

## Discussion Question 2

### *Salt Lake City, UT*

Getting word out to the people. Letters to the editor and newspaper stories.

Assisted and low cost programs so people can learn to fish and camp. \$10 for campground to participate in activity.

Working model is education thru YouTube online. Educating parents on how to get their kids outdoors.

Success in marketing, state travel agency and agencies. Work w/organizations from Fed. Funding for promotional efforts.

Boy Scout base. 30 years later they remember where they visited.

Partnering w/other agencies and organizations. Lots of stakeholders are brought in. Conservation needs to be science based.

Sometimes resources of Fed Gov't are not available timely. Easier to do cooperative agreement w/local gov't.

Works w/Wildlife Resources and gets more accomplished. More interest from general public.

Quarterly meetings w/DWR.

Fully endorses youth groups - involving them works.

Nothing has worked except Bill Barrett.

Gov't can facilitate groups getting together. Outfitters, environmentalists, etc., presented to NPS and got adopted.

Bringing interns in. Going out to the community and asking their concerns. Learn the local issues. Getting all of the points of view.

Why should we reinvent the wheel. We have conservation groups and Boy Scouts that have been around for years. Here let us help you expand.

## Discussion Question 2

### ***Salt Lake City, UT***

***(cont.)***

This is great event. You can walk away with the hope that something will happen even after a couple years. Same hope with San Juan Co. May not ever happen because of politics. Fed Gov't can bring groups together like in Washington Co. and with the attitude

Best item that works is education- education in terms of maps, trail info. Kiosks, partnerships with all, school education too. Instead of teaching not to do something.. Teach them how. The 80/20 rule (80% follow rules and 20 do not) - enforcement is critical

He agrees in his work as a BLM ranger education and enforcement needs to be combined for it to work. Need to explain to people why the law is there why need to obey and if needed use cuffs.

When BLM dealt with OHV designation plan some of the OHV users were very upset much controversy. Retaliation occurred, etc. They funded one person for enforcement but really this person worked on education and hit the areas with crates of maps and information

Another approach that works is good signs.

Dialogue takes time, but there is a public lands council that works. Gather as much input as possible and then make the best decision possible.

Collaborative work....the Tuschar Mountains collaborative for grazing allotments was wonderful. Lowered AUMs thru science. Public range lands need to be resilient due to Climate Change....we need science thru monitoring. Direction from on high - oil and gas p

Folks that are making a living from the land are bringing more and more people out to the "lands" to help with fencing and riparian efforts...they can be the teachers. Treasured Landscapes are not necessary because the farmers are already connected to the land

Generations of tradition in Blanding of looting the lands - academic archeologists paid rural folks to dig up pots. Something that may be working - after the antiquities bust - the boy scouts - who in the past had gone out on private lands to dig and get

Partnerships are the key to get energetic youth moving..AmeriCorps and other Conservation Corps....funding from a National Level is the key to continuing this educational experience. Public Lands Service Act is a bill in Congress right now. Connects young

Get together with curriculum experts and develop a spiral curriculum. Work with themes at the grade school level and come out with a program. There would be federal grants to provide the materials and internships to train kids at an early age to move forward

Bureaucratic organizations need to understand ranching and farming in order to understand the land and economics. Feds should be talking to the states so that resources are shared...get rid of the "lines".

Take what is local and add to the curriculum to build it up.

## Discussion Question 2

### ***Salt Lake City, UT***

***(cont.)***

Road closure - worked with Tooele and Utah Magnesium, UDNR & others - built interpretive display to educate the students that live in Tooele county regarding the closure of Stansbury island. Plan to teach teachers how to teach students. Partnerships is th

All about the children and future. What works for education for kids - quality of life now and in future - overall respect for the land - energy, oil gas, coal extraction to devastation of land for future of children, state and country. Need to look at ou

Greatest thing that has worked was during FDR in the great depression. Trails in Yellowstone built by youth. Need youth core programs.

Youth cores area working.

Volunteer groups to help with education and monitoring. Need to make them aware of what is appropriate in the outdoors. Back country horse patrols can help along with the bikers.

Education and enforcement is needed. An online map somewhere does me no good when I'm on the ground - need signs and kiosks with maps. USFS did well in Am. Fk canyon in signing trails. Forest Lake is a problem since it is empty half the year and people wi

AM Fk: Pleasant Grove Ranger District - have different management styles even in the same Forest Unit. We tried working with the SL ranger district and they had no interest in the specific trails program. Some are engaging community in promoting stewardsh

Education works, starting at an early level.

Provide a community created map of the issues on forest lands to local and regional management units (e.g. USFS) so the someone beyond the overworked forest units can receive this information and get engaged in the dialogue.

Get programs with telescopes at supermarkets and other high visibility areas.

Enforcement. Different than rules of road in driving. Want to be able to go to website on map to see what lands can be grazed or not. Where motorized vehicle is allowed.

Education. Get more people into the outdoors--need to educate for proper use. People need to know what the rules are--signing, etc.

CD for OHV trails is coming out. There are those that will go where they want regardless. Most people want to be legal and obey the laws of the back ground if it were mapped out, signed, etc. If trails are signed and on maps then there is not a lot of abu

## Discussion Question 2

### ***Salt Lake City, UT***

***(cont.)***

We make signs for appropriate use. Putting people to work, works. We can pound posts and put up fences. Let us do work that is meaningful. A lot of our public infrastructure projects - putting people to work works. We put up signs. Give us meaningful work

It has to be signage. There has to be social marketing to make it work. Need to do background research. Understand why people care and why they do something. Signage and info is important but background research needs to be done- marketing. Find out the w

Economic advantages, recreation advantages. Threats to national parks--air quality, off-road vehicle uses, etc. Higher levels of cooperation between land managers and landowners--need to see more of this coordination and cooperation. What are apparent are

3.4 million acres of land in Utah granted to support public schools. Showed map. Recreation impacts all of the school lands. Every school gets discretionary money from lands. How are you going to preserve recreation without funding. WE want to have these

Good science, peer review works. Modern technology is good. Cannot mine water--we conserve it. Study drain systems in Utah to meet agriculture and recreation needs. Get people out on the land and sea and experience it. Suggest BLM have open house to show

Division of natural resources has a program where you can call on people poaching. Something similar should be set up for off road use. Brought kids together that have never seen a deer from inner city and local farm kids. More money for youth national co

## Discussion Question 2

### *Seattle, WA*

Walkability and access to green spaces is a problem in Seattle neighborhoods; have plans but they are not funded/built; have a very good re: with MBSNF, supportive of our work in bringing diverse youth to the forest; ie, provide funding for Eagle Watcher program and have a community partner who has been very helpful in helping us access all of the resources that are available.

parents tend to push kids to their interests; people don't do what doesn't apply to them (not interested, not available); important to show kids that Hollywood doesn't depict the facts; need to take kids out to places like NW trek – the don't do things they don't know about – if you're taking your kid to the park, offer to take a neighbor kid; if parents don't know about opportunities, hard for kids to know about them (e.g. 4H programs); also won't be funding if no one shows up – need to make it relevant to kids

Trails in WA are in very poor shape, keeps people from coming out. Disappointed with low funding to public lands, particularly Forest Service near populated areas. Not sure how money is appropriated to specific needs. Seems that forest service trails near less populated areas are in better shape than those near urban areas. Understands recent weather is contributing to problem, but thinks this is and has been a problem for many years. Also many trails further from urban areas receive a lot of ORV use which takes these trails out of circulation for other trail users.

overuse of local trails, lacking resources, equalize based upon use rather than political power

More emphasis needed on local schools and parks, participation at the local level

Public agency staffing is revolving door. Need sustainable funding sources for recreation.

Environmental and outdoor recreation education is needed, including ORV use.

Uncertainty of climate change. Need a synthesis in adaptation options for land mgmt. Need to create easier channels to engage youth in outdoor recreation, technology.

NPS provides structure and framework to address environmental issues. Use the NPS organization as a framework to address these issues. Also, utilize local urban parks to teach issues and provide close access to outdoor areas.

getting to the National Parks without cars – public transportation

Center for Wooden Boats. Barrier is funding for transportation to bring kids from schools to outdoors.

## Discussion Question 2

**Seattle, WA**

**(cont.)**

Cooperation/Collaboration between USFS and private user groups. Need to maintain access and quality of experience to keep people coming back. This goes a long way toward people coming back. User groups must take responsibility for care of the land. Volunteerism works.

Mountains to Sound Greenway – Kids learn more when they are actually outside. Youth programs, volunteer programs such as these help make the connection between people and the land

amounts of grants available significantly decreasing and more competitive. No money to do the things needed

Wild and Scenic Institute: Low funding levels for nonprofits providing education and outdoor recreation.

process by which land uses are determined and way decisions are made. Public rights and public are being given away. Agencies collaborate with special use committees that are heavily stacked towards local interests. EG in Montana Resource Advisory Committee represent local industry, labor, 5 are tribes, 2 seats are for environmental groups. Lawsuit at end of Bush administration – filed to stop BLM from evaluating any further BLM lands for wilderness designation. Obama administration has been discussing in order to reinstate some of these, but so far no action. Fed agency hearings are not set up to fully represent all Americans. For example they are set up outside the agency where local special interests can dominate the discussion. Environmental groups don't find out about some things until EA is out. Special hearing was held in MN which was near Boundary Waters – at Minneapolis hearing only pro-mining interests were heard. Media was not allowed in the room. Members of Congress feel free to give away our land if its in their special interest. Senator Tester (MT) Bill which would order mgmt of Beaverhood NF to put out minimum level timber cut. Discouraging that Americans who don't live adjacent to federal lands are ignored in process. Too much local and commercial influence in federal land use decisions.

existing built environment needs improved preservation and funding to restore and preserve them. Natural Heritage Areas help to get people out into the outdoors and need to be supported with funding

Mountains to Sound Greenway – Collaboration between govt, community and non-profits. Take over landscape with maps, community plans to map out landscapes, collectively obtain funding from various govt agencies. Look at history of Mt to Sound Greenway. Look at documentary on Jim Ellis. • Partnerships between non-profits and govt.s works well ie: land trusts, etc. Focus on what disparate groups agree on rather than disagree.

state of WA and OR both have CWA laws that apply to the Columbia River, but have different standards, particularly with respect to gas going over dam and impacts to salmon; states should have same standards; maybe have federal government help the states agree on a standard

## Discussion Question 2

***Seattle, WA***

***(cont.)***

permitting and access; company that brings people and kids outdoors, but on federal land (USFS and NPS) it's difficult to go through permitting process to bring people to locations; lots of hoops to jump through – staff admit that hoops exist because of lack of staff to process applications; with USFS there is a moratorium on issuing new permits – if you want more people outdoors, need to make it possible for non-profits and other professionals access to the land; permitting processes are too complicated (think about a single unified application, similar to what grants have done, or colleges); also there seem to be monopolies of companies with access to specific national parks; also the cost of filling out the permitting; agree that people need to be prepared, follow leave no trace, etc., but would be good to have one application apply multiple places

NPS needs to make sure it is representative of the cross section of our society. Look for opp to protect landscape that rep. who we are as a nation.

Snake River dam comment seconded. Need preservation of open space as more priority. Cascadia environmental science center. Senior High kids have less time in curric to be involved in envir studies and getting outdoors through classroom. Parents spending more time working and don't have time to get out w/ their kids. Stimulus bill should fund ESA recovery work...would provide more opportunities to get out and see these species.

one challenge is lack of cooperation between federal agencies; eg. At NOCA, want grizzly population augmented but all agencies aren't moving at the same pace – NPS wants it but the FWS not agreeing

Trans Alta owns Centralia Coal plant impacts Mount Rainier. Recommend Jon Jarvis converse with Governor on this. Other federal agencies – trying to protect resources around Bumping Lake but Bureau of Reclamation is working counter. BPA is standing in way of taking out dams. National Park Service is working to take out Elwa dams, but its been 25 years and still hasn't happened.

Underserved populations need to be engaged through multi-tiered approach. Need for accessible outdoor recreation opportunities, through partnerships, private industry.

Understanding of value of wilderness – not only for recreation, but for clean air, water, and other ecosystem services.

cost. Example – outside of Leavenworth - \$70. How many families can afford this cost?

We need to engage the populations that live in our cities. More diverse populations. Form a more collaborative culture

dual edge sword 'idea of diversity'. Myriad of interests that have to be addressed. Dichotomy of use and protect. Finding right balance is difficult. Challenge is lots of interests that need to come together for compromise solutions

## Discussion Question 2

***Seattle, WA***

***(cont.)***

applauds the First Lady for wanting to get kids out moving; it is a challenge in making the outdoors accessible for many people living in Seattle

access to trails & open land for equestrian use, fractures in park connections - regulations, ordinances, taxation

Access is difficult for all recreation, particularly for ORV use. Need for open-mindedness in land managers for all forms of recreation

Lack of connection for minority population to public land. Need for focus on green spaces in urban environments to lead to greater public land participation.

RTP works very well, leverages federal dollars; real, legitimate collaboration works really well – having a pre-set agenda doesn't work (in collaborative efforts); have had great participation and success with volunteer efforts to build mountain bike parks, 12,000 hours in once case; give us more access to more areas and we will do the work.

low access due to poverty, lacking resources (transportation & funding) to provide volunteer services with public lands

LWCF funds are too low

Lack of public transportation

need to use the technologies that young people are using to reach them

Earth Corps; from Kenya: some environmental issues are cross-cutting; the EC program teaches environmental skills, very good way to help young people get involved in the outdoors, and can lead to careers; also, Americorps

important to have a clear goal when you ask groups to collaborate

Kitsap Co, put out maps for m/c and ATV trails. 500 miles of ATV trails in Kitsap Co. Getting the maps distributed is key to increasing use and knowledge of these areas.

lots of money available that is not being connected. Money in Ed and Labor not getting to Youth initiative.

Competition in funding in local jurisdictions. LWCF highly competitive, and not enough to cover needs.

## Discussion Question 2

**Seattle, WA**

**(cont.)**

WWRP funding not available to non-profits ; RTP and NOVA funds very beneficial fund sources, but in danger of losing them....need the RTP funding coming in the next transportation bill....used for backcountry grant programs.

Act as liaison to provide environmental education and outdoor recreation to kids with special needs with physical, cultural, and financial barriers to accessing the outdoors. Would like to see more funding for smaller orgs that are trying to bring people to the outdoors and funding for transportation to do so. Need funding for the introductory level of exposure to the outdoors. Also need funding for outreach programs specifically targeting special needs groups. Trend appears that National Forests will fund service projects targeting groups doing hands-on conservation – this doesn't facilitate programming for kids who are experiencing the outdoors for the first time and we want to meet those needs and bridge that gap.

success in obtaining matching state funds for challenge cost share programs; a diverse coalition brought together as result of the statute, WA Wildlife and Recreation Program...the most successful program you have never heard of!

King County Historical Society. Encouraged to see talk of preservation and protection of historical sites. Troubled by two things with current administration. 1) Save America's Treasures and 2) Preserve America. Administration is also proposing to cut in half funds for National heritage areas. Confused by what administration is saying about encouraging use and protection of these areas while cutting funds for these programs. Propose fully fund both programs.

AmeriCorps vol work with schools and teachers to provide good educational experience for kids in the area. Funding is a problem

elected officials need to see better the value of conservation, recreation and the out of doors to place a higher priority on it.

Access and land closures. 6 million in Puget Sound Region. Only access is 200 miles east of here

Renegade trails and problem people

Lack of law enforcement. His group tries to educate but they can not keep up with everyone. We are in danger of losing very sensitive areas

Washington Trails Association: USFS staff is retiring and understaffed. Difficult to work with due to limited staffing.

Shrinking land base for ORV use. Lack of understanding in ORV use.

## Discussion Question 2

**Seattle, WA**

**(cont.)**

Immigrants lacking an avenue to engage with policies, need ways to reach out to these communities to engage and for policy making

Difficult economic times – outdoor recreation considered discretionary spending yet this is a primary factor in quality of life

Zoning for housing along waterways and rivers has not been sufficient to protect them for riparian health and public safety. Zoning affecting construction quality, energy conservation, green building, not sufficient. Better standards are needed. Also need better protections for Orcas from Dept of Defense operations, re sonar. Need conservation related job program like CCC to employ youth, homeless, jobless

Focus on technology to engage youth. Revisit education curriculum to see how land ethics are incorporated.

Biggest short and long term challenge is climate change. Would love to see synergy with connecting youth to public lands and climate change issue. Climate change issue is opportunity to connect youth to outdoors and public lands

WTA working very well for volunteer trail work; a very good system;

Important for people/orgs/groups to come together

waterfall garden in Pioneer Sq; then to Klondike Goldrush NHP; challenge is getting kids away from the computer and out; once kids get a taste of excitement and pleasure of the outdoors, they get the spark; just a matter of getting them out on a regular basis

Transportation challenge, school participation demographics has changed with less participation by inner city schools especially due to costs of transportation.

Runs program for high adventure outdoor experiences for girls. This is first summer they have had access to National Forests. Can't get permits because fall in category of commercial users. Non-profits that pay staff are categorized as commercial users of forests and there are limits for historical use permits. Lot of historical users don't serve diverse users. End result is encouraging access to non-diverse traditional users. Has been movement to special agreements diverse youth have to do service work instead of just being able to recreate. Reason its beginning to change is due to lobbying of non-profits

People try to respect rules but without access will do illegal and

## Discussion Question 2

**Seattle, WA**

**(cont.)**

Challenge to have the management in place to organize volunteers to help care for forests to trim trees, maintain forests, manage multiple activities (like cross country skiing and snowmobiling). Resources and willingness by agencies to use volunteers

find out why people aren't outdoors. Kioks/info stations have info that may focus on negative. Access to these places is a barrier. Need local, closer places. Arctic NWR – short terms gains

Need more focus on health care issues and outdoor activity and that connection. Need to do more to encourage healthy, active lifestyles.

Converting to Wilderness Areas limits land use/access for various user groups

Timber Tamers (4-wheel drive association). Accessibility and diversity. Keep pushing the off-road community out of places and they all end up in one place that is over used. Same thing would happen at Green Lake if you ask everyone to go hike there on Sundays.

Pacific Forest Trust: Lack of resources for funding in permanent conservation easements.

inspiring America to take care of wilderness – funding to maintain & steward public lands – problems in all agencies (forests, parks, state, local)

one obstacle with respect to private landowners is negative incentives as opposed to positive incentives from government policies, eg. Wetlands, endangered species; conservation reserves provide positive incentives

extend excise tax on hunting and fishing equipment – a very successful program - to other recreational equipment

one of biggest challenges is quality of life for all of us; whether rural or urban; concerned with policies and the idea that more people need to live in cities that are already crowded and how to achieve that; concerned about use of eminent domain and that use becoming abuse; more development is moving to the cities; concerned about how we achieve quality of life is not compromised by policies to force people to live in certain areas

Concern about commercialization of National Parks to the point where people can't afford to visit.

on corporations to encourage volunteers to come out to work on public recreation lands.

We have done a lot of research around people not engaging in the outdoors – common factor is fear. Lack of exposure, lack of understanding of the issues

## Discussion Question 2

**Seattle, WA**

**(cont.)**

Removal of predators from the ecosystem. Need to focus on how ecosystems evolved.

Jefferson Land Trust. Need a more predictable source of grant funding; need fund sources available to work at the local levels; teachers need more flexibility to incorporate environment into curriculum and classrooms.

Diversity in natural res workforce doesn't fully exist yet so obstacle to getting people out. LWCF Pres America, Nat Heritage program have helped to get funding on ground but have been cut. Need incentives/funds to buy people out; do the right thing. NRTP funds help create work for youth. Adequate funding for LE on public lands.

Government prevents access to recreation areas with gates and closures. Improved access needed to increase outdoor activity.

· Greatest obstacle to restore watershed is threat of invasive species, spread from private yards. Pollution another threat affecting salmon restoration in the watershed. Spread of invasives needs to be taken more seriously – ivy, blackberry, other species. Creates rodent habitat, encourages insects, needs to be addressed.

could be very effective at removing barriers

trail projects are great ways to engage people;

drive to OLYM NP thru the OLYM NF and challenge to conservation is lumber is a big economic resource; UW has a sustainable forestry program – federal interest could help expand

Parks are designed around the camping experience. Changing demographics leads to a lack of access. Lack of opportunities and locations in parks that are accessible to the American Public

Strong support to Pres for clean energy bill. Recommend breaching dams on Snake River-restoration, job creation. Subsidies for wasteful energy uses; change tax code

Already have great programs and agencies exist, but not enough funding, not enough job openings. Reinvigorate with funds to keep these going.

Priv bussiness operating on public land – interp of NEPA/enviro laws. Update 1986 ski rec act.

LWCF Pres America, Nat Heritage program have helped to get funding on ground but have been cut.

## Discussion Question 2

**Seattle, WA**

**(cont.)**

Need Incentives/funds to by people out; do the right thing.

NRTP fund help create work for youth. Adequate funding for LE on public lands.

Barrier in higher ed model where teachers are feeling pinched to get it all done or don't have the skill to get the enviro curric/projects done.

People are too busy – program managers are working at getting the funding year to year and keeping and growing the programs are difficult. Need static, stable funding.

Limited funding. High proportion of federal budget goes to military spending; propose to devote more to environmental programs and access.

Primary funding source for environment comes from off shore oil drilling leases but it hasn't been fully funded (Land and Water Conservation Fund). Need to fund at full \$900 million per year.

· When and where will future listening sessions occur? AGO website should provide this information.

Relating wilderness to urban users. Lack of connection between urban, dense populations with reasons for environmentalism, conservation. Lack of understanding in agencies, and the use of common language among agencies.

underserved urban schools despite love of nature experiences for local youth

Education and environmental learning works. Align and integrate env education into traditional academic goals. Should be connected.

Volunteering is a valuable to forge deep sense of connection to the land.

Collaboration of NGO's. Not a lot of money around in govt. Must use these partnerships to leverage limited funding. Leave no Trace is a good example of information dissemination and adoption by Govt. NGO articulates issues.

Need to search out NGOs that can engage youth

Save America's Treasures effectively funds historic vessels in getting youth out on the water. Foothills trips for youths. Preserve America program promotes heritage and cultural site as tourist destinations. Gets people out to rural areas and to parks.

## Discussion Question 2

**Seattle, WA**

**(cont.)**

Art – Artists on Trails – King County Trails-artists are playing music on trails, interpreting trails with new imagination and different perspective on appreciating outdoor areas

How do we reach diverse populations when dealing with outdoor recreation issues. Currently a mono-culture. How to engage other age groups and cultural groups?

This session was not publicized well. Some just found out about this this morning.

This room doesn't look like the community culturally. However, during the earlier youth session, it was more representative. Also, Eastern and Mid-Washington did not seem to be represented here.

Initial reintroduction to the environ - salmon in the classroom program; all about the money and keeping environmental education centers open; a perfect chance to catch kids – few parks that have ed centers are losing funding – a huge missed opportunity

- people at two ends of economic scale, is there a way that adults could be exposed to the outdoors so that they realize the need for their kids to be outdoors; some people can afford camps; at what way can we inspire parents to learn more so that they realize the importance for their kids (whether they are at either end of the economic spectrum); parents need to be aware of nature deficit disorder; example is teaching science to young children at the library

- general challenge is transportation to bigger open spaces; younger people are often dependent on other people to access the outdoors; e.g. HWY 2 requires a private car – no shuttle to get you out to the woods; infrastructure to get people to open space relatively inexpensively

Mom says can't be out at night

Fear

Being harmed

Too far away

Violence

Transportation

## Discussion Question 2

***Seattle, WA***

***(cont.)***

Save Our Salmon, Lack of political will to do what is necessary to restore salmon, federal leaders need greater willingness to solve challenges

- Spending billions of dollars to subsidize fossil fuels; need to put that funding into clean energy.

People don't believe large change is possible, but a green sustainable lifestyle is possible. Small changes can be effective in conservation

Water is an obstacle and challenge

Barriers between agencies – state, local

Effectively get volunteer groups & manage them

overuse of trails, lack of access, trails closing, abuse of designated trails – volunteering more than using

Getting kids outdoors – required service hours for students – need contacts & transportation

Population shift from rural to urban – they have to create for each other, value exchange

Difficult for small farmers to transfer land to new generation due to low values, high investment in fallow

Jurisdictional issues, boundaries and working with various agencies – water quality, partnerships, working locally

Getting businesses to consider the effects of the land and consequences, less focus on money, consider long term

Varied communication from rangers on land access

Need more grant writers to get funding, more notice for grant fund availability

Educate teachers on how to incorporate experiential education into curriculums

## Discussion Question 2

***Seattle, WA***

***(cont.)***

Same – maintenance of existing trails. Used to have so many trails, now gone. Would like effort to have more

Same – access. Boy and Girl Scouts are having difficulty with permitting

Seattle has good urban parks but transportation needed to get outside of city

Oregon State Parks – political issue. Quality of life. Recreation and conservation - marginalized importance of the qualities that add to spiritual, etc, well being. Lack of political capitol. Should have stronger allegiance with education agriculture and health care systems

Land use conflicts. Oregon faces challenges faced at parks, conflicts among users

We do not have long term sustainable funding sources

Identify disadvantaged youth unable to access the wilderness. Recruit diverse populations – gain skills and not be fearful. Fear, financial, cultural, physical, lack of time

Doing something else / something better (e.g. video games)

Information not available

Being lazy

Parks: dirty and dangerous

Parks are closed when you want to use them (not open)

No equipment/gear for recreation activities

Transportation

## Discussion Question 2

Construction (being closed)

Park closure because of budget

money

Transportation- Don't have outdoor space within walking distance so they cant get there

## Discussion Question 2

***Seattle, WA***

***(cont.)***

Money- Many parks charge admission fees

neighborhood parks may not be safe for youth-homeless people, drugs, etc

Lack of activities- Nothing to do in neighborhood

Kids would rather stay inside with electronics (video games, TV) than go outside

Parks don't appeal to young people-Should have more Bike/Skate parks

Some parks restrict activities that youth want to do, like biking or skateboarding

Lack of knowledge- Some people don't know what opportunities exist

Location- too far away

minimal personal transportation options

no driver's license

limited public transportation

limited money/equipment

lack of time

competing entertainment options

cultural norms

## Discussion Question 2

***Seattle, WA***

***(cont.)***

safety concerns

lack of awareness and interest

pollution

conflicting priorities

need more accessibility to parks and open spaces to grow their own food for youth and their families. Need more education and information around sustainable, local food production.

Overwhelming competition for federal funding, grants, philanthropic etc. to support youth serving organizations.

- The general public may not know the differences between federal agencies. Entrance fees, permits, etc.

agency staff is not available to families at district offices. There's nobody available to explain the rules and the different regulations and passes.

Take children to public parks and they're not safe. As a child growing up in a small town, parents had no worries about where she was.

It's not safe anymore—children need constant supervision. How do we deal with these safety issues?

It's not safe anymore for kids to play and have fun.

Questions about corridors and connectivity—what does that mean? Questions about purchasing private lands. Pete Silva details what this means—connecting lands.

example of graduate students that are 18-19 year olds with no first hand knowledge of the land and forests, need for connection with land. Important working forests, fisheries, but if no knowledge – difficult to engage in communications. Plug for education in K-12 to get aht background. Need to prioritize challenges – concern with conversion of lands, need to reconsider economic values. Sustainable forestry – federal agency support for local groups' proposals, changes in law.

## Discussion Question 2

***Seattle, WA***

***(cont.)***

Abating threat of forest fires in central Cascades. In early 2009 they helped pass an act to allow FS to work with partners on restoring land—taking landscape approach to treat a place as one landscape instead of doing things patch by patch.

Authorized at \$40 mill per year—idea was everyone would bring funding together.

FS has created collaborative program where federal funds can only be used on federal lands

Asking state to bring match—want this policy reinterpreted so funds can be co-mingled to address this issue.

FLRA's coverage and eligibility should be expanded to allow restoration on Tribal lands, State lands, and Private lands

Need to see better funding. A lot of the funding gets passed down to local communities so they can conserve.

Need more funding to preserve America's treasures. Historic landmark vessels being used for children's camps—these historic places can be used as exercise for kids (obesity crisis). Passport in time program—kids get out to excavate sites.

Heritage area is a way of using private property, esp. ag. Land, good program for heritage farms where private owners get matching grants to repair barns, keeps ag community and keeps lands in private hands and allows them allow to keep their historic building.

It'd be great to increase this funding. Where does this funding come from? Dept. of Interior (?). Use the money for the public good.

Kids don't know they can go out into the forests and parks. It is not a part of their culture.

Classrooms don't have time for guest speakers. Some parks have crime issues.

Washington Trails Assoc., we do volunteer trail work all over Washington. Infrastructure is crumbling, we need partners at the agencies who can help us help them. We need better funding at the agencies to staff positions that can help non-profits restore trail infrastructure and use resources more effectively. Fund National Recreational Trails Program.

Commissioner – salmon recovery board – federal government is biggest problem – overstocked forests – instream flow concerns in meeting goals in Okanogan Co. Forest health is an issue. Litigation can hold up actions moving forward. Concern that any group across the US can comment hold. One entity able to stall progress

## Discussion Question 2

**Seattle, WA**

**(cont.)**

· people back to the land – how is this reconciled with roads management, and the removal of roads. Road closure shifts users. Little connection of people to and in the agency can be a can have with users. Access issues and users.

multi agency problem – not talking. Support a multi agency oversight group. No child left behind depends on interagency support and local groups – Scouts. Scouts special use permit not renewed. Sees discrimination in resources and permit process. Barriers to getting youth to the outdoors. Need to coordinate federal agencies with local groups. 4 million members – strong advocacy group.

“Silo effect” ....barriers to govt. agencies cooperating.

Educate people on the urban opportunities, time, access and knowledge.

Unable to offer program due to permit issues-appears to be an administrative problem, same problem with boy scouts.

Reclassified as an outfitter and can no longer take kids to Forest Service Areas

Lack of a united plan connecting federal agencies with the states, focusing on schools, municipalities, etc who are trying to connect people with nature.

More and more lands being closed to public use. NOVA funds—gas taxes on people who own snowmobiles, etc.—those taxes should be delivered back to agencies.

These funds from registrations is supposed to go to a fund to maintain snow parks, but that money has been taken away and given to general fund.

These areas are now closed down with the reasoning that there’s no money to maintain them. That’s frustrating.

He’s into trailriding—no money to maintain or fix this area—forcing overuse in other areas, and they say there’s too many people using this. Public access to land and monies being dedicated are being sent elsewhere.

support public learning activities that will encourage youth to experience National Parks. People from diverse backgrounds, new citizens are not experiencing the Parks. Need to reach out to those who are not familiar with local and national parks.

Mt. – Seattle – vested interest in the PNW, first come have interests that they don’t want to give up. Water rights issues – use or loose. Concern with limited resources

## Discussion Question 2

***Seattle, WA***

***(cont.)***

· memorial and cultural site to help adults/youth to think about actions not happening again. Looking for federal support.

Lack of general understanding that student learning is enhanced by learning in the outdoors.

Need full funding of the Historic Preservation Fund. There is a lack of focus in classrooms on history.

Land conservation organizations work well with landowners, but state agencies often feel it is their turf. We need the right scale of conversations with large landowners.

I work a very diverse school district, because of the focus on school testing there is no time to devote to outdoor recreation opportunities.

need to keep or waterways and lands safe so that they can continue to be enjoyed. Consider the Gulf of Mexico crisis. Enforce the regulations and implement those that will protect natural resource.

Portland – superfund site. Education is a challenge for all ages. Regulations inadequate, lack of enforcement, some stakeholders feel polluters and promoters are together, and that other voices not heard. Concern with water quality in Willamette River – containments. Polluters are self-monitoring. Need EPA to step up enforcement and supportive.

equal access to the outdoors – there are barriers – fees, education, adult users taking youth.

Accessibility issues. #1 Make the outdoors more accessible. No mention of special needs. No programs mentioned for youth and adults.

Agencies working with landowner need to not be regulatory in nature.

vol. for NP – youth education – need to figure out K-12 education- get into curriculum and out in the woods – interagency cooperation and local involvement early. Concern with having Mt. St. Helens under NPS – more funding and different emphasis than USFS. How can federal government cooperate between agencies, Not enough \$, everyone will need to Do more with less.

Sessions like this are the answer to these issues. People can discuss the issues openly in the public arena. A state law holds landowners harmless for recreation use of property.

– coordination between different agencies, especially in regards to water for salmon and other uses. TFW – water quality recovery plans – 10 years too long. Jurisdictional concerns. User conflicts with limited resources

## Discussion Question 2

**Seattle, WA**

**(cont.)**

Lack of full funding for Land and Water Conservation Fund. It has been underfunded for many years. Volunteers in Forest Act is dysfunctional as organized by the Forest Service. Liability is borne by individual National Forests which makes forest managers overly cautious, and cripples ability to work in the woods.

Schools are not engaged in educating kids on land management issues because there is a lack of unified curriculum. There are some from individual agencies, but not coordinated. We should elevate Environmental Science as a core class rather than an elective.

landscape scale – challenge between conservation and recreation, parks loved to death. Need to identify point where resource uses are at odds with each other. Need for communication – interest groups at the table. Goals may be at odds with one another, and the time it takes to work with the system to get to identify the point at odds.

youth and youth of color out to the forests and parks. Access issues and making areas welcoming to families – diversity in workforce – career goals. City parks program start for youth to get out to the forests and parks

so many agencies – compartmentalize, - land being bought up – how does this effect tax base, border – homeland security, role of federal government involving the local government. Don't see details being shared.

Publicize the lack of liability for homeowners for trespasses

Motorized access for recreation continues to be restricted. This is an issue for snow machines. \_\_\_\_...don't allow funding allocated for trail activities go back to general fund

raised money through vehicle tabs (state) that was re-appropriated to the general fund. Those funds show go back to expanding motorized access to public lands. Funding is a barrier to motorized access.

Land acquisition not equal to conservation. Can end up with unintended consequences. Concern with need to include a diverse group of recreation uses and work with the diverse groups. Need to make areas usable. Need to support facilities – ex. LO maintenance – one group wants to support it, others don't. Need to work with community. Make site enjoyable – have service in the service. Adventure series per park/forest. Barrier to use – permit process – ex. Film couldn't get permit to film in forest. Money to the field – had to ask for 6 times as much from Congress. Need to streamline the processes and participate locally. Need recreation plan for Forests – too long a time frame for planning process.

Access issue with roads and counties. One of few accesses to Olympic National Park has been washed out since 2001, and that was one of very few access roads that's handicap accessible.

Grizzly bear restoration: Fear of this wildlife—is it a deterrent?

## Discussion Question 2

***Seattle, WA***

***(cont.)***

RE: Private property owners: People are motivated to take good care of property and learn and understand better ways to manage property, but they are burdened with layers of regulation from federal to local levels, which impacts the usage of their land.

Thousands in permitting before they can even turn a shovel. Affects affordable housing. If people can't use their land, they eventually end up getting forced out a lot of times.

Older people whose savings are tied up in property lose this investment. Zoning issues. Puget Sound restoration: Is this going to be another layer of bureaucracy with property rights? That extends all the way to the Cascades, which makes it harder for people to use their property.

Use education to protect property rights.

In terms of adding to federal lands, in the West so much of it is already federal (1/3 of WA state, 85% of Nevada)

Big national financial crisis, and management of federal lands has suffered from inadequate funding.

Reports of billions of dollars in maintenance backlogs. If we add to those national lands, are those dollars going to get spread further and further, and not do a.

Outdoor education is hindered by high costs of food and transportation. Students are generally afraid of the outdoors. Experience is the answer.

Landscape conservation issue—ability to manage wildlife and access.

A few years ago in NW we had mass floods and it showed we have problems accessing our national parks. FS roads were wiped out.

Agencies unclear on whose responsibility it is.

There needs to be clarity about this.

Loosening about ERFO regulations to restore roads as they were previously.

Second concern is north cascades grizzly bear augmentation study. Fish and Wildlife Service dragging feet on this—what's the opposition to studying grizzly augmentation?

## Discussion Question 2

### *Seattle, WA*

*(cont.)*

PCT – volunteers out on trail – good partnerships, challenges – disconnect between National and local levels – National direction may be difficult to implement on the ground – ex. Liability – concern with injuries workmen’s comp – who pays, concern with risks and funding not there to cover. Funding availability, criteria and representations on panels.

Limiting motorized access limits many of the Baby Boom generation that is aging. “It is a disservice”. More tolerance for people with mobility issues

look at whole basin – several jurisdictions involved – one person can hold up actions, government has a large role in leadership

access fees can be an obstacle – parking at trailheads. Questions about fee use – admin and enforcement, want to see it invested back in trails. Lack of knowledge of fee, arrive at trailhead, back to facility to get pass – hassle, Need information on trail situation. Keep funding for trails.

Off road vehicle use in WA State and in country displaces hikers and equestrians from trails. People who seek peace and quiet will be driven away by people who make noise

Machines displace wildlife, impact soil and vegetation

Sedimentation into streams—these human impacts are important

Damage can last a long time

Messaging that comes from proponents of off-road vehicle proponents is a concern, Impacts should be considered

Needs to be better staffing to ensure following the law

Reiter Forest—state DNR land—off-road vehicles were damaging the forest

Maintenance of these lands takes money—this is a funding issue

Access to lands for high impact uses: There needs to be a linkage to deal with that usage in monitoring and enforcing

The land belongs to everybody—not just who happens to be on it at the moment

## Discussion Question 2

***Seattle, WA***

***(cont.)***

NOVA again—federal connection to what happens on federal lands is affected by state money

4x4 community recognized propensity of their own members—state commissioner reopened Reiter for motorized use

Views impacted by these vehicles, which are now allowed on gravel road: Message is that it will encourage illegal use

Has implications for other forest roads

Need to expand funding for motorized trail development as well.

Access for groups (non-profits) is limited by the regulations and permits required. Need to remove those barriers to kids back into the woods.

Water is also a key issue in this discussion. Bureau of Reclamation and the Corps of Engineers needs to have their authorities reviewed and need to be encouraged to embrace conservation.

Sky Valley Recreation and Planning? The liability that private landowners incur when they allow the public to access to their lands is a barrier to recreation. Consider the Moab, UT and Hatfield/McCoy Trail system model

Federal agencies need to be at the table with local governments – coordinate at the beginning of plans

- Process can a barrier - NEPA

If we could pay less taxes, we would have more time to recreate.

To use the resources requires multiple permits from multiple agencies.

Forest Service needs to devote more money to trail maintenance so that state can use money for other resources. Need to make sure to at least budget for basic maintenance and services

Too much of the budget spent on land acquisition – this money should be spent on recreation/resource facilities. Closing campsites and other reductions in maintenance is detrimental

## Discussion Question 2

***Seattle, WA***

***(cont.)***

Insufficient cooperation between agencies, e.g. road maintenance by Parks and Forest. Need better interagency coordination

Getting to the outdoors to recreate costs more money now, e.g. gas. Could there be reduced fees or subsidized costs based on income level?

Collaboration between agencies on reaching out to youth could be improved.

Budget cuts have limited infrastructure within agencies to coordinate youth and other volunteers to do the park and trail maintenance. We have more volunteers than money.

Lack of adequate resources for observation and monitoring for conservation.

Should be working with private landowners who know more about the land/resources to set conservation goals.

Federal, State and local agencies need to do better enforcement on public and private lands.

Single source-mandated funding is too limited.

Army Corps wetlands regulations get in the way of viable agriculture.

Federal and state regulations often are not appropriate to the use of the land. Landowners know best use of land.

Land use/recreation restrictions are unexplained, e.g. ORVs. ORV users contribute more to the resource budget and provide more money for trail maintenance, but are more limited in using the land.

Engaging youth: take opportunities to partner with schools, e.g. Students helping with water testing and monitoring.

Payment in lieu of taxes program: federal government payments to locals have lapsed, negatively impacting property taxes.

## Discussion Question 2

### *Spokane, WA*

Successful stewardship of the land requires a comprehensive strategy. Ecosystems rarely align perfectly with property boundaries on a map.

Tribal Nations exercise jurisdiction over tribal trust lands at the reservation level. Tribal lands were once vast and contiguous, but were reduced and fragmented over time due to myriad federal policies.

Congress passed the General Allotment Act in 1887, which led the "checkerboard" nature of many tribal reservations that exists today.

The General Allotment Act divided tribal land into 80 and 160-acre parcels for individual tribal members. The allotments to individuals were to be held in trust for the Indian owners for no more than 25 years, after which the owner would hold fee title to the land. Many of the allotments provided to Indian owners fell out of Indian ownership through tax foreclosures. Moreover, many allotments are now subject to "fractionated" ownership as a result of the intestate succession that occurred following the death of the original allottee.

This fractionation makes it incredibly difficult for tribes to include those lands in comprehensive land-use planning.

In addition to causing problems at the tribal level, land fractionation imposes a significant burden on the Department. An independent report commissioned by the Office of Special Trustee identified 4 million individual Indian interests in allotted lands. That report estimated that the Department's administrative cost for each individual interest was \$108. The total administrative cost to the Department associated with fractionation on tribal lands was \$432 million. A separate independent report projected that the growing rate of fractionation would cost the Department \$523 million by FY 2014, and \$1 billion by FY 2024 just to maintain its current level of administration. The report estimated that a \$2 billion investment in all of Indian Country over a period of 15 years could effectively eliminate the myriad problems associated with fractionation of Indian lands.

The precise location and description of culturally significant sites is a sensitive issue for tribal nations and their citizens, making it difficult to include many such sites in a public initiative. Moreover, many of these sites may be located outside of tribal lands. Federal agencies should work in consultation and collaboration with tribal leaders to ensure tribal access to, and preservation of, these sites to the greatest extent possible.

There are many tracts of non-trust federal lands adjacent to, or near, tribal lands. These lands vary from National Parks and National Forests to surplus military property. The management of these federal lands has a direct and substantial impact on the management of nearby tribal lands, and on nearby tribal communities. This is especially true where tribes have reserved the use and enjoyment of resources under a treaty with the United States.

The primary obstacle faced by tribes in their efforts to protect cultural and natural resources is insufficient funding to meet the needs.

## Discussion Question 2

### ***Spokane, WA***

***(cont.)***

Tribal governments often attempt to leverage federal funding to receive grants from other agencies and private organizations, but this creates an unpredictable situation.

Indian tribes will often supplement federal funding with their own tribal government revenues; however, for many tribes with abundant natural resources --those with large land-bases and/or located in remote areas -- tribal government revenues are scarce.

This lack of funding impedes the ability of tribal governments to recruit, hire, and retain qualified staff, and limits their ability to purchase equipment necessary to manage natural resources.

Another obstacle tribes face is inconsistent, and sometimes nonexistent, consultation by federal agencies where their actions impact cultural and natural resources within and near tribal lands. Consultation is especially important where government actions may impact cultural resources, such as sacred sites. The inconsistent application of consultation pursuant to the President's Executive Memorandum often places the burden on tribes to initiate, or expand the scope of, consultation.

There are a number of instances where tribes have reserved the right to hunt, fish, gather, and conduct other activities outside of tribal lands pursuant to a treaty with the United States. Protection of off-reservation treaty resources involves a collaborative effort between tribes, states, and the United States. In some cases, state natural resource agencies rely upon tribes to manage natural resources in treaty territories, even where tribes may lack the funding and human resources necessary to do so. In other cases, state agencies are uncooperative in facilitating tribal management of federally-protected treaty resources.

## Discussion Question 2

### ***Written & Online Comments***

Work towards efficiency maximization by making all land management plans available online so that agencies, state, local, and federal governments, and private sector entities can view ongoing projects and coordinate efforts. Currently too much unnecessary

In reaching out to minority groups and youth, it is extremely important to be able to relate to their situations and experiences -- most programs that attempt to connect with youth and minorities really fail to understand those populations, which makes

Make state governments equal to federal government in planning process. Agencies have to train together if they're working on the same projects; current system has all agencies training separately, which doesn't make any sense

Consider urban environment

Wilderness society: working at the right scale/letting people see themselves -- allows buy-in of shared and different values. Connections can be seen. Too small scale can be difficult

Youth: make connecting with nature and the outdoors a priority when they're young

Get the private sector involved in these initiatives; coordinate agencies and groups on different projects to increase efficient use of time and resources

Family legacy is a key component to consider when conducting outreach; hard to talk about youth without talking about parents. The nature of environmental stewardship is a multi-generational concept so we should try to get families involved in activities;

Communities of color: veer from traditional vols., long term mentoring -- start young, grade school, recruit teens as teachers/mentors, conservation big brothers/big sisters, encourage higher education -- getting children of color into sciences, not a sho

Transportation: NPS/other agencies could provide buses, require states to create envt. Literacy campaign/curricula; nature bridge -- public/private partnership, 40,000 children/year, continuum of care to involve children in the outdoors, keep listening --

Make principals of conservation less esoteric -- connect all principals

Concerns with overgrazing (increasing elk population). Concerns regarding: buccillois to Cattle Agency with responsibility?

piggyback where collaborations are happening and bridge natural resources, rural America is losing economic battle -- they are losing jobs and not reaping the benefits of conservation, conservation is costly and they don't get the results

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Federal government has lack of real relationships -- system is hierarchical and transient, fed government is everywhere but nowhere, federal structures need to engage local groups and people more steadily

Transportation to get youth involved - major issue in urban areas

Federal grants don't reach small, non-profits

Use social media - meet young people where they are; people-to-people interaction; cultivate "real" relationships

Lack of scientific understanding of nutrient dynamics in agro and urban ecosystems on watershed and landscape scales.

Failure of a large portion of the electorate and many corporate leaders and politicians to understand the vital connection between health, landscapes and their own well-being and the Nation's well-being.

Climate change; getting kids outdoors; protecting special places; encouraging volunteerism; actively engaging all ages

Clearly there are thousands of projects ready to get young people involved directly with the outdoors. The Appalachian Mountain Club alone would have many projects up and down that could get kids to work on trails - trails that are close to home e.g. near major cities but also in more rural remote regions. Some kind of civilian conservation corps - or re-civilization would be good. But working with partners rather than creating a stand alone project so partner agencies can hold on to these young people and have them become life long advocates for the outdoors. Fully fund LWCF as a key funding source. As suggested have secretaries work across agency lines. Help support private landowners that provide access and recreation opportunities in their lands - e.g. Northern Maine where the majority of the land is privately owned.

Habitat degradation, fragmentation & loss. Need for additional dedicated funding for state fish & wildlife agencies to meet growing issues & mandates. Disconnection of the American public from the "great outdoors"

State Wildlife Action plans, national fish habitat action plan, among others, offer that analyses threat analysis and strategies to deal with habitat loss. Get the voluntary public access program up and running

The impact of recreation on the land and economic impact to local communities

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Funding for private land conservation. Estate taxes. Generational succession of landowners.

Collaboration, funding, allowing third parties to hold conservation easements from all funding sources (including LWCP). Incentives for landowners to be part of the solution.

There are many, many problems of course but to me our biggest challenge is to preserve and restore enough wilderness, open space, and other networks of protected lands to provide for the needs of plants and wildlife in the age of climate change.

Loss of forests

The kick off film says America is "80% urban." That is incorrect. The nation is 80% metropolitan. (60% suburban and 20% urban). You can't conflate those into 80% urban. Very misleading. It undermines those of us living outside the metropolitan areas, but just as importantly in a country where suburbs are resource rich, it undermines our cities and their needs.

Pine Beetle infestation in the west. Lack of Youth participation in Outdoor activities- Conservation

Funding , sprawl, habitat loss, pollution, nature deficit disorder(s), water quality, connectivity, highly stimulating entertainment (computers, media, etc.)

Lack of resources to address the urgent, now-or-never conservation opportunities now facing us.

Loss of critical wildlife habitat, migration corridors, etc. A specific example.. The native prairies. It's also a piece of Americana.

Underfunding is a persistent problem. Having the environment viewed as an impediment to economic interests must be overcome.

The lack of close to home outdoor recreation venues available to youth, especially in and/or close to urban areas

New funding-forest legacy + NAWCA have been outstanding. They should be expanded and used as models. LWCF should be fully funded using additional fees on oil + gas development. These two programs do more to leverage funded dollars than any other.

Global weather change. Polluted water. Pesticides misuse. Endangered Species-Critical habitat

Face them-all of them-vigorously with sound science-use more collective time together effectively day by day-precious time

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Improving the scientific basis for environmental decision-making is one the most critical challenges facing our nation today.

Climate change, loss of biodiversity, open space preservation, water conservation

As the Executive Director of Greening Youth Foundation, a cooperative agreement holder with National Park Service, one thing that I see that is needed is access to fellowship opportunities with the various agencies within the DOI. A fellowship program would be the next logical step for grassroots conservation organizations to connect underserved young adults to conservation careers.

Please continue to have active forums in which we can engage and collaborate with one another. We need to be a support system for each other. Please include Gullah/Leeches as "tribal leaders" and a resource for traditional knowledge. We are willing to work on interpretive pieces that will help "bring to life" the areas we are here to protect and conserve.

How do we do landscape-scale conservation that spans public, private, non-profit and tribal land to address measurable conservation objectives (biodiversity/ecosystem services/ certifiable commodity production/amenities)?

Full and dedicated funding for LWCF with an equal share of the stateside program

Too much emphasis on iconic landscapes - not enough on local or regional; such as Midwest - protect special areas and restore what's been lost - water quality, habitat, climate change. Fragmentation of landscape. Competing goals - biofuels production v. water quality v. habitat.

Young People are detached from nature. Lack of incentives for private landowners.

Conservation of private lands particularly in the eastern U.S.; Climate change

Sprawl development that impacts open space and working landscapes. Loss of wildlife habitat and overall disconnect with nature

1) culture of disconnect where families have no history with the land; and the land in the cities does not speak for itself but rather for crime, pollutions and disinvestment 2) dollars

More dollars... non traditional such as tax credits and cross funding (like ISTEAs enhancement). More coordination and interdisciplinary outreach among agencies. Before you start new programs look at what is out there and think about how to join, several, deepen and fund partnerships

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We need to get kids off the couch and get them outdoors. We need to protect public lands from external threats (including invasive species)

Innovative outreach-take nature & activities to kids & encourage them to get outdoors after introducing them to the outdoors. In Missouri, our WOW- Wonders Of Wildlife program has been very successful at getting families together outdoors. Our State Park youth corps will introduce a new generation to the outdoors this year.

Increasing population with its appurtenant uses. All of which affect the availability land quality of water, wildlife habitat, and land use.

As our private forests, farms, and ranches face additional challenges associated with a changing climate and a growing need for public benefits to serve an increasing population, they also face growing economic pressures as the land they manage for a combination of conservation and economic benefits becomes less economically competitive.

a lost generation of conservations, inadequate spokespersons, conservation myopia, too many people assuming that the personal experience they had that engaged them in the outdoors applies to everyone

One significant challenge is bringing together, on a local level across the nation, the diverse stakeholders, who can make a true on-the-ground difference to create a shared vision for the future. A vision that reflects and respects the local cultural history and promotes economic development while being sustainable and beneficial to future generations.

Conservation is facing a new paradigm with climate change. With a changing system we can no longer simply conserve lands and waters, but manage toward a new equilibrium that is currently only based on models.

Use this initiative to create a national crusade for conservation that provides a clear and compelling vision, that uses Bill Crown's? Language around the "conservation of shared values" that elevates conservation around the concept of commonality and community and that provides both tax incentives to individuals and financial incentives to communities to actively implement the conservation agenda.

Your leadership on these matters is critical. Thank you, I urge you to continue, to be courageous and risk failure, to embrace landscape-scale initiatives of the Great Regional level, and to know there is a great, natural thirst for re-birth of the values you are promoting-landscape scale, innovative, collaborations. Thank you very much.

Big corporate interests who profits seem to rule over the concerns, livelihoods and interests of the rest of us.

Lack of economic incentives for land protection. Need for green jobs programs

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

All of the polls show that most Americans feel that we can not effectively address climate change. As well, they are pessimistic about how well Carson, the Administration, and other government institutions can address our problems.

Many strategies need to be deployed. But one central strategy is to show examples of success. Give the public hope that we can succeed. National Parks are the best places to demonstrate and communicate successful strategies to respond to climate change.

Great Lakes-Water Preservation. Open Space preservation-climate control adaptation. Leap frog development

GIV-Preserving greenways/blueways-Conservation design planning.

Need to fully fund and program urban national parks such as Gateway NRA and help fund city, county, and state efforts to get kids outdoors, learning and exercising, with federal grants for facilities and programs.

Challenge: make the American people full partners in conservation, stewardship + enjoyment of their public + private resources. Conservation= with and for the American people.

Loss of quantity and quality of habitat and natural spaces (rural and urban)

1. Landscape approach to connect communities, economy, and people to places; 2. Outdoor programming - CCC, AmeriCorps, new federal leadership, & environment. Edu.

Continued loss of working farms and natural lands. Loss of food production around urban areas

Federal Estate Tax deferral for working farms and land of conservation value. Permanent Conservation easement tax incentives for farmers

Failure to make better land use decisions, which has created a whole host of environmental, economic, and social dysfunctions. Failure to invest in natural and build infrastructure in existing communities

Land conservation incentives for private lands. Reinvestment in urban infrastructure, particularly transit and storm water. Major investment in metropolitan energy efficiency.

In our city of Pittsburgh, a rustbeet distressed municipality, taking care of the existing 175 park facilities with excellence and finding the money to do this is our biggest challenge. Our private non-profit group is 14 years old and has raised almost \$50 million.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Balancing the need to make access to our resources easier with preserving and protecting these resources. Educating parents and individuals on the benefits of outdoor activities. Parents just don't know how to inspire their kids to take advantage of these resources. I can't stress strongly enough the need to provide local outdoor opportunities within 30 minutes of every children's life and the need to reeducate parents on the benefits and "how to" of outdoor pursuits. camping, fishing, hiking, biking, etc. There is a lost generation of parents who have not been exposed to the outdoors, they cannot be expected to teach their children, what they themselves do not know. they need the tools + resources. Parents will always be the mentors for outdoor activities. We can't replace them.

We have a lot of good programs but we need a coordinated focus by all agencies on youth and educating their parents on outdoor activities "how to" "where to"

More urban parks, less dead malls. [www.redfieldstogreenfields.org](http://www.redfieldstogreenfields.org). [www.moreparks.org](http://www.moreparks.org)

Climate Change and land preservation

Reconnecting youth to America's outdoors and their hunting heritage. Providing increased access to existing public lands. Reform ESA. In its lifetime it has evolved into a tool to block too many things; i.e. states rights to manage wolves. Increased funding for LWCF.

Too many dead malls & outdated factories

"TALK, PPIC, or FDIC" like fund to help finance purchase of bad commercial real estate for new urban parks

A disconnect between Americans, especially children and communities of color, with the great outdoors. People need a sense of place/ownership to appreciate wilderness + nature to serve as future stewards. Climate change- fragmentation.

Nutrient enrichment of waters, from Ag non-point sources

The most important challenge is that most people live in cities and don't have enough opportunities for access or engagement with the outdoors. In particular, young people are missing opportunities to shape their values based on experiences outdoors and relevant to their lives. Combined with sprawling, unplanned development, this problem will only get worse unless steps are taken quickly.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Loss of wild lands and wildlife habitat decline and fragmentation, worsened by the impacts of climate change and invasive species, disease. Need assurance in thinking and attitude by Americans that wild lands are our natural wealth that should not be squandered and abused. Must develop effective and valid/respected mechanisms

Loss of wild lands and wildlife habitat decline and fragmentation, worsened by the impacts of climate change and invasive species, disease. Need assurance in thinking and attitude by Americans that wildlands are our natural wealth that should not be squandered and abused. Must develop effective and valid/respected mechanisms

To expand support we must maintain the legitimacy of already preserved landscapes. An ongoing program for the acquisition of private holdings from willing servers within designated protected areas, such as wilderness, is vital to opening legitimacy.

The forest of the Northern Appalachians, stretching from New York to Nova Scotia is one of the largest, relatively un-fragmented, temperate forests in the world. (80 million acres) protecting and connecting this Eastern wilderness should be a DOI priority.

Climate change. Lack of full appreciation of the value of wild lands.

Invasive Species are one of America's greatest threats on conserving our great outdoors.

Education is a proven method to slow the invasion. President Obama should consider an Executive Order to stop the spread on all Federal Lands

Increasing minimum impact access opportunities for children and families.

Strategies: have wilderness protection and wildlife corridors -- be part of Great Outdoors Initiative. We cannot be bullied by the radical right. The majority of Americans find their own sense of democracy tied to the land. We need to honor the vision: like Stewart Udall as a great visionary and Secretary of Interior who honored conservation as a bipartisan concern.

An over abundance of predators are causing significant declines in game herds out west. This reduces hunter opportunity, millions in conservation dollars via lost license sales and loss of jobs and rural economies. An exponential problem.

1) trust in the federal land managers 2) climate change, wildfire, water scarcity, insect and disease 3) Loss of conservation skills in Rural America 4) Increasing poverty in rural America, especially adjacent to public lands

Loss of habitat, Money, Science

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Great American Outdoors Initiative. The LCC effort to provide GIS and science and huge partnerships to leverage \$. You are on the right track. Find money.

Ask more of for-profit businesses to better work together and how we can be of better use in conservation. Our goal is to get 6 M kids into the great outdoors through multiple partnerships.

Want to thank \_\_\_\_\_ for working so hard towards conservation. Take away our gratitude.

Land and water conservation fund needs permanent funding. Better distribution of funding and flexibility to apply the funding better. When energy bills are passed, we need that profit to be reinvested into conservation programs and projects.

Drakes estero. Pastoral and wilderness zones must be protected. Oystery owner wants the permit to expire to push a commercial operation and we do not want the permit to expire.

Motorized vehicle users are unfairly victimized because people believe we detract from conservation. We use it to get our families outdoors and means of transportation for those who are disabled. Brings economic viability to forests and deserts. Gets kids outdoors.

We need a better financial investment in getting kids to the outdoors

Private lands conservation must be an important part of protecting the working landscape. Want to participate in grants.

Need better management in the delta area. The future of the delta lies in education and we want to play a role in designed future plans for the delta.

Keep permitting access to public lands and support the multiple-use concept. All public lands should be available to our citizens with no limitations.

Fishing is 3rd most popular outdoor activity in the US. Fishing licenses dropped a few years ago. Our foundation gets funding from federal govt to support increase in fishing. Anglers Legacy Program pushes everyone (parents, teachers, etc) to take kids fishing to get them interested. We want to work with federal govt and states to get more kids out fishing. Lets join forces. We need more fish in rivers and streams as well.

Need more accessibility of open space for kids. Better balance of property rights in the berryessa snow mountain range for more access to kids.

More easements needed to better protect the environment.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We want to encourage you to make your programs more accessible for youth on public lands projects.

Currently working on water systems in regards to Eurasian mussels. Water infestation in lake meade and lake havisu. Must address more containment on invasive species. Will help habitat by federal govt taking a more proactive role in containment.

Opposition to berryessa snow mountain designation. Fosters poaching and trespassing. It is already protected and this designation only has a negative impact.

Supports land and water conservation fund. Needs to ensure that it is fully funded. • Establish a national pool for national insurance emergency fund.

Bring oaks back into the landscape. Plant them more along roads. They will create better habitat for insect and birds.

Pay attention to grassroots efforts to protect maculany river. Sacred agricultural sites. Value to wildlife. We need to better protect it.

We need more bicycle access and safer trails. More kids and women will get out and bike if we have better infrastructure (Amtrak should allow bringing bicycles onboard to be easier) to get people to the wilderness on their bikes and ensure that the trails are safe.

Challenge to get people to know about conservation lands. No clear policy directive for BLM to manage more consistent national landscape.

Need better corridors for motorized vehicles to avoid wildlife.

We support sustainable private lands. Need more partnerships with federal govt for better private ownership landscapes. Estate tax reform needs more support.

Need to protect fisheries for bass and trout. • DC must provide encouragement to replace unnatural community lighting to enhance the night sky.

Need more environmental education to get more kids outside. Federal grant program needed to support more environmental education around the US. Need more transportation to get more kids outside – more buses.

Must employ more inner city, at risk youth. Get them out of their communities and into the outdoors. Support more paid work opportunities.

We need to better support land trust organizations. They protect ag lands, waterways, etc. You must allow land trusts to hold conservation easements.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

National wildlife refuges need to be less isolated. From the sacramento river to the coast range the refuges need to be more accessible.

3M people participate in our group. MOUs with BLM and others allow us to do projects on forest and public lands. We work to build more sustainable trails. We protect wide open spaces. We need more trail upkeep. Increase in mountain biking supports more kids getting out into the outdoors. Need more money for trail upkeep too. King Range supported by Thompson – thanks.

F-Prioritize and fund outdoor service learning opportunities in schools followed by opportunities for youth training programs after graduation that offer EQUAL scholarship opportunities similar to the military GI bill.

G-Providing local opportunities for outdoor jobs and careers (growing your own food, A community initiative to restore and renew vacant lots, use local building and construction companies, community grants etc.)

B-Campus recruiting for environmental jobs at career fairs, etc. - making jobs more accessible, desirable, and cool. Going out and engaging youth - not just being there - really working to connect

C-Funding for more accessible afterschool outdoors programs from private (like North Face) and public (education + park & recreation) partnerships.

I-Get the government out to clean up the toxic waste so we can provide safe and clean spaces for the outdoors - clean it up for the people there - environmental justice.

F-More youth should be involved, events in the morning planning it (9-12) except - not on Sunday mornings, because people have family obligations.

H-Lack of parental and school promotion of the outdoors with their kids.

L-Lack of family influence and awareness about the outdoors.

E-Electronic entertainment such as computers, videogames, television etc. Too much focus on technology why go outside" "the inside is so comfy".

D-Lack of exposure, resources, awareness, fun and adventure family and community support to get outdoors.

A-Negative ideas surrounding the outdoors as dangerous cultural impressions of the outdoors can impede recreation

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

C-Misinformed perceptions including safety hazards, access, and lack of perceived value in the outdoor experience and lack of health benefits.

I-Urban environments don't help to encourage parents to let their children outside - safety and availability.

B-Lack of information between what to do, where to go and how to be safe.

J-Lack of a perceived benefit and exposure to being outdoors.

F-The way media defines and portrays the outdoors, creates a preconceived notion of danger, separation, the dichotomy of extreme adventure and underestimating activity, and the lack of an accessible medium.

G-Lack of outdoor role models/mentors (i.e. a celebrity for role models).

F-I would like to gain new skills in outdoor recreation (pitching a tent, starting a fire, identifying plants and animals, etc.) but are not sure how.

I-People who live in urban areas care less about the environment/conservation than people living in rural areas.

A-I would recreate outdoors (bike, hike, run, swim, fish, hunt, rock climb) but there aren't any places within 3 miles of my home or apartment to do them.

Young people today are more interested in their technology and "X-Boxes" than the outdoors.

Outdoor classes a requirement in schools and make sure that after school programs are funded well enough to be accessible to all kids.

Pass legislation for environmental education (this is a current bill in congress) pass environmental literacy plans to implement environmental education nation-wide.

Have environmental education part of the curriculum at schools and make outdoor time as well as hands on outdoor classes mandatory.

Lack of parental and school promotion of the outdoors with their kids.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Lack of family influence and awareness about the outdoors.

Electronic entertainment such as computers, videogames, television etc. Too much focus on technology "why go outside" "the inside is so comfy".

Bring nature back to the city - urban/nature are two separate things - perception. This creates a problem and nature becomes less accessible for all people and requires resources people don't have and can't afford.

Providing local opportunities for outdoor jobs and careers (growing your own food, A community initiative to restore and renew vacant lots, use local building and construction companies, community grants etc.)

Promote safer parks with free events and youth programs, have schools partner with the youth programs to get kids outdoors.

Create natural play areas in structured environments such as schools.

Partner with universities to provide internship credits for students who help educate, provide recreation experiences, mentor the youth on outdoor issues.

Create an outdoor ambassador internship that provides training and encourages teachers to incorporate the outdoors into the curriculum within their school.

Create and promote free family outdoor events where they can get active outdoors and obtain free local outdoor experiences.

Creating a political platform that focuses on outdoor experiential education curriculum requirements for schools.

We must create a social norm that moves away from electronic companionship and moves toward outdoor experiences that inherently fulfill youth's physical, mental, and spiritual needs.

Find and foster role-modeling relationships (mentors) that involve the outdoors in communities.

Incorporate the outdoors into standard curriculums through field trips & life skills.

Funding for more accessible afterschool outdoors programs from private (like North Face) and public (education + park & recreation) partnerships.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Advocate with dept of education & bigger organizations to get funding for Environmental and Outdoor Education programs in schools/classes and provide scholarships to get people involved in the programs. (ie: afterschool programs).

Get the government out to clean up the toxic waste so we can provide safe and clean spaces for the outdoors - clean it up for the people there - environmental justice.

Holding free and safe outdoor events at schools in communities to get neighbors outside.

Create safe, green spaces for kids and families to exercise and grow their own food within their communities by inspiring and supporting local outdoor leaders and sustaining those positions by offering internships/jobs/money/support.

Safer and easier access to parks, fitness opportunities, and outlets.

Website and cell phone initiatives. Outdoor Volunteer website paired with non profits. Phone - take cell phone pictures of areas that can use a project and send it to local agency that supports the above website

Mineralogical societies

Represent "rockhounds"

Multiple use concept

Conservation and recreation are compatible and desirable

Use is not abuse

Conservation priorities

Delta region is endangered

High unemployment rates for young adults, esp people of color

## Discussion Question 2

Night sky is a resource

Encourage towns to replace modern streetlights to allow people to see night sky

Stebbins Cold Canyon

Fully fund land and water conservation funds

USFS establish national pool for volunteer liability insurance

Needed to help promote volunteerism

Growing population puts demands on resources need to limit population growth

Threatened plants in the area

NWR's need to be less isolated

Need more connectivity

How to connect Sac River via refuges to coast range to enhance value

Invasive quagga and zebra mussels

Sources of infestation are Federal jurisdiction waters

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

we must remember that, in addition to protecting our outdoors spaces for the next generation, we all must also share in the job of encouraging our young people to develop their own relationships with nature, and to inspire them to take up their own banner of protecting and preserving the land they will someday inherit.

we live in a world where too many young people often have no opportunity to experience the joys of our natural world. The unfortunate reality is that, for these young people, video games and indoor activities are common practice and there is no bond with the rhythms of nature. The result is a generation that lacks this important connection. Children and families need natural areas within easy reach of our cities. The Rio Grande Nature Center or a neighborhood park, a special place like Tingley Beach or the river or the bosque - some accessible natural environment that provides that crucial connection.

Non-point pollutants focused on quality/health environment

Engage the entire family, connect with kids at a younger age, kids with parents, don't assume you know what is best

Engage volunteers to work and adopt trail sections

Loss of public lands funding to support infrastructure - "Green Zing" (green experience online)

Opportunities for information exchange; where do you get federal funding?

In reaching out to minority groups and youth, it is extremely important to be able to relate to their situations and experiences -- most programs that attempt to connect with youth and minorities really fail to understand those populations, which makes them less likely to participate in similar events in the future

Environmental education -- people are not aware of opportunities around home -- take information to the people. If people don't understand their own environment, they likely will not care about a distance environment

Change the language that we use to talk about youth, remove artificial barriers

Landscape scape conservation - knit together landscapes

Restore large wetland complex

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

don't wait 100+ years to have this type of discussion, trickle down from event, put spotlight of partners, volunteers

Parents don't know how to camp, state program to show parents how to camp so they can take their kids

Foster conversations between wildlife, environmental, private property

Technical assistance/best management practices

Children need environmental literacy

Some degree of land restriction is positive -- there can be negative consequences to opening access to all lands

Extremely important to know the historical context and where we fit into it today

Legacy of stewardship through generations. Have to talk about parents and youth together

Kinds are overprogrammed -- need for a resume by 16 years old

No public transportation, no affordable transportation, entrance fees

Rangers bore kids to death. Need to be cooperative work -- rangers come to communities

The opportunity to connect with the outdoors is not available for many people; accessibility

Most organizations don't have enough funding to expand their activities to help facilitate the goals of AGO

Very few entry level positions in conservation related fields exist due to lack of funding; creates a barrier to the involvement of younger demographic

Lack of agricultural connection to land at family level; success --> guest ranches, wildlife training during recreation/fun

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Bankers under 35 want clean technology conservation and want to see these initiatives make money, encourage great leaders to promote these things in the economy

2008 Farm Bill -- socially disadvantaged farmers formed an alliance and made sure that conservation came back to communities with 30% advanced pay that was advanced to people/groups who could not afford to start conservation efforts on their own

Don't compete with programs that are already doing good things -- just because federal government doesn't know about it, doesn't mean it's not a good program

Conservation and stewardship hampered by partisanship - tax credits needed

Lack of research on experience changes behavior

Engage people in such a way that they understand and believe they can do something about conservation - connect via pride in the outdoors

Dedicated funding for this purpose, whether LWCF or otherwise, is critical for states to conserve land and continue connecting growing populations to the outdoors. Stateside LWCF funding has been substantially reduced over the past 5-10 years and general taxpayer funding has been reduced substantially for the Colorado Division of Parks and Outdoor Recreation, which has reduced our capacities to meet needs in these areas. Conservation and recreation can be odd at times. However, outdoor recreation is the conduit by which we connect current and future generations connect to the outdoors, and quality natural settings are necessary if we are to conduct these activities. Conservation and outdoor recreation partners need to continue to work together to further shared goals. We need more coordination and collaboration between federal & state agencies, and local governments and other outdoor recreation and conservation stakeholders. Institutional barriers need to be broken down so all parties can be on the same page. Additional outdoor recreation planning expertise integrated within all levels of land use planning will also ensure that more connections to the outdoors are available for the public to enjoy and benefit from.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

What We Glean from the Ag Census Data. When most people think of agriculture in New York State, they think of “upstate”, not the Hudson Valley, which long has been subjected to intense development pressure from commuters and second home owners. But in fact, according to the Census of Agriculture, in 2007 there were 848,214 acres of farmland in the Hudson Valley. That is equivalent to more than 1,300 square miles of land. This is an extraordinary resource, especially in light of its proximity to New York City. 17% of the land in the region is farmland – again an impressive figure given that the percentage for the entire state was 24. Collectively, the Valley’s farms had sales of \$510,322,000 – more than one-half billion dollars. Think of the impact of this money recirculating in the local and regional economy – and the negative impact if it were to be lost. Yet until very recently agriculture has been the “invisible economy” - overlooked in the context of economic development efforts that sought the “silver bullet” of new industrial development. Meanwhile, these farmers – critical small businesspeople – struggled to receive the support that they need and deserve from economic development and related agencies.

Now for the sobering side of this story: the average net cash income for the Valley’s farmers was \$13,624. That is only 42% of the NY State average net cash farm income of \$32,533. This reflects many things, including the high costs of doing business in a metropolitan region. Clearly this is not sustainable without a family member working off the farm or other sources of income.

The continuing loss of farmland, at a time when the importance of fresh locally produced food is becoming increasingly apparent as a matter of public health and food security, indicates the need to take action on every level to support the economic viability of the region’s farmers.

Our understanding of the importance of local community engagement was confirmed recently by a study undertaken by land use attorney Joel Russell. Over the years Mr. Russell has helped several towns in the Valley design zoning intended to encourage agriculture. Last year he undertook an assessment of which of these efforts had been effective and why. He concluded that farmland protection zoning by itself is never sufficient to preserve farmland. Instead, he found that communities with successful farmland protection programs have a distinctive culture, in which farming, farmers, and farmland are valued for their own sake, and not just for scenic value or as a way to prevent residential or commercial development.

Mr. Russell’s conclusion buttresses the results of a study Glynwood undertook in conjunction with the analysis of the 2002 Agricultural Census Data for the Valley. We found that “ ...other areas of the country that have been working to strengthen their regional food systems have found that it is important to develop a widespread, fundamental and passionate belief that agriculture must be part of the region’s future. This belief galvanizes the community and policy makers to support agriculture and gives the farmers the confidence they need to persevere.”

As explained above, the Hudson Valley is characterized by many dispersed, small and mid-size farmers. Over the past several decades, as much of the nation’s agricultural economy has shifted toward consolidation and commodity production, the network of small-scale processing and distribution infrastructure on which smaller, independent farmers depend has seriously frayed. As a result, it has become increasingly difficult for many farmers to reach markets efficiently, which discourages optimal production and reduces farm viability.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

For example, the Valley grows good grass and is a good place for pasturing livestock. The market for meat from pastured animals is very strong and growing, as more consumers understand its health and environmental benefits. But it is hard for producers to reach this market because there are too few USDA licensed slaughterhouses nearby. Glynwood's farm manager must schedule appointments 9 to 12 months in advance, often for only one or two steer at a time, then travel 150 miles round trip first to deliver the animals, then to pick up the meat. This certainly contributes to the fact that high quality meat from regional farmers is much higher priced than meat from the industrial system. It also reduces the amount of regional meat that is produced. A recent study in Massachusetts, in a region quite similar to the Hudson Valley, found that nearly 60% of the farmers who responded to their survey projected increases in the number of animals they would bring for slaughter and processing with "better access to a reliable USDA-inspected facility". Between 45 and 80% of the farms who responded (depending on the species) indicated that they would expand their capacity and these increases would result in production per species for most farms more than doubling.<sup>4</sup> Our less formal survey of producers in the Hudson Valley suggested a similar pent up opportunity for increased production of pastured livestock

However, to help set the stage for these young people (or others who are transitioning into farming as a career) to be successful over the long haul, we must begin to provide a more comprehensive training and mentoring program. Glynwood and our colleagues at the Stone Barns Center for Food and Agriculture are collaborating on the development of a new farmer training curriculum that will be launched in stages beginning this winter. It will be a serious, though initially limited, response to a growing need and opportunity. We view it as an extension of the work that both organizations are currently doing to support the CRAFT (Collaborative Regional Alliance for Farmer Training) program in the region. With more resources, a more comprehensive program could – and we hope will - be developed.

Another barrier for access for new farmers is the high cost of farmland, which can range up to \$10,000 per acre. However, there are increasing numbers of people who have purchased former farmland as a second home who are now interested in having it farmed. But they don't know how to determine what their land is suited for or identify a farmer and establish a long-term relationship. Glynwood has worked with some of these owners and understands their needs. Land trusts also know many of the owners who are interested in having their land farmed. But there is no overall training program that 'graduates' new entry farmers who we know have the skills to successfully begin farming this land.

## Discussion Question 2

***(cont.)***

Yet agriculture in the Valley is profoundly different from the type of agriculture on which the federal government has focused its attention and financial support in past decades. The “get big or get out” mantra did not suit this region and never will. The farmers of this landscape – producing environmental and economic benefits while they produce the food we need – are small and mid-size farmers, many with very diverse production. If the USDA is to be a more effective partner for them and for this region it must find ways to support and encourage this type and scale of farming. What it accomplishes in doing so can be replicated where this type of farming still exists near other major metropolitan centers as well, with profound and lasting impacts

Farmers in the Hudson Valley often feel that government agencies at all level, including the federal, do not respect their importance to the local economy or the potential they hold to strengthen the food system in the metropolitan area. Yet it is hard to make the case for their importance because the best data we have is from the Ag Census. And while it is extremely useful - as evidenced above, we use it to the fullest extent possible - it does not adequately capture detailed information about the kind of farming we have in this region: small and mid-size farmers with mixed production. So we don't have enough clarity in the data as it applies to our smaller, diversified farmers who are making a living at farming.

For example, farmers often indicate their frustration with government sponsored credit and insurance programs. While there may be funding available, the application processes are often onerous and seem overly complicated, likely reflecting the fact that the funds which are critically needed by these farmers are far less than the amounts generally sought through these programs, larger sums that may appropriately require more paperwork

the Ag Census data has some limitations. Agriculture is the “invisible economy” – the money farmers spend on locally available services and supplies can have a major impact on the local community. One informal survey that we conducted in the Hudson Valley showed that \$1.25 million of the local farmers' expenses was spent right there in that community. It was an eye-opening discovery. How about asking them where they spent it? Even a general percentage of dollars spent within the region would give us a powerful sense of the strong role that farmers play in our local economies.

The new inclusion in 2007 of farm typologies took a step in the right direction by correlating things like farm sales and the primary occupation of the farmer. It shows us how many farms are being operated by someone with another career, vs. farmers who rely on farming for their livelihood, and their general level of sales. We need to have more information related to this kind of scheme. We need to be able to filter information by typology, but also show what farmers in each typology category are producing, what they're spending, how big their farms are, etc.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Census uses industrial classification codes to categorize farms according to their principal production. However, many of our farmers in the Hudson Valley practice diversified agriculture – meaning, a combination of things at once. This may provide a way to diversify income, spread risk and/or try to develop new products. But if a farm has sales split across a few different sectors (vegetables, poultry, and goats for example) they are classified in the catchall “Other” categories. We suggest that the USDA consider adding some greater specificity so that the Census could better illustrate the vital role of diversified agriculture.

2. Providing incentives, investments and policies to support the strategic conservation of working forest landscapes.

a. I believe the biggest thing that could be done here is to abolish the death (AKA estate) tax. Most American farms and forests are owned by private families. Due to inflation, the nominal value of the land continues to rise thus forcing owners into ever higher levels of taxation where it becomes increasingly necessary to sell off acreage in order to pay the estate taxes. This is counter productive to long term conservation of working forest landscapes.

After indicating I would come to the Grappone Conference Center in New Hampshire I now find my schedule will not allow me to do so. Hence my written comments are below. I have briefly commented on the five breakout group sessions. I trust that you have the ability to see that these comments get into the record?

1. Promoting markets for wood products etc.

a. I believe the Federal EPA has made a grave mistake in their final PSD tailoring rule which treats biogenic Co2 the same as fossil fuel Co2 emissions. This will have the negative effect of ruling out biomass as a fuel source for electrical generation or combined heat and power. Reconsideration of this rule could go a long way in incentivising more investment/jobs in the forest products sector. As it now stands the EPA ruling only hurts working forests. Better to do nothing than to do those things that hurt American working forests.

I am opposed to the idea of "working forests." I want forests to be allowed to regenerate naturally, and I don't want for them to be managed like crops.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am writing in regards to the "America's Great Outdoors Initiative" and the Concord, New Hampshire public listening session on "working forests."

Overpopulation of this country is a problem that our national parks, forests and wetlands should not have to endure. There are VERY few virgin timber stands left in America, we logged the American Chestnut to extinction as its numbers were not great enough that it could rebound from the blight imported to this country. As I am certain you are aware, you MUST protect this country as best as you can, I am POSITIVE that you are being met with great opposition - if your intent is to have the national forests be more accessible to visitors while protecting their splendor, I urge you to spell it out clearly. Hunters, hikers, campers, and non-motorized horse, dog sled and bikers should be welcomed into the lands, however, industry should not. The mountains in eastern KY are being destroyed at an alarming rate, these are not WORKING mountains any more, they are vanishing. BE SURE this does NOT HAPPEN TO OUR FORESTS!

Recognize that broad eco-systems are at stake and must be addressed beyond any particular state's preferences. The red rain that falls on the denver area and covers cars, houses, and my expensive photovoltaic solar panels so that the sun can no longer reach them originates in abusive "historic" land practices---read over-grazing---in the Utah desert. If "scientific management" is the guide, why is this happening? Barren drilling and mining sites likewise destroy the land and water. Have we learned nothing from the Dust Bowl of the 30s? Specifics relating to these broad recommendations abound. We now need to move forward.

Productive natural resources are vital for the well-being of the individual rancher, the local, state and national economies...society as a whole. A healthy rangeland provides for a healthy watershed and a renewable resource. Ranching sustains open spaces and aesthetic feature which contribute to recreational opportunities, food production, healthy environmental systems, and ecological sustainability. - Excerpts from the Colorado Cattlemen's Association Resource Stewardship Code of Ethics.

Currently the LWCF does not allow private land trusts or conservation organizations to utilize funding for conservation projects We would request this be removed.

Limitation on conservation tools and initiatives that landowners are requesting, such as term environmental market agreements. Regulations are still the preferred method of achieving conservation goals as opposed to voluntary incentives. Incentives have been shown to outperform, at significantly lower cost to tax payers, than regulations that have unintended and far-reaching consequences.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The 1965 Land and Water Conservation Fund Act requires the preparation of a statewide comprehensive outdoor recreation plan (SCORP) in order for states to receive SWCF funds. Every five years, all 50 states and territories develop and submit a SCORP to the NPS. Each federal resource agency has its own planning legislation and regulations, promulgated by NEPA. Our federal agencies develop plans for their own jurisdiction. That is, federal agencies are not authorized or responsible for statewide comprehensive planning. The LWCF SCORP program was administered by the Bureau of Outdoor Recreation for a decade, then shifted to the Heritage Conservation and Recreation Service until HCRS was disbanded in 1981, and is administered today by 1.5 FTE within the NPW WO. The nature of administering the SCORP program has gone from a proactive, collaborative, interagency resource/support program to simply a LWCF stateside grants program (i.e., a check the box program). Along with the 30-year shift in program administration from a federal Bureau to 1.5 FTE, LWCF funding during this time has been erratic and declining. The relatively few dollars on the stateside has influenced the quality, integrity and utility of SCORPs. That is, today SCORPs are largely viewed as simply an administrative requirement necessary to secure stateside LWCF funding.

It is commonly recognized by the NPS and the National Association of Recreation Resource Planners that the number of "good" SCORP plans in the nation is few. The SCORPs recently prepared by Colorado, Wisconsin, Oregon, Georgia, and Virginia are commendable. The declining respect and utility of SCORPs over the years is recognized by others, and thus involvement and collaboration in the planning process by our federal agencies has waned. The LWCF Act provides minimal guidance for what a SCORP should contain, but does allow the Secretary of the Interior to add additional requirements as deemed appropriate, both in process and context.

By way of background, all New England today faces profound threats to its land and natural-resource base. Climate change and its impacts on the region's biodiversity and agricultural and forest economies, fragmentation of the landscape from sprawling development and generational turnover in farm and forest operations, and all-but-unlimited demand for coastal property threaten the viability of the plants, animals, and resource-based industries and communities that depend on them. These forces also threaten the human experience of our natural world. As a marker of change, tourism now eclipses forestry and farming as a source of employment in the region's rural places, even while tourism depends directly upon the very quality of the landscape and the vitality of local industry. As the nation urbanizes, efforts to re-create elsewhere what New England has long enjoyed come even as our own qualities of the landscape are in peril. Happily, growing public awareness of climate change and its impacts, the role farms and forests play as carbon sinks, the greatly increased demand for locally-grown foods and the resurgence of small-scale, community-based agriculture raise the urgency of and public receptivity to effective conservation initiatives.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

What's happening: Because of a warming climate, mountain pine beetles now survive longer at higher elevations, allowing them to infest trees they do not normally infest in any significant numbers. These trees are Whitebark Pine, and they are the keystone tree species of the Greater Yellowstone Ecosystem - 20 million acres of wilderness that includes Yellowstone National Park, Grand Teton National Park, the National Elk Refuge, and six national forests. Whitebarks are the equivalent of the Rockies' redwoods. They are ancient, stalwart trees, populating the wind-ranked plateaus and ridgetops of the ecosystem, and they are the Giving Tree of the GYE: their seeds (from their cones) are the most nutritious seeds in the entire system. Grizzly Bears depend on these seeds, and their loss could mean the loss of the griz from the northern Rockies. In the past decade, 95% of all white bark forests in the GYE have become infested with mountain pine beetle.

4. Contrary to what some may say, there are thousands of family farms and ranches across the West that are threatened with the possibility that the land may be lost to pay the estate tax after a death in the family. There are several proposals being suggested to address this, including one by our Congressman John Salazar. We urge you to take this point into consideration in your recommendations.

5. Finally, we urge you to make the conservation easement income tax incentive permanent. Nationally, this single incentive nearly doubled the pace of land conservation since it was instituted in 1996. In closing, we have the opportunity to protect the West's iconic working ranch landscapes, but only if we work with private agricultural landowners. Based on our success and the backlog of conservation projects waiting for funding, the landowners are ready and we have the appropriate tools to accomplish this work. We simply lack the funding to allow all of us to accomplish our conservation goals. Thank you again for coming to Colorado to listen to our vision for conservation.

Besides NAWCA, we would like to indicate our strong support for the conservation provisions of the Farm Bill, soon to be considered for reauthorization. We strongly endorse the restoration of baseline funding for Wetland Reserve Program and the inclusion of an additional working lands provisions that will allow grazing rights and encourage more and diverse agricultural participation in key waterfowl habitat areas. The "Sodsaver" provisions of the Farm Bill, weakened in 2008, must be revised if the Prairie Potholes are to remain the continent's waterfowl nursery, while the Conservation Reserve Program and the Conservation Reserve Enhancement Program also need to be strengthened.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To help move this effort forward, we request that you facilitate a meeting with Nancy Sutley, Chair of the Council on Environment Quality (CEQ), where we might explain this program and the critical role that CEQ could play in helping to coordinate the support of various administrative agencies in implementing the Initiative. For example, there are also excellent opportunities associated with the 2010 Farm Bill to modify existing USDA programs like the Farm and Ranch Protection Program to achieve our goals. Coordination between NOAA and the natural Resources conservation Service would be most helpful. Our SLRAI represents something that we can do now about climate change that would likely be supported by the agricultural community, the commercial and sports fishing community, conservationists and sportsmen but we need to raise awareness in the Administration and coordinate a variety of existing programs in a number of agencies. This is an appropriate role for CEQ.

In California, water supply is always an issue with respect to wetland conservation. The Central Valley Project Improvement Act (CVPIA) almost two decades ago held great promise, providing water allocations for both wintering habitat and for summer irrigation that provides the waterfowl food, and mandating the construction of the needed water conveyance facilities. Yet, we have seen a declining amount of summer water and very little activity in construction of conveyance, all the responsibility of the Bureau of Reclamation. We need a commitment from this Administration that the Bureau will make good on its legal obligations.

Finally, given the significant role that we foresee conservation easements having in not only sea level rise adaptation, but in preserving wetlands throughout the country, we strongly recommend that the Administration supports current legislation in Congress to enhance tax incentives expired at the end of 2009. They need to be renewed and made permanent. There is support for this legislation from both major parties.

The primary obstacle to achieving goals for recreation and reconnecting people to the outdoors has to do with the "definition of what constitutes a Road". The definition normally used does not define what a "Road" is, but what "Roadless" is. Below is the accepted use: The term "road" when applied to wilderness is a specific legal term based on the clear intent of congress, as specified during discussion and passage of the Federal Lands Policy and Management Act of 1976 (FLPMA). Accordingly, BLM uses the following road definition derived from the House Report accompanying FLPMA: The work 'roadless' refers to the absence of roads which have been improved and maintained by mechanical means to insure relatively regular and continuous use. A way maintained solely by the passage of vehicles does not constitute a road. (Report 94-1163, page 17, May 15, 1976)

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Further Icarification is provided by minutes from a House Public Lands Subcommittee session, where the above report language was discussed: Rep. Steiger: "Mr. Chairman, if I may, and I would confine this to the report, but I would like to spell out, which I gather was never done in the Wilderness Act, what we are talking about when we talk about a road. I think the accepted deal in the Forest Service is that it is a graveled and graded road and that sort of thing. As far as I am concerned, I think we are talking about a road that is in any way maintained and improved, a dirt road improved by grading, or the placing of culverts, or by the making of bar ditches and that sort of thing. I don't think we mean jeep trails and that sort of thing, and there is a difference" (House Public Lands Subcommittee Markup Session of Sept. 22, 1975, pp. 329-332). The road definition in the House report was clearly intended to delineate which vehicle routes would disqualify wilderness study areas and which would not. Furthermore, it is clear that Congress intended that vehicle routes that do not meet this definition of road should not exclude an area from wilderness consideration, for protection as a wilderness study area, or for designation as wilderness.

Yet because of the predominate "conservationist" (read "preservationist") views of the majority of Public Land Management employees, they have twisted the words "of roads which have been improved and maintained by mechanical means to insure relatively regular and continuous use." to mean that "the road must have continuous and regular mechanical maintenance." By that definition, many state and county roads could be included in a designated Wilderness. Some might argue that many city streets would not merit the name "road" for lack of maintenance. By way of example, in the recently designated Dominguez Wilderness Area south of Grand Junction, Colorado, just inside the north east border is a "constructed road" proceeding through a new BLM gate that runs up the side of a mesa to and around Triangle Mesa. This "road" has been dozed deep into the side-hill as it ascends to the top of the mesa. These deep gouges into the hill side will take hundreds of years in the desert environment to become unnoticeable from across the small valley where the new Wilderness boundary lies.

For this reason, the whole "roadless study" (RARE I, RARE II, and more recent studies) required by the Wilderness Act have been faulty from the beginning. Many "roadless areas" are not "roadless". Not now nor back in the 1970s when most of these "studies" began. The proof is still there for anyone of honesty and integrity to see.

The fact that a land management agency elects to abandon or close a road or an area has absolutely nothing to do with the FACT that it is and was a road.

With the wanton closures and "designations" being perpetrated by land management and Congress on the advice of those agencies, the remaining open areas and roads are under more and more pressure due to the confinement of people attempting to recreate into smaller and smaller areas. As more and more miles of existing roads, trails, and areas are closed to motorized use, the growing numbers of users have fewer roads, trails, and areas of public land to access by their preferred method. By confining all these users in this manner, the remaining open roads, trails, and areas are seeing much faster degradation from overuse, therefore forcing land management to close more areas for "reclamation".

## Discussion Question 2

### **Written & Online Comments**

*(cont.)*

A current "policy" of the USFS and BLM is to look at all inventoried roads and trails not having a "loop" effect. The thinking goes something like this: If the road or trail comes to an end with no exit, it must be closed. What they fail to see in this policy is that when one comes to the end of one of these roads or trails, they will invariably see a whole new country on the return trip. These spur roads offer the recreating public a way of "getting off the beaten path" and finding a place with at least "semi-solitude" even with their vehicle close by. The end of a spur road invariably is what the road was built for in the first place. Historical interests are found at the end of the road. They don't "just go out there". There was a reason for stopping there. Even if it is simply an overlook now, the end of most spur roads are interesting. People with disabilities are most affected by this policy of "loop roads". How are they going to achieve solitude when all that is left open to motorized travel is a "loop road" that everyone in the entire area is using? The answer is obvious... they cannot!

Even people on a bicycle will look for a road or trail where they don't have 100-cars per hour passing them and raising dust for them to breathe. The "conservation first" way of looking at public land management has many short-comings. First, just what are we "conserving" this land for by closing it to motorized traffic? If in excess of 90% of the public wanting to utilize their "public lands" for whatever recreation they choose arrive by motor vehicle, who is the winner after a closure has been implemented? Certainly not the overwhelming majority of the recreating public! The only people winning by these closures are people with a political agenda and those looking to exert "power over the majority", often one and the same.

"The act to establish a National Wilderness Preservation System for the permanent good of the whole people, and for other purposes." This is the "purpose" of the Wilderness Act. One question they did not address... "when is there enough Wilderness?" When does the Wilderness "process" become "watered down" and bastardized to the degradation of the meaning of the word simply to satisfy the whims of a few willing to degrade the whole process? As for "reconnecting people to the outdoors", what message is carried to someone hearing the area is "Closed"? "You cannot drive in the area" Does that sound like the first choice most people would gravitate to? If most of the area surrounding a city is "closed to motorized use", what possible reason would anyone with an ATV, motorcycle, Jeep, or even a mountain bike in many cases have for traveling to that area?

When all of public lands are closed to motorized use, why would anyone want a new ATV? How many jobs will be lost in the manufacture, sales, and maintenance sectors of the economy?

Many of the management techniques being taught presently do not work in the "real world". If you listen to retired land management people, most will admit the policies are wrong and should be changed. Let people who have local management experience be the ones who make the policies. Not some "desk jockey" in Washington DC or some professional politician who has never even heard of the area!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There is not a reasonable "one-size-fits-all" policy when it comes to Land Management. Seldom to two areas have the same physical or political issues to deal with. The Secretaries of Agriculture and Interior are political appointments. They normally don't have any "real" qualifications to make policy for local areas and they surly do not have knowledge of the local area issues. Again, let us have a balanced approach with a balanced panel of "very experienced" (20 years or more) LOCAL land managemnet leaders and local governments make the local policies and have them implemented by a more balanced population of personnel in each local office. It is perfectly clear that the present arrangement of management is not working for the betterment of our public lands.

Forests are being decimated by bug infestations which lead to wildfires because present policies have precluded logging and other uses of the renewable resources. Proper land management would include select logging in areas with mature trees. Newer technologies and machinery can and should be used to "manage" these resources. It can and will help make the forests more:

- Healthy
- protect them from huge wildfires and insects
- promote local economies with jobs
- promote income from resource sales to the federal government
- protect watersheds
- promote recreation opportunities

In other words, everybody wins... except the "Preservationists" who will not be satisfied no matter what you do.

2. Every user type should have an equal voice. Quit the "dismissal of motorized users" attitude... and yes, it does exist! We are a legitimate use of public lands and should not be treated like a pariah in meetings and offices. We've heard the comments made after meetings with land management personnel and do not appreciate the prevalent attitude of the majority of Public land management personnel. If we had "Our way", many of you would not be welcome in the office either.

5. find some way to minimize interference from the "DC crows" in what should be "local" issues. They have no firsthand knowledge and nothing to lose with their rules, so should just keep silent.

First, I have enrolled in several Farm Bill Conservation Programs, including the conservation Reserve Program (CRP) and have encountered some unexpected hurdles and challenges with these programs. For instance, CRP helped fund the initial establishment of longlead pine on my land but offers little assistance for the maintenance costs of this tract, including maintaining roads and controlling invaise species. Additionally, I have run into some challenges with applyingprescribed fire to the tract that borders the national forest, the USSA cost-share programs have been extremely helpful in defryaing costs of forest management including seeling release, reforestation, pre-commerical thinning, and control of pin beetle infestation.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Second, I am gravely concerned about the effects of the estate tax on the ability of family forest owners to keep their land in the family. Often, the high costs due to the state tax to transfer land to the next generation result in fragmentation. MY first two tracts are in a family LLC. There are many restrictions included to protect the land from member sales and tax burdens that often causes fragmentation of our privately held land. However, this was a very expensive and burdensome legal process. Many family forest owners cannot afford to put their land in an LLC. Congress needs to find a fix to the estate tax that removes some of the tax burden of generational transfer and will encourage continued management and conservation of family forest lands. H.R. 5475, The Family Farm Estate Tax Relief Act of 2010, introduced by Rep. Mike Thompson (R-CA) is a good start to finding a solution.

New England's forest landscape is becoming increasingly parcelized. Land trust conservation projects typically are less than 100 acres with fund-raising activities undertaken one project at a time. The Harvard Forests' recently released report: *Wildlands and Woodlands -- A Vision of the New England Landscape* proposed that 70% of the forested landscape (or 30 million acres) be preserved to sustain human well-being/. Conservation by a myriad of land trusts at a one-project-at-a-time pace will not begin to achieve the Harvard Forest vision. Accordingly, a new paradigm for conservation is needed.

Engaging stewardship of the historic, natural, cultural and recreational resources is best accomplished through partnerships with existing organizations - primarily the community nonprofits. But these organizations often struggle with management and leadership issues. An out-of-date or poorly defined vision prevents them from achieving meaningful results. Although adequate funding is a challenge for everyone, a lack of leadership and vision is the limiting factor of success for anything.

The initial Wilderness Act envisioned about 20 million acres as suitable. Today we have over 120 million acres of Wilderness where public access is restricted. The majority of the public have been forced onto smaller and smaller areas outside of Wilderness. In order to encourage Americans to enjoy the outdoors we do not need more Wilderness, we need less.

The President and Congress need to adopt and implement the recommendations of the National Parks Second Century Commission Report in preparation for the Centennial anniversary of the National Park Service in 2016.

the need for compatible use buffers at Robins Air Force Base to protect against development intruding on its boundary and jeopardizing its mission capacity.

Growing public desire for greater recreational access to the Ocmulgee through the creation of a cohesive river trail from Macon south, potentially extending to the Altamaha river. Groups such as the Georgia River Network, Georgia Canoeing Association, and others are working to improve public access and connectivity.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Georgia Wildlife Federation and the National Parks conservation Association do not, in any way, seek to obstruct or hinder a boundary expansion for the Ocmulgee National Monument. We do, however, suggest and request that while a boundary determination is being made. Congress should simultaneously examine, in the form of a Special Resource Study (SRS), the potential preservation of the broader river corridor, at least as far south as Hawkinsville. The National Park Service is Empowered to undertake boundary adjustment studies for existing park units under its own initiative, without further direction from Congress. However, an SRS is much more comprehensive and inclusive in scope, and cannot be initiated by the Park Service without Congressional authorization.

Wilderness. The U.S. Forest Service in Western North Carolina has failed to identify, study, and recommend more areas for protection under the Wilderness Act of 1964. Citizens have identified approximately forty eligible areas on the Pisgah and Nantahala National Forests, alone. Yet no positive steps have been taken by the Department of Agriculture to find these areas, to study them, and to protect them, pending designation by Congress as Wilderness areas.

The need for full operational funding for the national park service.

Compared to the overall federal budget, the Park Service is very small - only one tenth of 1 percent Providing Parks the funds need to serve visitors and protect resources is a tiny investment in our national heritage, and provides economic benefits and jobs in struggling communities nationwide. A recent SPCA -commissioned report, The U.S. National Park System: An Economic Asset at Risk, found that the National Parks generate over four dollars in value to the public for every tax dollar invested by the Federal Government.

As recommended by the National Parks Second Century Commission in their final report to Congress and the Administration, NPCA is advocating for a multi-year commitment that reduces the operations shortfall by at least \$100 million per year, as well as an additional \$500 million to meet the construction and maintenance needs of our National Parks.. First and foremost, the President and Congress must support operations funding for the National Park Service, sufficient to meet its' needs.

Lack of a secure and fully funded, mandatory land and water conservation fund.

In order to preserve America's treasured landscapes and places of national significance, it is essential that the President and Congress fully fund a mandatory LWCF program. Current events in the Gulf of Mexico make keeping this promise more important than ever.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Despite the proximity to this open space, San Gabriel Valley residents have traditionally suffered from limited access to high quality recreation opportunities as well as high diabetes and obesity rates. The San Gabriel Valley has a large ethnic-minority population that is severely underserved by nearby public lands such as the Angeles National Forest, which hosts over 500,000 visitors a year along the dramatic canyons of the San Gabriel River. There is currently a dearth of basic recreation support along the river such as rest rooms, trash removal, rangers, stewardship education programs, graffiti removal and safe river access--the list goes on. San Gabriel Valley residents could also benefit from a stronger system of trails and transportation to get our constituents to their public lands.

The Conservancy itself is engaged in Park Service-approved activities to restore the historic West Bay Club property, currently under a use and occupancy estate. In addition to taking steps to maintain the relationship between people and places, federal agencies should do all they can to meet their own historic preservation duties. Unfortunately, despite the hard work and commendable effort of federal agency staff, funding is not sufficient to carry out his mission.

Assistance from nongovernmental sources is needed. To address this problem, federal agencies should seek partnerships and cooperative management agreements with community groups, non-profit friends groups, and private foundations. Such partnerships not only provide a source of private funding, but also enhance and enrich the capability of the federal partner to do its professional job more efficiently and effectively.

Unfortunately, unfounded concerns and political ideologies have prohibited range management and control of the population of prairie dogs inhabiting the grasslands. This has not only adversely affected the health of the range, but also allowed for the spread of disease in the prairie dog population of other species.

This important and sensitive eco-region is anchored by three national parks (Mount Rainier, Olympic, and North Cascades) and a number of designated wilderness areas within national forests. The watersheds that drain into the Puget Sound sustain salmon and steelhead; however, most of the runs are listed as either threatened or endangered and face real challenges for recovery. The lower elevation watersheds and working forests are mostly privately owned and are important for corridors and connectivity for fish and wildlife - particularly as we deal with climate change.

Congresswoman Chu spoke about and other speakers mentioned making the San Gabriel Mountains more accessible. They mentioned how the problem of obesity would be solved if only people could get outdoors.

Congresswoman Chu mentioned seeing "dirty diapers and trash" left along the San Gabriel River and that this was due to "no trash cans nor restrooms".

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We are frequent visitors to Whittier Narrows, the San Gabriels and many other state, county and federal open space. Never do we hike without gloves and trash bags to pick up the filth left behind. It is highly doubtful that anyone trucked into the mountains will respect it any more than those already there. We find chip bags, soda and beer cans, broken bottles of beer, plastic water bottles, fast food leftovers and yes, dirty diapers! Did I mention the graffiti on every rock that has the slightest smooth surface? While we have paid our dues as responsible conservationists who cherish natural places, we are unconvinced that increased effort to bring more visitors will do anything but hasten the decline of what is left. One speaker mentioned the conflict of people and the impact on habitat and wildlife! Hooray!

Last August we were camping in the Angeles Forest at Chileo. When we arrived at our campsite, I walked around and saw a campfire still smoldering! It took lots of water to put it dead out. We told the woman who was checking to see if we had paid our camp fee. She said there is nothing to do since the forest service personnel cannot prove who left the fire! Even though someone - I assume - had paid the camping fee for the night before????? Perhaps a letter from the forest service might have caught the attention of these people. Another campsite was strewn with 3 or 4 bag loads of trash - which we picked up.

Finally: Is the supervisor of the Angeles Forest still employed? The handling of the devastating and preventable fire showed gross incompetence. The most recent article - this one in the LA Times - 7/5/10 quotes Capt. Perri Hall regarding the inability to contact and then to get action when the fire was small and able to be put out. his comments contradict the official "review". We watched tv coverage last August and September. One forest official believe it was Mike Dietrich said "we are concerned about the loss of human life and property, but we are also aware of the COST TO TAXPAYERS". What? Why is this an issue when the forest is burning? Were officials, including the Supervisor, trying to look good on expenditures instead of focusing on putting out the fire? And why was only human life an property an issue? Did no one think about the animals an other life forms being incinerated? The forest was THEIR life and property.

Lastly: on the Discovery Center at Whittier Narrows. This is an outrageous waste of money; it will destroy natural space to impose a huge building - no doubt with county and other government officials' names on it - which building is more likely to serve as a meeting place for more bureaucrats. Stop this project now! It is shameful to waste the money, time and space on this project. Lease the Whittier Narrows alone!

We face new challenges in preserving our outdoor spaces, and I share your belief that the solutions will not originate solely from Washington. It will be necessary to engage with citizens across the country in order to share knowledge, study existing community-level conservation efforts, and develop common-sense strategies which are suitable for implementation on a wider scale.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While representatives of some of our organizations have participated at some of the sessions, we have found it difficult to find out information prior to the meeting date about when and where sessions are going to be held. In some cases, we learned about proposed listening sessions from third parties who had the information well in advance of the time it was actually listed on the AGO website. In other instances, listening sessions were held that were never posted on the AGO website. This inconsistency in terms of timely notification means that many Americans are excluded from the reprocess that purports to seek public input as your agencies prepare to submit to the President a set of recommendations for the use of our public lands.

Some listening sessions feature panel discussions and we applaud this approach. We are not aware, however, of any representative of the motorized recreation community being asked to participate in any of these panel discussions. This omission is troubling to us especially since motorized recreation is recognized as a legitimate activity on public lands and frankly, provides much needed economic stimulus to many rural communities adjacent to federal lands. Therefore, we would like the opportunity to participate.

Finally, we would like to recommend that at least one listening session be devoted to the role that motorized recreation can play in connecting more Americans, young and old alike, to our public lands. We all recognize that many of our citizens spend far too much time indoors working or playing in front of a computer screen. While perhaps intellectually stimulating, it certainly does not foster physical fitness so critical to a healthy lifestyle. Responsible motorized recreation can and does connect people to the outdoors and in many cases serves as the prime motivator of connecting our young people to America's Great Outdoors.

communication technology/transportation

Maine is a boarder state. Maine's transportation infrastructure and climate impacts access; communication technology is not evenly availably (or easily) in rural areas. Maine is an aging population state. Maine's cultures of farming, hunter, and working water from some endangered waterways by big paper mill companies, clear cutting, developers; working waterfront is not limited to fishing or shipping; public access and vary from town to town along the coast. Public access is not always a standard procedure or easily found.

Rural communities are concerned with landscapes.

Urban conservation alienates ranchers who are concerned with the preservation of land and wildlife.

Equal access to Justice Act creates too many lawsuits by environmental groups. NEPA efficiency to reduce lawsuits.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

River restoration. Fish and Wildlife Partners Program. Forest Service partnership agreements. Including tribes in the process early on. Guided recreation. Conservation easements. Tribes do not qualify for federal funds. May 9-11 is a River Honoring on Tillethead(?) Indian Reservation.

Landownership contributions to conservation easements. Lewis and Clark Trail. National Historical Trails helps get kids out in the outdoors and recreate. MT Legacy Program.

Transportation: many of the sites are difficult to reach without a car - it's a long drive, maybe unfamiliar too (there should be more signs on the roads). Education: many youths do not know that the National Park Service exists; there should be something about the NPS in schools - hey, many high school students need jobs and community service.

Jamaica Bay: funding

The great outdoors in our city backyard - we need to make these estuary plans coherent to everyday citizens living on the Jamaican Bay. How can they participate and reach these resources?

More opportunity for youth

School children have few opportunities for outdoor experience beyond their local parks. Recommend expanding outdoor overnight camping in Gateway and other parks and environmental education programs.

The key to access is affordable water transportation that links all major U.S. state and city parks. We need regional management systems - one harbor, another for Hudson River Valley. The key to mgt success is enduring partnerships with civic and enviro groups.

Coordinating task force for region, too many agencies. Pay attention to developments in conservation biology, especially landscape ecology, also endangered species. Look for solutions that help people and nature, like coastal preservation.

We must be creative but also challenge our experiences that have worked elsewhere.

Discontinue hiring from the inside in order to bring new ideas to the table.

Access is important for it's own sake but also to build constituents that support a healthy and vibrant and accessible harbor. How can we get federal state and local authorities to create docks and piers to get people to the water and land and vice versa?

Each federal agency has their own restoration program. They need to work better together to combine funding for great restoration instead of the their agendas. State regulators need to get on board with restoration to make permitting easy.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The effort need an overarching authority to create a perennial high level body to break through red tape and provide continued priority and energy.

How do we bring NJ to the table? Gateway also stretches into NJ, as well as the comprehensive restoration plan. In order to succeed, we cannot ignore the other side of the harbor

Williams and National Grid are participants in the Blue Ribbon Commission and desire to play our part in improving Gateway as private partners. We find the maze of stakeholders daunting to navigate such that we can move our project to supply additional natural gas supplies forward. Any streamlining of priorities and efforts that would provide us a clear path forward to allow us to do our part in supplying gas to the region and bring a good opportunity to be corporate stewards in the region is appreciated. we would love to discuss further.

For too long we have rested on the laurels of America's greatest conservation leaders, from President Teddy Roosevelt to Secretary Udall to President Carter, who assembled the greatest collection of National Parks, Forests, Monuments, Wildlife Refuges, and Wilderness on earth. Preserving these lands required perseverance and a willingness to override local opposition to land preservation, which had stood in the way of protecting the Grand Canyon, Alaska, and other national treasures. Preserving America's greatest places also required meaningful levels of funding, particularly for the Land and Water Conservation Fund. We must be willing to emulate the leadership of Roosevelt and his successors if we are to provide our constituents with the recreational and wilderness opportunities that distinguish America from all other countries.

In my district alone residents face a 19,000 acre park land deficit. We need to expand and create new National Parks and other public lands aggressively to meet the needs of a growing population, while protecting existing federal roadless areas for low impact recreation.

We also need to expand public lands in rapidly growing urban areas. Northern Virginia would benefit from substantial public land acquisition as well as more public access points to the Chesapeake Bay and her tributaries.

Just as we could not have witnessed the unspoiled glory of creation without the leadership of Roosevelt and others, so too generations 100 years from now depend upon us to protect lands and waters that will otherwise be desecrated by the relentless march of development.

As residents of the magnificent Puget Sound region, we can easily recognize the importance of the great outdoors and how critical its preservation is to both our culture and economic livelihood. I applaud the Obama Administration's search for solutions to conserving and increasing access to our public lands, improving outdoor recreational opportunities, and celebrating the role that the environment has played in our rich cultural heritage.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While most of the groups and programs that are assembled here today may be providing valuable outdoor experiences for kids they are all too expensive to seriously impact the severity of the problem we face today. We have created a forest ambivalent electorate and one need only look at the metrics; if your organization is providing expensive, all inclusive mountain and outdoor experiences and especially the ones that continue to characterize millions of kids as at-risk, - how racist is that- underserved and mostly capable of working on expensive work crews on public lands- we would like to suggest that you fold up your tent.

Expensive programming means that you will only ever be able to reach a "finite" number of children and overlooks the reality of today's economic challenges. and if those programs were so successful, why are we so non-inclusive of youth and emerging population today? Hopefully the Obama administration understands that we are seeing a crisis in America . . . not just because the average youth in this state is spending 48 1/2 hours weekly in front of media or that there has been a doubling of obesity and diabetes rates and that millions of kids are missing out on the "inspirational" value of natural world experiences (quote commerce city and kid in a trailer park anecdote) - but because "PURE" outdoor and mountain recreation experiences for kids are key to preventing a "forest ambivalent" culture!

There also needs to be a realization that the greatest threat to public lands and the environment here in Colorado and on most public lands is not global arming, bark beetle infestation, boreal toads, lynx habitat or off highway vehicle use ..... it's this pernicious lack of youth outreach and the fact that in a places like Denver, other than the 2-3 day outdoor educational experience that we provide almost 10,000 kids annually, 95 percent of Denver kids never ever get to the mountains during their youth ..... we have 1.26 million kids under 18 in Colorado and in spite of the fact that we live in a state that is defined by its mountains, most of our children (over 1 million) never enjoy them in spite of the fact that 25 of 26 of Colorado's ski areas now operate on land that belongs to all Americans ..... not just the wealthiest! This is disgraceful.

Twenty and thirty years ago, there was more youth participation in the outdoors and in mountain sports because it was viewed as "affordable" and "welcoming" to more Americans. Not so today! In fact almost all high schools and middle schools used to have mountain clubs or ski clubs and frankly more families valued and could afford to recreate in national parks and forests. We need to empower teachers to augment natural world course work and physical education with actual hands on experiences in the outdoors.

Limit cell phone use – it's an obstacle; employ strategic use of technology.

Can the federal government be more of a central resource for all different organizations and people to access and share? Coordinate management and outreach.

Push back on/counter the media-induced fear factor.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Federal agencies need to learn how to talk to each other within the multiple agencies. There is a disconnect between them. BIA (Bureau of Indian Affairs) doesn't seem to have a voice and needs to learn how to talk to other agencies.

The federal agencies should get together with the local state agencies and the school districts to talk about how to facilitate connecting people to the outdoors.

Give states and local leaders more say in what happens locally, rather than blanket policies for the entire country.

LA County Fair youtube videos showing silly LA County behaviors illustrate that urban folks don't have great outdoor connections. Or iphone apps.

Money is a barrier – people can't afford to drive, or to pay entry, or leave the city.

Sheer numbers of visitors impact the environment and other people's experiences.

People don't know how to act or what to do in the outdoors – there's a lack of education and experience.

There are complaints about the new Forest Service travel management map – it doesn't really let people see what's going on. The map is so poor. It's easy for me to get confused. Then, if enforcement is hard edged, that's a turn off for users.

Provide opportunities to a wide spectrum of users- conflicts are bound to happen. There can be a push to create duplicative trails, which is a no good.

Mineral development, like oil, gas, and uranium, creates a challenge to recreation and conservation. Extraction creates impact. Example might be Sublette County's Jonah Field, which wiped out historic antelope hunting.

Social structures that are indoors encourage young people hang out at malls or online. We need to build social structures that include the outdoors.

There's a lack of credit to land owners. The federal government has already decided to be recreation focused. But programs that help recreation have a negative impact on landowners.

Poor air or water quality issues don't encourage conservation or affinity.

More work hours in America shortens recreation time.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

A lack of commitment to stewardship, or to ethics. Not getting landowner permission for hunting, for example.

A few people's lack of common sense or respect for the land can shut down access for everyone, including proper users.

Stop pushing more wilderness and closure of areas. Mountain pine beetle and other resource issues still need to be addressed and can't be with imbalance of too much wilderness. Minerals industry pays the taxes, so there needs to be a balance.

Allow enough access to let families access wild places. Too much wilderness makes it hard for people access wilderness in the time real people have. One example is the proliferation of wilderness study areas in the Red Desert that severely restrict travel.

The Land and Water Conservation Fund (LWCF) is used nationally for federal land acquisition. Most counties in Wyoming have laws opposing net gain in federal land.

Children go outdoors less than they used to – they watch TV. My parents used to send me outside. They didn't allow me to stay inside.

There is a stigma of land managers vs. private landowners. Cultural friction.

Kids are overscheduled—other things are taking their time.

There is a perception that it's expensive and takes lots of equipment to get kids outside.

There's a diminished societal acceptance of risk. There is an aversion to risk and expensive associated litigation.

Commissioners outlawing certain types of animals in Fremont County, such as wolves and bears—politics work against much of our wildlife.

Emotions run high.

Individual organizational goals are place above those of the county.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

When people whose wages come from tax dollars lecture ranch owners about Coordinated Research Management Programs, it wears on ranch owners. These are conflicting priorities. Fewer farmers or ranchers that have sizeable property, so this creates pressure on land owners. As landowners, we are only caretakers for a certain amount of time—it's not really ours. The world has more needs with the same amount of finite resources.

I'm now losing sheep to predators in broad daylight, and that hasn't happened for the 33 years I've been doing this. People need to see that things are shifting wildly.

The lack of a central clearinghouse for program access, or rules for various types of access. We need a one-stop shop for all of the information, as well as better outreach and resource sharing.

We need more time, more energy, and more money.

We need a better structure for transportation – it's hard to get kids transported to the outdoors.

The government should be more of a central resource for all different organizations and for people to access and share.

We chase federal dollars for conservation programs. But if we only receive a per capita portion of those funds, it's not enough. The conservation values in this state are more than competitive for federal dollars, and private land conservation has to be a major part of that. Use Land and Water Conservation dollars to preserve those private lands. It preserves our state's cultural identity as well.

Consider keeping viable ranches without a conservation easement. Keeping ranches working is as simple as not making everything they do feel incredibly difficult. Make it easier for those ranchers to get their jobs done. Permitting, litigation, etc., make it hard to get things done.

People not acting because they think they need to ask for the Government's help and funding. Individuals can do an incredible amount on their own. Keep the funding local to begin with.

More public conversation and media coverage of recreation to balance the focus on energy.

Seeing kids and families out on trail is great, but the negative part of that is people who ruin things and tear up the land. So balancing use with preservation.

Affordable hiker/biker campsites at state parks that are cheaper than car/RV camping sites.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

More sharing of information about economic impacts and opportunities that exist for individuals to engage with the outdoors.

Tourism doesn't stop in the summer.

We're still getting accumulation of annoying impacts. Firewooding is everywhere. Even though there are fewer people camping, we're leaving a legacy of that everywhere, and that's something we can focus on. We need more education on how to minimize impact.

Wyoming Conservation Corps has been very successful. Why not promote that on a national basis because kids involved in that can earn college credits and get a healthy stipend.

Funding. There is a lack of education about how you treat public spaces. People don't realize they're paying to fix what they just broke.

A lack of money. Money to keep trails open, keep them passable.

Money that is collected on local basis must go into the ground, not into some black hole someplace. Keep funds raised locally local.

Vandalism and destruction of public structures by public. Money does go into fixing these things, pumping outhouses.

The media portrays the idea that as soon as children walk out the door, the boogeyman is going to get them. The media has not done us any favors. Parents are paranoid and scared to let their kids be kids and have opportunity to be outside. Don't throw crimes against children in our faces every day.

Multi-use. Trying to make every group happy is impossible. Every group wants more and is willing to give less.

There is a lack of volunteerism from the users.

The lack of a clear understanding by volunteers makes them unreliable and problematic. They come and go as they please.

New additions are considered sexier than maintenance. This is a challenge.

The Good Ole Boy Attitude pervades decisions.. We did it this way and we won't change. There is a reluctance to change.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Deterioration of our infrastructures is a challenge.

Fear factor – urbanized folk are afraid of the outdoors, need a guide

The desire to find solitude is at odds with the increased crowding of outdoor places

We need to protect places from the people who enjoy them.

People don't want to work to have fun, and there needs to be a way for these people to access remote areas

Kids can't recreate on their own – educate parents

Tough economy makes expensive weekends harder to do for families

In just a generation or two, a remarkable amount has been lost. Reservation youth often haven't ever fished in their lives.

Safety and money inhibit us from taking out groups of kids.

Access to transportation limits group activities.

There is a disconnect with between people's food and where it comes from

Regulations limit what families can do together, like collecting firewood or cutting poles. Now you just buy all this at the store.

Media sensationalizing the outdoors, with extreme and crazy survival stories, making regular nature seem boring

Bad press, like bear attacks, instill fear

More bears and wolves make families more cautious

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The economy makes it harder to buy and use ATVs, limiting parents' ability to take kids out

Schools don't support taking students outdoors, which also affects access to parents

Cultural shifts deter people from outdoor experiences, these are hard to change

Kids don't like to do things outside anymore.

People are close minded; they ignore all of the issues, and they need to open their minds to get anything done

People are getting lazy, sponsored by technology

In the olden days, we just got kicked outside to go play. We weren't going on sponsored ski trips. That seems to have gone away.

From a young age parents are placing children in front of TVs, they making it a babysitter and a reward.

News from the TV only reports about death in the outdoors.

A lot of parents are holding down many jobs, they have to feed their kids then regroup for their next jobs and the solution is plop them in front the TV. I was amazed at how many children had not been up sinks canyon (8 miles from town) to go on a hike, feed the fish, etc.

Parents feel it is dangerous to go outside

Some outdoor activities are not fun when you are out of shape and over weight. Skiing is not fun when you are out of shape.

Poor nutrition and lack of activity is a deterrent. Parents aren't paying attention to this.

School food is bad, and bad for you.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Some schools have no PE program. Some schools have no sports at all.

PE teachers in Wyoming should be able to run an outdoor field trip.

Teachers will cancel field trips, like a trip to Yellowstone, as a punishment.

Young children aren't going on as many field trips.

Communication between public lands folks and the public could be better, and many forms of communication should be used.

Trail crews lack knowledge and experience to do their job correctly.

When a decision is reached by a land agency regarding natural resources there is a vocal opposition. Agencies' hands are tied and nothing happens. For example, with timber management, there are acres and acres of dead trees that aren't being logged.

There is a lack of resources and support for winter outdoor activities. People don't have the training or equipment necessary for winter recreation.

As fishing and hiking are easy for us, there is a reluctance to teach too many the trade.

It's fine if people want to get out, but don't show them our favorite fishing spot. Once-secret areas are now in marketing materials, bringing people in droves.

While less people are going outside, some places are being more impacted

With folks migrating to urban settings and a flagging economy, more folks are heading outside when they take trips. We need to be doing more outdoor education within the public in the school system, but it should be slow, and not widespread.

No Child Left Behind is forcing teachers to find the most objective parts of education, and forcing them to teach to the test. Funding is tied to whether students know facts. It needs to change. Students love to learn outside.

The system has rid itself of good teachers that would take them outside. Access to our youth is biggest challenge and school systems don't provide funding.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It is hard to balance our need for industrial development of these lands with my love for these lands. I drive a car. It has an impact. I have a conflict. To best address this, we need to be smart with our impact. And balance development with protecting lands.

The education system doesn't recognized the legitimacy of outdoor education. Outward Bound doesn't count for school credit.

We are so convenience based -we need things quick. There is no interest in the outdoors. There is no good draw away from technology. But technology can help fix this.

We need to focus on cultures in big cities. Amazing at the boy scout level, few scout masters knew the animals in Wyoming. Takes dedication. We can figure out ways to manage land for the best uses; we live in a small population, and there's no need to have every use on every acre of public lands.

There is a lack of access to public lands in this state.

Numerous environmental terrorists are harming the health of our forests.

Conservation easements are an effective way to protect land and provide additional public access. And we have a lot of federally protected land.

Kids are more computer-oriented. They are afraid to go outdoors.

There's not enough MONEY!

There's not enough access.

Educational priorities, i.e. curriculum and funding, are an obstacle to outdoor activities.

Time management of individuals, and the scheduling of free time. Electronic interference should be limited.

Organizations can work together to better to coordinate their efforts and to communicate. Fremont County ATV Association has to contact many different organizations to find out where they can ride.

There's not enough transparency in federal planning.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Youth are bombarded with consumer advertising, which drowns out the call to go outdoors.

Deferred maintenance projects at parks reduce their appeal.

Kids don't show up, and don't have outdoor activities as a priority. Can we create an incentive for kids to volunteer to build trails, etc.?

Youth don't even know about this stuff! Communication is insufficient.

Events don't always make it clear that kids are welcome.

Parents are afraid to let their kids play outdoors, and they over-schedule their kids' time.

Many teenagers are so involved in activities/sports (overachiever lifestyle) that they don't feel they have time to go outdoors.

If it's not scheduled, it's easier to play a video game

If there was more funding for public land agencies these three problems (money, access, time) would be alleviated

People do not lobby actively enough on an individual level for our government to address these priorities.

Our educational priorities, such as a focus on high-stakes testing, do not allow for enough field trips. We would probably produce more scientists if we connected students to the natural world.

Many communities are not structured to enhance exposure to outdoor opportunities (bikeable/walkable, signs, etc.)

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Participants at the session told numerous stories of effective partnerships at a local level that utilize existing resources and organizations to connect people to the outdoors and conserve open spaces. Sadly, many stories ended with reports of partnerships dissolving due to resource scarcity. This region, like others, is blessed with incredible ingenuity, motivation and capability. Coupled with adequate funding and resources, these efforts could be sustained over time to significant long-term positive impact. Many conversations focused on building and sustaining partnerships between federal, state and local agencies and school districts, and also incorporating non-profit groups, local landowners, outdoor education institutions, and local businesses.

Inconsistency across agencies, confusing bureaucratic processes and administrative hurdles, rules and regulations that often seem punitive, are poorly explained, and change with land ownership boundaries: these are all obstacles to many people who seek to visit the outdoors. Much of this could be addressed through better communication, both between agencies and from agencies to local communities and the public. It could also be addressed by enabling and empowering local governments, organizations, and individuals who hold in depth knowledge and experience about their communities and public lands.

Money is a barrier: many people can't afford to drive, pay to enter, or acquire gear.

Lack of recreation funding for the federal agencies.

Deferred maintenance projects at parks and other public lands.

Lack of education or experience prevents people from going outdoors.

Poor tools prevent going outdoors; e.g., inadequate maps or ability to use them make it hard for people to do the right thing and enjoy themselves.

Lack of understanding that private landowners can be good land stewards. Federal agencies are too recreation focused at the expense of landowners (e.g. ranchers).

Impact of a few can have negative effect on everyone's access and experience. We need better connection between natural systems and social systems (people) in the form of education.

We lack a central clearinghouse for program access, rules for various types of access. Need a one-stop shop for all of the information; better outreach and resource sharing rather than each land agency reinventing the wheel.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Negative impact on the environment affects people's experiences. New development, urban sprawl, subdivision, energy development all have significant impacts that affect recreation and other uses.

Poor air and water quality have negative impact on recreation.

Youth lack role models and are influenced by pop culture, which is not outdoorsy.

Kids are over-scheduled.

Teachers have limited time; high cost of insurance to get kids outdoors, paperwork to develop and maintain school and extracurricular programs for kids.

Hard to get kids transported TO the outdoors—need a better structure for transportation.

Kids are bombarded with consumer advertising, which drowns out the outdoors.

Media sensationalism emphasizes the bad and scary (e.g. bear attacks).

Changes in family and social structure (e.g., increase in single parenting) make it harder for kids to connect to the outdoors.

Cultural friction between land managers and private land owners make partnerships challenging.

Diminished social acceptance of risk and fear of litigation.

Too much federal government interference in local issues.

Political polarity on sustainable use, two extremes and no middle ground, blocks sustainable management (gridlock).

Inconsistent leadership at the federal level. It is great that current administration is advocating outdoors, but there is no follow through. In two years there might be a new focus.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The bureaucracies don't understand the constraints of businesses.

The USFS often does not have the funding/personnel to support partnerships to the full extent possible (i.e. volunteers are turned away because there are not enough staff to train and assist them).

No one my age (mid high school) likes to do things outside.

Laziness sponsored by technology.

Poor nutrition and lack of activity decrease motivation to go outdoors.

School food is bad. If you eat it everyday you would gain 20 lbs.

Some schools have no PE program. Some schools have no sports at all.

Not only that, but the forests need protection from the devastation of the Ips ponderosae bark beetle that is currently ravaging Lodgepole pines, White pines, Ponderosa pines, and other pines. This beetle has almost wiped out Canada's lodgepole pines. We need to act before it ravages America's forests too.

My hometown is in Michigan, one of the most beautiful and safe states to hike in, due to the lack of larger predatory animals, poisonous snakes and insects. Home to the Great Lakes, our water shed suffers dramatically from the illegal dumping of chemicals by big money, such as Dow. While I recognize the need for companies like Dow, they use their "weight" to dismiss the damage they cause and do not accept responsibility. They must be held responsible; they owe something to the people who allowed them to prosper, while they dumped Dioxin into our rivers. Thousands of people's land is now worthless and the health problems are numerous. If you, Sir President, can tax sodas and other things considered unhealthy to the general population, then you must stand for our land and waters. It must be protected and the people who damage it, must be held accountable to the strongest extent. Thank you for your time.

They are murdering mules and donkeys on federal reserve land just because they eat there.

Most agree that recreation has been under funded for decades. This may be the result of a lack of recognition that recreation does in fact require investment. Trails especially need money to be designed well.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Too little staffing and resources to take advantage of unsolicited volunteers. Some volunteers are turned away, or sent to easily accessed areas, rather than those that really need their attention.

Some agencies have a lack of "open mindedness". While less of a problem in the Jackson Hole area, other regions suffer from agencies that cannot be flexible and consider new ideas.

A culture of fear. Excessive liability concerns make getting people, especially young people outside difficult. This is a widespread societal problem with an overly litigious society, but one that schools and agencies especially struggle with.

Some public lands feel more welcoming than others. Rules and regulations that are difficult to understand can make people feel "policed" and even turn some people away. National parks and Forest Service land serve complementary purposes, with the Forest Service land often perceived to be more welcoming and less regulated.

Agency's recreation capacity is focused on commercial use. As a result, resources are taken away from working with volunteers and the general public. This is a funding and a philosophical limitation.

The limitations of time and money keep people from trying new activities and exploring new areas. Work limits recreation time and cost limits equipment purchases.

Many schools do not make an effort to connect kids to the outdoors. Instead, a longstanding focus on science and math takes precedent over any sort of outdoors education. Kids at most schools spend 8 hours a day indoors. I. On the other hand, kids have spent time inside for generations, so the difference lies in what kids are doing with those hours they are not indoors at school.

Cultural distractions. The digital realm dominates at the expense of the natural world.

The balance between introducing new people to the outdoors, while saving the remote experience.

More entry level trails - accessible.

Building political power through the people who are engaged in the outdoor community. If we don't have that, it will not change the way things are.

Making funding sources through non-motorized users a standard practice.

Watch that you don't go too far in Paying to Play. You want to be able to preserve and conserve, but you don't want to destroy the resource for what it was intended for.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Collaboration with other groups, motorized and non-motorized.

Bring it back to a lifestyle choice, finding ways to relate to people that live in urban areas.

Lack of time is an excuse-the administration can find the time to do what it wants.

Lack of vision (i.e. "I didn't know you could do that"), lack of money (e.g. artificial leg costs \$17K; mountain bikes are expensive), poor marketing.

Cultural differences and the different activities associated. o Fear/lack of familiarity. o Importance of the tribe (individualistic activities)--lack of being able to sustain activities (immersion). o Important to get diversity of cultures into outdoor recreation in Junior High and before in order to make a transition into college.

No education (no P.E., public schools don't start kids on the "outdoor" path). o Early engagement (as young as kindergarten) and early and positive access and experiences.

Poor Urban Planning--80% of Americans are in urban environments.

Elitist attitude among retailers and the desire of users to find exclusive places.

Conflict between recreation and conservation

Creating a welcoming environment for diverse cultures. o Different opportunities and inclusivity strategies to engage in the outdoors for different cultures. o Traditional outdoor recreation providers to need learn more about this.

More tools need to be utilized to get people excited about nature. o Getting outside doesn't have to mean going for a 'birding hike' or a tour of some kind, but can translate into "where you are" areas.

Too much bureaucracy in trail building, maintenance, and permitting systems within the USFS, BLM, and NPS.

In general, there is a strong disconnect between DC rhetoric and on the ground realities.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Permitting system is restrictive. o Non-profits need more opportunities to implement youth-based outdoor programming. o Needs to be more support in the "reconnecting people to America" agenda.

Federal agencies need to be more coordinated and streamlined.

Recreation keeps getting pushed to the bottom of the priority list when federal land managers' priorities needs on lands during the planning processes.

Money, money, money--for equipment, access, gas, driving, recycling programs, etc.

Coalitions are fragmented and consistent unified messages get lost.

Weakening recreational use statutes (e.g. CA is pursuing strong regulations).

Wilderness v. recreation (e.g. mountain bikers)--see N.C.A.

Resistance to change. We need to change existing notions that outdoor recreation means far-from-home, expensive, and extreme opportunities. A change in the paradigm calls for more education about outdoor recreation.

Lack of education. The health and wellness benefits of outdoor recreation are not stressed enough in our country. We need to tap into technological resources in order to communicate with youth and emerging populations about where and how to recreate. Families need to know about low-cost alternatives to watching television. And universities are underutilized given their resources and missions.

Lack of transportation and connectivity. Youth and emerging populations need more, better, low-cost transportation methods to access outdoor spaces. Gateway trails throughout urban areas need to be established.

Access. There need to be more greenbelt parks in more neighborhoods. Among the urban areas, these parks must be safe. Also, competing interests on common lands poses a challenge to recreation.

Too much red tape and bureaucracy. Government rules and procedures can get in the way or dissuade public/private partnerships from occurring.

Eclectic policies. The many different rules and policies regarding public lands can be confusing and irritating. Streamlining, updating, and creating more uniformed rules and policies would encourage new users.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Funding. Funding lies at the root of most of the above, but is also needed to create more spaces to recreate and maintain those areas with good access and high use.

People's resistance to change.

Lack of funding.

Lack of education/facilitators.

Lack of connectivity/accessibility/transportation.

Too much bureaucracy, red tape, backlog.

Poor exposure and lack of awareness and guidance (esp. in Texas).

The difficulty in changing paradigms/people's negative preconceptions of the outside world.

Lack of manpower and funds to build more trails/spaces.

Getting new people to the spaces, people who would not find them on their own.

Communication, education, and readily accessible and clear information (online and inside spaces/mapping).

Need more resources and incentives for private partnerships to work.

People afraid to take the first step--need programming to encourage people to try something new.

Health and wellness of being outdoors is not stressed enough.

People need more options on how to keep kids away from the T.V.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Need to change people's perspective on what an outdoors activity is (e.g., people often fail to associate kayaking outside the realm of whitewater).

University resources are underutilized.

Education about low-cost outdoor activity--mental barrier to entry.

Transportation, especially with kids, is one of the largest problems. Need more greenbelt parks in more neighborhoods; add "gateway" trails in urban areas.

Funding for publicizing and maintenance.

Federal government has declared university groups as commercial regarding outdoor trips; need to have university permitting.

Each national park and/or forest deals with policies differently--need more uniformity.

No one encourages access--the response being that getting more people into outdoor spaces make jobs more difficult.

The process for permitting is difficult; problematic policies, no incentive to get more people in the parks.

Competing interests--increased access, more people in the spaces could create conservational/maintenance/etc. problems.

Where there is good access, there is often poor infrastructure that won't support growth.

The challenge lies in preserving the land for the public, not from the public.

Trash and litter is becoming a huge problem in the area.

Education the young generation to pick up after themselves.

Maintenance at trailheads.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Lack of education and communication regarding conservation and sustainability, especially among youth (need to start young). This is a problem within and without schools.

Ongoing education versus reactive education (e.g., water conservation even when NOT in a drought).

Educating multiple cultures/creating a jingle for every culture.

Transportation - getting kids/emerging populations to recreational places.

Avenues for low-income families to access the outdoors.

Unsafe cities lead to parents afraid to letting their kids get out as much as they used to.

Accreditation versus one-time funds.

Access to outdoors for those in urban environments is limited. Access and opportunities to experience natural settings close-to-home in the urban environment does not meet current needs. In addition, transportation to outdoor places is a challenge.

Perceptions of safety and a culture of fear. The outdoors can be scary for kids particularly those who have no prior experience.

Elimination of outdoor education and physical education in schools. The focus on academics and testing has taken away from opportunities to enjoy the outdoors and physical activities. This has impacts on how the next generation connects to the outdoors as well as implications for public health.

Outreach methods are marketed to existing constituencies. In communicating opportunities on public lands, agencies typically focus on marketing to a narrow segment of the population and in particular those who already know what's out there. Agencies need to think about diversifying their outreach (not just ethnic but also ability level, economic status, etc.). Making information available in other languages or culturally relevant formats is typically not done.

Youth focused programs are a welcome development but more efforts need to be focused on the entire family. Parents need to share in the experience and they are essential to providing these children with opportunities for future experiences.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Lack of direction and resolution of conflict resolution. There are many conflicts among user groups on public lands. In general, agencies have shown a lack of leadership in addressing these conflicts that then end up in court.

Gear is expensive. Many activities require gear and/or training that is expensive.

Laws and policies have not been updated to reflect current values and needs. Historic laws such as the 1872 Mining Law remain the books. Policies that place greater value on resource extraction than experiences on public lands remain.

Lack of opportunities to get outdoors

Transportation barriers-lack of money

Political climate for protecting land

Lack of understanding of the economics and benefits of outdoor recreation

Loss of access

Difficulty in compromising on access (e.g. mountain biking and wilderness issue)

1872 Mining Act and other historic settlement area laws

Elimination or reduction of outdoor education-Leave no Child Behind

Perception that it's not safe outside

Technology

If places were protected we could spend more time enjoying and less time working for protection

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Lack of scientific knowledge

Federal funding prioritization

Territorialism vs. finding commonalities

Education and funding for transportation to outdoor places

No one knows what it means to get people outside-what does conservation mean to people

Demystifying conservation/environmentalism. Immigrant kids are not familiar with what it means to be outside

Outdoor School-it can be scary for kids that have not spent time outside before

Knowledge gap-people don't always know that they have free access to public lands-make it simple for people to figure out how to use their public lands

Administrative rules can be confusing-lack of uniformity. Agencies complain about people not using their public lands but there are barriers

Access is key-let people know that our protected public lands are available to all

Keep it simple-help people understand what the rules are

Lack of diversity in outdoor pursuits. Important to model-if you see people that look like you recreating in the outdoors, you might be able to envision spending more time outside.

We need to think about making our agencies more diverse-how do we accommodate more kinds of diversity (not just ethnic and racial but ability/disability, economic, etc.)

Outreach efforts are marketed to existing constituencies-not to new diverse constituencies

Hire people from the community who know the community members (community ambassadors)

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Federal funding of Land and Water Conservation Fund

Managing multiple use-uses may conflict or have different impacts

Wilderness designations that don't move forward because of multiple uses

Mountain biking and ATV use may cause different impacts

Lack of conflict resolution direction

Not enough outdoor options in cities and other areas-Forest Park as an example

Lack of safe access for people to recreate-public access sites are limited

Undervalue natural resources-have not identified or communicated the existing "special places".  
Value of carbon sequestration or watershed

Better connection between federal government and state shouldn't have to rely on the economic market for this

Technology-youth are attracted to being inside

Culturally specific organizations are poorly funded

Accessibility-trails not always in great shape

Kid focused programs devalue families and child adult bonds

Transportation as a barrier

Non-profit organizations operate as volunteers so if "life" happens then organizations disappear

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Changing mindset

Establishing awareness

Tying connection together and making it personal

Creating advocates

Reaching the greatest audience

Federal agencies not doing their job because of non involvement uncaring or understanding

Accountability

Access/transportation

Never getting out of town/lack of awareness of how easily it is

Politics

Natural Resource harvesting/allocation vs. conservation and the financial imbalance

Disconnect between recreation and health and other broad issues

Conflicts between user groups

Framing conservation in terms of policies and disconnect exist. Oregon supports outdoor conservation but perhaps doesn't relate to policies

Connecting hunting/fishing with trail/bikers/outdoor enthusiasts

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Issues of fear (historical context)

Lack of information easily available in other languages

Advocate for access-get young people into the outdoors and introduce them to it. Take ownership and then advocate for it.

Better access to nature in the urban environment.

Need for better access-lots of competing interests take away from "quiet recreation"

For urban areas accessible information is not available-think about venues to communicate including church groups, farmers markets, etc. Once people connect they will return.

Need to integrate into the culture-how do we do this?

Culturally appropriate communication-will raise level of awareness

Economics is one of the obstacles. Outdoor Industry is very inclusive but in general it's expensive to do things outside (gear, training, etc.)

Need to create subsidies for those who experience economic barriers to getting outside.

Several strong factors can work to keep people indoors including fear about safety, questions about the value of outdoor experiences, a lack of access via public transportation to outdoor resources, and the absence of information about opportunities and costs.

For program/property managers, lack of funds certainly presents a primary challenge, but along with that came comments that major challenges exist in the simple disbursement of funding from the Federal Government and the delays and problems of red tape. Liability also effects the activities of program and property managers as does a sheer lack of time to plan, organize, and carry out their projects.

Another thematic thread in response to the question of challenges relates more to the need for stronger public relations messaging about the importance and value of getting outdoors. With the lack of environmental education in schools, the first challenge is to convince people to get outside. Several participants expressed that as outdoor enthusiasts they were in the minority within their urban populations.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Fear of the outdoors o Fear of wildlife, violence (perceived or real) o Need to feel safe o Inside vs. Outside - what is safe?

Overbearing parents

Outdoor recreation - competes with other choices o Sports o Technology

Transportation o Linkages to open spaces o Public transportation not enough space to transport bikes o Accessibility - transit (car/bus/self propel)

Equal access - transportation to open space from minority population areas

Inaccessibility and lack of awareness of opportunities to get out

Access to open space (ocean, rivers, trailheads)

Understanding if things are free

Expensive - costs outweigh the benefits

Poverty limits potential to get out

Recreation not seen as important/relevant in everyday life

Resources (cross-reference; information sharing)

Funding

More economic recovery money for SCA/CCC Type programs

Pettiness and competition for federal funds

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Waiting in line for free resources/programs

Liability

Time to develop programs and develop leaders, finding time to get outside

No universal Environmental Education in Schools

Green Jobs and nature connection experiences

Land development patterns

Balancing protection - enjoy/conservate not interfere

Stream line regulatory process for stewardship

Disproportionate distribution of urban open space

Urban populations o Turf wars o Lack of resources (Don't allow \$\$ to get out of turf)

a. Fully fund LWCF - 21%, 353

b. Address current obstacles: access, culture, values - 18%, 312

c. Lack of education to explain value of resources, how to respect property, and how to do conservation planning - 17%, 280

d. Insufficient public information - 16%, 275

e. Loss of access through funding - 15%, 252

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

f. Limits on research - 13%, 219

1.) Maine's land ethic is in danger because of loss of access and not enough funding.

2.) Lack of funding. Lack of coordination of organizations. Need to work across boundaries.

3.) Political ideology - even though an opportunity may arise with public support, it could be blocked by public ideology. Group ideology - some people have idea of what some piece of land should be used for, all are opinionated and different groups have different meaning of outdoors. Public policies are written for the west - need a flexible federal approach so ME can understand how to fit into national opportunities. not everyone understands the concept of public lands (little state and national public lands in ME). Need right mix of public, political financial support.

4.) Limits on research - money, time, and infrastructure. School curriculum requirements create environment of competing demands and priorities. Federal landowner liability (not an issue in Maine).

5.) Focus on removing large obstacles - make it easier for people to access the outdoors. We need everything from a shift in cultural values, to removing negative media hype about the outdoors, and public infrastructure. Low income population presents cost barriers. Lack of understanding conservation (something is being taken away). Need to make outdoor recreation a destination.

6.) Entry level deterrents/obstacles such as insufficient public information, entry-level knowledge, mentors. Funding for people who steward resources and deliver recreational programming. Fear of change and of federal government. Societal hurdles - lifestyle, technology, access, etc. Lack of coordination across sectors (transportation, health, and conservation).

7.) Education to explain values of resources, how to respect property, and how to do conservation planning. Money - need funding. Need incentives for private access.

Poor air or water quality issues don't encourage conservation or affinity.

Changes in family structure, such as single parent households, create fewer opportunities for getting out with families. Kids may not get connected with the grandparents' farm, for example.

More work hours in America shortens recreation time.

A lack of commitment to stewardship, or to ethics. Not getting landowner permission for hunting, for example.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

A few people's lack of common sense or respect for the land can shut down access for everyone, including proper users.

The Land and Water Conservation Fund (LWCF) is used nationally for federal land acquisition. Most counties in Wyoming have laws opposing net gain in federal land.

Children go outdoors less than they used to – they watch TV. My parents used to send me outside. They didn't allow me to stay inside.

We have to potential to love our wilderness areas to death.

We can think about natural systems and social systems—what falls short is the education piece-- the connection between the two

There is a stigma of land managers vs. private landowners. Cultural friction.

There is a perception that it's expensive and takes lots of equipment to get kids outside.

There's a diminished societal acceptance of risk. There is an aversion to risk and expensive associated litigation.

Commissioners outlawing certain types of animals in Fremont County, such as wolves and bears—politics work against much of our wildlife.

Emotions run high.

Individual organizational goals are place above those of the county.

When people whose wages come from tax dollars lecture ranch owners about Coordinated Research Management Programs, it wears on ranch owners. These are conflicting priorities. Fewer farmers or ranchers that have sizeable property, so this creates pressure on land owners. As landowners, we are only caretakers for a certain amount of time—it's not really ours. The world has more needs with the same amount of finite resources.

I'm now losing sheep to predators in broad daylight, and that hasn't happened for the 33 years I've been doing this. People need to see that things are shifting wildly.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Teachers are burdened with limited time, there is a high cost of insurance to get kids outdoors, there is too much paperwork to develop and maintain school and extracurricular programs for kids. These programs take a tremendous amount of work and energy.

The mining, gas, oil, uranium, and coal industries.

The lack of a central clearinghouse for program access, or rules for various types of access. We need a one-stop shop for all of the information, as well as better outreach and resource sharing.

We need a better structure for transportation – it's hard to get kids transported to the outdoors.

In just a generation or two, a remarkable amount has been lost. Reservation youth often haven't ever fished in their lives.

Safety and money inhibit us from taking out groups of kids.

Access to transportation limits group activities.

There is a disconnect with between people's food and where it comes from.

Regulations limit what families can do together, like collecting firewood or cutting poles. Now you just buy all this at the store.

Media sensationalizing the outdoors, with extreme and crazy survival stories, making regular nature seem boring.

Bad press, like bear attacks, instill fear.

More bears and wolves make families more cautious.

The economy makes it harder to buy and use ATV's limiting parents' ability to take kids out

Cultural shifts deter people from outdoor experiences, these are hard to change

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Trail crews lack knowledge and experience to do their job correctly.

When a decision is reached by a land agency regarding natural resources there is a vocal opposition. Agencies' hands are tied and nothing happens. For example, with timber management, there are acres and acres of dead trees that aren't being logged.

There is political polarity on sustainable use, with two extremes as the only possibilities. No middle ground blocks sustainable management.

As fishing and hiking are easy for us, there is a reluctance to teach too many the trade.

It's fine if people want to get out, but don't show them our favorite fishing spot. Once-secret areas are now in marketing materials. Bringing people in droves.

While less people are going outside, some places are being more impacted.

The education system doesn't recognize the legitimacy of outdoor education. Outward Bound doesn't count for school credit.

We are so convenience based -we need things quick. There is no interest in the outdoors. There is no good draw away from technology. But technology can help fix this.

There is a lack of access to public lands in this state.

There is inconsistent leadership at the federal level. Though it's great that the current Administration is advocating for outdoors, there's no follow through. In two years there might be a new focus.

Numerous environmental terrorists are harming the health of our forests.

We can't have a timber harvest to combat beetle kill, so there might be no solution. This might be something we may not be able to stop. We are looking too much at right now and not 100 years from now, when there could be benefits to what is going on right here right now. We can't prevent everything.

There's no real focused, multi-agency effort, on providing educational opportunities that teaches kids about and in the outdoors. Agencies have different foci.

Kids are more computer-oriented. They are afraid to go outdoors.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Time management of individuals, and the scheduling of free time. Electronic interference should be limited.

There's not enough transparency in federal planning.

Youth are bombarded with consumer advertising, which drowns out the call to go outdoors.

Deferred maintenance projects at parks reduce their appeal.

Youth don't even know about this stuff! Communication is insufficient.

Events don't always make it clear that kids are welcome.

Parents are afraid to let their kids play outdoors, and they over-schedule their kids' time.

Many teenagers are so involved in activities/sports (overachiever lifestyle) that they don't feel they have time to go outdoors.

If it's not scheduled, it's easier to play a video game

People do not lobby actively enough on an individual level for our government to address these priorities.

Our educational priorities, such as a focus on high-stakes testing, do not allow for enough field trips. We would probably produce more scientists if we connected students to the natural world.

Many communities are not structured to enhance exposure to outdoor opportunities (bikeable/walkable, signs, etc.)

The session was clearly marked by emphasis on the importance of access to land, both to sustain our economies and maintain our active lifestyles and cultural heritage. Regarding federal involvement in land management and formal protection of public land, we heard both ends of the opinion spectrum. Many expressed strong desire for less federal government control and no more additional protection (e.g., Wilderness designation) as a means of improving access. Others supported the concept of additional protection to encourage more recreation access and relieve pressure from extractive uses. A common theme involved the need for more consistent and clear regulations and administrative processes to remove barriers for visiting the outdoors.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The topic of education was dominant in two primary realms: education that facilitates visitation for all people, and school education that exposes children to the outdoors at an early age and provides the tools to become lifelong recreates and appreciators of the land. Attendees consistently expressed the concern that many don't visit the outdoors because they don't know where to go, what programs and resources are available, or feel they don't have the skills to do so safely. People almost unanimously agreed that our existing education system fails to introduce children and youth to the outdoors in a way that connects them for life. The importance of parents in exposing their children to outdoor pursuits is seen as critical, and conversely the role children can play in involving their entire families in the outdoors is also important.

Participants at the session told numerous stories of effective partnerships at a local level that utilize existing resources and organizations to connect people to the outdoors and conserve open spaces. Sadly, many stories ended with reports of partnerships dissolving due to resource scarcity. This region, like others, is blessed with incredible talent, motivation and capability. Coupled with adequate funding and resources, these efforts could be sustained over time to significant long-term positive impact. Many conversations focused on building and sustaining partnerships between federal agencies and local school districts, and also incorporating non-profit groups, outdoor education institutions, and local businesses.

Open field trips to ALL schools. My brother did a field trip at his elementary school, but I didn't get to do that.

Federal land management agencies don't work, the DEQ and EPA don't function well because there is no one there with the know-how. Public lands need to be return to the public, and the public should own and manage public lands, few folk left that know how to run the lands.

It is hard to balance our need for industrial development of these lands with my love for these lands. I drive a car. It has an impact. To best address this, we need to be smart with our impact. And balance development with protecting lands.

Getting kids outdoors! You need to get them there. Children age are 8-10 open to the strongest impact. It's a problem that they can't get enough kids to go to the park.

No child left behind is forcing teachers to find the most objective parts of education, and forcing them to teach to the test. Funding is tied to whether student know facts. It need to need to change. Students love to learn outside.

Communication between public lands folks and the public could be better, and many forms of communication should be used.

The system has rid itself of good teachers that would take them outside. Access to our youth is biggest and school system don't provide funding.

People are close minded; they ignore all of the issues, and they need to open their minds to get anything done.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

People are getting lazy, sponsored by technology

In the olden days, we just got kicked outside to go play. We weren't going on sponsored ski trips. That seems to have gone away.

From a young age parents are placing children in front of TV's, they making it a babysitter and a reward.

News from the TV only reports about death in the outdoors.

A lot of parents are holding down many jobs, they have to feed their kids and regroup for their next jobs and the solution is plop them in front of the TV. I was amazed at how many children had not been up sinks canyon (8 miles from town) to go on a hike, feed the fish, etc.

Some outdoor activities are not fun when you are out of shape and over weight. Skiing is not fun when you are out of shape.

Poor nutrition and lack of activity is a deterrent. Parents aren't paying attention to this.

School food is bad, and bad for you

Teachers will cancel field trips, like a trip to Yellowstone, as a punishment.

Young children aren't going on as many field trips.

PE teachers in Wyoming should be able to run an outdoor field trip.

Limiting youth access to cell phones and TV, as they are a barrier to kids' going outside.

Improving communication. This includes two aspects. First, communication between groups and agencies about what is working and what is not. Second, between groups and the public, where better messaging, promotion and advertising can make a give difference. In some cases, opportunities exist for people underrepresented in the outdoors (like inner-city kids) but they do not get the message.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We need to focus on cultures in big cities. Amazing at the boy scout level, few scout masters knew the animals in Wyoming. Takes dedication. We can figure out ways to manage land for the best uses; we live in a small population, and there's no need to have every use on every acre of public lands.

Public lands belong to the state, but the state asks the feds to manage it. The federal government should discuss land management with locals, and communicate at a local level.

A lot of groups don't want to be educated. The federal government should look for right ways to manage lands, and recognize individuals that are experts.

Kids don't show up, and don't have outdoor activities as a priority. Can we create an incentive for kids to volunteer to build trails, etc.?

Wilderness classification is bad, and the Wilderness act is outdated. It's designed to keep folks out of the wilderness. It's protecting disease. The federal government should aid local communities to restore forest health.

There is a lack of resources and support for winter outdoor activities. People don't have the training or equipment necessary for winter recreation.

With folks migrating to urban setting and a flagging economy, more folks are heading outside when they take trips. We need to be doing more outdoor education within the public in the school system, but it should be slow, and not widespread.

There's not enough MONEY!

There's not enough access.

Educational priorities, i.e. curriculum and funding, are an obstacle to outdoor activities.

USFS needs adequate funding/personnel to support partnerships to the fullest extent possible. Volunteers are turned away because there is not enough staff to train and assist them.

Some schools have no PE program. Some school have not sports at all.

Hard to get kids transported TO the outdoors - need a better structure for transportation.

Too much federal government interference in local issues.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Money is a barrier – people can't afford to drive, or to pay entry, or leave the city.

Sheer numbers of visitors impact the environment and other people's experiences.

People don't know how to act or what to do in the outdoors – there's a lack of education and experience.

There are complaints about the new Forest Service travel management map – it doesn't really let people see what's going on. The map is so poor. It's easy for me to get confused. Then, if enforcement is hard edged, that's a turn off for users.

Provide opportunities to a wide spectrum of users- conflicts are bound to happen. There can be a push to create duplicative trails, which is a no good.

Mineral development, like oil, gas, and uranium, creates a challenge to recreation and conservation. Extraction creates impact. Example might be Sublette County's Jonah Field, which wiped out historic antelope hunting.

Youth lack good outdoor role models.

Media sensationalism, such as bear attacks, focus on the scary, bad aspects of the outdoors.

Social structures that are indoors encourage young people hang out at malls or online. We need to build social structures that include the outdoors.

Poor maps and confusing characterizations/land classification by the federal government, like class I viewsheds or "special recreation areas," pose a challenge.

There's a lack of credit to land owners. The federal government has already decided to be recreation focused. But programs that help recreation have a negative impact on landowners.

Wyoming Conservation Corps has been very successful. Why not promote that on a national basis because kids involved in that can earn college credits and get a healthy stipend.

Roadside access points to beautiful places and fishing areas work well. We would like to see more pavilions and picnic tables and more family friendly places that would encourage families to get out.

Education and coverage of existing resources. How many miles of trail people do have access to and what do we already have in our backyards?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Government regulation is a double-edged sword. If you look at list of things you can/can't do and where you can/can't go, it's government interference basically.

Funding. There is a lack of education about how you treat public spaces. People don't realize they're paying to fix what they just broke.

A lack of money. Money to keep trails open, keep them passable.

Money that is collected on local basis must go into the ground, not into some black hole someplace. Keep funds raised locally local.

Vandalism and destruction of public structures by public. Money does go into fixing these things, pumping outhouses.

The media portrays the idea that as soon as children walk out the door, the boogeyman is going to get them. The media has not done us any favors. Parents are paranoid and scared to let their kids be kids and have opportunity to be outside. Don't throw crimes against children in our faces every day.

Media doesn't cover recreation. "If it doesn't bleed it won't read." Examples of media over coverage include bear attacks, lyme disease.

Level the scale between actual versus perceived risk.

Multi-use. Trying to make every group happy is impossible. Every group wants more and is willing to give less.

There is a lack of volunteerism from the users.

The lack of a clear understanding by volunteers makes them unreliable and problematic. They come and go as they please.

New additions are considered sexier than maintenance. This is a challenge.

The Good Ole Boy Attitude pervades decisions.. We did it this way and we won't change. There is a reluctance to change.

Deterioration of our infrastructures is a challenge.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Fear factor - urbanized folk are afraid of the outdoors, need a guide.

The desire to find solitude is at odds with the increased crowding of outdoor places.

We need to protect places from the people who enjoy them.

People don't want to work to have fun, and there needs to be a way for these people to access remote areas.

Kids can't recreate on their own - educate parents

Tough economy makes expensive weekends harder to do for families.

Major obstacles to advancing a 21st century approach to conservation include the following. A) The Need for Full Operational Funding for the National Park Service. Compared to the overall federal budget, the Park Service is very small—only one tenth of 1 percent. Providing Parks the funds needed to serve visitors and protect resources is a tiny investment in our national heritage, and provides economic benefits and jobs in struggling communities nationwide. A recent NPCA-commissioned report, *The U.S. National Park System: An Economic Asset at Risk*, found that the National Parks generate over four dollars in value to the public for every tax dollar invested by the Federal Government.

The President's 2011 budget request for the National Park Service is approximately \$2.7 billion—a decrease of \$21.6 million over the current fiscal year 2010 budget. Within the total budget, nearly \$100 million in park programs are reduced or eliminated—including Save America's Treasures and Preserve America grants—and parks are left without funding to pay for cost of living adjustments for staff. The operations budget proposal does not come close to meeting the \$100 million request by the National Parks Second Century Commission, and is insufficient to maintain current park operations and visitor services.

As recommended by the National Parks Second Century Commission in their final report to Congress and the Administration, NPCA is advocating for a multi-year commitment that reduces the operations shortfall by at least \$100 million per year, as well as an additional \$500 million to meet the construction and maintenance needs of our National Parks. First and foremost, the President and Congress must support operations funding for the National Park Service, sufficient to meet its' needs.

## Discussion Question 2

***(cont.)***

In spite of these successes, the LWCF program has been dramatically underfunded. Every year, \$900 million from federal Outer Continental Shelf (OCS) drilling lease proceeds are supposed to be dedicated to the LWCF. But the full funding of \$900 million promised by Congress has been reached only once since 1965. Congress has diverted as much as \$17 billion -- 85 percent -- of the Fund's dedicated revenue for projects unrelated to conservation or recreation. Over the last eight years LWCF funding for federal land protection has dropped over 70 percent, hitting a low of \$130 million in Fiscal Year 2008. In order to preserve America's treasured landscapes and places of national significance, it is essential that the President and Congress fully fund a mandatory LWCF program. Current events in the Gulf of Mexico make keeping this promise more important than ever.

A major issue for the Parkway is the fact that, while the Park encompasses only 82,000 acres of public land, it has more than 1,000 miles of boundary to manage and interacts with, 500,000 acres of scenic landscape outside its boundary. The Parkway was designed and created to maximize scenic views and give visitors the impression that they are in a park with boundaries to the horizon. Over the years, population has increased and development pressures have grown, such that today it is a real possibility that many of the scenic views and defining landscapes that make up the visitor experience could be irreparably marred or altogether lost.

Cities are where economic, political, and intellectual capital is concentrated and where public opinion is shaped. Law and policy emerging from urban centers will increasingly determine the fate of biodiversity far from their borders. This law and policy for a community, a country, a planet may be grounded in the values and experiences of an urban population. Will outdoor experiences be among them? Author Richard Louv suggests not, unless we can develop an effective remedy for the phenomenon he terms "nature deficit disorder." Outdoor experiences – a connection with the natural world – seem no longer be a primary part of growing up.

While perhaps not unique to urban youngsters, the disconnection from nature is certainly related to the opportunity – or lack of opportunity – to experience nature, which may be more acute in urban areas. Protecting and restoring nature and the opportunity to experience it will be of increasing importance if we hope to develop a citizenry that broadly shares values of a natural world, whether we label it conservation, ecological literacy, or biodiversity. In nature-filled cities may be the preservation of the wild.

- The traditional view that natural resource conservation and outdoor recreation are interests that compete with economic prosperity, and cultural and social development is a false paradigm

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

· The Departments of Interior, Agriculture, Transportation, and perhaps others, need to develop and resource a “Sustainable Communities Program.” AND wherever, self-organized partnerships evolve that include local, state, and federal agencies, farmers, sportsmen, environmentalists, business interests, and educators, AND they can cast a common vision for their natural resource future, AND leverage local human and financial resources, (a good example is the Chicago Metropolitan Agency for Planning’s GoTo 2040 Plan), federal funding programs need to be “de-siloed” and local priorities should be allowed to drive resource management and funding decisions.

I’ve been in environmental education for about 20 years. We have a generation of children who are being raised by caregivers who were not outside themselves much when growing up. Also, children today have an environment in which it is easy to stay inside, and with parents and caregivers also inside, it’s even easier. So how can we get them outside? We need more places to go, in our backyards and neighborhoods. Second, we need to work on outdoor education, and to help caregivers’ get over their ambivalence about getting outside and how to do that. We need to reach children and their parents.

I also represent Eden Place Nature Center in Chicago. Everything we do is close within the community, and I think we need more investment in smaller organizations already operating in communities to make a large scale difference. We train youth, and pay them when funding is available. Allowing them the time to learn and come back the following year is what we hope for. We also recognize the outdoors is a personal experience and should not always be looked at as a quota. We work closely with the schools in our area to plant the seed with youth, implanting the passion and love and give them something they enjoy doing. That leads them to get their families involved. The Chicago area has a lot of park districts, but on the south side the park districts are not as cooperative as they might be. A lot of youth on the south side don’t have a place to go and we can provide that. And we can redefine ‘outdoors’ as a safe place between school and home.

The resource is significant but the picture is not all rosy—there are serious threats to the long term viability of this resource. Fragmentation, hydrologic alterations, invasive species, fire deprivation, development, and an increasingly disconnected public. These are familiar threats to natural resource managers everywhere.

Vast portions of the American agricultural landscape have had the hydrology substantially altered to efficiently move water from the land. This can significantly improve agricultural productivity and provide substantial environmental benefits, but can have unintended consequences to downstream water quality and quantity as it relates to volume and velocity. The application of drainage management tools and practices can be utilized to cost effectively manage surface and subsurface water in a manner that results in improved water quality, reduced flooding, added recreational opportunities, enhanced and expanded habitat conservation and, oftentimes, improve agricultural production.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

One of the most effective techniques to reliably improve the productivity of row crops is to improve field drainage. Doing so allows earlier access to the field for spring planting and reduces the likelihood of flooding once crops are planted. Unfortunately, improving drainage can facilitate nitrogen loss from the field. This robs crops of essential nutrients for growth and may make excess nitrogen available in undesirable locations like drinking water or marine estuaries. By managing the hydrology of agricultural fields it is possible to retain the positive benefits of drainage while significantly reducing nutrient loss. Production improvements can be supported, nitrogen losses demonstrably reduced and habitat protected.

Future listening sessions should be announced well in advance so people can plan their calendars and so interested organizations can assist in spreading the word. The website needs to be kept upto-date. It also needs to be kept simple. I have heard some complaints from people who find it hard to navigate. And while I understand and support the need for registration to make comments and to vote, I think it is not a good idea to have one's votes linked to one's personal profile for all other users to see. (I have no problem with the comments themselves being linked, however.) Of course, AGOI does not exist in a vacuum, and there are other issues which affect it, but which were probably beyond the scope of the listening session. But without an examination of these other issues, AGOI cannot be totally successful. Most important is funding, although population (which was mentioned at UCD) needs to be taken into account as well.

#### POPULATION

We can't hope to make outdoors accessible to everyone if the population keeps growing. We need to come up with a policy to minimize population growth and even reduce it. It's not just a matter of immigration, either, although projections seem to show that the bulk of future population growth will come from immigration and descendants of present immigrants. This is important for both urban outdoors issues like city parks and recreation areas and facilities as well as wildlands.

#### USERS OF PUBLIC LANDS

Land managers must remember that users of public lands are the owners of those lands. There is an increasing trend in which land managers view the public as customers, when in fact, American citizens are the owners of the land and the employers of the land managers. Even if the idea behind this thinking is to promote "good customer service," the thinking is backward. Land managers need to see themselves as "public servants" and act accordingly.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

#### LOCAL INTERESTS VS. NATIONAL INTEREST

The Administration needs to proudly broadcast its support for public lands, from the President and Secretary of the Interior on down, and at every opportunity. It was disconcerting to see Secretary Salazar say that land use decisions would be made at the local level in Utah when politicians and others in that state, representing a minority of Americans, voiced opposition to the

possibility of new national monuments. This is not to say that local opinions should be ignored, but federal public lands belong to all Americans. Only a small minority of Americans lives in those states having the most vocal anti-public lands attitudes, and this minority should not be allowed veto power over proposals and management policies that benefit the majority of Americans.

The history of land conservation issues repeatedly shows that in the long term local citizens see the benefit of conservation initiatives, even if they initially opposed a park or monument designation. For example, Utah's national parks are now among the crown jewels of the National Park System, even though most of them faced vehement local opposition initially.

#### ACCESS & MOTORIZED RECREATION

Not everyone can go everywhere. People need to face up to that simple fact. Therefore, not every group of persons should be given the same level of access -- not because they are less deserving as people, but because some methods of access are destructive of other important values. There have been proposals in Yosemite National Park, for example, to build tramways to the tops of Glacier Point and Half Dome so people can get up to the summits more easily. High levels of motorized access should not be allowed everywhere, because they are destructive of wilderness values, for example. Not every trail should be paved.

Off-highway vehicles should not be allowed free travel everywhere. In fact they should be severely curtailed, as they are destructive of habitat, solitude, and quiet. Furthermore, quiet recreationists-hikers, hunters and anglers, photographers, rafters, birders and wildlife viewers, cross-country skiers, and others-make up the majority of the users of America's public lands. Their desire for peace and quiet in the outdoors should take precedence over the noise of OHV and snowmobiles. OHVs and snowmobiles ruin the experience for them, but the reverse is not true.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

#### PARTNERSHIPS & CONCESSIONAIRES

There is a growing trend toward the development of public-private partnerships in the management of our federal (and other) public lands. While useful in the short term, because of funding constraints, in the long term these partnerships will tend to undermine the notion of public lands being the birthright of every American. Rather, the natural temptation will be to plan

around and for those projects that will attract private funding. And while this temptation might be overcome, it will take a special kind of land manager to do so. In any event, the commercial interests of planners must be always subservient to public interest and benefit.

A related topic is the role that private concessionaires play in the running of our public lands. Again, the public interest must take precedence over the interests of private concessionaires. Resource management decisions must be made on the basis of sound science and not private desires. Concessionaire fees must return a fair value to the agency since it is a public resource being exploited [or private gain (even while providing a public service)]. But charges to the public (citizens) should not be exorbitant, either, such that average citizens are priced out. Prices for lodging in the national parks are becoming far beyond the range of ordinary Americans to enjoy. A quick look at some lodgings shows the following examples:

Yosemite Lodge, mid-week, after Labor Day, \$208 minimum for 2.

Awaynee Hotel, Yosemite, 2 adults, mid-week, after Labor Day, \$498 for 2.

High Sierra Camps, Yosemite, (tent cabins, including dinner & breakfast), \$153/person.

Zion National Park Lodge, mid-week after Labor Day, minimum \$158.95 for 2.

Fees need to be reasonable for families to be able to camp, but the use of concessionaires, by the Forest Service in particular, to run campgrounds causes several problems. The first is that not only must campers pay the costs of maintaining the campground, they must also cover the concessionaire's fee to the government plus cover a reasonable profit. So campers pay much higher fees than they might if the government were running the campground. Secondly, concessionaires are closing "non-profitable" campgrounds earlier and earlier every year, whereas

the Forest Service used to keep campgrounds open, with bad weather being the more decisive factor. The trend toward concessionaire operations is depriving people of opportunities to enjoy their public lands in an inexpensive manner.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

#### OHVs & GETTING CHILDREN OUTDOORS

It was disturbing at the Davis session to hear OHV proponents say that OHVs are good ways to get kids away from their computers, and that as a consequence, more public lands should be made available for OHV use.

The idea behind getting children outdoors rests on at least two propositions. The first is that exposure to Nature is beneficial for children (and adults, too, for that matter). Nature is a wonderful way to learn about science, and increasingly, exposure to Nature is linked to mental health benefits as well. The second proposition is that getting children outdoors increases their physical activity, leading to physical health benefits.

OHV recreation may get children outdoors, but it does not get them close to nature. Instead the thrill comes from driving the machine. And OHV use does not promote physical activity. Far better for both purposes is to get children out hiking. (OHV use also exposes children to pollution from exhaust and to the risk of accidents.)

Overall, OHV use is not good for our public lands. The temptation to go off-trail is great, and user-created trails, once established, are hard to eradicate. Trails fragment wildlife habitat. OHV use contributes to soil erosion, and increasingly, there is evidence that the dust blows away, sometimes settling on snowpack, causing earlier and more rapid snowmelt.

The region is primarily privately owned in family ranches that focus on raising livestock. The traditions of that community are being rapidly lost as financial conditions, including government incentives, pressure ranching families to convert native prairie and wetlands to cropland. The U.S. Fish and Wildlife Service, Ducks Unlimited, and numerous other partners have worked for decades to preserve the remaining native prairies and rich habitat by helping ranch families retain their land as productive working landscapes for livestock and wildlife.

In spite of the progress of these partnerships in protecting this landscape, the ranching and outdoors lifestyles, and the nationwide benefits that the PPR provides, this vital region of America's Great Outdoors and the lifestyle it supports is being chipped away faster than it can be conserved. Ducks Unlimited encourages the Administration to support the efforts of these partnerships and enhance their abilities to protect these core national values by recognizing the PPR as a key component of the America's Great Outdoors Initiative, and by increasing funding to protect and restore this landscape.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

#### Farm Bill priorities

The Farm Bill and waterfowl are inextricably linked. The management of our nation's agricultural lands greatly affects duck populations, particularly in the nesting grounds of the grasslands and wetlands of the PPR. DU's approach to the Farm Bill is pragmatic: we realize that quality cropland should and will be devoted to providing food, fiber, and fuel for our nation. We also realize that not all ground is suitable for crop production. Some of it is too rocky, steep, wet, or dry to reliably produce a crop; hence, DU's commonsense approach of "Farm the Best and Conserve the Rest."

The remaining 22 million acres of native prairie in the U.S. portion of the PPR produce an abundant fall flight of ducks, geese, and many other migratory bird species from this country each year while simultaneously providing the backbone for a robust ranching industry. Unfortunately, this native prairie habitat base is being whittled away, the victim of drought-tolerant crop varieties, high commodity prices, increasing demand for food, and federal policies that encourage farming marginal cropland. The PPR has already lost 70 percent or more of its native grassland, and DU researchers have documented annual loss rates of up to 2 percent of this habitat in the heart of the "duck factory." This loss rate of 2% translates into the loss of 50,000 or more ducks each year, and means that 50% of the remaining prairie will be gone in about 30 years.

We must remove farm bill policies that subsidize the conversion of native prairie and wetlands, fully enforce swampbuster, make sodsaver mandatory, and take other policy steps to remove all federal incentives that encourage the continued conversion of our native prairies and wetlands.

Farm Bill programs such as the Conservation Reserve Program (CRP), which sets aside marginal croplands that provide wildlife habitat as well as conserving soil, improving water quality, and sequestering carbon, are particularly vital to the waterfowl populations of the PPR. The PPR has lost nearly 1.6 million acres of CRP lands since 2007, and another 2.8 million acres of contracts are set to expire by 2012. Biologists expect that the loss of this waterfowl breeding habitat will have a significant impact on waterfowl production in the U.S. Focusing some resources of the Wetlands Reserve Program (WRP), which compensates farmers and ranchers who retire flood-prone croplands and restore wetlands, on the PPR also would help to reverse the loss of these habitats and grazing lands. The key to both of these programs is funding-lack of funding keeps the U.S.D.A. from being able to enroll all those landowners who wish to take part in these conservation programs.

Access

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Knowledge of opportunities or simple familiarity of what activities are possible

School curriculum limits ability for kids to get outdoors. Field trips are limited by time and constraints

Extra-curricular activities (soccer, clubs, etc.) also keep kids from outdoors. Supervised activities are "safer" than outdoors

Parental involvement is a challenge -- programs like Scouts keep parents involved, Time is biggest issue facing parental involvement

Liability issues in outdoor programs

Loss of outdoor ideals through passing generations -- less people in each generation learning about outdoors, Loss of the "conservation ethic". Outdoor classrooms/education campaigns can help parents learn -- pass on to kids

Funding for recreation is not a priority (as opposed to agriculture, etc.)

Systems are not set up for effective partnerships. Many barriers/red tape in federal agencies. Agencies have lost trust of the people

Agencies are disconnected from each other -- causes confusion of the public. Disconnect between city parks and state/fed. Parks

Nature is not "cool"

Electronics and technology (with both youth and adults)

Media and society. Need to make outdoors attractive to people

Initiatives are good, but rarely funded -- can end up setting agencies back

"Traditional thinking" -- may have to totally rethink kids and outdoors

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Outdoor recreation can be expensive

Competition to outdoors from many other ways to spend time and money

Exposure of most people to outdoors

Lack of advertising from agencies

Marketing -- need to become part of media

There are "do'ers" and "watchers" -- need to find a way to get to watchers

The Need for Full Operational Funding for the National Park Service

Compared to the overall federal budget, the Park Service is very small ---only one tenth of 1 percent. Providing Parks the funds needed to serve visitors and protect resources is a tiny investment in our national heritage, and provides economic benefits and jobs in struggling communities nationwide.

First and foremost, the President and Congress must support operations funding for the National Park Service, sufficient to meet its' needs.

Lack of a Secure and Fully Funded, Mandatory Land and Water Conservation Fund

The opportunity now exists to provide landscape level protection for this corridor through the innovative use of a dual National Park and Preserve designation.

Thus an expansion of the National Monument would provide the medium for communicating a superior telling of the ancestral Muscogean story and its intersection with American history. Ideally, a boundary adjustment for the Monument would extend to the northern border of the Bond Swamp National Wildlife Refuge. It would include the full extent of the Ocmulgee Old Fields and as much of the Muscogee Traditional Cultural Property as possible.

- Access to existing public lands, not shortage of federal lands, is #1 issue why hunters stop hunting. ESA and "Sensational" criteria scores higher than access needs and should be changed

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Treasured Landscapes such as the Great Lakes and Chesapeake Bay need to be managed with a comprehensive ecosystem approach. Targeting alien species like carp is important, but non point source pollution, global climate change, and greenhouse gas emissions are far more destructive in the long run. We need to provide new legislation and funding to address these issues in order to better understand and manage for fish and wildlife welfare through adaptation, mitigation, and restoration.

Youth in the Outdoors: Programs designed to Engage Youth and get kids outside to explore and play should be continued and expanded. It is critical to get them out and light their conservation passion.

LWCF State F&W have hard time accessing State side LWCF  
Investment criteria should ensure State F&W should be eligible

The #1 issue threatening fish and wildlife populations is Habitat Loss/Fragmentation. The resolution needs to be at the State and local levels, not Federal. The federal role should be development and distribution of Awareness Educational materials provided to local entities.

There is a lack of coordinated Recreation Management Planning for FS & BLM. Recreational Shooting is often not explicitly protected in plans. There is concern that FS planning Rule may not protect recreational shooting, due to incompatible activities being approved nearby. The FS and BLM should designate Shooting Areas in the Plans.

- Hunting is under represented in FS Planning. States Fish and Wildlife agencies should be given official Cooperating Agency role, and not be treated just another public commenter.

Forest Health not just invasive species control, but needs to be more proactive. Aggressive management and control measures need to be taken in cases such as the bark beetle infestation in the West. It is not acceptable to just monitor and map the spread and document tree mortality.

Visitation at NPS areas is higher than National Wildlife Refuges and National Forests, but despite excellent interpretive programming by the NPS, they have not done a good job of interpreting the need for active management of habitats and wildlife populations. Visitors come away with the inaccurate impression that plant and animal populations never need active management. The NPS should improve this area of interpretation.

Urban Kids have to have local opportunities for outside recreation. Familiarity with the outdoors begins with threshold experiences in small “green spots” near home

Research shows that in order to successfully get people outdoors on a sustained basis, access must be available locally. Local opportunities and settings for outdoor recreation are critical.

Outdoor Communities must step up and become good mentors. The traditional model of youth being mentored by their parents or older friends and relatives is too often broken and no longer effective. We must all step up and pass along our knowledge and passion for the outdoors.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Many outside areas are being closed off due to liability concerns by the landowner. Is there a Federal solution to limiting liability? Capping?

Looking for coordination of all Departments and programs- Interior, HHS, Education, EPA, Agriculture, to team up in alignment to leverage limited capacities and provide better overall package of services and opportunities to States and Communities.

USDA and Interior should make better use of existing conservation package of authorities for new and innovative tax incentives to encourage landowners participation in recreational access programs such as USDA's Open Fields.

Prairies of N/S Dakota, important for nesting wild fowl. Loosing area pretty fast, ability to show how able to work with ranchers on working lands with easements. Currently, 600 ranchers willing to work together on conservation of 300,000 acres, looking for donors with matching funds to help preserve. Organizations like DU can effectively assist Feds and landowners by brokering conservation easements, but they need a more efficient system.

Call for education legislation with no child left inside, want to get kids out side reconnection

Prairie Pothole region, really need to look at a way to look at conservation in the 21st century look at places at landscape scale and adopt a model of public/private partnerships. Like to see fed to use all existing tools/programs that are currently formula driven, to create a new pool of funds to really help certain areas. National Fish Conservation Act must be passed into law.

Dep of Commerce, marine resource management, different approach to marine resources, but they are not learning from the lessons of Public Lands Management (e.g. successful Wildlife Refuge model).

Echo what everyone is said. Climate change is the biggest threat to climate change now and in the future. National adaptation strategy is important and urgently needed. LWCF as a conservation tool is an important part, and should be fully funded.

Prairie Pothole region is very important and at risk of being lost, and should be a designated Treasured Landscape. Key conservation programs in the Farm Bill should be focused on the Prairie Pothole Treasured landscape.

During the past 20 years there has been a dramatic increase in obesity in the United States. In 2008, every state in the nation had a prevalence of obesity 20% or more, with the exception of Colorado, according to the Centers for Disease Control and Prevention.

The U.S. Forest Service in its groundbreaking Forest on the Edge report in 2005 predicted unprecedented new threats to eastern forests from forest subdivision and development through 2030.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The report locates the top fifteen watersheds in the nation for projected future development in the East and anticipates that 44 million acres of private forest nationwide will be lost to development through 2030

The vast majority of eastern forests are privately owned and not protected from development

Less than twenty percent of eastern forests are currently conserved from development and major changes to eastern landscapes are looming

It is imperative that we continue to make significant public and private investments in forest conservation to limit and offset impacts from new development on our most critical forest resource areas.

I am writing to you to implore you to save Bristol Bay from a mining disaster. We have already ruined our Gulf Coast line with a massive oil spill. We cannot afford to leave our children a ruined country. The destruction that will occur is unthinkable. As you know Bristol Bay area is a treasure drawing many forms of wildlife, that require our protection to their habitat such as: grizzlies, wolves, seals and whales spawning salmon which are the linchpin of this glorious wilderness, supporting valuable commercial fisheries, indigenous people and a vast array of wildlife. Yet the whole system could come crashing down if giant mining interests get their way.

The only way these foreign mining companies can get at the rich gold and copper deposits located in this pristine area that we the United State people have preserved, is to extract this ore through destructive and pollution-producing hard-rock mining. At risk is over 1 million acres of public land. This land should be preserved for our children and grandchildren. What kind of a legacy are we leaving exchanging dollars for natural resources that once gone will never come back? I tell you this beautiful piece of natural beauty must remain in its natural glory. It is our duty as human beings protecting the earth to be excellent sheppard's of this treasure. I implore you to use your conscience and protect this natural wonder that we the people of the United States have inherited.

Think about it, do we want pristine areas with animals in their natural habitat roaming free? Or an open-pit mine that would be 2 miles wide (enough to line up nine of the world's longest cruise ships end-to-end) and 2,000 feet deep (enough to engulf the Empire State Building)? As proposed, the mine would generate more than 9 billion tons of waste held behind a series of massive earthen dams -- all of them taller than China's Three Gorges Dam and located just 20 miles from an active fault line. A proposed single accident here would be disastrous. But even the construction and operation of the mine could disrupt salmon migration and jeopardize the larger ecosystem. It's a risk most local Alaskans and United States citizens all over the country are not willing to take -- the true gold of this region, they say, is its fish and wildlife. I live in New England and feel strongly we need to protect this area. It is our duty.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

A study of mines similar to the proposed Pebble mine showed that 85 percent of them polluted nearby waters. The Pebble Mine proposal threatens Bristol Bay's clean waters, wild salmon, wildlife and traditional subsistence ways of life.

Public lands in the Bristol Bay watershed should be closed to large-scale metallic sulfide mining. Protecting habitat, subsistence and recreation resources should be the top priority.

VTC's initial reaction is that the proposal fails to meet some of its key stated goals. Second, the proposal probably marks the most profound overhaul of the North Woods economic and cultural fabric of all-time. As such, VTC is worried that far reaching decisions will be made within the federal bureaucracy, the uppermost levels of state government, and the preservationist group board rooms before the residents of the North Woods region have a chance to determine whether they are even interested in a complete overhaul of their current way of life.

VTC fears that NEFA's proposal is sending us in that direction again. NEFA's Draft Concept Paper speaks of 15 million new "conserved" acres in the Northeast, and recruitment of funding from private interests, such as those involved in the Champion purchase, whose policies are well-known to include all of the restrictions mentioned above. The \$2 billion proposal also suggests large federal land purchases. The timing of the proposal closely follows the Green Mt. National Forest Twenty-Year Land Plan controversy that rocked Vermont from 2003-2006. The outcome of this controversy resulted in 42,000 acres (65 square miles) of new federally designated "wilderness". As NEFA members know, federal "wilderness" designation involves many of the aforementioned restrictions associated with the Champion Lands purchase. The GMNF "wilderness" designation would have been much more expansive if the Vermont Traditions Coalition, the administration of Gov. Jim Douglas, ten forest host towns, and a plethora of other traditional interests had not fought the "wilderness" proposal tooth and nail including two trips by Vermont Traditions Coalition representatives to the nation's capitol. The Vermont House of Representatives even passed a Resolution calling upon the U. S. Forest Service and Congressional delegation to refrain from designating any new "wilderness" in the Green Mt. National Forest. Regarding the NEFA proposal, why would all the interests that have been victimized by the restrictions outlined above want to bring on a massive new injection of the same prescription? Why would they be interested in a drawn out highly technical, highly contentious public input process which pits ordinary citizens who want to preserve their current way of life against a small army of well-paid hired personnel associated with numerous preservationist groups?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

At present, Vermont includes the ever expanding 400,000 acre Green Mt. Forest stretching from our southern border all the way into Chittenden County on the Northwest side of the state .. There's a proposed federal Wild & Scenic designation stretched over a sprawling chunk of Northwest Vermont. In Northeast Vermont, there's the former Champion Lands and substantial expanses of easement lands. Plus, there are thousands of acres of state lands throughout Northern Vermont. Finally, VTC understands that there is a new proposal that has not been widely publicized to designate the Lake Champlain basin as a "Heritage Area." Do Vermonters and other residents of the great North Woods really want wealthy national preservation groups, the federal government, and state entities controlling much of the remaining real estate on the northern tier? The model NEFA proposes seems to be exactly that. While NEFA talks about preservation of the culture and traditions of the North Woods, the original Champion lands purchase and NEFA's Draft Concept Paper suggest that a restrictive model controlled by outside interests will once again be advocated by the controlling interests.

In addition to the 65 square miles of restrictive "wilderness" that Vermont's Congressional delegation added to the Green Mt. National Forest in 2006, there are 91 square miles of pre-existing restrictive "wilderness" in the GMNF: a total of approximately 100,000 acres. Plus, much of the remaining land in the forest is locked up in other restrictive federally designated categories. Timber sale acreage on federal lands throughout the country has nose-dived in recent decades. Due to an entanglement of procedural pre-requisites to any timber sale, the federal government doesn't even come close to "Allowable Timber Sale" quotas that delineate the timber cutting goals of the forest.

That's not all. While the State of Vermont's public lands timber cutting efforts have greatly improved during the last eight years, Vermont state government still falls woefully short of cutting even the available timber left after exclusion of cutting by "sensitive" land classifications. Conservation easements owned by preservation groups, whose mission is often hostile to timber cutting, also tend to sharply limit our open landscape's timber management potential rather than preserving it. Rather than supply "expanded forest products production and consumption" as your Concept Paper proclaims, federal ownership and preservationist groups ownership sharply limits timber product availability for the forest products industry. NEFA's purported solution to future forest products industry sustainability fails, and produces outcomes contrary to NEFA's stated goals.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The limits on timber cutting and termination of traditional access roads by the federal government and easement owners also discourage hunting. A landscape with reduced timber management depletes the health and abundance of virtually all wildlife species. Lack of access roads prevents sportsmen from using large amounts of the preserved land. Plus, restrictions placed on access roads, snowmobiling and ATV riding sharply-limit recreational tourism potential. The Champion Lands proposal often years ago, like your proposal, touts the eco-tourism potential of the public and preservationist group land acquisitions, but then proposes restrictions on traditional tourism opportunities such as fishing, hunting, and motorized recreation. It is no secret that, by far, the number one tourist driver of the Champion lands region economy is snowmobiling, yet the Champion lands purchases sought limitations on future snowmobile trails in the Champion region. The Nature Conservancy and Vermont Land Trust routinely try to terminate motorized recreation in easement lands that they acquire even if motorized recreation trails pre-exist the easement acquisition. Plus, the Nature Conservancy stops open hunting on lands it requires, and mandates "Hunting By Permission Only". Often times, finding out where to get permission and other impediments make what should be an unnecessary requirement even more difficult to comply with. Plus, TNC is quick to shut off "sensitive areas" to hunting (while continuing to allow other user groups to utilize these areas).

Like timber cutting, creation of recreational amenities on public land has nose dived in recent years. The federal government has created such a tangle of procedural prerequisites to recreational amenity creation that federal land managers have trouble creating such amenities even when they want to. Instead, federal trends demonstrate that closure of access roads, trails, camping areas, and other amenities is more likely than creation of such amenities.

The federal land management system also suffers from a revolving door of land managers. National Forest managers are routinely transferred to a different national forest location every few years thereby diminishing institutional knowledge and mission connectivity. Vt. Traditions Coalition opposes NEFA's advocacy of regionalism, because smaller bureaucratic entities such as the individual states are able to better manage their lands than larger entities such as the federal government. For many reasons, regionalizing the future of North Woods land management will create negative consequences for residents of the NOLih Woods. To the maximum extent possible, residents of the North Woods should remain in control of their land base. The above-referenced federal and preservationist group initiatives that have been completed or are being attempted already involve a dangerous amount of land use control being transferred from NOLih Woods residents to outside conglomerates and the loss of local control that goes with it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The federal government's appetite for restrictive land designations that cut off public access and use of public land shows no signs of going away soon. Major new "wilderness" designations involving millions of acres throughout the United States passed in the last couple of years. Now, proposals are already floating about for another massive national effort to add millions of acres of federally designated "wilderness" to the millions of acres of recently designated "wilderness" and the millions of acres of long-time "wilderness". Thus, the entities that NEFA selects to preserve the future of forest industry sustainability and traditional rural land uses, in fact, have a demonstrable record of failure to deliver on such promises. Furthermore, time and again, these entities have demonstrated an appetite for adding new restricted acreages that ban many of the activities NEFA claims they will promote. Fundamentally, there is no "end game" to the drive to add restrictive roadless acreages to the vast expanses of previously restricted lands.

NEFA's proposed \$2 billion, ten year acquisition of 15 million acres (23,437 square miles) of the North Woods sections of New England and New York does not deliver on NEFA's stated goals, and therefore, if NEFA's goals are truly as stated, NEFA needs to seek a different solution. The proposal needs to paint a realistic picture of its outcomes. What is actually being proposed appears to be a National Park. At present, Vermont Traditions Coalition has seen no indication that the people of the North Woods want to undergo such a wholesale transition in their way of life.

In the 1990's, a study commission thoroughly considered the desires of North Woods residents for their future. It is VTC's understanding that ideas along the lines of the NEFA Draft Concept Paper were rejected. The outcome of the 1990s study, if VTC's recollection is correct, calls into question whether NEFA should even be embarking on the herein referenced proposal. If NEFA insists on moving forward with the proposal regardless of whether it conflicts with the desires reflected in the 1990s study, then, at the least, a thorough public input process should be undertaken before decisions are made, not after. For a proposal as dramatic and far reaching as NEFA's Draft Concept Paper, a much longer comment period for public input and greater outreach than NEFA has used would seem to be highly advisable.

Rather than reiterate those March 31, 2010 Comments for you in the context of the Great Outdoors Initiative, VTC will simply include them here. VTC strongly suspects that the Great Outdoors Initiative is headed toward the same policy that's advocated by the Concept Paper. VTC therefore asks that you simply extrapolate the comments from the March 31 VTC submission to the Great Outdoors Initiative. If the Great Outdoors Initiative is headed in the direction of restrictions on recreation, timber management, and road access to federal lands or federal lands to be acquired, VTC's opposition and the rationale for it are clear. Based on the experiences of the last 12 years, both in Vermont and nationally, VTC does not trust the federal government as a landowner and strongly opposes land ownership interests being conveyed to private preservationists groups with restriction agendas.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

VTC understands the importance of the great outdoors and the need to reconnect the people with nature. More importantly we understand the importance of protecting Vermont's rural identity and traditional land use

practices which make Vermont as unique as it is. As more and more lands are being conserved in the name of the public good, the rigid, broad-based federal land restrictions that come with these purchases are taking away our way of life, piece by piece, year by year and in essence discollecing people from the "great outdoors".

These federal land restrictions have worked to displace hunting camps, shut down snowmobile trails, outlaw all motorized use, ban horseback riding and mountain biking, close off road networks, shut down timber harvesting, end fish stocking, and on and on. These federal restrictions and ever changing land plans cater to, in many cases, unnecessarily to only a small user group. VTC believes all forms of recreation are important. Not only to the people who visit, but to those who live there and depend on recreation to fuel the economy. These broad-based restrictions that are filtered down from federal agencies working in conjunction with wealthy, national, extreme environmental organizations work to only disconnect people from nature, local economies and divided recreational user groups. Battles over land use can create great distaste, ripping local communities apart over unnecessary federal restrictions. VTC has witnessed this firsthand. When the federal government worked with the Nature Conservancy and the Vermont Land Trust to conserve the 126,000 acre champion lands timber company lands as part of the Silvio Conte Refuge system, they coined the lands pristine. Yet, they strived to remove the people who cared for the land for generations. A decade later those scars are still not healed.

Working forests provide many public benefits. These forests provide clean air, clean water, forest products, wildlife habitat, recreation, jobs, renewable energy and help mitigate climate change. Forests are as important an infrastructure to our country as roads and bridges. Here in New Hampshire, as in many other parts of the East, the majority of these working forests are privately-owned. Unlike public property, there is no guarantee that these lands will stay in forests.

New Hampshire is one of the fastest growing states in New England, yet it remains about 84% forested. As the economy picks up we will see a renewed threat from fragmentation and conversion. We must act now to protect these private forests, for once they are gone it is too late. I applaud the Administration for this initiative, and I look forward to important things happening as a result. Thank you again for seeking input.

## Discussion Question 2

### ***Written & Online Comments***

As an agriculture professional, the food statement is completely uneducated and off base. It was written by someone who obviously does not understand how food is really produced and how natural resources are managed in the real world.

In Massachusetts, OHV enthusiasts are the only user group that pay fees for recreational use of public lands. yet we are the only user group that is regularly ignored in the process. Land closures focused specifically on the OHV user group happen regularly without comment of any kind. Currently OHV use for the type of riding i do (ATV) is limited to 2 state parks in all the state of Massachusetts. There was never any comment period, open hearing or notification. I am limited to two parks almost 4 hours drive away. This does not constitute fair representation by D.E.M officials and more than just being exclusionary it is downright discrimination against the one user group that is REQUIRED to pay a usage fee in the state. Almost cause for a class action lawsuit.

To clarify a statement above, OHV users are the only user group required to pay a usage fee, collected by means of a sales tax and yearly registration. Other user groups pay fees at certain parks but they are voluntary in that the user can find other parks with no user fees.

Further restriction of public lands will only concentrate the use into smaller and smaller areas. Before long those areas will become undesirable wastelands from overuse. Responsible management by user groups with limited involvement by government is the best way to ensure the well-being of public lands. The public is very capable of good stewardship and responsibility for the conservation of the natural resources which are ours by right. Using wilderness designations to lock down public lands breeds suspicion of the government's motivation. Conservation and scientific study groups are welcome in these areas because they help maintain their wild nature, but not with the motivation to restrict human access. There are countless examples of user groups throughout the country which have successfully maintained and improved sensitive areas with multiple users. Rather than sealing up these areas to access to us and our posterity, preserve the freedom of everyone to access these areas for recreation and our appreciation.

We do not need more Wilderness. There are other methods to conserve large areas without Wilderness, such as National Recreation Areas or Backcountry designation, which conserve land but still allow access. I can count on one hand the number of hikers or horsemen I've seen while riding some of the country's remote trail systems....Wilderness shuts out everyone but them, and they end up with vast tracts of land that most people won't or can't go into. Backcountry designation keeps the land accessible. No more Wilderness!

As George Santayana said: "Those who cannot remember the past are condemned to repeat it." Keeping history alive and available to all of our citizens is very important for our continued education on our past mistakes. Civil War battlefields remind us in a tangible way of an important (some might argue THE most important) part of our history.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Most people who use off road vehicles already have a drivers license. It is not their driving safety and skills that are being challenged, it their common sense. Just because someone invested in an off road vehicle does that mean we have to provide them with a place to operate their vehicle? The vehicle does not come with any other licenses or permits to operate it on the open land, range, or mountain region and destroy it. If someone purchases such a vehicle it should be assumed that they own their own tract of land to operate on. It is not our responsibility to see that their have a place to use their purchase, I don't care how much it cost. What is wrong with off roading with mules, horses, mountain bikes or feet?

The NJ Pinelands National Reserve (The Pine Barrens) was regonized as a federal and state treasure back in 1978 by the United States Congress. In 1979 New Jersey passed the Pinelands Protection Act and established the Pinelands Commission in 1980 to monitor the areas growth and protect 1.1 million acres of Pinelands in South New Jersey. After 30 years development has been monitored but nearly nothing has been done to protect the area from people who want to deposit their refuse in it or tramp over it in their off road vehicles. The area is not one bit user friendly. The citizens of NJ have very limited access and almost no facilities for recreation such as hiking and exploring. Few of the roads are usable or marked and there are few access/information points available. People who want to explore and get out into nature are pretty much left to their own devices. The State of New Jersey invest little money or time into this ecological gem. By making a large part of it into a National Park it would insure that it is kept safe from those who want to use it for their own personal dumping and playground and open it up to the citizens of NJ and the United States. Such a designation would also help to further insure that the flora and fauna, some of which are endangered and rare, are more readily protected.

\$1000 per barrel of oil and \$1000 per ton of coal should be added to the lease price of any public land oil or coal lease to cover the cost of health care for millions of people whose lungs are damaged by burned fossil fuel, for the cleanup of environmental pollution and for the ongoing damage to the whole globe by global warming.

A few environmental groups seem to have been hijacked by the corperations they were supposed to watch and help protect the environment against, so being a so called leader of one of these groups may not be a good litmus test for choosing heads of agencies like the FWS. On the other hand, the environmentalists who have a proven track record of caring about wild places and who have fought in the courts to uphold environmental laws for little or no money; absolutely and of course they should be at the top of FWS, BLM, USFS, etc.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

A lot of emphasis has been placed on saving the Amazon rainforest in order to offset carbon emissions and reverse global climate change. This is a popular idea among utilities in the US because it is fairly cheap to buy land in the jungle and it causes no pain to utility users here. However, it is not nearly enough to save just one old forest. Global climate change is everyone's problem and is going to require way more than a drop in the bucket approach to fix it. We should be saving every large swath of old-growth forest on Earth and restore what we can as fast as we can. The economic consequences of not doing that are going to make the recent financial crisis look like a dollar stuck in an ATM, and the environmental consequences of inaction are going to make the Gulf oil spill look like a plugged toilet.

A more than adequate compromise was made between wilderness and non wilderness about 60 years ago when the national forests became giant logging industrial forests. If it's still roadless, it is rare and should be preserved as wilderness. It doesn't matter if you think it is not spectacular or that you think you could use it some other way. Just leave it alone. It doesn't matter if you ever see it either.

This has a lot to do with the great outdoors. GMO crops change the way the whole world of plants works. They are a threat to the wild just like any form of pollution is.

Certain people here on this blog evidently think that every kid in New York City should drive their car 2000 miles to the top of the Colorado Plateau just to experience what any one of our great grand parents used to be able to experience from the comfort of their homes. It's been 200 years since this whole country was a wilderness, that's 1.9 billion acres in the lower 48 states. Of that, there is less than 1 percent of that wilderness left and most of that is rock, ice and bone dry desert. Why is it so hard for some people to find value in preserving what's left?

Whether species are migratory or not, their habitat will be moving either north or south, depending on what the climate is doing. Because the problem is global, the Pacific Crest will be affected. In order to connect Mexico and Canada with a park on government land, there are not a whole lot of choices for boundaries. Your point about the freeway crossings is important. It was irresponsible to build interstate freeways that totally cut off migrations of animals, but that is done, so we need to figure out how that might be mitigated in the near future.

Our lower 48 states is 1.9 billion acres. I may be wrong, and I encourage you to show me the location of a million acres of contiguous forested wilderness in the lower 48. Please look at the landscape carefully in satellite photos before you respond. Rock and ice do not qualify as wilderness forest, nor do logged over lands.

Diversity is something that seems hard for loggers to understand. Fallen trees, even huge areas of them, create habitats that won't exist if people go around cleaning up everything that people think of as unsightly. Forests don't exist just for our ideas about what forests are. Any proposal to log in National Parks is a bad idea because untouched land is important to our understanding of the difference between natural condition and managed condition. If we don't have a way to measure that, we have no foundation for scientific analysis.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

For those of you who use google earth, take a flight across the USA at about 15000 feet and you will see that most of our country is divided up into ranches, checkerboards of farmland and checkerboards made by logging right up to property lines. Very little of the country is unfenced and most of the wild land is deep desert or solid rock. I am a supporter of property rights, but people who think of public land as part of their ranch are welfare ranchers who should quit leaching off taxpayers.

This post is about oil, gas and coal leases on public land and is not "off subject". It reflects a view held by many that costs to our society are not calculated carefully when public land managers decide on lease prices.

Get a better web designer, get a bigger computer, get a faster connection. This website barely works. I've brought it to the attention of DOI and nothing was done. If you want to have a lively discussion of the issues, make your website work a lot better. Otherwise, you're wasting everyone's time and you are definitely not helping the Whitehouse understand public land issues. This is the worst, most sluggish website I've ever visited. It's hard to log in, almost impossible to vote, you push buttons and they disappear and nothing happens. GET IT RIGHT!

I am always amazed at the crowd on this list who would execute all the wildlife just so they can "recreate" with huge machines. The term "recreation" is defined pretty loosely. I don't see any "recreation" in driving a noisy vehicle, shooting a gun, towing a house.

I can't believe that this country is dumping garbage in the ocean and burning it on barges at sea. Everything should be recycled. Everything should be packaged as small as possible. Nothing should go to waste.

I just want to remind you that this post is talking about a tiny, tiny fraction of the US. The lower 48 states amounts to 1.9 billion acres. If you don't like the concept of wild land that is left totally to nature, please visit any of the 1.9 billion other acres in the US. If you want nature with roads and cell phones, go to LA or New York city. That is nature too, and is totally accessible.

I keep hearing that a million acres is huge. Just because you can't count that high doesn't mean it's big. A viable population of most large mammals cannot live on a million acres. A million acres is a tiny, tiny fraction of the area of the United States. A million acres is nothing alongside the area affected by the gulf oil spill. A million acres is trivial alongside the area of the Earth affected by man made climate change. Wilderness areas are not set aside only for your enjoyment. They are a refuge for wildlife and plant species, a source of clean water and clean air, and a reminder of what we've already lost, which is 1.8 billion acres of wilderness here in the lower 48.

I looked for a definition of "Klamath" and found nothing except for the location of the river. The Klamath is imperiled by oxygen depletion caused by over fertilization by livestock grazing in the Klamath Basin in marshlands and then the water being stored and ripened in the man made lakes. Your attack against American Indian fishing is pure BS too.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I suggest to \_\_\_\_\_ that you utilize the potential that the internet gives you and research google maps satellite photos of our country to really understand that almost every acre of the USA except for the rock and ice are developed, fenced, logged, mined. Yes, there are many acres of bone dry desert and desolate mountains declared as wilderness, but that does nothing to stop the constant movement toward extinction of species who need moderation. How would you like it if the only place available for you to live was the top of a 14000 foot peak.

I think the biggest problem with OHV's is their ability to quickly destroy things when the people at the controls are not aware of problems they are creating. One of the things that is most offensive to me about OHVs is the noise. Why would I want to go for a hike and hear nothing but revving engines? The noise can be heard a mile away. When you are riding an OHV you don't even realize there are other people using the land for recreation. It appears you don't care, so I have no sympathy for families of OHVers or their fond memories.

I worked in a timbered national forest for many years. People who believe in letting fires burn and not heavily managing forests do not necessarily have "more money than sense" as \_\_\_\_ says. And we're not all insulated from reality in big cities either, as some people imply. And, when you write a letter, don't say we when you mean you. Rather than suggesting that your so called eco groups have the big bucks, and file lawsuits, look at the big timber big bucks and their lawsuits that threaten the government if national forests don't liquidate all the trees. Big timber is as manipulative and threatening as the mafia.

If it weren't for the right to sue land managers, the land managers would simply ignore the law. Laws are being broken. That is why there are lawsuits. On the other hand, why should the federal government subsidize mining, logging and ranching on our public land? Why is it so OK for the government to allow industry to become welfare recipients?

If you get rid of the subsidies for timber companies, you automatically help the recycling industry. I'm still amazed at how hard it is to get recycled paper. Stop giving welfare to the timber industry!

If you need to use your neighbors property so you can live in your space, good luck. Ranchers need to join the plight of all the rest of us. We have to do what we can to survive within the limits that are handed to us. Just because you own property and you call yourself a rancher does not mean that you have a right to use my property (I own a share of that public land) for your gain. Get real.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In the last ten years I'll bet almost everyone in the USA visited a national or state park. Most probably went to a naturalist program. I understand your desire to help folks understand the protected places, but this blog is filled with people who are misinformed and downright nasty toward what they call eco freaks. I've noticed over the years that there's absolutely nothing you can say to these people to get them to think about the world in a different way. No matter how the facts present themselves, no matter whether they have asthma and cancer, no matter that fluctuations in the weather get more radical or that cities keep eating their family farms or that oil keeps dumping into the ocean destroying their fishing. They just don't get it and they never will and park programs to them are just like watching TV or camping from the comfort of their motorhomes. These people are permanently, unalterably disconnected from the world they live in. They see the world as a cartoon where they are the only thing that matters. They don't want to know about the world, just want to use people like you and your park programs for their entertainment. I am going to call these people eco-phobes from now on and I hope you will too. And I will refer to the oil industry people as drill-huggers. I am going to make up degrading titles for each of these groups of people just as they have made up titles for people who care about the clean air, clean water and wild places. And, best of all, I will never support naturalist programs that entertain them or their kids between TV programs.

In the lower 48, wild areas are basically large city parks surrounded by clearcuts and mines. They are mostly polluted little things protecting values that humans find important like mountain tops and recreational opportunities. For the most part they can be walked across in a day and are almost unnoticeable from an airplane. They are almost never the preferred habitat of any species, are 99 percent rock or ice, never include the full habitat of any large animal. If you stand on one side of almost any one of these areas, you can easily see the other side of it. The philosophy of putting lines around these areas encourages people to think small and whimpish thoughts. Everything is managed by people for the benefit of people who think that their "use" of these wild areas is the only reason for them to exist. I don't mind that some small areas are set aside for the people who don't have time or the physique to go on major, thought provoking journeys, but there's definitely no room here for Lewis and Clark.

It cracks me up to hear the OHV crowd use the disabled American argument to support their case for more OHV trails. In my opinion, all of you must be disabled. You better get off your asses and go hiking or your bodies will atrophy and all you'll be able to do is watch TV. You are lazy. You are lame. You wish that was a disability. For people who are truly disabled, do you really want to be lumped in with these lazy lumps of fat who are using you as an excuse for their fat behavior.

It's not about protecting user groups, it's about wildlife.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I've seen fire fighters light a line along a road five miles from a lightening fire. The fires never did meet by the time winter rains came. This is arson, by my standards, and vandalism. It happens all the time. Fire is used by the government to increase funding for fire fighting. The size of fires the previous season is what dictates how much money fire control gets in the next year. It's not a good way to get objective land management. The National park Service should take over management of all the sensitive areas. Any area with a low density of roads on government land should become a national park and be managed with a great deal of respect for the natural condition of the land. There are a hundred such proposals made by the New National Parks Project.

Livestock does a lot of damage in some places, including spreading noxious weeds. That costs taxpayers a lot of money and degrades a lot of land for every other use. Cattle also stomp wet meadows to death and ruin the water quality in creeks. A lot of the land where cattle graze is city watershed. Cattle pollute the water so cities have to spend more on water treatment. Cattle also ruin trails for hikers, making them big and ugly with crap all over them and cattle hugely increase the fly population and kill all the meadow flowers. Ranchers on public land also poison and shoot carnivores that threaten their cows and sheep. That upsets the whole balance of nature.

Most of those roads were only there to get to large trees that have already been cut. With the nation wide concern about the decline in salmon runs, a huge food source of yesteryear, it would be more cost effective to remove culverts and outslope the road surfaces. You're blaming environmentalists for the problem. The endangered species act is an attempt to protect people like you and your families and friends from becoming extinct. The roads are a problem for the salmon and a bunch of other species. That problem directly affects your food supply. Wouldn't you rather have the fish than the thousands of miles of dusty roads that lead to stumps and brush?

Mr Evers, you need to stand on the edge of New York City and imagine the lack of native wildlife from sea to shining sea. I used to live in Montana and am aware of the rock and ice in the Rocky Mountains.

Much of wilderness areas are set aside because a lot of people consider those areas sacred ground. Just as I would not attempt to ride a motorcycle through your church, ORV and OHV users should not ride motorized vehicles through my church. If I rode a motorcycle through your church I would expect serious consequences. If you rode one through my church, you should expect what???

My great grandfather was a logger on the end of a misery whip in the redwood forests near what is now Redwood National Park. At that time they thought the forest was a never ending resource. It was considered a radical idea to preserve any of it. Now there is only a tiny fraction of the original ancient forest left and cutting even one tree can effect endangered wildlife. The radicals are now those who do the logging. All logging in old growth should end, even if the trees are fire killed snags or are dying from insects or disease. Big trees are a habitat type whether they are dead or alive. Any more, only a radical could cut an ancient tree.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Nature is basically a dictator and it's laws are inflexible. Governments who don't align laws carefully to reflect the laws of nature won't last for long. This is where we are getting in trouble with carbon emissions, ocean acidification, air and water pollution, over fishing and farmland destruction right now. We need to line up our law with the law of nature right away, or we are going to be extinct.

OHV use causes erosion, wildlife disruption and there is way plenty of land dedicated to this sport. It has nothing to do with wilderness and connecting the wilderness and OHV use is as ludicrous as connecting the Iraq war with American wilderness. In fact, if you want to ride around in an OHV, why don't you go to Iraq. Then you can do all the things you love to do all at the same time, and you can get paid for it.

Oran, The middle ground is long gone. There are 1.9 billion acres in the lower 48 states and only a handful of areas are roadless. By middle ground I assume you mean that a billion acres of wilderness should be set aside; right? I would agree with that.

Over 95 percent of the old growth trees in the US have been cut. Party's over.

I am in favor of new national parks, but there is no such thing as erecting a lodge and a monorail without destroying a roadless area. There are no roadless areas that are expendable. How about putting the lodge outside of the roadless area and making the park a little bigger to include a road that is already there. There are lots of national park proposals that do just that.

People think dogs are stupid because dogs only know 7 people words. Well...how many dog words do you know. Learn how to listen to the wildlife. They are saying plenty! Be a better listener.

Quit buying things from overseas that can be made close to home. Twenty eight of the worlds largest container ships pollute more than all the cars in the world. How? They burn tar and waste plastic and their engines are as big as coal fired power plants. Just over the horizon, out at sea, out of sight and out of mind, and as soon as they leave US waters, the smoke flows black out of their stacks, unregulated. A coastal breeze brings their acid haze onshore. If you have trouble breathing, don't go to the beach. Don't go to the parks. The sulphuric acid haze from ships is everywhere.

Rachel, You are absolutely right about starvation forcing people to cause environmental havoc. I think agriculture is required to produce way too much food today because people eat and waste way too much in this country. Also, hamburger takes a lot more land to produce than rice and potatoes. As always, living on Earth is a balancing act. In my opinion, this is the best of three alternatives I put forward, not ecotopia, but we may not go extinct in the next few years on this course.

this is not just about roads. It is about scenery devaluation, air and noise pollution, campsite crowding and funding for the maintenance of facilities.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Large vehicles take away from the national park experience. If I'm looking at the rear end of a huge RV, I can't see the view. If you can afford to drive around in a gas hog, you can afford to pay more to camp and drive on roads. If you do not support this, like I have said, you want me to give you welfare. I don't want to.

Scenario 1 - Money and business rule Business owns the government and all laws end up serving the largest corporations. Propaganda is all that media broadcasts, so, even though people think they have a democracy, they end up voting the way they are told to by the media, and the media is owned by the largest corporations. Resources are liquidated as fast as possible and conglomerating companies becomes the business goal. Soon there is a financial crisis and in a state of emergency the government declares that everyone will become slaves to the largest corporations. The only people who are allowed to eat decent food are the heads of the largest corporations. The rest of us get dog chow.

Scenario 2 - present course Money and business rule but large corporations allow a little voice by the little people. This is so the little guys don't think about rioting. Most people think they've got it pretty good, not being bothered by the government, so they go along with the program and let the big corporations have the vast majority of control. Resources are liquidated faster than is sustainable and the ocean gets over fished, oil becomes harder and harder to find, farmland becomes paved to make cities. Eventually, there is not enough food and people complain about costs, but the corporations make scapegoats for the worker bees to hate and they tell the workers that all their problems are caused by what they call enviro-freaks. The worker bees fall for the bait and the corporations keep on with business as usual. Eventually though, the resources run out and rioting and then civil war can't be avoided. Environmental problems like the gulf oil spill make it impossible to restart any economy, no matter what kind of government takes over.

some people support local control down to whoever lives next door. States are big and don't give a damn about what anyone thinks, just like the fed. Federal land is owned by all of us and the guy next door shouldn't have any more say about management than someone on top of a tower in NY, and states shouldn't have any more say than the number of folks who live in the state.

The government has done an absolutely awesome job of making sure these corridors have been destroyed, clearcutting, freeway building and allowing cities to grow between them. Restoration will be a big word in the 21st century.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The government needs to get out of the welfare business and quit giving extravagant amounts of money to people who spend their time lazing around wasting natural resources and when they should be out there working for a living like the rest of us hard working Americans. Every year millions of government dollars go to mining, logging, cattle grazing, auto companies, huge banks and oil drillers. The government builds them roads, leases land to them for almost nothing and then taxpayers have to come in and clean up their messes when they're done destroying the planet for their profits. And quit subsidizing OHVs and their high maintenance trails. And quit making big campsites in National Parks to accommodate people who waste gas and parking space moving their house around. Get out of the welfare business and this country would run like it was intended by our founding fathers.

The insect infestations of the present are rooted in land management activities of the past, like heavy handed fire control efforts caused by the Smoky the Bear sales pitch. Smoky the Bear was serving the logging industry and only the logging industry, snuffing every lightening fire that would have reduced fuel loading and insect populations, to the advantage of the production of wood. That worked out very badly, as you can see. But it's no wonder that there is a distrust of land managers because, really, they have not done a splendid job in the past, and I would say that there are probably many "manager wanna be's" who would not do a very good job in the future. The laws are conflicting because a lot of people have mixed feelings about the term 'management' and would rather just leave well enough alone, leaving nature to clean up the mess in good time. It's too bad, but that's the way it is.

The lower 48 states is 1.9 billion acres and only a small fraction of 1 percent of that land is off limits to OHVs. If you can't find somewhere to ride you're OHV in this country, you are not looking very hard. Maybe you are spending too much time watching TV or eating, or maybe you can't visualize small fractions. Quit your ridiculous griping about the lack of opportunities for OHVs. Your argument is absolutely absurd.

The more space you take up and the more damage you do to roads, the more you should pay to use an area of public land. If you use public transportation, or walk into an area, your fees should be minimal. If you drive in an F350 towing a trailer with OHV on the rear, you need to pay accordingly to the damage you are causing to roads, air quality, camp space, etc. If you don't like this idea, you are expecting people like me who live lightly on the land to support you and your heavy handed ways. In other words, you are expecting me to give you welfare. (and quit complaining about the backlog of maintenance in National Parks. Just pay the higher fees or quit damaging the roads.) Vehicle weight should be used as a measure of how much unnecessary crap you are carrying that you don't need.

The most common feature of our national park system is wet meadows between rock mountains. Horses can do a great deal of damage to these wet meadows in a hurry. If the national park system was expanded to include more robust grazer environments like the Great Plains, I would be in favor of this. As it stands right now, the wet meadows where horses would feed are taking a beating already.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The problem remains the same: OHVs, because of their weight, speed and their ability to get to places where no one else goes, cause damage that taxpayers have to pay to fix, a lot of damage. I don't care how many of you are responsible riders who do your best to mitigate problems. One idiot on an ATV can cause thousands in damage. I don't want to pay for that; not one time. But it wouldn't be just one time. Damage would amount to millions. Electric OHVs will probably be even heavier because of batteries. I look forward to the conversion because of noise reduction and no gas fumes.

The real costs of doing business on public land include damage to water quality, damage to wildlife habitat, damage to conflicting uses like dispersed recreation, and restoration. These hidden costs become a burden on taxpayers. Example: In the hay-day of logging in the Pacific NW, roads were being built by the government to access timber sales, where the roads were costing way more than the trees would ever be worth. Example: Miners pay almost nothing for mining claims and never clean up their messes.

The real costs of doing business on public land include damage to water quality, damage to wildlife habitat, damage to conflicting uses like dispersed recreation. These hidden costs become a burden on taxpayers and are never covered by fees collected from loggers, miners or ranchers. Period. Welfare is what they call it in other circles.

The reason our cultural heritage is important is because our distant ancestors were small in number and remnants of their deeds are few and far between. Now that there are 350 million of us in the USA, I wonder how much importance future generations will put on finding one more plastic piece of junk, one more chemical killed landscape. Will archeologists in the future think finding the remnants of one of our billion ugly buildings requires a closer look, or will it be more important for them to study a remnant of wilderness.

The reason the USA is a rich country is that in just 200 years we have consumed almost all of the resources of the entire Earth. We have built an infrastructure to get the trees and minerals to market like no other. The people who made the decisions to build and bulldoze had no guilt about what they pillaged to boost their profits. I live in a 3000 square foot house, though I dare say it's not as comfortable as the 400 square foot cabin I lived in for years. I would gladly live in a tent. We don't need all the crap that we're being sold. We need to gather things carefully from the land again, because there's not much left. We took everything, and in such a short time.

There are 1.9 billion acres in the lower 48 states. Less than 1 percent of that has wilderness potential. Go tell your problem to Lewis and Clark. You're fighting for the right to cut the last tree. Then what?

There is no such thing as seeing the "wilderness" from an ORV. If you are in a vehicle, you have changed the environment by your presence. You can enjoy the scenery, but you have made the wildlife run away, you have destroyed the solitude. There are lots of places where you can ride your ORVs. The national forest road system could stretch from here to the moon and back. Better yet, enjoy the solitude of downtown LA or New York City. Everything started with an ORV. Look where it leads.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

This country is falling into a deep hole created by the suction dredging of human minds for the profit of the video game and mindless entertainment industry. You are what you eat, so to speak. If you watch a bunch of crap, you are a bunch of crap. If you know somebody who is wasting their time watching TV all day and then playing shoot em up video games all night, break their computers. Throw their TVs in the garbage. Make them go outside. Get a life America. Your life is being stolen from you and replaced with garbage.

This idea that should be extended to all commercial uses including mining and logging. This is public land owned by all of us and in many cases taxpayers are subsidizing private company profits as the USFS and BLM, for example, build and maintain roads specifically to groves of trees that are then cut, or to mineral formations that are then raided. Taxpayers don't get good value for the resources and cooperations rake in the profits. And then taxpayers have roads to nowhere and need to maintain them.

This is a concept that would allow migrations of species and may keep plants, animals and fish off the endangered species list during the uncertain times of global climate change. If species cannot migrate as their habitat moves with the new climate, they will become endangered and their listing under the endangered species act will have a devastating effect on our economy. This is a very important topic and I hope the anti environment people will try to understand the problem before they place comments. It is expected that about 40 percent of species will become endangered over the next 40 years. I think that figure will be much higher. This will affect everyone's lifestyle. I guarantee it.

This may be a good idea for some people but I am amazed at what you say it costs to go camping. A sleeping bag is fifty bucks and a piece of foam is twenty. America. Go camping. It's a very low cost way to travel. You don't need to have the look of a sportsman promoted by Il Bean. John Muir camped on a rock with nothing but a wool blanket. He never complained. Let's see if America has the fortitude to do without now and then.

Thousands of high quality employers move their business to places where employees can find recreation in pristine areas. This makes business sense because employee health is very important to the bottom line. Air and water pollution do the opposite to company profits and degrade whole communities as workers are basically thrown away when they are too sick to work anymore. Those workers declare bankruptcy, go on welfare and need government medical assistance, all paid for by the taxpayers. The intelligent dialog is the hard thing to come by. I don't know if that is possible. I could listen to a conservative talk radio show and shortly would find the same quotes used here in this blog by someone professing to have gone on a fact finding research mission to the north pole. There's very little that will change the mindset you are talking about. A lot of people have been beating their heads against the wall for years trying to communicate with people who maybe don't have enough math education to even understand the numbers involved. How do you explain to a young worker that someday they will probably have cancer and will be thrown away if they allow their companies ruin the land with toxic waste. I really don't see why this is hard to understand, but for some people, it is impossible.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Under the Hetch Hetchy Reservoir lies a valley similar the the most visited recreation valley in the nation; Yosemite. Like Yosemite it has waterfalls, towering cliffs and it would have lush meadows and a meandering, clear river. It is truly sublime, has been inside Yosemite National Park for a hundred years, but someone nurtured ignorance and dammed the Tuolumne River and flooded the place. Tear down the Hetch Hetchy Dam!

Well, the industrialists win and I have to live in the mess they make. Congress pulled the plug on carbon caps, so as far as I'm concerned, we all get to watch global climate change unfold with no effort being made to stop it. And the enviophobes, as always, are going to find a way to rationalize it as "not man made" even in the face of massive evidence, so they don't have to take any responsibility for it. The enviophobe response when climate change firmly grips the economy and sends us permanently into a tailspin will be, as usual, a massive buildup of arms, which will, as usual, do nothing to solve any problem. Have a good time folks. Enjoy the ride.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I do believe that there is a time and a place of OHV use. I do. For instance I thoroughly enjoy the San Juan Islands and camping and hiking on them. Most people would not have the means to get a OHV to those islands but if they allowed it would ruin a truly tranquil environment. When I ride in the mountains out here, I am riding on pre existing roads that are allowed to OHV travel. It is not permitted to wonder of these roads unless it is clearly marked. I do think there should be areas that OHV's are not permitted but I still believe that the government should REOPEN ( key word) areas that we used be able to ride on. This would spread the riders out over more area and the OHV user/acre ratio would go down. Trail wear from OHV's would go down because of less traffic and there would be less disturbance due to less encounters on trails. In regards to the animal species, I agree. If there is something that only lives in that area and is having problems with human interaction, yeah, there should be restrictions. There are hundreds of thousands of acres of beautiful landscape that can be explored and experienced through responsible OHV use and hiking, skiing, etc. I think that more of these kinds of areas could be open for use OHV's and other forms of outdoor recreation, or at least the access roads that can get you to most of the good places to offset the closing of one area. That way certain areas don't get overrun with traffic. In regards to the funding; In Washington there had been a Act in place since about 1976 that helped fund OHV trail use and maintenance in Washington state. When the highway-fuel tax was implemented, you were able to apply for a refund of the tax for vehicles that were used off highway; boats, ORV's, tractors, etc. In this Act, the ORV user's agreed that they would give up their right to receive a refund on their fuel tax if the money went to a special committee (NOVA: Non-Highway and Off-road Vehicles) that would use the funds to better the areas for ORV use. This worked great. We would still pay for tabs on the bikes so the DOL was happy and we were happy that we had more funding to improve and maintain the trails. Over the years, the money started to get spread around to non-ORV groups. Wasn't the greatest thing that could have happened, but we still were getting a good deal of support funds. Then last year, the Act was voted out of use by the legislature and now it just goes back to the highway (as far as I know) and the NOVA committee would no longer be in place. As of last year I believe it accounted for about \$4.5 million. That is why I might seem a little bitter, and for that, I am sorry. Honestly I try not to get bitter about it because I can still ride my motorcycle and be happy. I am more than happy to try and work things out together, but I feel that this recreational sport has been somewhat ignored in this state, as well as others and I feel that it should no longer go over looked.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There is more than 80% of Washington's land that OHV's cannot use and everyone else can and that # has increased over the years. The OHV population has not shrunk and has actually grown in size. I agree that the states should really decide what is done and should only receive funding from the government to help states fund their decisions. That is still great but how much is strictly dedicated to OHV's like the NOVA fund was? We had the funding to help repair, add and reconstruct areas as well as open up the possibility of a new area to ride on before. Now with half the funding, the DNR is sitting on the Reiter foothills project. The Reiter area, which is one of the most popular areas in western Washington to ride, because it is taking longer than expected and as far as I am concerned it is costing too much money and they can't do anything about it with the amount of money they had. If the extra 4-5 million dollars was there to help, we might actually be able to have it open by now and be over running areas like Walker Valley ORV park, Gifford Pinchot, Belfair, Capital Forest, etc. All of the people that used to go to Reiter every weekend didn't just stop riding, they went somewhere else. Less area = more traffic. More traffic = more maintenance. More maintenance = more money (that we don't have). So by closing an area, we have created more problems that we have solved. In terms of the sound regulation, 96dB at about 2 feet (ish, correct me if I am wrong) from the tail pipe is the new standard in exhaust level regulations. That is pretty dang quiet, with my quiet core in my exhaust, it isn't much louder than your average Briggs lawn mower, of course not nearly as loud as the Harley Davidsons that cruise your streets every day with NO MUFFLERS!!! Between 80 and 90dB is the range of your average alarm clock and the noise heard while standing on a busy street. 90 to 100 dB on average includes your lawn mower, shop tools, and standing next to a freeway. An acoustic guitar played with your fingers can be in the 80 dB range. The MAX our bikes can be in these tests is 96dB. Many exhausts are not. I know that mine isn't without the quiet core so I bought one. It is easily 96 dB. I can be legal and my bike runs. It is not required in Washington to have a 96 dB muffler, but it is required that the bike is sold with that muffler and that if you are to race in any form of off road or closed course race you need to meet 96 dB....for newer water cooled bikes.... My bike is air cooled and I believe my upper limit is a 102 dB which is about 5 times as loud as 96 dB. Some OHV riders believe that I might be selling out to the man because I have the ability to make my exhaust quiet, well get over it. Because I have my quiet core I get to bring my bike to more respectable levels and still get to ride. If it comes down to putting in a quiet core to keep you riding wouldn't you do it?! Just relax.

Thank you and that is great that you were able to ride and experience that! Where I have been riding lately, I see very few motorcycle tracks because we stay on the hard packed roads. The cows are allowed to free range out there and I have absolutely no problem with that, but they leave some impressive tracks in the soft soil by the streams where they drink. Nothing wrong with grazing cattle or wildlife, but seeing that shows that 1. there are responsible dirt bike riders that follow the rules and stay on the roads and 2. the natural wildlife that lives there "damages" the wilderness. Again, they can go anywhere they want and the numbers of animals spread and you can't really tell where they have been. Kind of applies to herds of ORV's: let them spread out and their tracks thin out. There we go, we got a nature metaphor for ORV's! woot woot.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I did not mean to offend you with that comment. In this case, this was an official ORV area that is maintained by the DNR and volunteers that are more often than not ORV users. I am not doubting that hikers and mountain bikers and other users help clear trails. this was just a situation that this group of ORV users experienced on the trail. Not trying to offend.

Try to ride dirt bike for yourself, I believe that will answer your question! Off-road motorcycle and motocross riders are some of the most agile, fit, high endurance people. You don't see 300lbs massive bodies suffering from diabetes and choking from 50 feet walk across parking lot here. I am a woman, very dedicated off-road motorcycle enthusiast, and in order to keep riding, I do minimum 30 miles of cross training/ mountain running, gym workouts that definitely are much harder than pink-obsessed aerobics or yoga classes. Then weekend comes, that's when real workout on the bike comes. Besides, you are always outdoors. One more thing, and trust me on that: if someone has depression problem, send him/ her to me for my off-road clinic. There is not room for depression, bad mood or so. We are healthy and we are happy!!!!

If this were part of a comprehensive strategy to connect youth, adults and families to the great outdoors it would be great to see this skill promoted. It can start with basic following trails and camping, or even riding your bike in the city, from one urban park to another; but what's key is that active problem solving in the context of enjoying the great outdoors which will be a prime component of that strategy. We must start looking into a future where we can develop stewards and activate families and friends to spend their valuable time and energy learning more about the great outdoors and how to protect and preserve...

I need to amend one portion and defend our two stroke brethren. Most racing dirt bikes that are/have been competitive in the last 8 years are 4 strokes. two strokes are not really the norm any more as far as racing. Now, you can have a two stroke that is properly setup for woods riding or just buy a KTM woods style two stroke that are quiet and very very nice off road machines. Putting a respectable muffler on a two stroke, as with a 4 stroke, is relatively easy but is still the riders choice. When you look at a catalog that has different exhausts in it, it has all of the exhausts, not just the woods pipes. Guys think, "well that one will give me the most power (better have a S.A.), or that one will give me the 97% of the possible power, but it is quiet. Umm, I am going to get the loud one." you got hear the power. No. you don't, and neither does the rest of the valley you are riding in. granted, right now my bike does not have the quiet core in it, I haven't put it back in yet after a couple races that I partook in. My bike is louder without it, but it still isn't as loud as some. Another thing, I am aware that I don't have my quiet core in and when I see people or animals I immediately back down and try to be as respectful as possible. I.e. not holding it wide open to get by the quickly. Slow down, thump, thump, thump past them and start to get on it after I am a little ways away from them. It's just common courtesy. I just read a post today on another forum I frequent about how a group hikers were pissed a group of dirt bikes coming up a trail that they were hiking on. One of the guys made the comment, "well you wouldn't have been able to hike up this far if we hadn't carried saws up on our bikes and cleared the trail for EVERYONE 3 months ago. How about that?"

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Ok. I am younger OHV user; I am 20. I ride motorcycles on designated roads and trails for motorized use. I go down spur roads that are dead ends just to see where they will pop out in the forest. I just went riding last evening cruising the forest roads enjoying the sun's colors reflecting off of the trees. I rode about 90 miles yesterday. I saw some amazing things. You want to guess what I saw? I saw an entire herd of elk (about 70 head) galloping across a field. I stopped and watched in awe. It was an amazing sight. They weren't scared of me, they were still 100 yards away or so. They were doing their own thing, and I let them. I cruise the roads. I observe the nature. You want to know my grief about trails and roads? When I was riding last night the hardest time I had riding was dealing with the ruts of 4x4's on the roads. The trucks come up there when it is still muddy and go over board trying to get through it. I have a Toyota 4runner and I have gone on the logging roads too. If there is a muddy spot on the road, I go slow and steady as long as I can and 99% of the time I can get through a spot while doing disturbing the ground very little. Once it is dry it is like riding on a slot car track and can really mess you up if you aren't paying attention. Here's the difference between a dirt bike and a 4x4. dirt bike 250 pounds with a 5" max wide tire. ONE wheel drive. My stock 4Runner for example, 3500 pounds 4 10.5" wide tires that are about 31" tall. the weight tends to push the truck down into the mud and then all 4 tires have to work. Creates a bunch of 10.5" wide ruts in the road. I use my SUV to take my friends and family to look out points that i can get to by road. I can't do that with my motorcycle. A dirt bike most of the time on roads and trails get through it leaving either slight surface earth disturbance maybe going down a inch or two that is about 4-5" wide. About as wide as a big hiking boot. A responsible off-road motorcycle rider knows how to tread lightly. IT IS POSSIBLE!!! yeah, I know, it looks cool watching a bunch of earth fly up in the air, but it isn't really doing much and in undisturbed earth it is just stupid. How many 5" wide trenches do you see in the trails? Ok, how many 10-15" wide trenches do you see? They are typically in parallel rows because they are on ATV's or trucks and SUV's. When I go down these roads, you probably can't even tell I was ever there. I have been closer to nature dirt bike riding than anything else. I have seen more natural beauty in one day than many people can say they have seen in a year. Yesterday i saw some amazing cliff formations that were about 40 miles from the last paved road. You can't hike that in a day and come back again. Also shutting down the OHV areas aren't going to stop people from riding. By shutting down more areas it forces more people into fewer areas and then those areas become completely over used and broken down. It isn't are fault that we didn't have anywhere to go. Think of it in our shoes. If some said that you couldn't hike in an area anymore because there was some plant that grew along the trails that can't be disturbed or something (I don't know, just roll with it), would you stop hiking? No. But what would you do? You would go somewhere else as would everyone else who used to hike there would have to go somewhere else. Then you shut down a few dozen more hiking areas and everyone starts going to the same 10 places that are closest to the most populous areas and they get crowded and over run with hikers. There will be more garbage, trail damage from traffic not the specific hiker's (POINT: different vehicle types) but from way to may people using the area. The point is, if there was more open areas for ORV's to go, it would spread out the ORV user population over more area making it much more peaceful for everyone. It scares the crap out of me to see horses or hikers on the trail because as aware as I am when i am riding, I would hate to spook someone and make the person or the animal jump into my path and hit them . I am not

***(cont.)***

out to shut down or belittle one's choice of recreational activity, but let's keep an open mind for god's sake. Think about this: In a political conversation with someone, have they ever actually changed your mind enough to make you go vote for a different party? (honestly?) No. You are not going to convince a ORV user to stop using his or her orv. IT'S THAT SIMPLE! Have you heard any ORV rider ask you to stop hiking and get a dirt bike because it's better? No. We are trying to be nice, but we get the book and then every possible comment thrown at us, and we can't do anything about it. We try. We are taking care of our trails. Here in Washington we had our main source of income for ORV trail protection and maintenance cut, which was about 4.5 million dollars. We have seen a uprising in the number of volunteers at work parties and have been working side by side with the DNR to get trail fixes and improvements done. We are trying to save what we enjoy doing with our friends and families. There is plenty of land for everyone.

Promote and stop restricting and discriminating off-road motorcycles. All recreational trails should be opened for skilled, two- wheel motorized riders. This is the only safe place or the young away from cities, predators, drugs, shopping malls, no good "friends", sickening activities. Quads (4-wheelers) are different: most common quad rider is typically a red neck type macho male with diminished self esteem that is trying to compensate for a certain deficiencies by being rowdy, obnoxious, drunk and unsafe for others. Motorcycle riders do not drink (seems like obvious suicide), respect trails rules and other riders, do very little to none damage (how much can you damage with two narrow wheels, considering that it is quite painful and "body-damaging" to trail blaze on the bike. I am a professional independent woman, have been riding since I was 5 years old, and I wish every kid grows up with this wonderful, exciting sport developing skills, thinking, coordination and outstanding physical and mental endurance, available for all ages and groups. I am seriously getting sick and tired of the entire hypocrisy of so called eco- environmental Nazi groups that either have no brains or simply too corrupted by making money on environmental "permits" to admit that even if every citizen of this country were to ride dirt bike every weekend, their emission readings won't even scratch a surface of what freight trucks, jumbo jets, ports and industrial equipment, in particular power stations, dump into the atmosphere. Oops. I forgot that it is not about environment, it's about money. You can make money destroying land by massive development, you can make money on making deals with trucking industry (even Mexicans truckers have more rights in our country than our own citizens wishing to exercise outdoors), making money on Chinese imports being hauled into this country by ships and then distributed by trucks, on corporates and government flying their jets... name it! But you can't really satisfy your greed on kids riding dirt bikes. But once again, we all are willing to pay a fee for maintenance and parking facilities as long as the areas are OPENED!!!! There is another problem that has become a national disease: If I don't or I can't do it, you shouldn't have rights either. Who are you people to keep complaining and telling other what they should be or should not be doing???? You should be raising a flag, high and clear, about mexican drug dealers and growers that are now totally free to grow dope on our CLOSED FOR PUBLIC public lands, compliments of tree- huggers and government radicals.

## Discussion Question 2

***(cont.)***

The good parts of this "idea" are clouded by poor choice of words and negative concepts that overshadow the important aspects of your side by side comparison. Miguel, I challenge you to transform your comment into something that can have a greater relevance and discussion on this forum. Many of us know what you mean but you can see from your ideas demotion that it does not resonate with people you are trying to converse with here... If you can provide solutions and ideas for how to combat the complex change in how people think about open space and open minds, you may get thru to us ;)

Can you name 3 American OHV manufactures that can compete with Japanese motorcycle companies? I love buying USA but this market doesn't really have an USA option that is competitive with the others. Now, regardless if i had an off road harley or a chinese knock-off, we would still have the problem of not enough OHV areas. We have just as much right to own and ride our Japanese machines as we do to own an American machine, so it doesn't matter if we have an American made or not, the issue of land use for OHV's still stands.

One example of potential dangers of GMO are crops with antibiotic-resistant genes. The British Medical Association, the leading association of doctors in Britain, urged an end to the use of antibiotic resistance genes in genetically engineered crops in a 1999 report. "There should be a ban on the use of antibiotic resistance marker genes in GM [genetically modified] food, as the risk to human health from antibiotic resistance developing in micro-organisms is one of the major public health threats that will be faced in the 21st Century. The risk that antibiotic resistance may be passed on to bacteria affecting human beings, through marker genes in the food chain, is one that cannot at present be ruled out," the Association said.[11]. Pesticide and Herbicide toxicity is not adequately tested. We are introducing tens of thousands of novel compounds into our environment without understanding the long term consequences. Example is the neurotoxic effects of cyperquat that has been linked to irreversible brain damage and Parkinsons.

National estuaries are locally beloved, but very underfunded by the federal govt. The time has come to give national estuaries the same status as national parks and national rivers, and make them eligible for federal-side Land & Water Conservation Funds (LWCF), and a formal part of America's Great Outdoors (AGO). AGO presents an opportunity to develop a cross-cutting federal initiative to leverage greater protection of recognized national priorities by focusing and funding existing federal programs, such as LWCF. The results would be: - Preservation and restoration of estuaries and watershed lands - Connecting people to nature with new blueways and trailways - Working waters which support local tourism and outdoor recreation businesses as well as fishing and clamming.

***(cont.)***

Through language and perceptive differences as to what is important, and unclear definitions of cultural and historical value, we frequently end up alienating what we should embrace and demolish what we should develop. As a consequence, individuals, organizations and communities suffer needlessly. Only when we cultivate and actualize more effective communication, embrace with sincerity inclusiveness and establish together across race, ethnic and cultural lines defined cultural principles that allow for the introduction of creative ways of implementing the process of development will success in sustainable cultural development proceed as an enduring public resource.

I have only become an OHV enthusiast in the last 5 years. I grew up in a place where it wasn't very common. However, my future husband and I spend our vacation time on the dunes in Winchester Bay Oregon, with other friends and family members. As a group, we spend thousands of dollars every time we visit. We abide by the laws, stay in designated areas, and are respectful to the families that live there. I however have noticed, that even in the last 5 years- more and more land is being closed for us to have the option to ride on. There are places on the sand dunes ( where the hills may be so steep, even an ATV could not get up) are off limits because we are protecting the beach grass.... That is too extreme! These are not places where people want to get "Unplugged", and enjoy the beach grass! Yet, my sport, my love and my vacation is being taken away. Without this, I also enjoy nature, outdoors, hiking, and fishing. I am suggesting those who are against OHV'S to research how much actual damage they are causing to National Land- which you and I own.

The US has to change backwards, mistaken, endless-frontier land policies from planning "no more wilderness" which will ensure that there isn't, to planning for our open spaces and unique places. The endless frontier exists no longer and as individual Americans like myself recognize, our wilderness areas need to be protected from further development in order to ensure the health of our selves, the remaining plants and animals, and the planet.

The forest dept. closed some of my favorite mtn bike trails due to noise complaints, exhaust, and tire rut damages from motorcycles. It took more money, time and effort to destroy/barricade/block off the trail than it would have been to divert the motorcycles with signage to less populated areas of the trail, leaving the shorter, closer trails for hikers and cyclists. Now no one can use the trails at all (without a long off-trail hike). And I can't imagine the dust, exhaust and noise required by the heavy machinery digging ditches and dragging trees across the existing trailways! There are miles of trails everywhere, just designate some as non-motorized. Don't close our access to nature by blocking it off. And return the right of way to animals and pedestrians please.

***(cont.)***

I couldn't agree more with what has been said. As one who spends an average of 100 fishing days a year on this river, and having first begun to walk its banks in 1983, I am appalled at the lack of stewardship and general carelessness that has characterized management of the trout fishery once acclaimed as "world class." When the energy industry began to astronomically increase activities on the mesas above the river, the river began to show signs of deterioration. Little or no efforts were made to control the erosion from such activities and we now have a riverbed covered with, in some instances, feet of sediment or "silt," as most refer to it. The BLM apparently made no efforts to ensure guidelines were being followed to protect the flora and fauna in the process although it is the responsible agency to ensure things are done properly. I am very disappointed, and discouraged. The re-operation of Navajo Dam by the BOR essentially put the final nails in the coffin as flows were drastically reduced with no consideration given to the impact to the trout fishery. In fact, BOR was quite transparent in stating the trout fishery was of little or no priority in the "decision tree" to regulating flows from the dam. Rationales for keeping flows very low always referred back to the "endangered species" downstream and the mandate to simulate a "natural hydrograph," which turned out to be little more than a smokescreen to store water at virtually every cost, witness the unwillingness to conduct an annual "peak flow discharge" in the late spring which is part of this "natural hydrograph" schematic and has been helpful to some extent in scouring the riverbed and helping to restore some of the aquatic invertebrates that are necessary for the trout's survival. The reason given had something to do with the basin snowpack being at "only 86% of normal..." Well, couldn't we have had a peak flow discharge of 86% of normal in terms of the time period, usually about 3-4 weeks from beginning to end? Even that would have helped in my estimation. Gone are the PMD hatches that characterized the San Juan Quality Trout Waters in July and August in the past; the baetis, or BWO's are also fewer in numbers and the sizes are dropping dramatically.....all due to the lack of importance the fishery commands in the larger scheme of things, the present and future projects of the BOR! I'm very disappointed and saddened that such a wonderful resource can just be canceled at will by some of our government agencies and would like a far greater degree of accountability and integrity to be exercised in such matters. Hopefully a new administration with a more global view of things will lead to restoration of our wild places without which.....and part of the irony here, we ourselves will not survive.

While I think it's great so many celebrities speak publicly (and act accordingly for documentation by paparazzi) about their local & organic passions, I feel that we're missing public recognition of the experts working in the field. I watched the Earth Day documentary on our local PBS station this week and was moved to see Johnny Carson interview scientists directly to inform the public about the Earth Day movement. I'm pretty sure basic celebrity PSAs still run during Saturday morning cartoons...but we've got a long way to go to take it to a meaningful level with adult consumers. Finding a way to get back to such a high level of esteem for those working in the field will go a long way to encourage the brightest of today's youth to seek out STEM careers for their futures.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Actually, the point is that they are accessible for recreation already, but only by adjacent property owners, and not the public who own the land. I'd be willing to agree with your point that not every place needs to be accessible for recreation if the land truly was inaccessible, and that included adjacent private owners. As it stands, the accessibility is unequal. That needs to change.

Your consistent desire not to use any tax dollars for, well, anything is just nonsensical. Do you like driving on maintained roads? How about enjoying a peaceful society because we have a police force? How about the ability to call 911 if you have an emergency, and then highly-trained assistance shows up to help within minutes? The list of worthy, tax-dollar-funded projects and services is lengthy, and it's myopic to simply say "not with my tax dollars" to every single idea proposed on this site.

Federal lands belong to all of us. They should be managed for the greater good, not based on what a small number of individuals think. If they are managed by each state, then the lands become fragmented. Preserved in some states, and trashed in others.

Getting some protections, whether conservation easements or fee title purchase, for more land, particularly in states with a low percentage of public land such as those in the Great Lakes and Mississippi basins, is far more important to our nation's present and future than increasing the level of protection of existing federal land. Moreover, the majority of people in states with vast amounts of existing federal land are opposed to Wilderness designation in high numbers while people in states without a large public land base support greater land protections. Compare what most Alaskans or Utahans think about Wilderness with what most Wisconsinites or lowans think about conservation easements or having more state parks and trails.

I agree that resource development should be last after protection of the resource, but it isn't the BLM that needs to be disbanded. It's that when an administration comes in that thinks resource extraction is a priority, that's what the BLM is told to do.

I also believe that sportsmen's license fees should not be diverted to support activities other than hunting, trapping, and fishing, etc. Activities such as; bird watching, and butterfly feed plots. These are also good land uses, but should be funded by the participants of those activities. Sportmen, and sportswomen pay the fees, and play second fiddle to those that would eliminate our activities if they could.

Many counties have thousands of acres of BLM or other federal land within their boundaries, but the public has no access to these lands because they are landlocked. We need to gain access to these lands in order to enjoy them for recreation.

Presently, the DEA and local law enforcement bust illegal marijuana gardens, but leave the associated pipes and trash. There needs to be funding for cleanup of the illegal grow sites. These sites ruin our landscapes, foul the water, and trash our lands. In the Ukiah BLM District, there are over 200 grow sites and only funding to clean up 3.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Recreation is a basic service. Without the opportunity to recreate, we will have more criminal activity, less connection to the natural world and understanding of the world at large, more health issues, etc. There will never be enough tax dollars for everything we want, but in order for society to be balanced, we need to make sure that we have opportunities to take care of our well being through outdoor recreation, as well as police, fire, etc. Recreation is not a luxury. It is essential.

Reform the 1872 mining law to require royalties on extracted minerals, leases on land instead of claims, and end patenting. Selling of mining claims has become big business, yet these claims cost next to nothing to obtain. Many claimants are simply waiting to patent the land and develop it as recreational or summer residences. Stop the privatization of public land.

So you're saying that if President Obama goes hiking, all of our wilderness issues will be solved? I'm all for leadership by example, but I'm pretty sure that's not going to be nearly enough. Policy will make the biggest difference towards protecting our future and the health of our planet.

Stop allowing patenting of mining claims. In the Tahoe National Forest, all the rivers and streams have mining claims on them. If they are patented, then they will become private and stop public recreation on all patented lands. This would fragment the forest, and open it up to home development.

The BLM needs to obtain access to the 9,100-acre BLM Berryessa Peak Unit from the Yolo County side of the Blue Ridge. This is the closest public land to all the towns in the County, but the public has no access.

The BLM started work on a 38-mile ridgeline trail in the late 1960's, that runs from Cache Creek to Putah Creek along the Yolo/Napa county lines. They need to complete this trail. They stopped after only building 8 miles, because a few people who had exclusive access to BLM land further down the ridge, complained. They need to finish the trail.

The land access decision making process is in the hands of career bureaucrats who are allowing themselves to be manipulated by special interests and failing to ensure that valid science and proper analysis are applied prior to land access decisions. The Federal Government must start from the default position that public lands should be kept open for the public to use and lands made available for all use patterns. Withdrawing land from public access should require a stringent burden of proof be provided by anyone who wants to exclude the public from public land. Today land is closed on trivial and unproven pretexts. This must be immediately stopped.

The method used here of cobbling together statistics from various, and sometimes biased, sources is flawed. "Users" does not equal "Uses". Public lands are open to EVERYONE, all users. But the things we share, in this case public lands, cannot be available to all uses. There must be rules that we all abide by when using the things we share, i.e. our shared public lands which are open to all users but out of necessity not all uses. "Users" does not equal "Uses".

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The problem with this approach is that there are those for whom agreement is impossible. We have people on local County committees who completely oppose the basic idea of public parks, so it is impossible to get them to agree to trail projects because the very idea of public land is disagreeable to them. So we can't even begin to have a dialogue they won't even agree on the foundation of that dialogue.

The real problem with "over population" is the lack of education or undereducation of women. When women are given access to a good education, they will make sound decisions about the size of their families.

This is a huge issue, and one that needs resolving in favor of the public gaining access. Those that would 'demote' this idea either don't care about public recreation and are working contrary to the ideas behind America's Great Outdoors, or they have exclusive access to public land and wish to keep it that way. Demand public access to public land. If you google 'landlocked BLM', you come up with results that show private owners charging fees to access public property, or private hunting lodges touting how they control all access to large tracts of public property. This privatization of the public estate is just wrong and greedy.

How much local produced items do you purchase? How many things have you bought this week produced on YOUR main street? How many things have you bought which were produced within 100, 500, 1000, 5000 miles of your residence. You preach to us about waste of gasoline (aka energy, causes of GHGs, etc). What a hypocrite you are. How often do you hit the local Walmart? How about we move on the FUD and tackle some real issues. Just for some facts: I use 5 gallons of gasoline in my dirt bike in a weeks time during a good week of riding; normally it's measured in a months time. You use 5 gallons commuting to your job on the highway daily. After you ride to work solo in your Volvo, your wife and 3 kids tumble into the minivan heading out to swimming, soccer, and baseball. After wasting another 5 gallons hauling the kids around each night from one side of town to the other, does she run over to McDonald's cuz she's too busy to fix dinner before the kids have to get into bed? Give us a break. You waste FAR more in your 'normal' activities then we do in a month on average to support our 'OHV' activities. To address the FUD around noise, I was on the trail yesterday...and we can't hear bikes a minute or more behind us out on the trail. This noise issue is a fallacy more often then not - but it's highly dependent on the natural surroundings. Nothing is 'cut and dried'. Where I live, the trees are a great container of sound...and we also have silencers on our bikes as discussed above. I agree standing next to a bunch of bikes all riding isn't pleasant...I don't like it when I'm not riding myself - but we're not saying everyone should have to endure that. If I don't want to camp around the OHV camp sites cuz of the noise, I don't - I camp else where and truck my bike in for the ride. ...how about simply equal access and a sensible sustainable plan for our use.

Your numbers are flawed. You are inappropriately mixing reports to arrive at your desired conclusion. Wheeled recreation is not most popular.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Why do we think that *\_people\_* are the only important constituents in the discussion of wilderness? What about the wilderness itself, and its inhabitants? What about the ecosystem? Someone should be speaking for it. Is it that important that humans should be able to trample ever square mile of this planet? Maybe it's important to have places where people don't go. Maybe there should be places where *\_nobody\_* goes.

I agree. More resources need to be available so the general public can enjoy these majestic animals in their natural habitat. Please allow these horses to be put in a sanctuary. I was not pleased that land agencies have not taken the initiative to produce positive results. Visitors would definitely want to see these animals in person and learn more about them by hiring Park rangers to offer interpretive programs. Great Idea..

Many people claim that federal land use planning for public lands (such as national forests or lands managed by the Bureau of Land Management) is broken. These land use plans cost millions of dollars to develop, routinely take 2-4 years to develop, and are instantaneously out of date as soon as they are finished. They are cumbersome paper documents that can only reliably be found in the offices of the federal agencies. We need an interdisciplinary task force, perhaps even a Congressional Commission made up of the finest planning, scientific and technological minds that will look forward to the next decade and figure out a methodology and technology that would allow the agencies to plan in a completely different way. One that:

- Creates an “open source” web-based planning tool that everyone could access
- Builds off of Google Earth type of platform
- Allows the agency to set the data standards but allows more than agency data to be considered
- Allows for natural values (ecosystem services) to be mapped
- Allows nimble, fast, transparent, predictive landscape analysis of various alternatives and of cumulative impacts
- Allows for adaptive management scenarios to be identified and analyzed up front and then tracked on the back end
- Allows a translation from a proposal in the plan to the budget that would be required to carry it out
- Allows the agency to update final plans as agency decisions and actions are made (i.e. an area is thinned for fire protection or an area is leased for oil and gas or a new trail is constructed) or for changing conditions (an area is burned in a fire or affected by another disturbance) so that the plan is always up to date with current conditions
- Tracks promised mitigation measures with actual mitigation and monitoring requirements
- Allows a comparison of cumulative impacts assumed during planning with what monitoring is actually showing
- Encourages cross-jurisdictional, cross agency and landscape level planning

• In essence, create a transparent planning process and a living document once approved. The advantage of having a Congressional Commission is that Congress would be invested in the outcome. In addition, Congress could invite key people from organizations such as Google, ESRI, Microsoft, Apple, National Geographic, Universities, and land use planning consultants and experts to work alongside some of the most creative agency planning staff. It is time to move federal resource planning and management into the 21st century.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I live in SW Virginia, where recycling is looked at as something foreign and not worth consideration. As a result it is extremely difficult to recycle cardboard, glass and non-aluminum metals. If there were a mandatory deposit on bottles and cans, there would be motivation from the local populace to recycle and collect bottles and cans from the roadsides, parking lots, etc. As of now, public places, natural areas, roadsides, streamsides, campsites and other outdoor use areas, are littered. Firepits at remote campsites always have a pile of bottles in the middle. A deposit would rid us of the littering, which is prevalent in Appalachia.

I think it would be useful for us to all stop using the word wilderness, as it is an incredibly slippery term with very heavy connotations. Can we please have this discussion using words such as "undeveloped" and "roadless." These words have spatial implications instead of being value laden frameworks. If we don't clear up the terminology then we cannot have an informed debate. That said, it is naive to think that we have any "wilderness" or undisturbed land left anywhere on the earth. Human impacts are everywhere, and we must allow people to interact meaningfully with our public lands to garner appreciation and stewardship. Its nice to refer Leopold and Marshall but perhaps we should get ourselves into a mindset like E.O. Wilson explains with his theory of "Biophilia" and Richard Louv's ideas of reconnection. We would do much better to protect our public resources from the effects of heavy industry and sprawling sub- and ex-urban development than to restrict recreationists from using it.

Ensuring that permanently protected private lands indeed remain "permanently protected" coupled with respecting local community values and quality of life are at the heart of this issue. Improper siting of utility infrastructure - especially in the hunt for domestic, sustainable energy development - can have huge unintended consequences by needlessly fragmenting open lands and working farms & ranches; destroying habitat; despoiling cherished & historic landscapes. Federal legislation to avoid protected private lands from the start in the siting of utilities is a good idea well worth supporting.

Off road vehicles are noisy, gas fuming, peace disturbing vehicles and have no place in National Parks (or anywhere in my opinion). Even if a dedicated area is set aside, the noise can carry miles - unless you are willing to build sound walls around a dedicated area these vehicles simply have no place. If you want to explore area where no one has been, how about being able to rent horses or bicycles. At least the peace won't disturb anyone fairly close by. ORVs are hazardous for wildlife.

Exactly Mark, I'm a OHV rider, but we need to find a sensible solution. Closing trails and land is NOT the answer. Don't let the irresponsible ruin it for the responsible riders.

OHV is not damaging to the environment, you environmental extremists need to get off your soapbox. Lets keep shutting down trails and land for OHV use so our kids have what to do????? i can honestly say this much if I didn't have access to private/public land for riding and racing I don't want to think of the trouble I could have got myself into. We need to keep the trails open, private landowners have the RIGHT to ride on there property just like you have the RIGHT to hike the trails. It's a priviledge i enjoy having and will fight to keep.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

About 600,000 citizen soldiers lost their lives in the Civil War. Considering that the population of the country was about 1/10th of what it is now, that is the equivalent of losing 6 million Americans today -- over 1000 times the number we have lost in Iraq and Afganistan. These brave men deserve to be honored perpetually, and saving the battlefields on which they sacrificed from development is an ideal way to do it. Plus, it preserves open land in populated areas for the recreational use of future generations. I support Civil War battlefield preservation with my personal funds and believe it is an appropriate use of Federal funds as well.

did you just call Solar and Wind co's "Big Energy"??? Are you joking? I guess the land grabs that oil and coal co's are making left and right are to serve our best interests in meeting our energy needs? Your comment is the first I've heard that mentions BLM using the Wilderness Act to designate any space for Solar or Wind projects. LOL.

Oil companies have already been given over 42 million acres of land that they have already been approved to drill on. Of that 42 million, they are using about 12 million. Why do they need to take away more land that the public could benefit from for their own selfish greed when they have 30 million acres they are sitting on and not even using?

There are many threatened landscapes worthy of wilderness protection, but southern Utah's redrock country is iconic, unique in all the world, and fragile. Cedar Mesa and the vast and complex San Rafael area in particular would be national parks anywhere else. Our open space on Federal land--belonging to all Americans, not just those who live nearest--can be enjoyed by all: hikers, paddlers, and ORV riders. But multiple use is possible only if sensible decisions are made to grant wilderness protection to lands with wilderness characteristics. ORV use scars the landscape, but that is acceptable in areas without outstanding scenic beauty or wilderness characteristics; the land heals itself over time. It is only the unfettered access to public lands for ORV use that destroys wilderness. Let's end the squabbling and designate the appropriate parts of our open space for appropriate uses. We will all come out ahead. Let's hope that BLM can rise to the occasion and meet its responsibilities instead of caving in to local interests.

Where I live, the only places we off-road are in the middle of nowhere. So I don't really understand this whole noise complaint...not to mention when you enjoy the sport, the sound of a screaming engine is actually soothing. People who drive low-rider cars with exhaust that is overboard are more annoying to me. But, who am I to say that they can't do that? Some of you sound like you belong in a retirement home... Offroading has brought my family closer, and I am glad that we can all hang out in an environment away from rat race. There are idiots in every sport/hobby...but those people do not represent the majority of the sport. Sure, there are offroaders that trash the place, just as there are campers and hikers that do that. But majority of offroaders are people that appreciate nature, are down-to-earth, and responsible. You don't drive hours to the middle of nowhere, weathering the harshness of the desert, covered in dust, all comforts left at home, and not be a nature lover! :)

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

From my viewpoint as a motorcyclist damaged trails are a problem. It only takes a few irresponsible (ab)users to damage a wet or steep section of trail. I think the heart of the matter is how do we correct the actions of the few who make life difficult for the many? This is where the enforcement agencies do NOT want to step in. It is up to us Citizens to force the government agencies to address the specific problems. Let us not take the easy way out by closing swaths of public land.

Sustaining and improving OHV and wheeled access to our public lands is important to me and many Americans. I would also like to see more chances for USERS to get involved in maintaining the trails and parks. If the Forest Service cannot support us then let us do the work.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

My counter The great tragedy is that technology is one of the few subjects that the left and the right, and the environmentalists and the corporations, all tend to view in the same way....technology is neutral!! And yet technology is certainly not neutral, and we need to understand this. Nuclear power and solar power will both light the lamps in your house. But to have nuclear power requires that society provide huge financial resources from central sources, apply fabulously high technology skills, and employ a military capacity to protect poisonous materials from terrorism and from accidental release, for all the 250,000 years that it remains highly dangerous. So society is essentially committed to a centralized technical military and financial mode of organization for a quarter of a million years. On the other hand, solar energy can be built by you and me, paid for by us, and it would not require support from any central system, whether technical, military, or financial. At least not from now on, because the technical base has been achieved. What this guy is selling is another 1/4 million years of enslavement to the centralized government we have in place. He is not saying hey why don't we cut back on how much we consume. During world war 2 all forms of energy be it food gas or lamps were all rationed. The fact of the matter that no one is saying is no form of mass produced energy is sustainable. Now to put the second to last nail in the coffin; Safety isn't the real issue (to the government that is)nuclear power hasn't become ubiquitous in the US, it is because it's so damn expensive. Even after decades of subsidies, it can't compete with other forms of energy. The cost of a kilowatt-hour of electricity generated by nuclear power is about 7 cents, coal 5 cents, natural gas 4 cents(note it is on the rise), wind power, solar, and hydro, at 3-5 cents. What is more amazing about the continuing high cost of nuclear power is the scale of subsidies lavished on the industry. In the past 50 years wind, solar and nuclear power combined have been funded to the tune of \$145 billion. Unfortunately 95% of those funds went to nuclear energy, the other two forms managed dramatic drops in unit costs, efficiency and, production of energy. Some versions of the White House- backed energy bill offer federal loan guarantees to cover half the cost of the first new plants to be built in 30 years. yet the Congressional Budget Office warns that it expects these plants to be " uneconomic to operate". Last nail on safety; On August 14, in New York, there was an electricity failure that plunged fifty million people into darkness. 16 nuclear power plants automatically shut down in the US and Canada. nuclear power plants run on off site power, not their own reactors. If the grid fails, reactors are designed to automatically close down. One or more diesel generators, with the capacity to power basic safety equipment including the cooling system, are supposed to start up. If a generator fails, the reactor cannot be restarted without off site power: another wonder of fanatic technological optimism. Something has to continually pump circulating cooling water to the reactor and to the giant, densely packed wasted fuel pools, or those fuel rods, active and spent, will catch fire and reproduce Chernobyl or worse. Don't just listen to me..... Please feel free to actually research these issues and find your own answers instead just moving with the herd, and repeating the propaganda.

As a wildlife-hugger even I can support this idea :) ...as long as hunting groups stop spreading unscientific info about predators. Science is showing wolves and other predators can actually INCREASE deer and elk populations and their herd health in some areas and often most places are wildly overpopulated and overbrowsed by game species (look at Yellowstone). Yet hunting lobbies are foaming at the mouth about wolves when science just doesn't support their premise.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Do you feel like it is good to at least set aside a little bit of our land out there for quieter access and for wildlife habitat? Honestly, sometimes I wish it was no access for anyone, but Wilderness designation is truly important to preserve some core habitat for wildlife. If wilderness advocates were willing to give a little and help build ORV trails elsewhere, could you meet in the middle and give some land up for wildlife and ecosystem protection (elk are pretty calm critters and it's awesome you saw some, but there are more sensitive species than them that really and truly need less interruption from humans). I think it is worth meeting in the middle to find a way! What do you think? PS- every type of user got their budget cut, not just ORV access. We all our working hard to make up the difference (my favorite conservation group is even building bike trails, so there are conservationists out there willing to work with all folks! You just need to help by not coming into the conversation with a closed mind and a chip on your shoulder, even when it seems like you should be angry)

I am actually watching closely a wilderness collaboration between timber, conservation folks, and recreationists right now where in fact, OHVs are actually being given MORE miles of trails than are being taken away, and yet still the heels are dug in and they state directly that their policy is "no loss"...not no net loss! I think its zealots on either side that make this so hard. If people would just be reasonable instead of emotional... To offer counterpoint to your statement...OHVs (motorized ones anyway--not sure if you consider mtn bikes OHVs) can be heard for miles around, so hiking in solitude isn't always that when there is access nearby, and OHVs can be hard on the environment especially if they abuse the access, as you said. I think that is the hard thing for hikers, horsebackers--the noise (I am actually not a backcountry hiker; I've got enough to do in my own yard :) and an injury limits me to small park trails )

I am a so-called treehugger (actually I am more of a bear and deer hugger :P) and I don't really see a problem with this idea. I see more and more that conservation groups are coming to the table, trying to make collaborative agreements that benefit all parties and still manage to help the environment. Sadly, more and more I see every attempt they make is met with stonewalling and refusal to give up a single thing by the off-road community, even when compensated elsewhere to no net loss. It is met with ire and anger instead of an attitude of trying to find solutions. Yes, there are zealots on BOTH sides. Let's just try to figure it out civilly. Look for and support those groups that are making an effort to collaborate. Here in WA, there is a great group, the Northeast WA Forestry Coalition that is making a real effort to bring everyone to the table. Even Sec. Vilsack pointed out how great it is.

It isn't that people are not doing there job - the eco groups have big money and file law suits that stop any kind of forest management that would help - but you don't see them out fighting the fires - those 'dead sticks' breed disease and insects that are killing the healthy stands of trees - they do not prevent erosion, the live roots of trees do - and YES THEY DO BURN when lightening strikes - We are tired of people that don't have much of a clue, but have more money than sense - stopping any healthy forest management – we are not un-educated in forest practices and have lived in the forest for many generations – we don't need to have special interest groups with money and an attitude think they are saving us -

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

FYI--Hikers/horsepackers/skiers/etc pay for access via trailhead passes as well. In the PNW, most places require a NW Forest Pass or a National Park pass, etc. For me, Wilderness isn't just about who gets to play there, though. It's about core ecological reserves in an increasingly developed world. As I've said in other comments, I would honestly be ok with no trail access into some wilderness areas, but I know THAT is an unpopular idea on all sides! :)

There has to be a balance and at this time there isn't due to eco-groups filing law suits that stop all management of our forests - until the special interest groups stop pouring money into stopping all activity in our forests - or forests will continue to die due to fire and disease - wanting what was 150 years ago by no management isn't going to make our forests healthy and restricting human activity in the forests isn't going to do anything except attract people growing pot - more than it is already. Where is the money that backs all this insane closure of our public lands??? We live here we see it - it needs to stop and we need to take care of our forests and the people that live here - not close it down so no one can see what is really going on!

Let's establish a 'Home for the Buffalo to roam' in Kansas in the Flint Hills area near the Tall Grass Prairie.

Here are numbers (all in sq mi): Us total area = 3,537,441 BLM lands = 395,313 Forest service lands = 301,195 National Park lands = 81,081 Total of these federal lands = 777,589 Wilderness areas = 168,000 Until recently in my local national forest, almost all the area of it that was not designated wilderness or given a special local designation was open to ATV's. Recently this has changed with the advent of a travel management plan. It is a big change and a serious reduction in area, to go from just about everything, to about half that much. I don't wonder if this isn't a recent change for many, that people are still mad about and trying to find a work-around. Meanwhile, there are twice as many people on the earth as there were when I was born. So there are presumably more people who want to do more things on more public lands, but there aren't more public lands. I do believe that the ATV's in my area are still quite ahead as far as access is concerned. I wistfully dream that locally as much wilderness could be designated as they have designated for ATV riding. I know however that this really isn't possible because of the geography and state of the forest. So on my local forest this plan would never be able to give the parity that it claims it can. The deck is already stacked in the ATV's favor.

Hey KC, we CAN buy more if we fully fund the LWCF: please vote: { <a href="http://ideas.usda.gov/ago/ideas.nsf/0/36F43F09FE08AEF08625774B001C924C?OpenDocument" rel="nofollow" target="\_blank">Link</a> }

Is there a policy in place for the harvesting seeds of indigenous trees prior to logging operations? or of the trees to be harvested, is there a policy of gathering the seeds, cones, laying on the forest floor for future plantings? I have heard of a boondoggle in the forest where non-native trees were planted and then needed to be removed due to disease and other maladies. Would it be better to gather the seeds, cones before the trees are cut or to harvest them laying on the ground, however the seeds could become damaged due to the heavy machinery and logging operations.

## Discussion Question 2

The Land and Water Conservation Fund is a great tool for the federal gov't to give back to the state and we can make it know that it should be fully funded: { <a href="http://ideas.usda.gov/ago/ideas.nsf/0/36F43F09FE08AEF08625774B001C924C?OpenDocument" rel="nofollow" target="\_blank">Link</a> }

The Land and Water Conservation Fund was established over 40 years ago as a powerful tool to bring recreation access to the great outdoors for millions of Americans by using a portion of fees collected from oil/gas operations. What a great use of a little bit of the money made by these industries to give back to states' conservation needs, reconnect people with wild places, and ensure working lands are not converted to development.&lt;br /&gt;&lt;br /&gt;This tool helps states acquire open space or conservation easements, to build recreation areas, and to protect ecosystems by underwriting projects that bring a broad range of people to the outdoors. &lt;br /&gt;&lt;br /&gt;From small things like ballparks to wild ecosystems, the Fund gives states the power and leadership role to determine their own healthy future. The Fund has helped create or improve national treasures like Harper's Ferry, the Big Sur Coast, Yellowstone, NYC's Central Park, and San Francisco's Golden Gate Park.&lt;br /&gt;&lt;br /&gt;There is just one thing wrong with the Fund: It has only been fully funded twice in 45 years. There is so much more this fund can do to get people outside, get them playing, and get them thinking about wild places.&lt;br /&gt;&lt;br /&gt;Fully fund the Land and Water Conservation Fund: Make the powerful tools we already have work to their fullest potential!&lt;br /&gt;

This monument will do nothing but further restrict usage of those who live in the area proposed by the people at KS Wild. There is no way it will bring more tourism to an area already economically depressed by out of control enviromentalism. There are no tourists here now !! Why would the monument increase tourism ? My family has lived here for over 35 years and my property would be inside the monument. There are too many gray areas and not enough info from Interior on how landowners will be affected. There are few jobs here as it is, and I feel that is this monument becomes a reality, many more jobs will be lost, mine included ! NO SISKIYOU CREST NATIONAL MONUMENT !!!!

Yup, good idea. We have to fund these laws and all the existing tools before we say they are broken. Of course they can't work well when you strangle them... I created an idea for funding Land and Water Conservation Fund, maybe vote for that, too? Thanks! { <a href="http://ideas.usda.gov/ago/ideas.nsf/0/36F43F09FE08AEF08625774B001C924C?OpenDocument" rel="nofollow" target="\_blank">Link</a> }

I was vacationing at June lake this past week. I saw many downed trees' and such. If those downed trees are not removed they become kindling for a fire. Thus causing a bigger devastation.

If the OHV scare away the wildlife, then why were the deer comfortable to come feed in the campground in the afternoon near where the OHV's were being ridden?

Never mind wind and solar aren't very productive ways of energy yet.

***(cont.)***

One of the biggest problems we face in many Wilderness areas not meet the wilderness criteria but still are.

All sportsmen should know our outdoor pursuits depend on maintaining viable fish and wildlife habitat. Unless tools like conservation easements that help groups like Ducks Unlimited and the landowners we work with are in place our lifestyle will continue to be at risk. More than 70 percent of wildlife gets food and shelter from our working farm, ranch and forest lands, but we're losing these habitats to development at the alarming rate of 5,000 acres each day. This legislation encourages voluntary, incentive-based donations of future development rights to ensure that farm and ranch families can continue to work their land, sell hunting leases and provide wildlife habitat for future generations. Ducks Unlimited has had great success using this incentive to accelerate the pace of waterfowl habitat conservation. This incentive helps Ducks Unlimited leverage Farm Bill and North American Wetlands Conservation Act funding. Landowners considering a perpetual commitment to conservation should not be pressured by an artificial deadline, and many will never begin the lengthy process without the reassurance of a permanent incentive.

I understand your wanting to protect the bison. But I'm not even sure a true 100% pure bison exists. Even if there is a true bison left they have adapted to partially domesticated life to survive. There is also a reason they are about extinct. They are a very large animal that can do a lot of damage to the land, especially if they are not controlled in some way. They carry diseases that can be passed on to other wildlife and domestic animals, also humans, if they are not vaccinated against them. Sorry, bad idea.

Sir, I would really like you to come and visit us on the ranch and try to keep up with us as we work to provide quality meat for the people of this world. You seem to be the one who has all the time to sit at your computer and dream up ideas and comment on things you think you know all about. It's obvious you don't have a clue. Just what do you do for a living?

Our land trust is working with a family who wants to protect its forest land with a conservation easement. We are working with the USDA Forest Legacy program to fund the easement purchase. Unfortunately we've had to convince our County to hold the conservation easement once protected because land trusts aren't allowed to hold the easement even with our conservation easement management experience. This will be our County's first conservation easement, and I'm grateful they are willing to hold it because if they weren't the family would not realize its protection dream. USDA has other conservation easement programs that DO allow land trusts to hold conservation easements, so what's different with Forest Legacy? It adds a significant challenge to our protection work.

But by locking ohvs out you are locking out land that will never be seen, except by airplane. A compromise usually feels like both sides lost.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I think that the U.S. Congress has helped to promote land conservation by enacting several incentives for landowners. But the Internal Revenue Service is putting a damper on landowners' interest in giving conservation easements by encouraging certain IRS agents / 'engineers' / 'appraisers' to harass easement donors. I am now in the process of being 'audited' because of a conservation easement that I donated to a local land trust. The claims of the 'engineer' have been petty, often false, and almost always presented antagonistically. I am confident that a reasonable judge will decide in my favor, but the cost to me in time and money will be enormous. It makes little sense to me for Congress, on one hand, to promote conservation easements while the IRS, on the other hand, discourages them.

Not at all, actually the area does not meet the criteria to be made wilderness. It is full of mines, and old roads that even have old (40's & 50's) cars on them. How is locking out ohvs in that area preserving nature the way it is suppose to be?

The original request was that ALL groups be brought to the table to discuss these important issues; it is critical that everyone be given a voice. Most importantly, the local people, whom any issue will most affect should be heard loudly and clearly. It is easy to support any initiative if that initiative does not directly affect one's self, however for those people living within the affected area, the initiative takes on an entirely new meaning. Conservation works best if it is completed in 'bottom-up' fashion with buy-in from the local community, but for some reason, many at the top fail to grasp this simple, yet important concept. Don't just listen to those most affected, hear them and use their input. There is lots of room to find common ground, but too often the vision of a few takes precedence over the livelihoods of others. By large margin this blog is comprised of people who are not making a living off of the landscape and people who do not live in the communities that are most affected. People in these communities are too busy trying to etch out a living and raise our food and fiber than to spend their time debating on these forums. But their voices matters and every opportunity possible should be provided so that they can share their thoughts.

The wilderness area I ride my dirt bike AROUND on a designated trail, I have never in 20 years of riding that area, seen a hiker or horseback rider. But yet I am locked out.

There has to be a way to coexist. I fully understand your' right to enjoy hunting. But a 50 inch path is not destroying the wilderness. I don't hunt, but I do enjoy my ohv. And they keep taking away the land for me to use. I like to do 50 to 60 mile loops when I ride, and the only people I have ever seen walking out that far are the ones with broken ohvs. The more land they take from the ohvs, the more we are going to be in the same spot.

We just have to face it. ORV users are going to doom the earth to a horrible death. ORV are the cause of everything wrong on this planet.

Well put!!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Dear President Obama and advisors, One of the biggest threats I see to the balance and protection of Earth and nature is the genetic manipulation of food crops and the resulting increase in the use of herbicides and pesticides that kill bees, birds, frogs, fish and ultimately humans. GMO crops themselves have also been implicated in killing cattle and in causing human illness. This is big business with big money behind it, yet it is supported in part by the farm subsidy programs paid for with our tax dollars. As a tax payer, I don't want to support farms growing GMO crops! (I also don't want to see former Monsanto executives appointed to public office!!) It would make much more sense to offer farm subsidies to the organic farmers who grow food without poisoning the environment, particularly those who grow the fruits and vegetables that are so necessary for human health, rather than supporting the financial health of mega-corporations (like Monsanto) that bully farmers into growing crops for the environmentally-destructive meat industry and the junk food industry with its demand for the cheap high fructose corn syrup that is rapidly undermining the health of our nation. We need GMO labeling laws to allow consumers to choose whether to buy these products or not (and most would not). We need laws protecting our farmers from the bullying of large corporations. I think a large percentage of the U.S. population would agree with both of these points. We also need to put the health of our environment and of our human population above financial interests by supporting clean, sustainable energy, clean sustainable farming, and much less meat consumption, since cattle are a significant factor in greenhouse gas production (in addition to high meat consumption being a major factor in diabetes, heart disease and cancer). I am also very concerned with the unregulated use of nano technology, because these microscopic particles can penetrate through the skin and enter the brains of humans and animals. There is no way of knowing what harm they could do when unleashed into the general environment. Of course there is a lot more we need to do to protect our planet, but these issues stand out as the greatest threats at the present time, because they could have huge consequences. And, though we can already see the increased pollution from toxic herbicide (i.e. Roundup and the like) and pesticide use, as well as allergic reactions to GMO crops, we really have no idea how much damage they could do once unleashed in the wider environment. I cannot overstate how important I feel these issues are and I hope someone in the Federal government will take note and start listening to the demands of the majority of U.S. taxpayers on the GMO issue in particular. For a cleaner, greener world, Bernadette Wulf

Agreed. I think most of us have our own ideas and we rush to add them here before checking to see if there are already similar ideas. I know I did that when I first found this site. Would be much more conducive to consolidate similar ideas. The site does give one the opportunity to delete their ideas. Also, I doubt very seriously if there is really any benefit to garnering votes for your own pet project. This is not a competition that will award some sort of prize for the highest number of votes.

Community gardens are popping up around the country. More emphasis should be put on encouraging butterfly gardens and other wildlife gardens to help connect children with nurturing nature.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Everyone is responsible for pollution of the nation's waterways and ground water. Individual as well as corporate responsibility must be acknowledged and action taken to reduce waste and its polluting effects. Septic systems and sewers are as polluting as farmlands. Manufacturing and mining is a big polluter. All of us need to look at ways to reduce pollution. If tax credits will be enough incentive, then let's use them. However, they will not work if transfer of credits is allowed. The biggest polluters will just buy the credits of others.

Children and adults, all of us, need to learn to protect and appreciate the area in which we live. Local history and environmental education can encourage and help direct, students and all community residents to observe, to question, to discover and to formulate answers that will give them a sense of place.

I agree that there needs to be a designated trail system for ORV users. However, I am disheartened when I see designated wilderness - not touched by the hand of man - covered with tracks from reckless, thoughtless, careless ORV tracks. This hurts it for everyone. I just returned from SE Utah which has the most unique, spectacular and diverse wilderness in the world. I can state that with some certainty because everywhere I went there tourists from all over the world in awe of the geology, the solitude, the untouched beauty, the historic cultural sites of cliff dwellings, etc. There are currently 17,000 miles of designated ORV trails in SE Utah. Surely that should be enough to keep riders happy and on a variety of trails without damaging more wilderness. Despite a sign posted at Factory Butte by the president of the ORV group to not ride off designated trails, or they might all be closed to ORVs, I observed tracks from various vehicles running in off in a number of places where there was no designated road, or even a well worn path and where there were clear signs saying 'not a designated trail'. These are the actions that will negatively impact the availability of useable ORV trails.

I agree with this challenge. The outdoors and recreation message needs to be taken into all communities within our urban centers. My son-in-law's brother's Boy Scout troop made up mostly of minority boys earned their merit badge for hiking in the outdoors by walking along canals in the Los Angeles area. If they had a connection to the National Forests (NF), they could easily have earned this merit badge at either the San Bernardino NF or the Angeles NF and learned so much more about our natural resources and how to use them.

I emphatically agree that the planning process needs to solicit ideas from all user groups. However, I am not aware of any intentional exclusion of specific user groups. On the contrary, many of the natural resource planners seek out those groups who may have an interest in land management. Planning requires active participation of land managers, individual users and groups of users. The planning process requires advertisement of opportunities to provide comments in local news media. User groups and individuals who are interested in commenting on planning need to actively seek out these advertisements or contact their land managers to open the line for communication. There is a dual responsibility requiring those interested in land management activities to seek out opportunities to comment and land managers to provide those opportunities.

## Discussion Question 2

***(cont.)***

Just returning from a camping and fishin trip in Utah's Uintah Mountians. Ashley National Forest people are trying but loosing to an off road vehicle crowd that just won't take no for an answer. Barracades and boulders are pushed and pulled from trailheads. Four-wheel trails split off in numerous directions, obliterating wildlife and people paths. Marsh and riparian areas are sometimes mud-holes you want to be careful not to step in. I agree with Jaclyn, some kind of interim protection needs to be put in place.

The hikers are much more prevalent than horseback riders, and that points out hte issue with your plan: If we allocate based on number of users rather than the requirement of the mode, you end up with an unworkable system. There may be far fewer riders than hikers, but riders require more space than hikers. We've tried sharing these spaces, but it's usually not very safe for one ot the other of the participants. This is coming from someone who had a close friend killed by a hiker's negligent actions. The hiker thought it would be funny to scare the horse, the rider was dragged for 3/4 mile through heavy brush and rocks before the horse broke a leg. Neither the horse or the rider survived, the hiker ran away and was never found. I've had mountain biking friends seriously injusred by hikers also. Many hikers love to take their dogs on the trail with them, and the dogs cause riders to crash because the hikers can't control their animals..

I think you missed the point, look at the tag to see sarcasm. But yes this is a polarized issue. Maybe we could double our green sticker fees again and close more areas, that way the few remaining areas get beat up so bad that we can prove land use is bad while still providing money for other interests to continue usurping. What kind of fees are your interests contributing to state economies? Have a nice day, I look forward to sharing the great outdoors with you too, really!

OHV and ATV and motorbike areas are sacrifice areas in my mind. The forest, public lands, whatever are places for enjoying appreciating and reconnecting with the natural world. Noise and machines are incompatible with this.

Really, really bad idea. We need Wilderness. God isn't making any more of it. We already have too many machines. Hooting around on a bike or ATV may be fun, having the wind in your face and going fast over rough terrain, but it's man against nature, not with nature.

So many good points... 1. My family has a little bit of land as do our neighbors. We take care of it to the best of our ability. As the newer neighbors with wineries install "mammal barriers" the deer, coyotes and mountain lions are forced into more restricted travel patterns and over concentration. Traditional ranchers would not have done this. 2. Public easements and conservation easements although written with the best of intent can be overly restrictive, our attorney advised us against it, the more detail in the document, the worse it gets for land owner. 3. Shooting of wolves and coyotes is a bad thing, but not all ranchers "hate wild life". There needs to be some form of economic support for a rancher not shooting predators. 4. This author wants to keep his private property private as do most of us, but the public is also loosing access to the areas that they might otherwise enjoy. I resent loosing access to public land just because I ride a horse, bicycle or motorcycle. Just my thoughts

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The HPF has never been fully funded in accordance to the formula that created it. We need to fully fund HPF and make a permanent fixture to assure the preservation of our cultural resources. The preservation of cultural resources goes hand-in-hand with the preservation of our natural resources. Now is the time to maximize our efforts for both.

I have an idea, use OHV funds for OHV. You know, like a budget. Unless you are also ok with your Social Security money being used for other things too.

I agree. The FS has blocked off several roads in the central Oregon coast range where I enjoy recreating. I ride dualsport motorcycles and enjoy exploring old roads. Just a few weeks ago I was riding my favorite road (which is on land with a timber lease to Roseburg resource company) and found a brand new gate had been put up to keep me out, but let the timber trucks in. I was absolutely disgusted to be locked out of your and my public lands, while a private company is allowed access. From what I understand about timber leases, the logging company owns the TREES, not the land they are planted on. Let me back in.

The White House press release dated April 16, 2010 announcing a "21st Century Strategy for America's Great Outdoors" starts a long-overdue conversation - congratulations! For too long THOSE WHO VISIT the Great Outdoors have sought to impose their version of environmental stewardship upon THOSE WHO LIVE AND WORK IN the Great Outdoors. Residents of the Great Outdoors include, farmers, ranchers, loggers, miners, guides, fisherman (and women), and hunters, to mention just a few. Some of us who abandoned the urban life for rural life have done so as the result of some childhood fantasy created in part by the rich baritoned-voice of Smokey the Bear. In his day he carried a message representative of the federal land agencies (BLM, USFS). Today, forest practices have been transformed based on greater understanding of ecosystems as a whole. It is time to reinvent Smokey and get him in front of the public with a new message and a new image.

These battlefields represent a critical moment in America's history and it is imperative that we save as many as possible. Many are threatened by development and will be lost forever without action. These fields are invaluable teaching tools for instructing the generations to come about this time in our history--they must be preserved.

this is public land and I should not be charged for non consumptive use; camping hiking horse back hunting ohv use etc.

We need more quality single track trail miles both on blm and usfs public lands that are available for two wheel mechanized and MOTORIZED use. An emphasis needs to be put on 20 to 60 mile LOOPS. There is no need or reason to close existing single track as this only puts more user pressure on the system as does the dead end trail approach!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

When my family goes camping, it includes 3 generations of ATV Rider. No other sport allows us the opportunity to enjoy the outdoors together like this when age and health issues are taken into consideration. We promote safe, responsible, and low impact land use, stay on the trails, and always pack out our own and someone else's garbage. My goal is to have 4 generations in the same camp spot some day and OHV use may just allow me to do that.

Europe has great architecture and castles and very old cities to admire. America is a very young country and we must preserve what we have left from our history or it will be gone. We do not have thousands of years of histories as do the European and Asian countries. Our history is so precious to us, we take it for granted so many times. It was fought for so hard and people treat it as if we can just throw it away.

These are all great suggestions. All of them should be implemented before there is irreparable damage to our environment and wildlife. The time has come for our government and compassionate caring citizens to take actions such as those voiced here.

America has a problem with people sitting on their butts. Video games, television and computers to name just a few more modern phenomena, all contribute to people of all ages growing into sedentary, unhealthy lifestyles; while simultaneously Federal land use policies are driving people off public lands. I say we strive to strike....a balance. Public lands are plentiful and resilient and I have a hard time believing that honest Americans recreating on these lands will harm them forever. We are already harming ourselves physically. I believe we should actually promote useage of public lands for hunting, fishing, canoeing, hiking, mountain biking, OHV use, horseback riding and the like. Americans need to get off the couch and go exercise and enjoy the God created beauty of this great country. All this talk of new Wilderness areas is political horseplay and needs to stop. Recreation pales in comparison to the damage that industrial development can do and we need to stop kidding ourselves regarding imaginary "environmental damage" created by people just being somewhere - in order to support some political agenda. Lets take a page from President Teddy Roosevelt's playbook and get out there. He created our National Park system so we could enjoy the outdoors and I think you will find that the more people get out there and experience our public lands, the more conservationists and folks wanting to actively protect and manage it you will find.

Designating land as a WSA designation is too dramatic of a tool to protect the land. Without sufficient oversight, the BLM can effectively shut down a piece of land to all but a very small percentage of users. There needs to be a tool in place that can incrementally restrict the access and usage of BLM land (conservation rather than preservation). In many cases, the BLM land in question is already being used by a variety of recreational users which should, by definition, preclude an area from earning a "wilderness" designation.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Mountain bike riders should be allowed in USFS designated wilderness areas. They are not motorized and have little impact when operated appropriately. Put in place a system where riders would have to earn a license to access the trails in the Wilderness areas. IMBA could develop training and testing. Riders should also have to perform a number of hours (50?) of trail maintenance within the annually to maintain their license. I believe most serious riders would have no reservations about earning the right to use the Wilderness areas. This would address some of the problems of inappropriate riding practices and provide the USFS with some much needed trail maintenance.

Having seen the infiltration of a BLM unit after which following a perversion of WSAs to stop OHV use on existing trails I have to say that the BLM tries to do a good job but can be derailed against the public interest.

I am sure this sounds like a great idea to anyone who lives in the city and doesn't try to make their living off of the land you speak of. I am sure I could think of different or better ways to use your city, block, or even home. If you think turning the whole country into a park I hope you know that your food doesn't just magically appear in the supermarket.

Single track trails are as important as hiking and atv trails. The real problem is too much push back against OHV use by judgemental enbjourmentalists whose goal seems not be a balance but to put an end to all activities as they so deem

Several national parks such as Theodore Roosevelt national park in ND and Rocky Mountain Nat'l park in Colorado are way overpopulated with elk that are damaging the habitat. Citizens could reconnect with the outdoors and do a service to the parks if citizens were allowed to hunt the elk in these parks. Benefits of hunting versus other means of control include: this generates revenue instead of expending it, encourages outdoor activity participation, promotes physical fitness, and we could even require prospective hunters to contribute volunteer hours to the park in addition to the cost of a tag in order to hunt.

i don't think the gov has allowed patenting or "perfecting the claim" since they put a stop to homesteading. so i think your beating a dead horse.

If you look at the National Parks, there are many ecosystems represented. However, a Grand Prairie is lacking and I do think that's a national tragedy. But, the same country that mandated Yellowstone be returned to it's former ecological functioning (big predators and all) could easily do the same for the Prairie!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

most of the roads in the usfs road systems were required by the usfs and built by logging companies to access trees, and were left for the usfs to fight fires. early on they became convenient for people to access areas never seen before by the public. later on, the us gov and the states figured out how to tax these people for "road Maintenance", and started the green sticker program. so ohv people have been paying all along for you to have access to all your hiking destinations. as years have gone by i've seen less and less maintenance on the roads in the national forest i live in the middle of, but have paid continually increasing fees on green stickers. most people i know that access the forest with ohv's are actually stewards of the forest and help maintain these roads themselves by filling potholes, clearing the roadway of fallen trees and rocks, and picking up trash all the cityfied people leave. i know it's cityfied people because there's not a micky d's for 90 miles, but we pick up their cups. bottom line, i don't ask you to pay for roads i use, so don't ask me to pay for your trail, but if you ask nice, i will help you build your own trail, neighbor.

Folks you need to understand what wildlife corridors are all about. You will not be able to retire next to them. In fact if you look up the plan from the self serving greedy Environmentalist you will learn they want to close off 90% of the lands where no human can live. This is scam to force every American into the cities. The Nature Conservancy is selling land back to the Government sometime at a huge profit. The other things everyone forget's is these far left wing extremist hate Humans. They want the roads the National power grid all human building rip up. I for one want to keep the land open just the way it is so future generation can drive out and explore the lands camp where they want and enjoy the land not box into a city like a slave.

Great post. The anti human side that drives cars lives in houses are the worst hypocrite alive. They hate people and want to kick people off private property steal jobs close off any and everything man does. These people need to crush their cars. burn their houses to the ground clean up the land and give it away to save the animals oh yes and leave the country. Oh that right they only want that to happen to rural America. It is high time these greedy self serving Eco Nazi are told no more. No more jobs close off so you can live in fairy tale land, no more closing off logging so we can have more forest fires, no more closing the roads off to vehicle traffic, no more taking of our land for your sick fantasy dreams of forcing everyone into the cities like slaves.

It is time to get the animal worshipping wolf people out of hunting laws. These people have watch the game herds get wiped out by wolves and laugh about it. Wolves have completely wiped out the Bighorn sheep, the Mt Goat and moose in Yellowstone park if you are save the predator type you people caused this destruction. Some parts of Montana are so low on game outfitters are asking the season be closed. The wolves are the worst disaster in the lower 48 history. Where ever these useless mutts are nothing but death and destruction. People dogs ripped to shreds children stalked Alaskan school teacher ripped to shreds. Enough of the wolf lies get those predators under control right NOW.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Last time I checked our public land are managed for multiple use. Mountain Bikes have lots of opportunity and there is also plenty of land for those who think wheeled vehicles have no place - it's called wilderness. Over half of California's public land is wilderness. That is more than enough. If you want all wheeled vehicles banned from public land that is pretty extreme. There is plenty for all and there have been major strides toward managing land for different uses so damage is controlled. Lots of people volunteer countless hours to do this, and we would be very disappointed if there was no place for us. Think about a scenario where all land is private and we have just a few parks where people can do only highly regulated managed activity. Sounds like a county without much personal freedom doesn't it? I prefer living in a democracy where everyone has rights, don't you?

My family and I are avid OHV riders ( we backpack too by the way, but I have a bad knee now so I can't do the long hikes any more). Over the years we have found our favorite places closed to OHV use, especially recently due to Travel Management. We always ride responsibly and use quiet exhaust systems and respect other users. We often stop to admire wildlife we see along the trail, it is thrilling to see a bear or bobcat. They usually stop when we stop so we get a great photo. I think they would run if they saw a hiker. We abhor seeing wheel tracks across a meadow and wonder what yahoo would do such a thing, you would have to be totally ignorant to do something like that, plus it brings down heat on our community. We have plenty of that as it is. We find it heartbreaking to find our trails and areas closed and do everything we can to promote responsible recreation and ask people to stay on the trail. We volunteer hours and hours to do trail work to make up for the lack of funding from the government even though we sometimes have to fight to do this. We go to hours and hours of boring meetings and read 600 page long environmental documents and write comments on them to help keep just a few miles of trail and believe me there are lots of other things we'd rather do. We have to do all this ourselves because we don't have the money to hire high priced lawyers. Thank goodness the NEPA process allows ordinary folks to at least participate, even though we usually end up with an adverse court decision in the end that closes our areas. We'll tolerate previously disturbed areas, no problem, in fact we're used to being given the places no one else wants. So let us at least have those and leave us alone.

Please take care of the huge backlog of maintenance that needs to be done on our existing National Parks and National Monuments before you even begin to think of creating more Parks/Mons. It is a National disgrace that we haven't taken care of our existing National Park system in a manner it so sorely needs!

Thank you. Stir up the lunatic fringe yes we know who the lunatic fringe truly are Eco Nazi a convict Eco Terrorist is working on the Wildland project. This lunatic said he wants 90% of the people of American removed forever. Anyone that support the wildland project is just a good German brown shirt.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The wolves are the biggest wildlife disaster known to man. They have done NOTHING good. Plenty of bad forced ranchers out of work, small business closed down due to the hunters no longer coming back, killed people, sport killed our wildlife. Wyoming had 1200 moose before the wolves today only 116 remain. The wolves don't balance nature they wipe it out. NO MORE WOLVES ANYWHERE.

Wolves are a fake endangered species wiping out everything in their path stop supporting super predators. leave the land open to all users. Wilderness area truly means cutting the public off from the land.

I think a better idea for us Americans (or US Americans), would be to put a large tax on tobacco products. That extra lump of money will be needed when the tobacco users are clogging up our hospitals with their self imposed medical problems. Heck, while I'm at it, the same goes for unhealthy foods. Unhealthy foods should have a huge tax too!

I think it is perfectly clear what is saying. Quit trying to shut us out of public land. I agree with when he says "In our great country we have worked, died and fought for, we should be able to access the land we own". I'm not sure how many of you have fought for our country, but I sure have. I've served 5 tours in Iraq and I've had multiple friends of mine die in combat. I can assure you that none of the Soldiers I have worked with would like to see public land closed because a lower case "w" becomes a upper case "W". If doesn't know what I'm suggesting, I'm suggesting that land being improperly designated as Wilderness (with a capital "W") is shutting out people who use it responsibly. People who use the land for good old family fun should have access to our land. People like hunters, fishers, hikers, mountain bikers, and OHV users. It's no wonder there is a problem with obesity in America, it's because there aren't enough families taking their kids outside to do things like riding dirt bikes or camping. Families can't do those things if lands are shut because they are redesignated as Wilderness with a capital W. Keep lands open for public use, because some of us have fought and died for the right to use them.

Invasive species are a major concern to farmers and ranchers. They have been very diligently working to control and monitoring outbreaks of noxious weeds on there property and have watched in vein as the neighboring public lands become evermore infested, choking out native species. The local conservation districts work very hard but are understaffed and underfunded. Education and extra funding to the local level would go a long way.

Thomas Fogle, you are a genius sir! Now that makes sense. There is such thing as new wilderness. Try using your computer for something other than typing uneducated rants and do some research. The United States isn't the only country on the Earth. Mother Nature has reestablished her dominance and created new wilderness all over the world. Climates change and new wilderness is established. You just don't notice it in your lifetime. Try looking beyond what directly in front of your face (your computer) and get outside and enjoy nature, although that's tough to do when you are shut out.

## Discussion Question 2

***(cont.)***

The Lewis and Clark Trail was the first of transcontinental discovery. There is something in the Lewis and Clark story for everyone. If you have read the Lewis and Clark story and have not found something that captivates your imagination, you have not gone deep enough. It is a Trail from the Atlantic to the Pacific. But, it is only partially recognized. We need to "complete the Trail" by including the eastern legacy (St. Louis to Washington City, Philadelphia, and Monticello). Bryant R. Boswell (10 Jun 2010)

I feel strongly that all public land needs to be taken care of regardless of what types of recreation is done on the land. The Forest Service and other entities that manage these federal and state lands cannot do it on their own. Each type of group that recreates on public land has councils, associations and clubs, etc. Some of these groups are more active than others, but when one or more of these groups donates time and resources to maintain the land, these groups should not EVER be in jeopardy of losing the right to recreate responsibly on these lands. I belong to one of these groups and we donate many man hours each year helping the forest service maintain trail systems. We cut out trees so that horsemen, mountain bikers, hikers and OHV users can use the trails that have been there in some cases over 100 years. When these trees are not cut out users from each group find ways around the fallen trees and end up re-routing trails in a direction that can actually cause erosion or other issues. The group that I belong to also works with the forest service helping build water bars on these trails so that any water that would normally travel down the trail and erode is run off of the trail in a natural way to preserve the trail and not cause unnecessary side effects to the area. Whether I hike in the area, ride my mountain bike, horse or off road motorcycle I reap the benefits of these work/service projects. There are many other groups that do the same types of work all over the country. When we all get involved and donate our time to keep the areas beautiful our groups should not have our access taken away. This theory applies from designated wilderness area that doesn't even allow foot traffic to mountain trails that look at closing down access to mountain bikers or OHV users that have recreated there for years. If a group is using an area and is donating time and helping to keep the area beautiful and usable, why suggest taking away that groups right to use the area?

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

We all have opinions on what access is okay. What it really comes down to is what you like to do on public lands. If your idea of recreating responsibly is in danger then you have an opinion on why that type of recreation is okay. Public land is public land. The real issue is taking land that is okay to use today and taking away someones right to use that land. Taking away access to land that someone has used for years should be expected to cause some controversy. As Americans we love our country and we all have cultural and family traditions with what we do when we recreate. When someone attempts to change a cultural tradition of one group, they should expect it to be met with opposition. Keep the lands open for what they were meant to be used for. Responsible recreation and use. Opening up new lands for new types of use is a totally different topic, but taking something away that has been there for generations and is still functioning should not be done no matter what type of recreation you prefer. Just because you prefer to walk on public land vs. ride a horse (which was there first anyway), a mountain bike or motorcycle doesn't mean that you are more responsible. It just means that the type of recreation you prefer "appears" to have less of an impact on the environment. One last thought. Our interstate highway system is used daily. Without maintenance to that highway system it would be broken down and impassable. We have the same issues with our public lands. If nobody is maintaining them, the trail systems we use and maintain today will become overgrown, eroded and impassable. If a group that uses the land loses access you may well also see that the group you just secluded will also no longer maintain the areas and leave the burden on the already overburdened forest service or state entities. These areas will also become unusable over time the elements will deteriorate the trails systems that cover these areas. We are then left with some beautiful pristine wilderness that we can look at in pictures and cannot enjoy.

My idea is to create an environmental stimulus for the US American economy by paying \$.03 cents for every cigarette butt collected and turned in for proper disposal. Some many smokers have used parks, intersections, lakes, and beaches as ashtrays. This is not fair to non-smokers. The time has come to put income in the pockets of those US Americans who want to preserve safe, healthy, and beautiful environments.

Off shore drilling must be stopped. Period. Require mandatory education in middle and high schools regarding the environment, wilderness preservation, etc. Require physical education classes to prevent the epidemic of obesity in kids-get them away from the computers and outside. Require voluntary action in some sort of environmental activity for graduation.

People who are not experienced in the outdoors will usually choose the easy way to interact with it (ride in a car, see a movie, shop in a store). They need naturalist programs to teach them how to enjoy untamed wildlife and unspoiled landscape. Don't cave in to pressure to Disneyfy our parks. With encouragement and opportunity, people can get beyond golf courses and tennis courts.

Yes, well deer carry ticks that can pass on diseases to humans, and skunks and raccoons can carry rabies, etc. Are we going to get rid of all animals because they are unsanitary and might cause some harm?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The BLM is underfunded and understaffed. The government is out of money and can't afford to properly maintain the wilderness. They need the help of OHV volunteers to maintain it. They are the ones who keep the fire roads open by clearing fallen trees and repairing washed out access trails. Without these trails, the whole area would burn and we would lose our precious wilderness.

The off-road crowd actually plays a vital role in the maintenance of the wilderness. Many of them work with the BLM to keep open fire roads and access trails by clearing fallen trees and repairing washed out areas. I have numerous friends who are Forest Service Volunteers that patrol the forests looking for fires, illegal campfires, and trails that stray from the designated path. The government is out of money and can't afford to maintain more forests. They are understaffed and underfunded. They need the help of OHV volunteers, and that means keeping those areas open.

Having just returned from a fabulous adventure on the Wild and Scenic Missouri River, through the Upper Missouri River Breaks National Monument, I was reminded how important it is to protect places like this through inclusion in the National Conservation Lands. This is the only section (149 miles) of the entire 2,200 miles of the Missouri River where you have any hope of experiencing the river as Lewis and Clark saw it more than 200 years ago. The National Monument protects rare plants and animals, dinosaur fossils and native American sites. These lands conserve the essential fabric of the West by protecting for our grandkids the lands, water, and wildlife we inherited from our grandparents. It is essential that National Conservation Lands receive strong policy guidance from the Department of the Interior that ensures their protection so that 200 years from now, kids can still experience the landscapes that inspired our country.

I am very much a nature lover. However, I can't agree with this suggestion if it suggested as a BROAD approach to all nature areas. Certainly there can be some areas left wild and other with accommodations for the less "rustic" adventurer. Certainly you can see the need for access for less fit individuals, clean restrooms and phones to use in case of emergencies.

I just wanted to add an interesting statistic to this discussion. I monitor the statistics on the Take Care of Your Share website. I can tell how many people find the website by using search terms such as "how can I take care of the planet" or "taking care of our planet" etc. Almost NONE of those searches come from within the United States. What it LOOKS like is that there are many more people in other countries that are looking for ways to make a difference, on a personal level. It is very disheartening. { <a href="http://www.takecareofyourshare.com/" rel="nofollow" target="\_blank">Link</a> }

I think it's an interesting idea to provide park passes to people in exchange for volunteer hours and wouldn't be surprised to find that this idea is already in play. However, I don't see why it should be restricted to government employees. The people with the most time to devote to volunteer are probably retirees or other people that are not employed full-time and these are the same people that would benefit the most from free passes and discounts.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It's too bad that we there isn't a way to combine all of these suggestions about Master Naturalist programs into one. It would make it easier to see how many people are in favor of them if there was only one place to vote for them.

Most of the major national parks have plenty of luxury accommodations. There are very few places where only rustic camping is available.

Somewhere along the line, trying to protect the environment has become a competition rather than a cooperative effort. I believe that it got much worse once "being green" started to be an economic issue rather than an environmental one. Environmental groups should learn to work together rather than feeling like they have to compete with each other. I assume the competitive aspect has to do with getting donations and I don't know the solution. But we are all on the same page and groups need to learn that. Working against each other is detrimental to the cause.

Uggggggghhh. The thought of turning the wilderness into another Disneyworld.

OHV users are an important and influential portion of the economic model of preservation for public lands that allow motorized sports. More often lately OHV users are demonized as destructive, careless, abusers of said lands. However, a larger and larger portion of the fees we pay are earmarked for support and restoration of these public lands (vehicle registration fees, land access fees, etc). Additionally, many OHV users promote conservation, upkeep, and social responsibility either through organized groups or through a fundamental belief that these lands are worth protecting and improving in order to enjoy them properly. Limiting or revoking rights already given should not be a strategy employed to satisfy the few mobilized against the actions of the masses of OHV users. The idea then is simple: instead of taking something away from OHV users, continue to provide access to these lands, adding something to their responsibilities that equate to an investment in the lands they use (other than the taxes, fees and volunteer time already given). Offer reduced vehicle registration fees or provide free land use passes for OHV users that volunteer time towards restoration or upkeep programs. The great American financial incentive at work, and much of this activity can be done while using an OHV, making the act of contributing to preservation and upkeep more enjoyable. OHV users are family oriented. Time spent together is rewarding and rich in outdoor experience. Self reliance and conservation are natural compliments to outdoor activity. Leverage the hundreds of thousands of OHV users to promote these concepts rather than souring their spirits with limitations and reductions of freedoms.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Over the past decades Multiple Use Lands and Trails have been closed at an alarming rate. This has been done with Wilderness and Monument Designations supported by a vocal minority and against the wishes and recommendations of the local residents, Forest Service and BLM. These closures have concentrated use on the remaining Multiple Use lands putting them in danger of being over used. The restrictions on the Wilderness and Monument lands have also eliminated conservation work. This is true in Sequoia National Forest and other Forests and BLM lands. The America's Great Outdoor Initiative must permanently protect remaining Multiple Use lands in order to: 1. Promote active conservation work and Forest Health. 2. Ensure all forms of recreation continue to be allowed for current and future generations. 3. Prevent any further concentration of use or closures of these lands where the majority of the public recreate. 4. Support local rural economies which depend on the income generated by the recreational user of Multiple Use lands, as well as sustainable grazing and timber harvesting which provide much needed products, jobs, income and taxes. 5. Protect Multiple Use lands where the majority of the public can go to refresh and recharge while recreating and supporting local rural economies. I attended the Los Angeles listening session on July 8, but was not chosen to speak so I have provided my testimony and suggestion here. I am the Executive Director of Stewards of the Sequoia. Since forming in 2004 we have continued to be the largest on the ground volunteer organization in the Sequoia National Forest. Our volunteers perform maintenance on over 200 miles of trails per year. Our conservation work has provided over \$350,000 in benefit to the local community and the Forest Lands at zero cost to the community. Our work is done on Multiple Use Trails which are enjoyed by everyone including motorized recreation, mountain bike, horse riding, hiking, hunting, fishing, rock climbing, camping and more. Our concerns are based on actual day to day involvement and working in the forest with land managers.

Preserved for whom? If you can't have access, what good is it? Guess you could look at a postcard or something.... Look at a map of the western US, Most of the land is already "preserved".

Regarding ORV/OHVs and the comment that "touring at low speeds is the only public land use that should occur", kinda makes "public" land less so. If by "public" you're referring to lands set aside as outdoor recreation areas, and also supported by taxpayers, and you are against the use of said land for anything other than "touring speeds", then you are specifically intending to deny land access to those who prefer offroad riding at anything but "touring speeds". Sadly, public lands are paid for by people that like to go fast too. In fact, here in the west (California, Nevada, Arizona) where the vast majority of offroad open area riding takes place, OHV users are by and large excellent stewards of lands that are set aside for such use. I simply don't understand the mindset that public lands should only be enjoyed in utter quiet, or that rights should be limited or stripped for some class(es) of users and not others.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Renewable Resource Harvesting such as Logging, Forest Thinning and Active Forest Management in America must comply to the strictest environmental standards in the world. So there is little risk of damaging the environment. Actually by discouraging logging in America we are supporting poor logging practices in other countries where they may have little or no environmental regulations, not to mention wasted fuel and energy shipping wood from far away places. Each of uses wood products every day and it will be provided from somewhere. It just makes sense to support Renewable Resource harvesting in America using the best practices in the world.

makes some excellent points. While I understand points, the fact is that people that enjoy the outdoors are also its most ardent supporters. If we take away the recreational aspect of our national parks, the majority of support for land preservation would disappear. Let's face it. Environmentalists make up far too small a percentage of our population, and the rest of the population has a tendency to be ignorant of the problems that exist a few miles from their front door. In Illinois recently, the governor proposed cutting educational funding by \$1.4 billion dollars. In Greece, the government is being forced to make massive cuts to all of its public services. The government is already trillions of dollars in debt. Do we really want to alienate such a large segment of people that actually support the preservation of federal lands and waters?

Stable wildlife populations require healthy and connected ecosystems. Some species migrate seasonally, others require large territories to hunt, and many--especially predator species--need to be able to move across great distances to maintain the genetic diversity that is key to their survival. Human encroachment on intact ecosystems leads to habitat fragmentation, recognized as a primary cause of the decline of species worldwide. Roads and highways, in particular, are a principal cause of habitat fragmentation, creating barriers to wildlife movement and resulting in animal-vehicle collisions. Global climate change will alter ecosystems and force wildlife to shift their range, underscoring the need for wildlife to move across the landscape. The issue of habitat fragmentation needs great attention now, in order to protect key remaining habitats and restore crucial linkages between habitat areas.

The argument that our National Forests are open to EVERYONE, but closed to those who do not enjoy my form of recreation is ELITIST, self-serving and invalid. To a reasonable person dispersed wheeled recreation has no more impacts than any other form of dispersed recreation. Wheeled recreation is a great way to enjoy the Outdoors and how most young people prefer to enjoy their public lands.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The assertion that wilderness quality lands continue to exist because they are "protected" by grazing interests ranges to the bizarre. The ecological quality of public lands in the west is very poor and much of the problem can be traced to the the crested wheat grass biological deserts created in the interest of cattle grazing. That said-- another poster is correct in that the 1964 Wilderness Act is clear that grazing is not an impediment to Wilderness designation and vice-versa. The discussion of how to protect the ecological resource of the Public Lands while still allowing for grazing is a separate discussion from wilderness. Given the effect rampant ORV use would have on cattle ranching, I wonder how ranchers are reacting to the apparent push for greater access for those destructive machines.

The health of the land is not determined by who recreates there. It is determined by how many people recreate there. In the case of many popular hiking spots the areas are overused and in very poor condition. The same is true where OHV recreation has been forced onto too small a trail system by those who seek to close our public lands to the majority of the public. The reality is every form of recreation has impacts. Water runs down the hill on every trail. How the trail is laid out determines how much erosion takes place, not who uses the trail. Many of the hiking trails I have been on had really bad erosion since hikers are most likely to shortcut switchbacks, which increase the speed of water flow and erosion. Trails that allow OHV use are often better laid out and receive more maintenance due to OHV self funded programs than other non motorized trails. People who enjoy motorized recreation volunteer and provide more trail funding than all other groups combined.

The law of supply and demand applies. Asphalt and concrete are permanent and very common, wilderness is fragile and rare. We should value more that which is rare and should therefore attach a very high value on wilderness. Opponents of wilderness are reflecting the values of 400 years ago when the attributes of civilization were very rare in North America and wilderness was common (and perceived as threatening). It's time America's for public lands policy to reflect the values of the 21st rather than the 17th century. It's time place a very high value and priority on protecting those last vestiges of North America that reflect the hand of God rather than the footprint of man.

The point is the Nations young people and the public already enjoy Off Road Recreation and Mountain Biking far more than other forms of recreation. There is nothing cobbled together about studies showing the participation in each form of recreation from the USDA Forest Service, International Mountain Bike Association, Outdoor Foundation and American Horse Council. Please note that not one of those organizations is an Off Road organization, yet their numbers confirm Off Roding is the most popular form of recreation. However if you doubt them, please go to an area where wheeled recreation is still allowed and see for yourself the huge numbers of people. The attempt to encourage people to hike for recreation has been a failure as shown by dropping visitation to National Parks where only hiking is allowed, while even in the face of more and more closures, more people choose wheeled recreation. Let's help our young people to get out more by providing more places for them to do what they already want to do, enjoy wheeled recreation.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There are many areas that are designated for mountain bikers and preserved with the aid of mountain biking associations. Without the demand by these individuals and groups, those lands would not be used and their preservation would be at risk. Within each of the areas that I bike are trails designated for hikers as well as wilderness areas in which biking is restricted. Multi-use trails allow for partnerships between local organizations and federal government in the management of these lands. It helps the government to share the burden and helps local economies when these groups sponsor activities on federal lands. These activities help taxpayers recognize why we would want to preserve lands. They allow more people to enjoy the use of those lands and develop an appreciation for them. Without mountain bikers, hikers, fisherman, hunters and the many others that use federal lands to pursue their passions, we would lose a huge amount of support at the polls and with the funds that they pay to pursue their hobbies. As a hiker, mtn biker, fisherman and hunter, I hope we all recognize that if we can't work together during these times of financial hardship that we may lose the very lands that we all want preserved.

There are many dissertations on why wilderness areas are crucial and necessary for healthy people, habitats, water sources, and wildlife. The list is too long to regurgitate here. But three major points are worth reiterating. There are few places left unadulterated by the hands of man. We have a responsibility to preserve any and all lands that meet wilderness criteria in perpetuity for the benefit of ourselves and, more importantly, our children. After all, we are merely borrowing these lands from them. Some places are too valuable not to protect from human adulteration. Some would cry "elitist." That is a very anthropocentric and selfish point of view. These places are worth protecting from humans as much as they are worth preserving for humans. The damage a single person could do is enough to destroy the rich tapestry of these ecosystems forever, in some cases. To those who say that wilderness is closed to people, doesn't allow access to the old or unable, or to firefighters, is a concept for the elite or affluent, and so forth, are simply ignorant to the facts of wilderness designation.

While I understand the importance of designating lands for OHV use, 1:1 is somewhat excessive. One, there are more than two types of people that use the lands. Two, we all need to recognize that OHV use does come at a higher cost to the lands and waters that we're trying to preserve. HOWEVER, hikers, bikers, environmentalists should begin to recognize their dependency on the OHV community. Obviously it is a large and vocal community, which very clearly cares about the retention and management of public lands. As someone else, the government has NO MONEY. If we all want to continue to enjoy public lands, if we want clean water, safe animals and plants, we need to find common ground. And we need to do it quickly.

I understand your concept about treating bison as a game species; in many cases worldwide, game species receive better protection than ag species. I'm not clear on whether you are wanting to designate the bovine mix bison *\*only\** as the game species?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

From the mountains to the sea, this outdoor destination is the backyard for urban L.A. For millions, it's important for recreation, drinking water, clean air, open space, wetlands, historical and cultural significance and habitat. But it needs improved park access for the San Gabriel Valley, more services to link diverse communities, and federal protections for the last wild places.

I would like to add to this that this is just the ramblings of a crazy man. The original author was just this week arrested for assaulting two mountain bikers on a trail with a hand saw. He attacked the cyclist and cut one across the chest with the saw. He will have his day in court so lets move on. As a mountain biker I agree that not all trails should be open to mountain biking but I do feel that this is a legitimate outdoor activity and when trails are designed for mountain bike use the destruction that the author points out is minimal. The conflict in the past arose because mountain bikers pushed for access to trails when there were none to ride on and may have done damage to the trails because they were not designed for cycling. Those days are past and trail design has improved. If a land manager works with local mountain bike groups and implements IMBA construction methods the damage can be limited. I know every trail work day we have are well attended and mountain bikers work very hard to build trail the right way while reducing the impact on nature. Should mountain bikers be allowed access to all land? No. Should mountain bikers be able to develop specific trails designed for their sport? Yes. Lastly, I suppose the author was out preserving nature with that hand saw he attacked the cyclist with. Yeah Right!!!!

I fully agree. If we want people - kids, families - to spend more time in the outdoors, we should be making it easier and cheaper for them. Not nickel and diming them at every campground and trailhead with a program that does not work.

The USFS in particular has utilized contractors and concessioners to collect FLREA (the former Fee Demo) fee money and campground fees. This practice results in a never ending escalation of the program as more fees are needed to justify the jobs to collect more fees. End the use of contractors and end fee collection at trailheads, return to volunteer campground hosts, and the problem is solved.

Three Rivers Land Conservancy is steward for natural areas in the Portland Metro urban area. Urban land is too expensive for a land trust to acquire. We hold easements and provide stewardship for land that we do not own. Owners of ecologically significant land are more likely to grant a conservation easement if there is a tax incentive to do so.

As I commented on your other post, the Federal Government reached out and closed our local trail system in spite of a long standing partnership of trail maintenance.

Great idea but it doesn't always work. I along with countless others, spent 2 or 3 weekends a year for over 7 years doing clean ups and maintenance on our favorite trail system only to have access closed 2 years ago by the Forest Service.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I guess we shouldn't be driving cars, using boats or flying planes. Wait a minute, we should never have allowed horses (well at least those ridden by humans) either. Do you realize how pathetic you sound? By having things like mountain bike and OHV use you extend the reach and use of the great outdoors to many more people. If it is done properly there is little impact on the ecosystems and I doubt you are going to put ANYTHING in danger of extinction. Wait a minute....do you live in a house? Do you drive on the road and park your CAR in parking lots that give access to natural areas? Bet they have a HUGE impact on the ecosystem. What are you wearing on your back? Oh...all these things are ok because they benefit YOU! How does that song go again.....This land is your land....this land is my land..... Maybe if you tried looking from another perspective and apply some logic you would see just how one sided and ridiculous your statements are.

I agree with most of this quote from above. Lets keep things like this for a while.. I think we can make things VERY Sustainable and allow all citizens to enjoy OUR Country. "We do not need more Wilderness. There are other methods to conserve large areas without Wilderness, such as National Recreation Areas or Backcountry designation, which conserve land but still allow access. I can count on one hand the number of hikers or horsemen I've seen while riding some of the country's remote trail systems....Wilderness shuts out everyone but them, and they end up with vast tracts of land that most people won't or can't go into. Backcountry designation keeps the land accessible. No more Wilderness!"

I doubt they hauled that trash in on an atv I can just see it now my own refrigerator man just reach back and grab a cold soda. just use you brain man Ive been out there off highway is usually the cleanest places you see, I ve been to the beaches, and lakes and seen the damage there too

I think this idea deserves promotion simply because it is a step in the right direction. Do I think mt. bikers should need a license to ride in Wilderness areas, no I do not. Just as equestrians don't need a license to use those areas. But if licensing makes the opposition feel better about sharing the land, then sure, let's do it. The only reason I see for prohibiting mountain bikes in areas which are otherwise open to hiking and equestrian use is when it is a popular area and there are frequent trail conflicts due to overuse. It is sensible to manage and restrict use to specific users in those cases only. But in remote wilderness areas where trail conflicts between different users are extremely rare, it is absolutely ridiculous that mt. bikes are banned yet equestrians are not. Motorized use is a different issue due to the higher environmental impact, however there is no reason why we shouldn't be able to support a reasonable number of managed trails open to them in all these areas as well. The key is "management", as there's plenty of land for us all to be happy!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I tried to show my son the Salem Church battlefield in Spotsylvania, Va, but could not keep his interest. We were walking through the furniture store parking lot, the bank parking lot, and I just COULD NOT keep his interest. He could not tell what I was talking about with all of the cars trying to park in the parking lots. Also, the asphalt was too hot to make it pleasant. I think the idea of allowing commercial development on Civil War battlefields IS A BAD IDEA. It does not work. And it is very hard to figure out what might have been here 150 years ago after the bulldozers have cleared the area and leveled all of the terrain. On the other hand, when we walked across the Spotsylvania Courthouse battlefield, my son could easily tell how the battle unfolded. The terrain, woods, and fields are very similar to what the battlefield was like 150 years ago. AND, nice and cool, with the trees. No asphalt to bake you into surrender!! So my idea is to, preserve the Civil War battlefields NOW. Don't try to do it later after the commercial property has totally transformed the area so that you do not recognize it. Also, trying to buy the commercial property later and transform it later will not work. It will be too costly and too difficult to bring the area back up to the pre-commercialization state.

Jaclyn - Section (d) (4) (2) of the Wilderness Act states: "the grazing of livestock where established prior to the effective date of this Act, shall be permitted to continue subject to such reasonable regulations as are deemed necessary by the Secretary of Agriculture." Key words in that sentence "subject to". Those legal terms get you every time. While I agree that public land should be protected and should be protected from companies that continually exploit the American peoples resources. I disagree that we need to further "protect" the land from the people. Wilderness areas only prohibit entry by anyone except government employees or persons on foot. Most are, here goes that term again, "Subject to" restrictions by horseback and mountain bike. All are subject to no motor vehicle use on existing roads! Unless of course you are a government employee and then you can enjoy the peoples property all to yourself. Protect it for Us, not from Us!

"That means keeping the machines out, the cycles, ATVs, cell towers and cell phones, recreational cabins, visitor centers, permanent climbing anchors, motor boats, chainsaws, helicopters, backhoes, and military trainings." Banning the public from public lands is bad policy. Effectively banning handicapped people from public lands is unconscionable.

I strongly agree that we need to use our sites to promote not just recreation but also education. Our heritage is our strength and needs to be better passed along to future generations. In particular, there needs to be more funding to protect, preserve and interpret the Civil War and Revolutionary War sites in our country.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The battlefields of our nation's most turbulent and defining four year period must be preserved. Joshua Lawrence Chamberlain said 120 years ago at Gettysburg, "In great deeds something abides. On great fields something stays. Forms change and pass; bodies disappear; but spirits linger, to consecrate ground for the vision place of souls. And reverent men and women from afar, and generations that know us not and that we know not of, heartdrawn to see where and by whom great things were suffered and done for them, shall come to this deathless field to ponder and dream; and lo! the shadow of a mighty presence shall wrap them in its bosom, and the power of the vision pass into their souls." Just like Chamberlain we must be visionaries! Don Torrence

The time is NOW to preserve what is left of Civil War Battlefields! Why the urgency? Reflect for a moment what has happened to so many of the Revolutionary War Battlefield sites. So many of them are in the heart of a city and are not preserved. We have an opportunity to save and preserve the remaining Civil War battlefields. Our government and our citizens must act NOW! Battlefields are memorials to those who helped to make our country what it is today. Battlefields are lessons of what has shaped our society. Battlefields are outside in fresh air and not in a room full of electronics or gizmos.

is incorrect when he states that that "most conservation initiatives ...end up excludng the public from public lands." Actually virtually all public lands are wide open to all members of the public. The controversies over "access" really revolve around the wishes of people and groups who want more access for motorized recreation. Access to the public is almost never restricted on public lands; access to motors is sometimes restricted to protect values that are important to a large majority of the public. These values include protecting wildlife habitat, minimizing erosion, minimizing noise and disturbance, and protecting wild landscapes.

is incorrect when he states that public access is retricted in Wilderness Areas. All Wilderness Areas are wide open to all members of the public. Many OHV enthusiasts spread this kind of misinformation, in an attempt to increase motorized access into wild areas.

This is a great idea! Too bad that more people do not see the common sense in sharing our outdoors.

## Discussion Question 2

***(cont.)***

Many of these ideas start out sounding straightforward and moderate, then the writers begin framing their individual political agendas by using phrases such as "locking up public lands," "controlled by a vocal minority," "wildlife terrorizing gearheads" and so on. Or mentioning red herrings like "disabled users can't access wilderness"--how many truly disabled people have you seen riding ATVs? Talk about a tiny minority. That's when I decide I can't promote or vote for either "side." I do a little offroad motorcycle riding, and a lot of climbing, hiking, and camping in Colorado. I have never been disturbed by an offroad vehicle while hiking, nor witnessed any deliberate trail (or off-trail) destruction by OHVs. If seeing a rut made by an offroad vehicle sends you into a rage, don't frequent the handful of areas where that happens. From the earth's point of view, that rut is very temporary. Off-road riding near the metropolitan front range is fairly restricted due to population and development, so riders and drivers of OHVs are necessarily concentrated in a few areas along the foothills. These areas may have environmental damage from overuse, as does Rocky Mountain National Park from an overabundance of elk. On the other hand, there are many open space parks in the foothills with hundreds of miles of trails open only to non-motorized use. The proportion seems about right to me. By the same token, if I'm willing to travel 20+ miles away from Denver/Boulder/Co. Spgs. metro areas, there are many riding opportunities and not that many hikers, etc. And riding areas (and consequent traffic) are highly dispersed, so recreational vehicles are creating much less damage than current oil/gas drilling or even mining that occurred over 100 years ago. If you live in the Western US, you know there is a lot of land and relatively few people. The conflicts between recreational users of public lands has been blown out of proportion by "vocal minorities" on both sides of the issue. I'm guessing most of the people complaining about the opposition have never ventured more than 200 yards from a parking lot. To sum up, my idea is: Do not attack your presumed opponent when formulating an idea. Wild lands are apolitical by nature, and you may have more in common with your "enemies" than your friends when it comes to conservation or multiple use philosophies. Don't mindlessly transmit your chosen faction's talking points, but use your actual experience to mold your opinion. Just because public land is called Wilderness by current law doesn't mean your grandchildren won't be riding electric motorbikes there in 50 years--laws can be changed after all.

Repeal the Fee Demonstration program. Analysis has shown it to have no net value, as it consumes all it brings in in administrative costs. It is an annoyance and an insult to ask folks to pay a fee to use scenic waypoints that their tax dollars have already paid for. If your goal is to encourage people to reconnect with the outdoors, then this barrier must go.

Snow country (boreal) forests are the largest, least understood, and most neglected by environmentalist. Skiers are also the largest, least understood, and most neglected outdoor constituency using this forest. As a retired national park ranger and professional skier I've observed this unfortunate disconnect with increasing interest ever since I wrote a Mineral King editorial for Powder Magazine back in the late '70s. My Ski Trails book (2008) provides the tools to remedy this critical information gap. Mineral King's Supreme Court case is only the beginning of skiing's contribution to environmental restoration.

## Discussion Question 2

***(cont.)***

A lot of the hiking trails in my area (and I've heard similar anecdotes from other regions) are practically destroyed every spring by masses of ATVers (including trails where ATV use is supposed to be restricted). The trails are rendered practically unuseable to anyone but ATVers, making the designation "multi-use trail" a joke. Off-roading is a perfectly legitimate form of outdoor recreation even if not my chosen way and I respect that, but it's clear that offroading in innappropriate settings (non-motorized trails) as well as responsible offroading (tearing up multi-use trails) is a problem. It's my belief that stricter penalties need to be imposed, but more importantly, that enforcement be taken seriously. The non-motorized status of hiking trails is completely unenforced in many areas and as a result no one hits the trails but the ATVers themselves. There are many responsible ATVers and offroaders out there who certainly deserve the right to do so (in fact, perhaps there should be more motorized-specific areas to reduce the wear on multi-use paths). In order to preserve their rights, it's essential to keep the irresponsible users off the public trails. Every ATVer who wants to go mudding has a few acres (or a buddy with a few acres) where they can go do so. Law enforcement needs to get serious about showing that public trails are NOT the place to do so.

Let's get out of Afghanistan and Iraq and use the billions of dollars saved to preserve what makes this country truly great; its natural treasures. One fine example of which is the Saugatuck Dunes along the coast of Lake Michigan, now threatened with destruction by land speculators.

Battlefields are like cemeteries. Would you want Walmart to build a parking lot over your loved ones' graves or tombstones? We need to preserve these battlefields not only out of respect, but to also help preserve our land, bodies of water, and habitats.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

you are only assuming that ORVs chase away the wildlife. You can not possibly know that as fact unless you yourself chased away wildlife on a motorized vehicle. I am a 56 year old woman who grew up in the great outdoors. My seventeen years experience enjoying the scenery on our public lands with a motorized vehicle says that you are wrong in your assumption. I happen to see a lot of wildlife. Just this past weekend, I saw a big black bear on an ORV trail. My husband later in the same place saw the same big black bear. My motorized vehicle did not chase the bear away nor did his. Not everyone likes hiking so making them hike for enjoyment and physical activity is unrealistic. You can't make everyone like walking in lock step. ORVing can be very physical and certainly more physical than would be if hiking is the only option allowed for everyone. Motor vehicles do not scare the wildlife as much as a hiker standing and pointing at the animal, such as a deer, saying "Look a deer." That scares the animals more. Also how do you know that animals break there legs on ORV trails? Have you seen it happen? I don't think so. Look how dangerous the forest is with all the under brush and fallen trees. I am sure that legs are more likely getting broken on forest debris than on a uneven ORV trail tread. I get so tired of hearing the same old rhetoric coming from the wilderness advocates as if they are authorities on ORV recreation when they don't even use one. They make a lot of assumptions and call them fact. Recreation with a motor vehicle is just as legitimate as any other form of recreation. My experience out in public lands is that there are more people enjoying recreating with some form of motorized vehicle than any other form of recreation. There aren't that many hikers as compared to ORVers, but most of the public lands are given to the hikers while the ORVers are given much less and getting lesser every day. It only takes a couple of years for hiking trails to disappear from lack of maintenance and use. Since hiking trail disappear they use ORV trails because they are kept maintained by the ORV community. Then the hikers complains that ORVer are using the trails and disturbing their solitude. The hikers should be grateful that we go out and clear our trails every Spring and SHARE our trails with them so they have a place to hike. The Forest Service mission says that they are to meet the recreating needs of the public. I say they are doing a very poor job of it. They are certainly not meeting the needs of motorized recreationists.

Frankly, why must our public lands be kept as wild as they can be? I don't see the point. It appears to me that a select few think that the land should be for their own personal use and not for anyone else. The more land locked up in wilderness the more conflict there is with what is left. Since when does the hiker take the high road and everyone else's desires and needs don't matter. The hiker is a very small portion of the users that interact with public lands. I think hikers should only be allowed to hike in wildernesses since it was set aside for their use only and there is more wilderness land for their personal use than there is multi-use land for the rest of us. Hikers have a bad reputation for being selfish, greedy and creating conflict with others they don't approve of.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I object to spending over \$2 billion of my tax dollars locking the majority of the public out of more of their public lands through inappropriate Wilderness and Monument designations. Wilderness and Monument are the most restrictive forms of land designation and reduces access to most people. The initial Wilderness Act envisioned about 20 million acres as suitable. Today we have over 120 million acres of Wilderness where public access is restricted. The majority of the public have been forced onto smaller and smaller areas outside of Wilderness. In order to encourage Americans to enjoy the outdoors we do not need more Wilderness areas, we need less. The goal to reconnect Americans especially youth with the outdoors can best be done by providing more places for them to enjoy their favorite forms of outdoor recreation. We need to revert some of these lands back to Multiple Use in order to promote access for urban youth and all Americans. Off Road Vehicle use is by far the most popular form of recreation, followed by Mountain Biking. Multiple Use lands are where the majority of people recreate, as well as where much of our timber and beef products come from, but these lands have been closed at an alarming rate. The President must protect these precious lands by designating them permanently as Multiple Use. The Initiative must preserve Multiple Use lands as Multiple Use for current and future generations to enjoy these and all other forms of recreation. The President is interested in local involvement in his plan, yet no multiple use groups have been included or invited. The initial plan has clearly been created by a small segment of special interest groups who seek to limit access to our public lands. The President needs to include the two largest forms of recreation as a priority in his plan to reconnect Americans with the Outdoors. That would be Off Highway Vehicle recreation and Mountain Biking. More areas need to be opened to people who enjoy these most popular ways to enjoy the outdoors. The proposed Wildlife Corridors along with the proposed Wilderness and Monument designations would harm rural areas, push people out of their homes and force them into cities. This destruction of our Rural Communities, also known as the United Nations Wildlands Project, is detrimental to the interests of all Americans and should not be supported in any way by the Outdoors Initiative.

we know you and your activities are far superior to anyone else's according to you. Unfortunately for you, the rest of us don't agree with you. All your babble is unsubstantiated. For example, you see one dead deer that you don't know how it died, but you are sure that it was either hit by an ORV or shot by someone that rides an ORV. You make a lot of assumptions and present them as facts. I have heard the statement before that we haul TVs, old refrigerators and dryers out to discard on our trails. I as an ORVer have always wondered how that is done. I have always wondered how I could haul an old refrigerator on the back of my dirt bike. What a feat that would be. You think you are such an authority on my recreation. Maybe you, can tell me how it is done. People will common sense find your silly statements laughable. Words like ruin and destroy are commonly over-used and misused to describe changes that occur to an ever changing environment. With statements like these you lose all credibility.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Have any of you taken the time to visit this areas that you want to turn into a bison commons? Or have you taken the time to visit with the people that care for this land ? If you have you would realize that your idea is totally of the wall it would destory the beauty that has been created with years of had work and sweat of the people that live there. The wildlife that is now present in this areas was not here 100+ years ago as you have been lead to beleive. The bison had destroyed the ground with over grazing which with cattle and sheep that has been managed and the land has become more productive. So please take the time to visit with the people that are putting their hard work into the land before making any judgements.

As the Federal government begins to connect land to people they need to take into account living cultures (people) such as the Gladesmen Culture in So. Fl. For cultures to survive their cultural community members must be supported by land management entities in accessing very remote areas of public lands in their traditional ways that existed prior to gov't. takeover. The association of place to cultural community members is critical to the cultures survival. Failing to do this will breed very stiff opposition every time to any plans being developed on a public property.

At first glance this idea seems very positive and harmless. There might be a few unintended consequences associated with this idea. Many power line easements may be private property owned by power companies who own the power transmission systems. They very well may not want the liabilities associated with formally inviting recreation activities onto their property. Unless one has touched a high voltage power transmission tower when it is damp one does not understand how serious an electrical shock one will receive. I have experienced that situation. It wasn't fatal but it might be to someone with a sensitivity to such things (e.g. person w/heart problems, pacemaker etc.). Cost and coordination of such a program in my opinion would be prohibitive during the austere times that taxpayers are and will be facing for decades into the future. Now if the beneficiaries of such a program (hikers and bicyclists could fund it entirely themselves including insurance that problem could be avoided. Possibly a license tag for bicycles and a permit for hiking-who knows. As far as orchards growing food for the homeless goes that cost would also have to be borne by someone (e.g. you and me) or the beneficiaries. I do not think the homeless can afford to pay and I doubt even the beneficiaries would want to. This idea could assist getting folks outdoors but not without a massive coordination and cost. Nice idea but too costly in my humble opinion.

The Constitution was designed to prevent the Feds from meddling in State policies. One need not worry though since many methods have been devised to avoid the mandates and protections that our Constitution is supposed to guarantee. A couple that come to mind are that our Judicial system now uses precedent rather than the Constitution to decide cases and States are regularly bribed to sell their State's decision making independence by entering into Section 6 agreements with the US Fish and Wildlife Agency as offered by the Endangered Species Act so as to further its purposes. There are many other methods also. If one really wants to learn how to minimize or destroy the appeal of hunting and fishing study the way Florida manages these activities. As they sincerely try to enhance the activities they are destroying them. One must live here and be involved in the issues to fully appreciate their folly.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Federal Highway Administration already diverts vast some of gas tax revenue away from highway upkeep to bicycle pathway programs. Bicyclists are hostile and arrogant to motorists also. I have seen them takeover 4 lane highways as they peddle 8 or 10 abreast through an area with total disregard for anyone but themselves. Possibly bicyclists should begin paying for the infrastructure they demand. License tags for bicycles to pay for their infrastructure is long overdue. That might slow down their outrageous requests. Believe it or not \$28,000,000 dollars was spent to pave the top of the flood control dike that encircles Lake Okeechobee in Florida for a handful of these folks who do not contribute a nickel as far as I know. This is one example of many that should not be allowed.

The Feds are enjoined alright by the US Constitution from meddling in States except that States are seduced into willingly selling the independence guaranteed by the Constitution in return for Federal dollars offered for doing so. A prime example is Section 6 Cooperative Agreements that further the purposes of the Endangered Species Act and allow the Constitution to be blatantly violated albeit for the right price.

The reason for the permit being issued could have been because nobody went to the County complaining about the project. In fact everyone in the locale might have been supportive of the project and the jobs it would create. Project mitigation might have produced a net gain for wildlife and habitat. Sometimes the glass is half full but we cannot allow ourselves to realize it.

Yes the states were required to do comprehensive plans because they were already taking the money without having the required plans. I sat through a 2 day development seminar for Florida's plan and witnessed what I consider fraud injected into the program in public. I reported this to the powers that be and nothing was done. I wouldn't recommend funding programs such as these from what I saw. It was strictly a rush for the money and nothing else.

You don't need to go racial sir since there are all colors running around America now. A whopping bunch of them have the firepower to prevent any species from running them out or worse. The feral horses don't have guns so they receive what fate hands out. Adoption is better than being dog food.

THIS is important. So many of the other suggestions baffle me in their ability to concentrate on utterly non-essential things. Protecting wildlife in the last few places where we have left them anything seems of paramount importance to me. I think all these points are excellent. Not without difficulties, sure, but we as Americans might feel better about ourselves if we for once did the RIGHT and not the EASIEST or MOST PROFITABLE thing.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As a result of Congressional hearings in 2008, the Government Accounting Office published a report on OHV use on federal lands in 2009 { <a href="http://www.gao.gov/new.items/d09509.pdf" rel="nofollow" target="\_blank">Link</a> } This reports tells the facts that motorized recreation is one of the top 4 threats to national forests (page 10), and that federal agencies are unable to sustainably manage OHVs on federal lands (page 35). Unlike wilderness areas that are relatively inexpensive to manage, sustainable management of OHVs would include having the necessary human and financial resources available to ensure compliance with regulations, educate users, maintain OHV use areas, and evaluate the existing OHV program. The OHV industry and their dealers and customers want all of the American taxpayers to subsidize the extremely high costs of motorized recreation by providing free land and paying all of the costs to make this high intensity use sustainable. I am happy to pay taxes to maintain wilderness anywhere it occurs, but you can forget about using my tax dollars to subsidize the OHV industry. OHVs should be banned from all public lands, and the manufactures, dealers, and their customers should buy their own land and pay all the costs to manage and use it.

I agree with the many comments already made. I just want to add that there is very little time to make substantial preservation progress as every day that goes by sees more precious battlefield lands taken over by housing developments, shopping centers, road construction, and so forth. Hence, maximum effort needs to be made in the next few years, or the opportunity to do so will be forever lost.

I could not agree more. Public land is looked at as free land by municipal, state and even Federal managers. When one person wants the cheapest, quickest way to get a project completed, they immediately look at cutting costs by having that project completed on Free parks. This is the greatest example of that type of thinking. Despite more valleys than the entire Sierra Mountains could provide, they had to choose the one that was already in the ownership of the Government. Take it down, and take down many more. Right now the Gold Ray Dam removal is underway on the Rogue River in Oregon. The Elwa Dam is soon to start being dismantled on the Elwa River in Olympic National Park in Washington State. We can have energy, and progress if we begin to think outside the dam box.

I like the idea of thinking BIG. This is the way to protect areas for the wildlife that should include us, but not be for our benefit first. Wilderness should be for the plants and animals first, and only secondarily for us humans. We will get the benefits if the wildlife does.

## Discussion Question 2

***(cont.)***

North of the California border lies a few groves of unprotected Sequoia Semper Vierens , the Coastal Redwood trees. These are located in the Siskiyou National Forest and none are protected from being logged. They are the northern most reaches of the ancient redwood trees and as such are an incredible gift to our nation, some 15 feet in diameter. I would like to see all these groves, and those in the Alfred E. Loeb Oregon State Park , adjacent to these groves,protected as National Wilderness. There is a vast area of the Siskiyou National Forest (in excess of 250,00-acres), that need to be designated Wilderness with Federal Protection. This would also protect the now unprotected Myrtle Trees of Oregon along with Port Orford Cedars besides the Redwoods. A Siskiyou National Park is really needed here, encompassing these wilderness areas and others.

This idea is not only long overdue, it is necessary with global warming. We are stewards of land, not owners--all of us. We have tremendous amounts of Federal, State, County, City and private land that should be looked at not only for "what we can get out it", but rather how we as individuals can help it. A good shepherd watches over his sheep,

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Sounds a little crazy at first, but think about it. We have the ability to control the amount of oxygen we produce, and the amount of moisture that we release into the atmosphere. How do we do it? By increasing on a massive scale the biomass (trees, etc.) that we plant. Trees create oxygen and atmosphere. Planting more biomass creates microclimates. Many microclimates create macroclimates. Microclimates can have positive benefits for reducing greenhouse gases and positively impacting moisture levels and climatic change. Don't Conservation agencies already do that? Yes, but not on a large enough scale. We need a new agency whose single mission focus is on atmospheric production, not lumber production. An agency who will research and focus on the most effective means of restoring our oxygen and climatic balance. A great deal of effort has been directed toward carbon dioxide reductions, while little attention has been given to increasing oxygen production. What are the benefits? JOBS -Besides the benefits already mentioned, this could be a massive jobs program all across the U.S. Just as the Civilian Conservation Corps. was established in post-Depression America, an agency for atmospheric production could employ 100's of thousands workers in a productive meaningful way. WATER - This program will preserve and increase our shrinking supply and growing drought of precious clean water. ATMOSPHERIC - Trees and biomass not only produce oxygen and water, but they consume carbon-dioxide, conserve evaporation and regulate temperatures in the process. How do we get started? Legislatively - Establish an agency for this purpose. Partner - Partner with the many federal and private organizations already in existence that serve a conservation role. Physically - One only needs to look at aerial views to see that there are millions of acres that can be planted, both public and private. You'll find many of those in your own backyard, from urban areas to remote regions. Begin with buffers along EVERY creek, stream and river to preserve our scarce supply of pure water. There are literally millions of places where trees don't currently exist where they could be planted. Through succession planting dry arroyos devoid of water could be converted to flowing streams. Microclimates are created that would allow, over time, the expansion of these buffer areas. SUMMARY: We have millions and millions of acres that could become oxygen-producing, water-producing, carbon-dioxide cleansing factories that would moderate our growing climatic changes while creating thousands of jobs. CALL TO ACTION: Don't just vote on this idea. Write a letter....to your newspaper...to your Congressman...to the President...to anyone that will listen and can move this forward from "just an idea" to a real goal that we can achieve for the betterment of our environment and America's Great Outdoors.

Stiffer penalties and strong enforcement in the area of ORV users will do more for conserving our natural resources than any single measure other than closing access to them and/or limiting areas where ORV's can operate. It will also assist in the "Reconnect with the Great Outdoors" program by making the forest the calm and peaceful place it once was. I live in the National Forest in Montana and this is our biggest problem relating to the conservation of our public lands.

The Historic Preservation Fund comes from the licencing of outer continental oil, gas, and mineral explorations. Considering the news from the Gulf this last week, we need full funding for the HP Fund in order just to protect the many thousands of "at risk" cultural properties in the Gulf Coast. These properties promote tourism, better quality of life, and a historical connection between the people of the Gulf and their homeland. People are worried about the loss of their Gulf Coast "Heritage" and this matching fund would greatly help these people.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

these threads are informative. there seem to be handful of professional anti-access agitators posting the same crap in every one, and a fairly broad spectrum of sensible and respectful multiple-use advocates that appreciate the need for a variety of recreation.

The non-motorized community needs to provide the money for these "trails", most of the money right now comes from motorized use in the way of gas tax. As for trails for motorized use they are being converted to non-motorized or not being maintained, as a motorized user I feel we need more trails for motorized use, not less.

Full, permanent funding of the HPF will support local government efforts through additional funding for the portion of HPF funding that must be passed through state historic preservation offices to Certified Local Governments (CLG's). Local preservation efforts are where the "rubber meets the road" and any financial assistance directed to these cities and towns will result in better trained local preservation commissions, more relevant design guidelines, and a greater level of protection for historic neighborhoods and commercial districts throughout the country. Marty McCune, Chair, National Alliance of Preservation Commissions

I first heard of this initiative in a short talk "Flat Hat Chat #7" by NPS Director Jarvis. I immediately thought of a place in my National Park community which is presently occupied by a dilapidated trailer park. This same place in the late 1800's was a productive homestead supplying goods to all accommodations in Yosemite Valley, Wawona as well as the mines at Bodie on the other side of the Sierra. Fruit trees from Hennessey's orchard remain as well as sections of the historic walls not destroyed or filled when first "re" developed in the late 1950's, early 1960's. The site has potential to be restored and could demonstrate a living history, preserving both the historic features and sustainable lifestyle. Work could be supported by visiting at risk youth mentored by local community members.

For my life time I have gone camping, fishing, hunting and hiking in the Colorado rockies, its a shame when you are fishing and enjoying the quiet that you came for, and a motorcycle or four wheeler buzzes by and disrupts the tranquil beauty, I came to enjoy. They are not there to see the wildlife or enjoy the quiet beauty. They can drive on roads and make noise where other vehicles are. There should be a place for just off road vehicles to go, they can all get together, and enjoy the noise and company of others just like themselves, and let the rest of us enjoy the parks in peace and quiet.

I agree completely with Sandy McGuire's idea of a National Park in western Kansas. As a 70 year resident of Kansas I feel our state is pathetically under-represented in the National Park's system even though Kansas has much to offer. Although the Tallgrass Prairie preserve is wonderful it gives a very limited view of what the true prairie was. It make sense both economically for the residents of western Kansas, but for future generations to actually experience the American prairie in terms of both it's wildlife and plants and to learn about the importance of this endangered ecosystem. " It is one of nature's most efficient carbon traps as plants draw carbon from the air and store it underground" (KC Star 6/6/2010)

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I have brought my son up in the back seat of our Jeep, and now, he is doing the same with his children. We go out with friends and as a family, promoting respect for the environment and those around us. My grand children are very lucky to get to go out into the back country and have the experience of seeing wildlife and open spaces. 95% of our children in the cities haven't a clue that there IS open space and back country. All they know are video games, and that is a sad commentary of our times.

Methane is a difficult greenhouse gas to control and everyone knows that. Before you can successfully burn it to provide energy, effective equipment and methods must be in place so you are not trading one problem for another. However, we went from cathode tube to transistors to solid state to microchips in short order, and the time between innovations is shortened. Surely we can meet that challenge. We would want to spend the R&D time, energy and money for this reason: Using methane to generate energy is a smart way to go because there is nothing more renewable. Cities, towns, burgs, businesses, and farms all generate many metric tons of sewage, a primary source of methane gas. Let's capture it, refine it, and burn it instead of dump it. Separate out the water for the water reclamation facilities (we have them in Arizona and they are used to water golf courses) and use the resulting matter to generate methane. Once the methane has been processed out, the remaining material has enough safe nutrients to be made into fertilizer. They do that in Pennsylvania now. There may have been an experimental community in Virginia or Maryland years ago that did exactly this. If they are still functioning as a community, let's look at their success. If they are not, then let's examine their failures and learn from them. But, let's do it. It is the ULTIMATE recycling venture!!

Tell me, Mr. Hines, where did your car, computer, furniture, pots & pans, toilet, rake, toilet paper, computer paper, glasses, hearing aids, dishes, clothes, food, meat, fruits and vegetables, tools, refrigerator, washer & dryer, etc., etc., etc. come from? Everything is either grown on the land or mined from the land. So, let's not lock up more land in wilderness and become more dependent on other countries than we already are. Or ..... are you willing to live in a cave and wipe your butt with banana leaf? Humans are and have to be part of the equation of living on this earth. We have to be respectful of Mother Earth, but, unless we are willing to go back and live like cavemen, we NEED miners. We NEED farmers. We NEED lumberjacks. We NEED oil drillers. They all provide for what we are and have today. Both Boxer and Feinstein have unnecessarily locked up public lands into wilderness so that they would have a warm and fuzzy feeling while sitting in their arm chairs. Most of these wilderness areas certainly didn't meet the definition of the 1964 Wilderness Act of "lands untramled by man" when roads and trails, old mining camps, etc. were already in existence on the land.

No off road vehicles!! Not in the parks and not in our neighborhoods.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

People should not disturb by peace with off road vehicles. It doesn't matter if it is in a park or at home in their own backyard. No one has the right to disturb other people's right to peace and quiet. It is a matter of RESPECT. It is too bad that people do not have RESPECT for one another anymore. RESPECT means do not disturb my peace and quiet!! Is that too hard to understand?????

If anyone thinks it is legal to run an ATV on their own property at all hours I would like to know what city and state they live in so I can check their city and state laws. Even if it was not illegal, it is immoral to disturb your neighbor's peace and quiet.

the one thing that i see and have been involved with is that big money such as the Sierra Club and agencies like that, want all access to the forest closed to all motorized and the way they get away with it is, "endangered species" (tho they've never seen that species in that area ever), erosion, (the forest service has never been out to stop or reroute ceertain areas) conflict, (with 2000 people using the forest in our area, they close trails so there's conflict because they're squizzing everyone in one area). It's the common sense approach that is lacking and it's easier to close down the forest to everyone or make it a wilderness instead of using the resources that they have at had such as volunteers. Our small group of 10 re-open all the trails every year by chain sawing the downfall and the forest service doesn't have to pay for a thing. It's volunteer. If they just asked, they'd be surprised how many people are out there to help re-route, clean, etc. It's a no brainer.

This idea has been demoted by a concentrated group of people who are promoting this casino. That is an illustration of the problem with this system. I believe there may need to be incentives for communities to protect their historic treasures and if the nation cares about its history it will find a way to do that.

This should be linked with "Federal Government role" and "Challenges" as well. The feds say it's a state issue, the state says its local, the locals say it's state, and everyone is just waiting for the appointed Pa Gaming Control Board to make the decision on the application, as though our national honor were not at stake. The Gettysburg Address is the most memorized speech in the world. This casino less than 3000 FEET from hallowed ground would be such an embarressment to the United States.

With the many competing needs at a local level, purchasing private lands or easements to provide access to public lands and resources, or trail connectivity, often are a lower priority. Many communities in rural areas, such as Idaho, have few resources for these property purchases, and open space ballot measures can be difficult to pass. Full funding and robust state program would go a long way to help these communities improve public access and quality of life for their residents.

If you truly want to foment physical fitness and see the wilderness, employ your own two feet instead of using fossil fuels.

I like this idea, except that directional drilling also has a lot of negative ecological consequences. I would add to this thought that continued use and development of natural resources should not occur without expanding and strengthening our recycling programs in the U.S. Until nothing is being wasted we should be cautious about our emphasis on extracting more.

The Roadless Area Conservation Rule has been in and out of the courts since it was enacted under the Clinton administration. It provides an excellent opportunity to protect wildlands under a less limiting designation than federally-designated wilderness. Encoding the protections guaranteed to roadless areas under the RACR seems like an excellent compromise between conservation objectives, industry interests, and recreation interests. Roads are a threat to the ecological integrity of our wildlands. While it is undeniable that motorized users also need and deserve access to wild places where they can recreate, such use is not appropriate everywhere. It causes erosion, disrupts wildlife, and negatively impacts water quality. Industry use of roads has similarly unfortunate impacts. By preventing additional road construction we can maintain existing access for motorized users and industry without ruling out opportunities for quiet recreation. In essence, we preserve the status quo. It seems to me that much of the debate here is focused around either Wilderness or Not Wilderness. Perhaps both sides should be considering workable compromises that serve the national interests of resource sustainability, economic independence, ecological health, biodiversity, and recreational access for a wide range of user groups, rather than digging our heels in.

Trail Rider: Wilderness areas are not closed off to people with disabilities, wheelchairs are allowed in the wilderness (as an exception to the general nonmotorized/mechanized thing) and there are wheelchairs that can handle trails and rough terrain. Where I live, a local nonprofit provides access to these expensive technologies for people who could not usually afford them, to help disabled people enjoy the outdoors. Wilderness areas provide many more recreational opportunities than just backpacking-- they are extremely valuable for wildlife habitat and offer great possibilities for hunting and fishing. They also protect watersheds and, theoretically, ensure that we have scientific references to check our land management elsewhere. Multiple use did not work. It resulted in overexploitation of natural resources that proved ecologically destructive. While I agree that the United States should strive for resource independence, and that this is one function of the public lands, we also need to take the long term future into account. Unless ecological function of the public lands is placed above all other objectives, we will not be handing down a livable situation to future generations. Rather than persisting with the failed strategy of multiple use as a principle of resource management, it is time to consider other options.

***(cont.)***

For the second time in five years, investors have applied for a license to operate a casino on the Gettysburg Battlefield's doorstep. In 2006, a local grass roots movement, assisted by a coalition of state and national organizations, defeated the first application . This year, one of those investors, now in league with a former legislator and racetrack operator, has applied for a gambling license once again. While the 2006 casino site was 1 1/2 miles away, this site would be 3000 feet from the southern entrance to the Battlefield, close to where Pickett's charge occurred and right on the Journey Through Hallowed Ground Trail, a National Scenic Byway originating in Monticello and ending in Gettysburg. Incidentally, creators of that Byway rejected Charlestown WVA's request to be included on the Trail despite it's historical significance specifically because the gambling venues in Charlestown were considered antithetical to heritage tourism. In 2006, 86% of those who testified during 3 days of public hearings spoke against locating a casino in Gettysburg. Despite that, our state legislators have either been unwilling or have lacked the political courage to protect this national treasure and other precious sites in our Commonwealth from such threats. now, the future of one of our nation's most significant and consecrated places is now up to the PA Gaming Control Board, a group of seven political appointees with gambling connections, who have the authority to either grant or reject this license application. We are, therefore, beseeching the federal government to enact legislation requiring a buffer zone around Gettysburg National Military Park specifically, and other such historic national parks generally, so that gambling establishments and other incompatible venues will not be permitted to threaten the priceless quality of experiences that these solemn sites provide for all our nation's citizens. If we fail to do this, then look for an amusement park or a miniature golf course near Shanksville after the Flight 93 Memorial is completed. Are there any places left in this country that are so powerful, so meaningful, so intrinsically a part of the American fabric that they are not for sale? If there are, then Gettysburg is one of them. There are thousands of casinos. There is only one Gettysburg. If we can't preserve our history, then shame on us all.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am imploring the federal government to protect the Gettysburg National Military Park (and other historic sites) from ill-advised ventures such as one now before the PA Gaming Control Board. It is an application to open a casino...a venue for frivolous escapist entertainment...3000 feet from the southernmost (and most used) entrance to the revered Gettysburg National Military Park. It will be located right on the "Journey Through Hallowed Ground", a National Scenic Byway which extends from Monticello to Gettysburg. Ironically, the creators of that byway purposely avoided nearby Charlestown WVA, despite its strategic location and significant historic importance, because of the racetracks and slots parlors there, which they deemed incompatible with heritage tourism. The investors say "it's not on battlefield property" but it will significantly and negatively affect the character of the area that is so intrinsically a part of the Gettysburg experience. The Battlefield, its contextual community, and the 51,000 casualties suffered on July 1, 2, and 3, 1863, represent the essence of what America is all about. Nothing that the word "Gettysburg" conjures up in the national consciousness can abide a casino and all the tawdriness it represents and attracts. One small example of this: thousands of children and adults each year follow their guides on the path of Pickett's charge, hiking across the Emmittsburg road where this casino will be located. How can that priceless experience be continued when the road is widened to handle the increasing volume of traffic? Abraham Lincoln, in his November 1863 address, beseeched us to be responsible stewards of this Hallowed Ground, where so many fought and died so that the words "all men are created equal" could truly have resonance for each citizen. Have we placed greed over any concern to preserve our historic sites for future generations? These investors tout economic development as their purpose for this travesty, but we have statistics showing indisputably that it will wreak economic and social havoc for this particular community. No one would object to economic development in keeping with the unique character of this place, but not a casino. Would we build a go-cart track at Shanksville, the site of the Flight 93 crash on Sept. 11? Would we open an amusement park at the gates of the cemetery in Normandy? A water park at the Arizona Memorial in Pearl Harbor? I think not. Four years ago, this same investor attempted to open a 3000-machine slots parlor 1 1/2 mile from the battlefield and was turned down by a torrent of public outrage expressed locally, regionally and nationally. Yet here we are again, locked in the same struggle because our state legislators lacked the political will to place a buffer around such sites to protect them from such predatory and inappropriate development. Ron Maxwell, Director of the epic movie "Gettysburg" spoke there recently in impassioned opposition to this casino. He was vilified by casino supporters for stating his opinion that these investors are not altruistic, but instead, exploiting the international fame of Gettysburg by locating it there; however, I suggest that if the battle had been fought elsewhere, or not at all, Gettysburg would still be a sleepy farm town in rural Adams County...a location no greedy investor would ever consider as a venue for a gambling establishment. The countless folks who come to Gettysburg each year to learn, to reflect, to grieve for the pain and death suffered there to save our union, don't come to gamble. Heritage tourists overwhelmingly say just the thought of a casino is repugnant to them. Please protect this sanctified hallowed ground and important outdoor classroom from such a threat. Assure all Americans that it will be preserved for future generations to embrace and to appreciate what happened there.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

This flurry of negative comments is indicative of the type of shenanigans that local supporters of this casino indulge in. Their entire campaign has been one of "dirty tricks" such as this, false assertions, misrepresentation, questionable "contributions:" to solicit support...and I could go on ad infinitum. To desecrate this iconic historic shrine with enterprises so antithetical to everything Gettysburg conjures up in the national consciousness is a travesty. The folks who are guilty of the negative comments on this website are one dimensional; they live only in the moment, with no appreciation for the past and no sense of stewardship or responsibility to our future generations. What a sad indictment of our society. You get 5 miles outside of Gettysburg, and the entire nation is incredulous that something so disdainful would even be considered!

A fine idea, and as far as getting funding by "balancing competing interests" goes, we should look at what this country spends on our armed forces. An NPR commentator said the U.S. annually spends more money on defense than the rest of the world does put together.

A great many social and economic problems worldwide, as well as most of our environmental and conservation problems, have roots in human overpopulation. No one denies the right of people to have as many children as they wish. However, for a very long time, businesses and religious groups have effectively blocked our addressing overpopulation as a serious national and worldwide concern. For the sakes of our children, our societies and our fellow creatures, the President of the United States and other world leaders should make a strong case for intelligent family planning.

Agreed. A good idea. We have entirely too much nighttime illumination. In some coastal areas it confuses turtle hatchlings. In the interior it messes with migrations.

on most topics I'm with you and I'll promote this one, but entirely too much is made of religious thoughts, things that are sacred to some people, beliefs of various ethnic groups, etc. Fact is, each of us is here for a limited amount of time; and the things that rattle around in our heads are not all that important. We each should strive to be happy and productive without harming others. Where we agree is that "others" includes the rest of our fellow creatures and the ecosystems that gave rise to us. It would be nice if we each could leave this world without trashing it. One of the positive things we can do is protect sufficient wilderness areas where the hundreds of thousands of other species can exist and evolve without our interference. No development, no mining, no forestry, no trails. That doesn't mean there shouldn't also be ample places for motorized recreation, but we have converted entirely too much of this planet to human uses.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

When people give opinions (in a democracy), you get a cross-section of what the public DESIRES. And, because people (myself included) are selfish, the most selfish ideas will get the most support. In the case of "land conservation" (this is the topic of the website, as I understand it), your comments will reflect this phenomenon in that most comments will be about land USE. That is, people will say "it's MY land!" and "I want to USE the land like this...". That is not land conservation as I see it. Land USE is in many ways the OPPOSITE of land CONSERVATION. For example, a majority of people will comment on how they should be able to access all areas of the land, and how they should be able to ride their motorized vehicles all over it. People who respect wilderness for its aesthetic value will be in the minority. Similarly, the people who would sell the timber on their land for money outnumber the people who would leave it alone and enjoy it for its beauty. Please keep this in mind. You might do well to do the OPPOSITE of what is suggested by users of this site, if your true aim is land CONSERVATION rather than land USE.

You are certainly right about this... "The same environmentalists who lobbied government to mandate Solar and Wind Energy are now crying out that paving our deserts and other natural areas with solar panels and wind generators should be stopped." That kind of action will accomplish nothing! Nuclear is the way to go. It is much safer than people think! Citing Chernobyl is a prime example of how little people know about current nuclear technology. The public knows so little about it and therefore fears it.

As a biologist, I study populations of various animal species. The bottom line is that populations of many many of our wonderful birds, mammals and others are declining. One major cause is loss of habitat. We urgently need to protect our remaining wilderness areas or we will lose these species. Our children should also have the chance to see Cerulean Warblers, Ocelots, Long-billed Curlews, Kit Foxes and all the other wonderful creatures that enrich our lives. We will lose them if we spoil our wild areas by careless, short-sighted development.

I think it would be a wonderful idea if our active duty service men and women did not have to pay to enjoy the very national parks they work to protect and defend. My son was a ranger with the National Park Service for 6 years, and it always bothered both of us that our active duty soldiers are required to pay admission to our national parks. They deserve to be treated better than that!

If we do not learn from our past, we are doomed to repeat our mistakes. So many of our ancestors fought in a war which many historians refer to as America's "Second War of Independence", and the war which created a nation out of individual states. It is incumbent on us to honor those who fought, and to preserve this hallowed ground for future generations. It is not enough to read about Civil War history. We must preserve battlefields to provide a more tangible history experience. The time is now to do all we can to save these sites as they are constantly disappearing due to urban sprawl.

In fact, many wilderness areas are susceptible to erosion, which is greatly worsened by offroad vehicles. This results in the degradation of what should be pristine wilderness areas. It is urgent that wilderness be protected from such unsustainable use.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Many of our animal and plant species are threatened with extinction and a major cause of species' decline is loss of habitat. A wilderness preserve is like an island. The smaller the island, the fewer the number of species that can survive there. We must protect more and larger wilderness areas so that we do not lose the many and varied lifeforms that enrich our lives. This fabulous biodiversity is indeed the greatest inheritance we can leave our children.

We really need MORE wilderness areas, not less. Many species are threatened with extinction. Urban sprawl continues to degrade our outdoors. So much has already been lost. Let us not lose any more of our wide wild places. Overturn the 'No More Wilderness' settlement.

Ah - all the old arguments come out , pitching one person with his or her way of life against another. Cows vs wolves. Ranchers vs. new people. What if, instead of going straight for your gun, pardner, you consider what the West (since most of the east is already developed) will look like in 100 years--after you are gone? Will it be stripped, run over by drills, polluted from coal, coal bed methane extraction? As you fly over it will you see more scars on all the mountains? You are never farther than 20 miles from a road already. So how do we "manage" forest, animals, plants, water, air? Is it going to be about money? machines? pollution? fighting? Or can we learn to understand that everything one person does to what we were all given for free, I might remind you, will affect everyone ultimately on the planet. Look what happened to the oil rig in the Gulf! So while we would all like to be able to go anywhere anytime and do what we want, what ultimately will be the best for everything Not manmade. After all, is there a master plan? Have we suddenly become , each one of us God? Or will we work together so that the world tomorrow is better off not worse off than when arrived.

I think that everyone is missing some creative thinking . In the future, when all wild things are subdued, turned into circus animals, drowned in oil spilled from exploding oil rigs, harvested to the last bluefin tuna for sushi, thumped by seismic thumper trucks into concrete like soil and the last bird is only seen in a picture on a computer screen, then some will wish they had thought of this idea sooner: - build special domes similar to football stadiums only 3 or 4 times larger and fill them with OHV type vehicles. The vehicles would sit on a platform. In front of them would be a computer screen. Similar to the simulators used by pilots in training, a driver would sit on the OHV, the platform movement could be controlled by the driver to simulate riding over any type of terrain he or she would like. He would wear a helmet through which he would hear any kind of sounds he would like as though he were outdoors. On the computer screen he would see any type of terrain he would like to ride over. All emissions from the machine could either be smelled by him or whisked away. Another part of each booth type enclosure could be a machine that blew dust or mud of any type all over the driver. No more trail degradation, wild animals spooked, air pollution in our forests and deserts and streams. My daughter, a pilot, assures me that when she was in the simulator training to be a helicopter pilot on her way to serving her country in the Gulf, she truly felt as though she were flying over the ocean in a storm. How about it? Just as good as the roller domes in Mad Max movies! Perhaps accidents could be programmed in so the drivers could experience all the thrills of off road exploration.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It is becoming more and more difficult to find any place in the United States where there is no intrusion of man made machine noises. We need to find a way to show the importance of places where people can hear only Natural sounds and understand the importance of this silence. Also to understand the beauty of something created by Nature and untrammelled by humans - Awaken a "Sense of Wonder"

Let's be careful about what constitutes access and who will truly be excluded. If motorized access is allowed in all wilderness areas then those who need quiet places will not be able to get away from city and machine noises. Many young people today don't even know what to do in a quiet place. So - machines will have to be made silent and not emit pollutants and not in any way destroy trails, cause erosion, etc. My Dad, when he was 90 and no longer able to hunt or hike or fish, did not demand access to all the land he would have liked to access. Why is there a need for noise in the wilderness that is man made?

Take a look at how many acres are now available for exploration for minerals valued more than the lives the land sustains. Then find out how many acres now available for exploration have been explored by seismic thumper trucks or any other means available for ascertaining what might lie beneath the surface. Then find out how many acres that have been explored have been developed. Then find out how many acres developed have yielded what was expected. Then tell everyone you know why we need more acres sold off that should be left as much as possible as Nature created them. And why should we value everything that land sustains that is undeveloped? Can you tell me why we should not value it? I think all of us who understand that everything is connected on this planet and that we have strafed, drilled, polluted, paved over and raped a great deal of it already to our detriment should, ask those opposed to any more wilderness to prove that it is better for our collective health as one species on Earth if we just go ahead and open all land everywhere to development. The burden of proof should be on anyone who does not value the everything given to our race and all living beings for FREE, not on those who understand its value. Unfortunately the BLM is a fox guarding a henhouse. They are supposed to protect and sell off land - money versus our future health.

The challenge that we face is industry - minerals management and more of it. The earth is rapidly being overtaken by industrial interests, where they can, and the litter and packaging from these sources is marring many highways and byways. An advertising or a public relations campaign touting the outdoors is very much in need of being launched. For instance, in California, where we live in San Jose, I am appalled when I learn, as a state park volunteer at Henry W. Coe State Park, that FOLKS HERE HAVE NEVER HEARD OF IT! How can such ignorance be. Some of these people have lived here for YEARS. Even a reporter from the San José Mercury News blithely mentions regularly in his environmental stories that people "have never heard of Henry W. Coe State Park." This is just stupid. An ad campaign - never mind the cost - could remedy this by helping to save California's 278 state parks. The cost should not become a factor. Volunteers could do this or a nonprofit. Visibility is very important. California needs to be jolted out of its torpor and those who say they never visit state parks engaged by the ads. "The future belongs to those who believe in the beauty of their dreams." - Eleanor Roosevelt

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The challenges facing our government and this country regarding wilderness--wild places where the hand of Nature is more apparent than the hands(and feet and machines of man) is that of lack of understanding and using the paradigm of money as a measuring stick of importance. Perhaps instead of only looking at money, we might consider that a day or more in a place not roughed up by humans might actually have a health benefit. And a person who has time in the woods, beside a stream, in a field of wildflowers, or listening to birds or the wind might not need to spend quite as much time as he or she had before in a doctor's office or psychologist's office. I believe that one challenge might be this to everyone who says " prove the value of wilderness" :prove that the wilderness, wild and beautiful places mostly free of man's hand do not have value to our mental, physical and spiritual health. "No more wilderness?" The challenge is learning to understand its value and importance.

## Discussion Question 2

***(cont.)***

The TRACK (Trails, Ridges, & Active, Caring Kids) program provides adventures for children and families of all ages. Whether following the clues from a brochure, an interpretive sign or with a guide, TRACK trails encourage kids of all ages to explore the world, find answers to questions and uncover hidden clues along the trail. Each TRACK trail provides multiple self-guided brochures or adventures at the trailhead and downloadable versions are available on the website ([www.kidsinparks.com](http://www.kidsinparks.com)). Modeled like a motivationally based scavenger hunt, as children search for the 'treasures' along the trail, they are promoted to traverse more of the trail's length. When children successfully complete the trail and register their adventure on the web site, they are sent an 'award' or incentive. With each adventure registered, the prizes get better and better. Overall program success and assessment is built into the delivery of those incentives.

**Background** There is mounting pressure on our time, pocketbook and physical condition. Park visitation has decreased, our waistlines have increased and our resources to deal with either have dwindled. Our children's preferred setting to play is inside, "where all the electrical outlets are," as one child said. At the Blue Ridge Parkway, only 7-12% of visitors bring children. Statistics show that children spend about 8 hours a day interacting with electronic media. With about one in four children overweight or obese, clearly nutritional and recreational choices are having a detrimental and devastating impact on our youth. Our challenge is to get kids unplugged, outside and onto the trails in our parks and public lands.

From studies that show increased brain activity and higher SAT scores when children play in natural settings, to research that links lower incidences of bullying, ADHD and depression in kids that play outside, there is clear evidence that children benefit from time in nature. Nature has restorative and healing qualities; our public lands are not just places set aside and protected for future generations, but are places that hold both significance and meaning for our lives today. We know that it is through a personal meaningful connection with natural and cultural resources that lasting positive impacts can be achieved both for the children and for the place. Getting visitors outdoors and children moving helps develop healthy stewards connected meaningfully to their heritage and their home. The TRACK program is designed to make hiking and walking more attractive to kids and families in order to increase physical activity and connection to the cultural heritage and natural resources of our local communities.

**Kids in Parks** is an Initiative of the Blue Ridge Parkway Foundation, the Blue Ridge Parkway and the Blue Cross and Blue Shield of North Carolina Foundation. It represents a unique partnership joining the public and private sectors in one common goal: to promote the health of our kids, our parks and our communities. Partner groups include schools, City and County Parks, State Parks, the National Forest Service, the National Park Service and private foundations throughout North Carolina and Virginia. The mission is to promote children's health, combat childhood obesity and reconnect youth with the outdoors by increasing physical activity, improving nutritional choices and engaging and educating families using outdoor activities along trails that are fun, exciting and promote stewardship.

**The TRACK Trail Program** The TRACK Trail program is a series of networked TRACK Trails on and in communities along the Blue Ridge Parkway. The idea is to create incremental steps with built in motivational incentives (discoveries made with each step along the trail and prizes sent after completing each trail) that lead families and children into the outdoors where they can have a fun family adventure along a trail in their local National Park. TRACK Trails are networked and linked through the web page [www.kidsinparks.com](http://www.kidsinparks.com), consistent trailhead signage, unified

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

brochure design and overall theoretical approach. A family could go on a TRACK Trail adventure in their local community park, visit the website to register for the prize and then see the other TRACK Trails. In this manner, we are building in the small steps of change needed to move a family from not even knowing about the possible avenues for recreation in their National Parks and public lands to having hiking on trails become a preferred option or at least a known choice. Our program is available for everyone with no real limits on participants. We have designed a sustainable program that does not require an initial major shift in existing norms, is easy to participate in, provides instant feedback allowing participants to monitor success, has multiple points of entry, utilizes multiple mediums of communication, and is FUN.

Many of today's urban youth have limited opportunities to experience nature on the scale that our national parks offer. Limited resources to travel to parks and wilderness areas, lack of educational opportunities and socio-economic issues all play a part in the disconnection between young people living in urban America and America's national parks. As a result, local parks have become learning centers and taken the place as a source of environmental education and experience with the natural world where youth can engage in learning, exploration and self discovery – and where an interest in the outdoors is first developed. Eighty percent of the American population now lives in urban areas. The environmental challenges faced by our nation require a new generation of leaders with knowledge of eco-systems, land and wildlife conservation management as well as the political expertise to balance demands between the natural and human worlds in our public parks. Our nation's city parks provide an excellent opportunity as training grounds for environmental stewardship and leadership among young people living in cities. This knowledge can then be transferred to management and stewardship of our national parks. More than 150 national park sites are within a 50-mile radius of a city of 100,000 or larger. This is nearly half of all parks in the National Park System. While many city parks have programming to bring young people into city parks, there are few coordinated programs that link urban youth with national parks. Support is needed to create connections between urban park programming and national parks, fostering and showcasing new models for city park and national park interaction. Tremendous innovation around youth development and green jobs is already taking place in our city parks: • In Chicago, where the "After School Matters" program developed by the Garfield Park Conservatory Alliance includes skills development and product development for the Conservatory store; • In Boston, through The Youth Conservation Corps, a city-wide effort to catalyze increased youth stewardship of parks developed by the Boston Natural Areas Network that exposes teens to environmental employment, higher education opportunities and community activism; • In New York, with the Bronx River Alliance's Bronx River Conservation Crew, a site partner to a green jobs training program for young adults in the South Bronx. The BRA's vision is to maximize the Bronx River as an economic, environmental and educational resource. Conservation crews serve as an example and mentor to young people and have become "local heroes" who are advocates of the river. What's missing is the link between great work at the city level and how to expand that work into adjacent and distant national park locations and, in turn, bring the best of national park programming into urban areas.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I think a little more research into the current policy on mining is in order. The mine shafts, tailings piles etc. are all left from old mines. I see alot more responsible activities at active mines than those 100 plus years ago. When does a mine stop being an eye sore and transition into a historical site?

we love to go atv riding as a family. were out side, looking at nature explaining things to the kids. n y state dosent give tax payers nothing for atvs but take our money. we ride in pa. other states have it. my family loves riding on the atvs..

Great idea, particularly now that many school districts are terminating middle school team sports or migrating to pay to play rule. Outdoor recreation, especially tied to local parks, seems a very cost effective way to promote not only a healthy lifestyle, but the conservation ethic. Still, I'd like to know how Texas is funding this program as there are inevitably transportation and programming costs.

Your assertion is patently incorrect. We "the OHV Community" do not whine and complain to get access of every single acre. But we do lobby and promote the fact that we are a large and recognized steward of public lands and have every right to access where history and reason dictate it's use. Locking up existing areas of use serves only to push any negative impacts and conflicts to greater levels serving no greater public service. Or is that your agenda?

All users cause damage. But more remote locations have fewer people to do so. Hikers cause minimal damage but by allowing all access to wilderness areas the damage will be quickened and nothing will be left in 1 or 2 generations.

Motor vehicles -- and I drive one every single day -- cause air pollution, noise, damage to the ground on which they move, and all kinds of bad things. National parks and wilderness areas are unique and need to be preserved for future generations. There is an inherent conflict between preservation and motor vehicles. Moreover -- and this is based purely on my observation of human behavior -- it seems to me that people value things more if they have to work a little harder to get them. If you can pop into a wilderness area the way you can pop into a mall, will you value it as much? There is lots of non-protected open space that people can access in their motor vehicles. BLM lands are certainly accessible by car and RV. Why should we open up even more of our precious and endangered outdoor space when the inevitable result will be to love it to death?

Motorized recreation burns fossil fuel. If we have learned anything from the Gulf oil disaster, it is that we need to encourage less, not more, fossil fuel consumption. Encouraging and/or supporting motor sports and motorized recreation takes us in the complete opposite direction. Our planet can't survive like this. If you value your family, and want a healthy world for them to grow up and raise their own children, then help us cut our unhealthy dependence on fossil fuels.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

A huge road block to getting anything positive done on the ground, whether it is building a trail, planting trees, thinning overgrown forests or just about anything else on public lands is lawsuits. They are most often filed over technicalities, such as document not being filed properly, not about any valid issues about the project. This happens because litigation groups can get their legal fees paid with our tax dollars under the Equal Access Justice Act. Reports show Enviro Groups like the Wilderness Society, Forest Guardians and Center for Biological Diversity have received \$4,716,264,730.00 (that is billion with a "b") in total payments were paid in taxpayer dollars from the Judgment Fund from 2003 through July 2007 for attorney fees and costs in cases against the federal government. For example: There are much needed Forest fuel reduction projects which would reduce dangerously high fuels loads in our unnaturally overgrown National Forests. Enviro Groups file lawsuits blocking these projects, a death sentence for the Forest which ends up incinerated along with all the wildlife and destruction of the watershed. Or lawsuits forcing trail closures which concentrate use and increase impacts on the land. Or lawsuits to ban fish stocking which cause native trout population to become over fished and also severely reduced the food supply to native wildlife like eagles. The original purpose of the Equal Justice Act was to help fund grass roots groups filing suits on behalf of the environment, but it has become twisted. This source of money has created an incentive to file suits merely to get the money, no matter that these suits are harming the environment by blocking needed projects. In order to help America's Great Outdoors the President should reform the Equal Access Justice Act and eliminate paying legal fees except based on merit.

All too often special interest groups promote Wilderness areas as a way of excluding the public. Let's keep BLM land open to all, not just a group of backpackers. Spending public money on these projects is not what the public wants now, or any time in the future. These projects are about excluding the public, not preserving public land. If the same money wasted on these projects ( taxes and private funding ) was used to improve BLM lands and access, we could put thousands of people to work with worthy project. The BLM has a poor record of how it manages it's land. Look at the Wild Horse over population in Nevada. Ever wonder what caused the "over grazing" ?? The BLM caused the problem by leasing the land to ranchers to graze cattle, no feed left for the Wild horses. This is just one small example of their management style, for a price, public land used for special interest groups at the expense of nature and native animals.

As an avid mountain biker and an avid hiker, I find it ridiculous to think that people could make such ignorant claims as \_\_\_\_\_. Yes, mountain biking does hasten erosion. Yes, I have personally seen small animals dead on trails. BUT - the lands on which they are currently living are preserved because people like me, hikers, bikers, fisherman, and hunters have deemed it important to support their preservation. We need to recognize that when budgets are tight the only way to continue to preserve the wonderful lands and habitats that we have been is through understanding and partnerships. Multi purpose trails mean greater community support. How is that not evident? How can we continue to preserve and maintain our national parks, forests, rivers etc. without the support of voters and tax payers? If you cannot recognize that the preservation of these magnificent places depends upon more than just your own type of use than you are allowing selfishness to cloud your perception.

## Discussion Question 2

***(cont.)***

By not allowing mechanized use of any kind into an area, closes the use of such area to more people than it grants access to. This would include physically disabled, and elderly. I feel that if all user groups were allowed adequate and reasonable input into designation of an all access area everyone could enjoy the area. Granted every group would need to compromise in some form or another. If this couldn't work out, then being a democracy, use should be granted to the largest user groups that can agree based on registration, granting access to the majority.

Encouraging our youth and the public to get out in the backcountry is important for physical health and to keep people connecting to nature. It is great the President wants to encourage recreation through his Great Outdoor Initiative. The most popular forms of Nature Recreation as a principal activity are: OHV recreation enjoyed by almost 80 million or about 28% of people in America, followed by mountain bike recreation with 50 million or 18% of the people, followed by hiking with 30 million or 11% of the people, followed by horseback riding with 2 million or 2% of the people, according to reports by USDA Forest Service, IMBA, Outdoor Foundation, American Horse Council. Considering wheeled recreation such as OHV and Mountain Bikes are the most popular forms of recreation, then the best way to accomplish the goal of encouraging people to enjoy the backcountry and to preserve access would be to provide more places where people can enjoy wheeled vehicle recreation. The Outdoor Initiative should remove support for the designation of Wilderness Areas and Monuments as both these land designations discourage or prohibit wheeled recreation and would therefore not be in keeping with the guiding principle of encouraging outdoor recreation. The Outdoor Initiative should support opening more trails to all forms of wheeled recreation so the public will have greater access to enjoy the Great American Outdoors.

***(cont.)***

How is it that OHV or any other recreational use can destroy the land? Where OHV use has not been concentrated onto too small a trail system there are large healthy populations of wildlife and plant life. Studies have shown that OHV use on a dispersed trail system is less stressful to wildlife than non motorized use because the motorized user leaves the area more quickly and sticks to the trails, whereas the non motorized user remains in the area longer and are unpredictable in that they may leave the trail (non motorized user are allowed to travel cross country and often do) It is only by looking specifically at the trail tread that any reduction in productivity of the land can be seen, but of course that is true for any trail OHV, Mountain Bike, Horse, Hiker. I have seen areas closed after a large Wildfire, which by the way totally destroyed the habitat, watershed and created six foot deep gullies. However after a mere year there is no evidence of the trails ever being there. Where is the so called irreparable damage caused by OHV's that we keep hearing about? I have seen trails closed and it would be hard to find evidence of use after two years. That cannot be considered permanent damage on any level and certainly not on a geological or natural timescale. This whole damage concept is really about personal perception. Just like the sound of brisk wind in the trees or a spring river being as loud as most OHV's, yet if someone who does not like OHV's hears the wind they don't mind it, but they object to the passing sound of an OHV.

I agree. As a teacher it is sometimes a daunting idea to change your curriculum. With AP courses and tight schedules to teach materials prior to state testing, it is hard to take your students out of the classroom. However, it is possible. I have a hard time thinking that rangers, wildlife biologists, environmentalists, and activist groups wouldn't jump at the chance to partnership with local schools to aid in the development and implementation of such programs. I envision weekend trips hiking the Appalachian Trail, camping on Cumberland Island to observe local fauna, walking in Gettysburg to truly understand the nature of the confrontation. We have preserved so many things that there are countless opportunities for educators to expand their classroom and offer students a much more meaningful educational experience.

I do not support such a Nat'l Conservation area designation. The land is already Nat'l forest and multi-use as it should be. We get clean water, hiking, views now. And I can drive in there to enjoy these things. Don't change anything. It's not broken, no need to fix it.

I hope you mean this is a retro active sense. California is up 9 million acres of Wilderness. We are due 9million new acres of OHV accessible land. This is just the Wilderness designations in the last 10 to 15 years and does not take into account areas that have just been closed.

I think this is a great idea. I agree completely. I've spent thousands of dollars on hiking, biking, fishing and hunting gear over the past 10 years. I love the activities and so I've been willing to spend it. With the advent of things like craig's list, an individual that can't afford to pay the extra cash for the tax can surely find the equipment from another source. An excise tax is a hidden cost anyway, and so most of us would just assume prices had gone up. As long as the money wasn't wasted or diverted in the bureaucratic nightmare of government budgets, I'd be happy to pay the money.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Puzzled by the desired outcome of this proposal. If you are suggesting that wilderness designation be limited to areas the size of "The Bob" or the Selway-Bitterroot ..... we're 100 years too late. In the lower 48 we've destroyed most of the opportunities for protection of large scale naturalness (but not all of them (see America's [not Utah's] Red Rock Country located in the state of Utah) or the Boulder Mountains in Idaho. If you are suggesting that it's not worthwhile or is inappropriate to protect less expansive areas then I REALLY disagree. Smaller areas are even more vulnerable than large ones (because they are unprotected by distance from roads). They are also likely necessary to protect in order to ensure that protected lands provide biological diversity.

It just is not feasible for most folks to explore the Nat'l Forest and BLM lands on foot or horseback. Keep the public land open and accessible to the public. Stop designating Wilderness Areas.

It seems to me that one of the main issues that will be confronting the federal government in future years will be its ability to continue funding the maintenance and acquisition of public lands. As we watch European governments struggle with vast cuts to their federal budgets, I worry that there will simply be no way to continue to preserve the land and water that we do in the way we do. The question then becomes one of how can we ensure the preservation of our lands without them being leased out to private entities that will actually harm the nature that we are trying to preserve and limit the use of those lands by the public. I feel that as a frequent user of federal lands for various pursuits it is incumbent upon me to help in their management. This means voting, volunteering and educating others. One person recommended the return of the CCC, an amazing idea. Others have commented on partnerships between local and state-wide organizations and the government. These need to be expanded and further developed. These partnerships help the government to shoulder the cost of management, but they also do something much more important. They increase popular understanding of the necessity for preserving federal lands. Furthermore, they help to give people a stake in this preservation. the government needs to develop area-specific curricula to help educate future generations. At the elementary level, students could learn about nature first hand in the lands surrounding their homes. In middle schools, students could conduct experiments, learn about plant and animal identification, study basic animal behaviors, and learn about the necessity of land management. In high school, the partnerships could take on more meaning with job shadowing, work-study programs, as well as developing skills in biology, chemistry, geology, paleontology, history etc actually in the field. While this might not seem to coincide with the fact that maintaining and managing our public lands is becoming prohibitively expensive, the development of future environmentalists and outdoors enthusiasts is absolutely essential for the continued support for our preserves. Field and Stream recently discussed the decline in youth interest in the outdoors. If these young people are ignorant of the magnificence of our natural preserves or the significance of our historical ones, will they even notice when they are gone?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Larger dispersed trail systems do not fragment habitat. We are not talking about building houses in the forest, these are trails just like the ones the animals make. The concept that recreation trails have a negative impact on wildlife is born from a human perception of a minority that certain forms of recreation are unacceptable and that man is not part of the environment. Many studies regarding wildlife disturbance actually show that motorized and mechanized trail use is less disturbing to wildlife than non motorized, because motorized and mechanized stays on the trails, is predictable and pass through the area more quickly than non motorized users do. Since non motorized users have exclusive use of 109 million acres of Wilderness lands (all our National Forest lands combined are only 192 million acres) there can be no reason for any complaints that people cannot enjoy nature without hearing an OHV. Just visit a Wilderness area that we set aside for you.

Local knowledge and expertise will provide better results during any local forest public land use plan. Top down mandates, plans and regulations hamper effective local management and cannot respond to the changed local needs on the ground. One example is the Travel Management Plan which was mandated to be done in every National Forest in order to ensure that trails were properly maintained. Over the past five years it has consumed huge amounts of time and money to merely yield a map. Had the same resource been applied to the maintenance of the existing trails most of the concerns could have been addressed. In order to ensure America's Great Outdoors are managed well effectively, top down planning should be minimized.

are you kidding me? Killing small animals? Do you have any data? Maybe there's a squished RED LEGGED FROG. I had to laugh a bit about your comments on lack of scientific data. I have seen so many emotional viewpoints expressed by preservationists that were dragged into court that had no scientific supporting data. Most recently the effort of PEER to shut down Carnegie in Livermore based on some irrelevant water management code. The statement about OHV and Mtn bikes driving animals away is a classic example the kind of BS used in these emotional viewpoints. Many dollars have spent to study animal patterns and it is just not true that animals are driven away. Inside of the highly used Hollister Hills OHV park it has been shown that the animal population inside the park is significantly higher than the surrounding area. Hopefully the general public will see through these fabricated stories and vote the correct way.

OHV Recreation is just another way to enjoy the beauty of the outdoors. Those who do not enjoy OHV recreation need to look beyond their limited point of view to realize we all want to enjoy the outdoors. OHV's also provide a way for those who cannot hike long distances to enjoy the small part of their public lands where OHV use is allowed. For those who cannot abide other people enjoying themselves through motorized recreation, we have already set aside the best of the best places as non motorized in Wilderness. All forms of land use have impacts. I have seen many areas denuded by hikers and huge erosion gullies caused by their shortcutting trails. In the long run I doubt any trail impacts are actually significant. I have seen areas closed where anti OHV people had claimed irreversible OHV damage to the land and within one or two years there was no visible evidence of an OHV ever being there.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While interaction through computers and other gadgets is likely inevitable, and needs no promotion, let's not fool ourselves that this will solve any problems or develop any greater appreciation for nature than screen-savers do. We need to get people, especially youth, INTO nature, into the wild, and away from computer screens, away from viewing Nature as just another product that someone else takes care of. If people don't actually put their feet down on the ground and see what a footprint is, then they won't appreciate how fragile a system it is. We need to move away from intermediacy of interaction and toward an immediacy of interaction with nature. Half of the joy of exploring nature is not knowing where a trail leads, getting lost, exploring. GPS can't do that for you.

100% promote and approve!! All access to everyone and every user group to all public lands is important. Leaving one user group out of the equation due to personal preference or other justifications has only created conflicts in management agencies and between user groups. Proper management of these areas is key to the success. Management teams in the form of Non Profit organizations are popping up all over America to assist with just this type of demand. Put them to work and manage the user groups and their public land effectively and promote responsible recreation and you will have a win win situation for all user groups.

The earth was created to be walked on, trampled by and used by HUMANS! By attempting to alienate any one user group in an effort to hoard the land or resources for your own personal gain or view point is selfish and self serving. 1 for 1 gives the land managers a real goal to accomplish when considering closing an area or designating a portion of land as Wilderness. The 1 for 1 idea gives the human haters (unless you ride a mountain bike, hike or weave baskets) a rule they HAVE to be accounted for. It is the very same premise of low income housing rules in local communities now. If you take you have to give equally elsewhere. Why would anyone be opposed to this? The only opposition here would be to oppose government involvement in any way shape or form. I personally agree with Little government involvement, but since that is never going to be the case we should have some equality in the government decisions to take from one and give to another by setting some guidelines. Same idea as welfare recipients? You want free food, free medical and free money then pee in a cup! Show your students report card and attendance record! and the list goes on, There is no such thing as a free lunch!

"Prior to the Wilderness area locking up the trails in my area, volunteer MOTORCYCLE groups did 95% of all trail maintenance on this patch of 300miles of trail." If there were 300 miles of trail in an area that was then declared as Wilderness, then it was one more case of an area that did not meet Congress' idea of "untrammelled" country, and it should never have been declared as Wilderness. But now it is, and the law prohibits mechanized as well as motorized use. Carving out some sort of exception for one group while excluding others makes a mockery of the law. Either the Wilderness Act means what it says, or it doesn't--at the cost of one more chink in the foundation of law our government is supposedly based upon. Demoted.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

this is a discussion of federal lands and federal policies. The federally established and defined term is 'OHV,' and it includes street-legal vehicles such as 4x4 trucks and SUVs used off paved highways. The use of the term 'ORV' is a wedge tactic to try and separate non-street-legal vehicles (ATVs, ROVs, and off-road motorcycles), which are nonetheless legal on many Forest roads, from the discussion. If an area contains human-created trails, or "ancient petroglyphs, pictographs, and dwellings," it does not meet the intent of Congress under the Wilderness Act. There are other means to protect such archaeological relics.

"Given the effect rampant ORV use would have on cattle ranching, I wonder how ranchers are reacting to the apparent push for greater access for those destructive machines." First off, it's OHV, not ORV, which would be eliminated by increased Wilderness Area designation; and most ranchers understand that sanctions against OHV also impact their ability to do their work.

Even if they're not "big city legislators," they're often eastern state legislators like Rep. Hinchey (D-NY22), who keeps sponsoring western state Wilderness legislation. I said it elsewhere; one for one--for every acre someone like Hinchey proposes, he should have to find an acre of proposed Wilderness in his home district.

your use of the terms "wilderness area," as in "you are still operation a heavy, noisy, polluting, gas burning machine into wilderness areas" ignores the fact that the term has been defined in federal law (earning itself capital letters in the process) as an area where motorized travel is prohibited. People who ride into Was are already violating federal law and should be prosecuted. As for the rest of public lands, some are legal for OHV use and some are not. Expanding use may be appropriate in some areas, curtailing use in some likewise, but the opportunity should exist because Americans can rightfully expect that some of their public lands be made available for motorized recreation. as for your idea, I presume that your goals for having licensing are to educate and regulate users to some degree, a process that already happening in many states with requirements for OHV registration and safety training. Until such time as you could provide more detail to your idea, such as whether your licensing regime will allow kids who can now legally join their adult family members in riding on public land, I would have to defer either promoting or demoting your idea. We have recently seen states make youth riding at various ages on certain machine types illegal, despite the facts that most youth injuries occur from unsupervised, untrained use of adult-sized machines. I can show you child after child who can safely use a child-sized machine with training and supervision. Would you allow them to be licensed?

"Looking at your voting record I can plainly see you are no fan of nature, wildlife or the preservation of either so I am not surprised by you comments but the least you could do is provide a valid argument." No, he just doesn't perceive those things the same way you do. The idea that one set of values is the only "correct" set is exactly the kind of fundamentalism that our nation's constitution was constructed to avoid.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I see land managers soliciting comments from user groups without informing those users of their rights under NEPA. A district FS employee will tell you that comments are welcomed outside of formal comment periods, without telling you that those comments have absolutely no bearing on the legal process NEPA requires. The constituent is left feeling he or she made a contribution that the land manager has legal obligation to integrate in the decision process, but that in reality has no bearing on the decision to be made, and that gives the commenter no legal standing to participate in further appeals.

I'm a 51-y.o. veteran actively applying for FS jobs, to no avail. I see the agencies stacked with people who come from green-friendly academia, with little place for people like me who might look more favorably on motorized recreation or resource development in the forests. Demoted.

In my experience here in NM, most of the resource damage is coming from folks engaged in a "traditional cultural lifestyle" that has nothing to do with OHV recreation: partying in pick-ups. The evidence can be seen along the side of forest roads in discarded Bud Light cans and broken booze bottles. These are not bona fide motorized recreationists (I dislike the coinage of that new word, but it serves a purpose) like serious ATV and off-road motorcycle riders; these are local drunkards out for a joyride in the family 4X4. So enforcement actions would most judiciously be funded from a tax on cheap liquor. And seizure of the vehicle in question (after appropriate due process) means that some beer-drinker's family is gonna be walking. But because we responsible riders do treasure public land trails, as we have been challenged to demonstrate by Mr. Dawson, we reluctantly agree to have our OHV registration money diverted to enforcement (most of the time we have no choice because the OHV boards are politically stacked against us and in favor of the local miscreants). That registration money is being diverted from trail building and maintenance, actions that benefits multiple use, because we lack the political strength to place resource damage costs where they truly belong, on the irresponsible users of alcohol. So what we will need is covert surveillance at trailheads to catch the beer drinkers when they are at loose, and surveillance of the local LEOs doing enforcement to make sure that they are actually busting their cousins and brothers who are doing the damage, and not just driving around in their units burning OHV registration money in their fuel tanks. But then, Mr. Dawson, you will have to live up to these words: "And if there is less destruction caused by OHV riders, then the rest of us will have less reason to object to the creation of new OHV routes." Because when the real causes of resource damage are understood, so will be the real reasons why you all disapprove of OHV use on public lands--because you simply don't like motorized recreation and you want everyone to visit public lands only on your terms.

you are the one misinterpreting the statistics, regardless of the source. The uses identified in the survey are NOT exclusive. That is my point. I trust the USFS study to convey exactly what it does, that a certain percentage engages in a certain activity. The survey does not convey that self-identified hikers or birdwatchers or OHVs are engaging ONLY in those activities, and it in no way conveys that participation in motorized recreation is exclusive of non-motorized recreation or vice versa.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

your statistics do not document EXCLUSIVE use. I may go to the forest on my motorcycle, and then engage in other non-motorized activities. The statistics are easily mis-interpreted. The 44,000 acre Cerro Grande fire was started by the US government and shut down access to an extensive multi-use trail network developed and maintained by dirt bikers from the local Los Alamos NM area. Kind, courteous motorcyclists lost their trails, perhaps permanently, because the government could not be trusted with matches. Opportunity was lost. The Great Outdoor Initiative should incorporate restoring sustainable access to historical use areas.

Much of this land has already been considered for Wilderness quality and been rejected under the standards of the Wilderness Act. But SUWA and others keep bringing up the same areas again and again whenever the political climate seems favorable for their ultimate goal of keeping the general public out of areas it considers of value.

People are citing the USFS study as evidence that because a larger percentage claim participation in so-called "quiet recreation," planning decisions should somehow favor those uses to the exclusion of other uses.

your ignorance and stereotyping of "OHV drivers" is breathtaking. you don't even understand what "wilderness areas" are. please note that to appeal a final decision on a Travel Management Plan, you must gain standing by filing a comment during the official Draft Plan comment period. Forest Service personnel will tell you that they will always accept comments, but only those comments filed during the official comment period grant you standing to appeal. A basic flaw of the Travel Management Planning process is that under NEPA, a "no action" alternative must be developed and considered, but the direction given to the Forests says that they will establish a management plan. So in Forests where there existing trail networks, there WILL be a change to those networks which disregards the NEPA-mandated "no change" alternative. In short, the game is fixed.

Start thinking about our history and stop destroying it. We owe it to our kids and to the men and woman who gave us history to talk about.

Under the impending USFS travel management rule implementation, thousands of miles of existing trails will be lost, as well as dispersed camping corridors that are whittled down to a fraction of the existing open area. Use will be far more concentrated but you can bet there will be no more money for trail maintenance. This is happening right now, and it will take a rebellion to reverse the consequences.

Environmentalists and hunters/fishermen should be natural allies: both realize that protecting habitat is crucial to maintaining species diversity. I fall solidly in the first category, but I have many friends who are responsible hunters who share the same conservation concerns I do. I don't mean to get into a ethical debate about hunting; I know many on the environmental side oppose it. But they need to ask themselves whether in the great scheme of things it would advance their goals to be pulling in tandem with hunters and fishermen. I think it would. If we can get to the table together, we can talk about things like the role of predators and the need to cull deal populations.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I share your concern, but the fact is that we as a country have taken no meaningful steps to move away from fossil fuels. Very few of us as individuals have taken any steps to reduce our carbon footprint. Until we create a consensus on what we as a society are willing to do, our politicians are going to remain as divided as the country is. And with no other fuel source on the horizon, we're going to continue to need coal that comes from strip mines, oil that comes from deep-water rigs and natural gas that comes from shale. Our economy depends on it. And I'll point out that burning natural gas is less damaging than burning coal or oil. For the time being, we're just going to have to do a better job of regulating the producers.

It is OUR land. Not just for a few to use. WE are the public. It just is not feasible for most folks to explore the Nat'l Forest and BLM lands on foot or horseback. Keep the public land open and accessible to the public. Stop designating Wilderness Areas. My wife is no longer able to hike. Will you ban her from enjoying the outdoors?

This is exactly the kind of thing we have government for: promoting the common good, in this case the preservation of other species that constitute critical components of the natural world we depend upon. I whole-heartedly endorse suggestions. Unfortunately, finding funding will be the challenge.

I strongly support a Buffalo Commons National Park on the High Plains of Kansas, Nebraska, and Oklahoma. Many counties on the High Plains are losing population and once those residents over 55 die, the High Plains will essentially be de-populated. The land can be acquired from willing sellers who would retain life estates (right to live on the land until they and their spouses die). Then it can be restored and species re-introduced. Eco-tourism and wind farms can be an economic lifeline for the remaining towns.

There are millions of acres of private inholdings in our national parks and wilderness areas. Frequently, these private landowners are building trophy homes or otherwise developing these lands in our national parks and wilderness areas. That is why a program should be established to buy these inholdings. A federal real estate transfer fee could be established to fund this program. Every parcel conveyed in America could have a \$20 federal fee imposed.

There have been several proposals over the years to create a Tallgrass Prairie National Park which would have up to 300,000 acres, including one east of Matfield Green where there is open range and an out-of-this world view. All were defeated by ranchers, the Kansas Farm Bureau and Kansas Livestock Assn. In order for it to have a natural ecosystem with bison roaming up to 3 miles a day, we need a very large park. Because of the opposition we ended up with the minuscule 11,000 acres which can't be expanded according to the enabling legislation.

We need a 300,000-acre Tallgrass Prairie National Park as originally proposed in the Kansas Flint Hills. The Tallgrass Prairie National Preserve at 11,000 acres is just too small to replicate a tallgrass prairie ecosystem with roving herds of bison.

Well, the program should have billions to fund the acquisition of in-holdings before they are developed. Time is of the essence. I don't see congress appropriating billions unless there IS a dedicated funding source such as some excise tax.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There is a strong link between the way we develop our cities, towns and other urban areas and the preservation of open lands-- both private and public. Suburban sprawl puts enormous pressure on private land owners to develop green space. We need to look at the problem from a wider angle, and reduce the development pressure by focusing development within existing urban areas. The EPA is already involved in promoting Smart Growth, the philosophy of densifying development in urban cores, making development mixed use (residential and commercial), thus making walking, biking, and public transportation a real option. This in turn reduces the need to drive everywhere, relieves development pressure, and reduces pollution. But the federal government can do more to promote this! 1.) First of all, the EPA can take on a strong role in creating a pro-Smart growth policy and then using that platform to educate the public, the states and the local governments about the negative effects of urban sprawl. We first have to identify urban sprawl as a problem and present Smart Growth as the solution. The federal government, through its agencies, can put pressure on cities and towns to follow the smart growth model of development. I envision a major PR campaign. 2.) The federal government hugely influences our nation's transportation infrastructure, policy, and planning. Transportation is intimately connected with land use planning. We need to do everything possible to promote public transportation options and development that supports those modes. 3.) Open space preservation -- preserving existing green space through public and private land conservation through support to federal and state land management agencies, as well as and private land trusts 4.) Promote greater regionalism in terms of land use planning. Currently most planning is done at the county level. We need to promote regional and state-level planning, and coordinate that with conservation planning. 5.) Provide state, regional, and local governments incentives for smart growth and comprehensive planning. Perhaps a national land use policy could act as a guide to state and regional governments...? 6.) Revitalize urban areas and make changes in housing policy and other tax-related policy to encourage this.

As we all know, our planet is in trouble. We owe it to our children and grandchildren to preserve our wildlife as it is suggested here. It is our only hope before it is too late.

the wilderness act lists among the attributes to be eligible "ecological, geological, or other features of scientific, educational, scenic, or historical value" so petroglyphs, etc. being of potential scientific, education, or historical value would not be disqualifiers. You mentioned the Utah wilderness proposal earlier saying it has been found not to qualify - actually nearly every acre the BLM has inventoried subsequent to that proposal has been found to have wilderness character by the BLM. Since Congress has not voted on it there is no definitive finding.

One of the biggest threats to Wilderness Areas is the gradual erosion of protection by various user groups such as mountain bikes and ATV's that want access for their use. The big problem with multiple use trails is that they really aren't: the dominant group turns to be the ones with the biggest most intrusive machines and everyone else is relegated to a secondary status and a vastly degraded experience. Certainly everyone has a right to do their thing, but this has to be done by segregating conflicting uses-not by cynically calming to want it for "everybody" when in fact they want it for their own uses. In this increasingly crowded and mechanized world we need places to escape and be in nature without being harassed by machines.

**(cont.)**

The 5% of environmentalist that cause problems are the ones who chain themselves to trees and burn equipment that is used to do a legal job and must be payed for by all when it is destroyed. I agree that we can't just go out and ride anywhere, but if it is all made out of bounds then I will be ridding illegal.

For educational and quality of life reasons, the battlefields should be preserved. Young people will benefit from real, open air, not just virtual, experience to enhance their knowledge of history. Planners and environmentalists have copiously written about the unfortunate consequences of sprawl, and repetitive US 1 big box shopping mall "normalcy".. Anchoring history and saving open space is of great value, esthetic, educational, like National Parks.

The artist Christo insists on imposing his "art" on the Arkansas River headwaters in Colorado. Should one person be allowed to force residents and recreationists of a mountain canyon to endure 3 years of construction for his 2-week display, endangering humans and wildlife?

Why is BLM even considering allowing any part of the Bighorn Sheep Canyon in south-central Colorado be covered with polypropelene fabric because Christo has the money and influence to impose his outdoor "art" on the area? Colorado's distinctive bighorn sheep herd is already stressed and endangered. The traffic issues during the 2-1/2 year construction phase will cause economic chaos to the area's seasonal recreation industry. If it's not here, it's somewhere else, someone else, some other personal gain. When and where do we draw the line? As of July 16, 2010, there are only 45 days to file official protest against this egotistical travesty. See [www.roarcolorado.org](http://www.roarcolorado.org) or [www.christosrealplan.org](http://www.christosrealplan.org) for info. For updates on DEIS see { <a href="http://www.blm.gov/co/st/en/fo/rgfo/planning/otr.html" rel="nofollow" target="\_blank">Link</a> }

State Fish and Game agencies are a logical way to promote habitat restoration and preservation using federal \$\$\$. This program was just barely able to establish itself in many States when it was pitched overboard. Many States have private lands programs that need a consistant source of funding, other State Fish and Game agencies have no program or capacity to work with private landowners; this was a valuable program for those states with a high percentage of private property (like Texas) but most importantly, for states with a small amount of private land compared to public land such as BLM. Most always, the most valuable wildlife habitat is privately owned--if we have no consistant funding to support our work with these landowners, they lose faith in government and we lose wonderful oportunities to build bridges with the public we work for. In some cases, he Landowner Incentive Program also provided the mechanism to increase collaboration with the Natural Resources Conservation Service to facilitate capacity in both agencies to promote important Farm Bill programs like the FRPP, WHIP, WRP, etc.

We visit Gettysburg PA. every year. I cannot think of a better cause to preserve than our historical battlefields. I take my niece & nephew with me and to think that they may not have the opportunity to take their children is a sad thought. The sacrifices that these soldiers have made for our freedom should always be remembered by preserving these historical sites.

## Discussion Question 2

***(cont.)***

Dark skies are essential to our lives and the environment. Having proper lighting saves energy and saves money. It's a win-win situation for everyone. Our night sky is being void of stars and the nature wonders that our ancestors saw in the past. I'm all for proper lighting and energy savings. We need the use of more proper outdoor lights and the sale of proper fixtures and not barn lights at our local Home Depot and Lowes. The technology is here, but the education on using proper lighting has far to go. Here in Texas, we still have some dark skies, but it is fast disappearing and if something isn't done to protect it, then our future generation will lose this beloved natural wonder.

I love to read about Civil War history, but there's nothing like walking on the actual land where the battles were fought to really bring the history alive. We can't afford to let this land be built over and destroyed. We need to take action now to preserve it for future generations to enjoy before it's lost forever.

The Buffalo Commons National Park is a wonderful idea. As a lifelong Kansan, I have always dreamed of seeing a portion of the prairie returned to the majestic buffalo. Western Kansas is dying, and this could spurn new interest and growth in the surrounding areas, preserve an important part of America's great history, and serve as the foundation for a biological and cultural renaissance. Our state song is "Home on the Range," but there's hardly any range left in Kansas. We need a Buffalo Commons National Park!

While I have visited many Civil War Battlefields and enjoyed and appreciate what the government has done in preserving them, unfortunately many of the battlefields have not been totally saved. It's important that these sites are preserved for the memory of those that fought there, the education of future generations and the open space that they supply in this every more congested country. I hope that my grandchildren and further generations have an even better experience at these battlefields than I did.

Mountain bikes don't belong in the mountains? Huh? That's like saying dirt bikes don't belong in the dirt. Hikers don't belong on hiking trails. Cars don't belong on roads. There are millions of acres of undeveloped public land in national forests, BLM land, national parks, etc. There's plenty of room for largely foot traffic only in areas like Yosemite, or ohv use like in national forests and on BLM land, as well as mountain biking and hiking. I'm not a big fan of quads, because they kick up tons of dust, but they have every bit as much right to ride as I do to bike, hike or ride a dirt bike. Just make certain areas targeted to specific types of use that can coexist well together. No need for vast closures of land to OHV. They pay hefty sticker fees and deserve the right to ride on public lands. There's enough for everyone.

Planes can fly over your 'isolated' wilderness, too. Are we going to ban flights now? And there's always that group of hikers with the guy with the loud voice. You know the one.. .the one whose voice echos off the valley walls no matter how much vegetation is there to absorb the sound. Are you going to propose a 100 mile hiker free zone so you can have that area all to yourself? You're going to have to get used to the fact you're not the only one in this world. You share the sidewalk with thousands. You can share a forest with a dozen. They share it with you.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

All wilderness quality land should IMMEDIATELY be protected. Period. Including the Arctic National Wildlife refuge. All roadless areas protected under Clinton should be in this category. And finally, all available wilderness areas in the Tongass National Forest in Alaska should be protected. They were left out of the roadless rule in the first place. Even if every bit of wilderness left in this country is protected, it will still leave plenty of room for the off road crowd. Some day, as this country gets more and more overcrowded, our children and grandchildren will thank us.

Are you kidding, EXERCISE???? How about going for a hike or actually using a bicycle? Now that would be exercise. Going from the TV remote to hoping on a motorized vehicle hardly counts as exercise or enjoying the outdoors. How can you hear anything with your motors rumbling? And more important, my hiking does not bother you in any way, but I can hear, and see, your motorized vehicles for miles. Your activity destroys MY activity. And there are plenty of places where you can use your vehicles. Way way more than wilderness. Just do the math on acreage dedicated to wilderness compared to available areas to ride. I live in the upper peninsula of Michigan, and I can show you miles and miles of forest trails, sand dunes, streams, aquatic areas, that have been pulverized by ATV people. I would say the majority are NOT responsible. My hiking has yet to destroy one trail.

I agree, there needs to be more connection between agencies (USFS, NPS, BLM) and local communities where they operate. Less us vs. them and more "we". Local oversight groups for nearby national parks and monuments etc. More grassroots change than top down from D. C. Use local knowledge, contractors, volunteers, non-profits to build a network and consensus.

I know of 35,000 acres of state public land that is landlocked by Weyerhaeuser. The state land butts against USFS land with trails. There is no legal public access to either the state or USFS trailheads. And since the land has no legal access, it is ineligible for most grants (recreation plans, trail work, etc.) This situation only continues because Weyerhaeuser knows 1) the state has no power of eminent domain to acquire a public access easement 2) the USFS has no money to acquire an easement. This whole situation is WRONG. And it is just one corner of one state. Multiply this across the nation and hundreds of thousands of acres of public land is locked by private interests. PS. the access would be on existing roads, and not punching anything new into roadless areas.

I've been spearheading a campaign to obtain an easement on existing roads to 35,000 acres of landlocked state land. This land is backed against a USFS national Monument. Trails come to the state/USFS boundary, but there is no legal public access to the area (total of about 50,000 public landlocked acres). The state Dept. of Nat. Resources has no eminent domain for public access. The USFS has not been aggressive in helping the situation, although their trailheads are landlocked. The landowner at first refused to participate in easement discussions as a willing partner. Why should they, when they have control of 50,000 more acres? We need to acquire access in these situations--willing landowner or not. Yes, I'm for property rights, but the public land should have rights, too. P.S. The blocking landowner is Weyerhaeuser, not a small farmer or rancher.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We've all heard our lands our being loved to death, but times have changed, and now areas are "regulated to death". Permits, passes, fees, reservatios a year ahead, reams of hunting/fishing/hiking regulations. No wonder people stay on the couch. At Mt. St. Helens, the backcountry is so restricted elk us it more than hikers! The rules make it nearly impossible to take the average child backpacking. The fishing rules on Coldwater Lake are are so difficult, the state sponsored "take a city kid fishing event" netted ZERO fish for over 50 kids. Yellowstone is another example. Fishing is so regulated and confusing, we arrived at one of the suggested places for kids to fish (from the official rules book), only to find "no fishing" signs. We gave up. Read the posts, Wilderness Areas (a great idea to start with) have even lost support. You've got to let people in if you want to maintain the public's support (and funding). If this means a few footprints left behind, so be it.

Where I live, Weyerhaeuser has a chunk of 40,000 acres of state and USFS land landlocked, and they think this is "ok". Does anyone in the public agree?

Here in northern Illinois There is a severe lack of public OHV land and that causes illegal riding in areas with no designated trail and people blazing new trail and Resulting in excessive damage. Illinois needs to open there eyes and have a few less hiking and bike trails and more ohv trails. There would also be less polution caused by all of us Illinois people loading up our big diesel and gas guzzling trucks Towing huge trailers and driving 2 to 6 hours every weekend to wisconsin to leagly ride our machines and get into nature. Even if Illinois opened trails in the winter when hiking and biking are not as common That would at least be a start.

I have a second homeTahoe which has nearly a thousand miles of hiking trails surrounding the lake. OHV trails are less than 100 miles, how is this considered "fair use" for all Americans who these lands belong to? All Americans own this land and we all should have equal access to it. OHV trails have and remain to be closed at a alarming rate closing off access to a large segment of the population that pays taxes and should share their right to these lands.....

There's an old saying "United We Stand and Divided We Fall" Why not use the ideas and expertise that comes from interested partners. The partnership would provide a lobbying strength from it's combined members. The Nature Conservancy (nature.org) is noted for their ability to restore land to where it should be. They are at the Gulf spill now and have been since day one. Also, The Sierra Club is prominent in it's environmental approach. Using [www.care2.com](http://www.care2.com) would not be a bad idea. We need to create and reinforce awareness and positive approaches to our park lands. Care 2 has 13 million members worldwide. We need to get more people concerned at the grass roots level

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There are at least four challenges faced by youth and adults, families and community groups, within the context of our relationship with natural landscapes and watersheds: 1) kids spend less time outside in nature than in previous generations, Response: We can demonstrate that children as young as five can learn an amazing amount about, and come to care passionately for, the health of water and wildlife, landscape and habitat over a brief period of time, if they come regularly to one place and have opportunities to share what they have learned; 2) children spend less time interacting with adults than 25 years ago, Response: Given the appropriate opportunity youth will choose to spend regular time with adults over other activities, especially virtual ones, are able to learn to pair and partner with different adults, and learn important relationship skills more quickly and efficiently than older peers and adults; 3) adults demonstrating healthy group functioning to youth is increasingly unavailable to youth (this is because we have moved to the 'one serving the many' cultural form, where one teacher/coach/leader directs many youth, telling them what to do, rather than the traditional 'many serving the one' barn-raising type of group coordination where adults demonstrate and show youth what to do and how to do it). Response: A combined team composed of a group of 6-10 adults and a group of 6-10 youth allows youth to see, imitate and model effective group functioning skills demonstrated by those adults. This configuration also allows the explicit and systematic development of inter-group skills, as well. 4) individual, couple, family and community interactions with the natural environment has decreased in regularity and, as a consequence, has increased detrimental effects upon the health of water, land and wildlife by human ignorance and carelessness. Response: The creation of community nodes up and down a watershed and/or across a landscape is possible if existing community groups can begin to align and synchronize their efforts with one another. Using 123Mystery skills to teach and optimize the formation of groups and inter-group alliances focused upon preservation, restoration and conservation activities within a watershed/landscape can transform those communities and significantly improve the health of that watershed/landscape. Using the brief orientation exercises we have constructed, a very quick and efficient way to orient small and large groups to the enhanced utility of upgrading and optimizing old formats typically used for environmental education and action, offering innovative concepts, processes and skills as a precise and potent intervention alternative, essentially moves participants from the old individualized education emphasis to the newer, optimized dualized learning format involving pairing individuals and pairing groups for greater efficiency, effectiveness and productive effort within and across communities in a more coherent, focused and cohesive manner (e.g. -- Stewardship Environmental Education Leadership Skills (SEELS) Training Team initiating (adult/youth) Rotary/Boy Scout Water Resource Teams in community nodes down the full length of connected watersheds --).

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There is plenty of land to allow all types of public recreation without one person's ideals dictating another's. The idea that we should close our public land to all access only fits a single groups ideals. I personally enjoy the outdoors in many ways - on water, foot, bicycle, and dirt bike and I don't believe that any single recreation group should have the final say in how our land is designated and accessed. I also don't believe it's a good idea for hikers, equestrian, and OHV's to share the same trails or areas as it causes safety issues and lack of enjoyment for all user groups. We have more than enough beautiful land to share and enjoy within our respective recreation styles - but nobody will enjoy the land if it's designated as wilderness and we're all locked out.

America's cultural resources define who we are and are indispensable. HistoriCorps is the future of preserving these resources on public lands. It comes at a critical time when these resources are fading just when budgets are being trimmed to take care of them. It is also important as an opportunity for the participants, primarily young people, to learn more about the resources themselves and the skills needed to preserve them.

comment is spot on!! However, I do agree that a program of awareness and stronger enforcement is appropriate. No matter what activity you are talking about, there are always a small number of people who refuse to obey the rules. This is just as true for hikers and stock users as it is for ORV users. Stronger penalties and more effective enforcement for all Forest visitors is in order.

I think some clarification of your comment is needed -- perhaps you misunderstood my comment. No one is advocating that existing Wilderness Areas should be available for motorized use. Use of motorized or mechanical devices in Wilderness Areas is strictly illegal, and no one is advocating that should be changed.

Everyone endorses the concept of conserving public land for the benefit of the public. Unfortunately, most conservation initiatives proposed by Federal Agencies and influential "conservation groups" end up excluding the public from public lands. Conservation and Access do not have to be mutually exclusive. The America's Great Outdoors Initiative should explicitly adopt a policy encouraging access opportunities for all Forest visitors and explicitly reject proposals which deny access to any responsible and sustainable recreation activity on public land.

Federal Agencies are specifically enjoined from attempts to manage state or private lands. Any attempts to educate or influence states or individuals to manage their lands in any way, shape, or form is a bad idea. A simple case of Federal over-reach. States, ranchers, and individuals have a far better understanding of their land management needs than any Federal Agency. This is a bad idea and should be deleted from the America's Great Outdoors Initiative altogether.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Federal top-down driven initiatives such as this Great Outdoors initiative are driven by wealthy, influential Beltway conservation groups and are specifically designed and choreographed to shape public opinion rather than acquire input from the public. As just one of many examples of how this is done, the listening sessions for this initiative are scheduled during working hours on a weekday. Few ordinary citizens will be able to attend, but paid professional employees of wealthy conservation groups are sure to attend, virtually guaranteeing the outcome. Organizers of these listening sessions also are careful to hold listening sessions at "friendly" locations. For example, the listening session for Montana is to be held in Missoula, where virtually every conservation group has a full-time office. Why not Great Falls? It's a bigger population center than Missoula, but also known to be much more conservative. These Orwellian initiatives to shape public opinion rather than listen for public input are "Business as Usual" in Washington DC, in contradiction to Candidate Obama's promises.

I agree. The Forest Service and BLM are supposed to be "decentralized" organizations where decisions are made at the lowest possible organizational level. Yet all of the major initiatives such as the Roadless Rule, Forest Plans, Travel Planning, Planning Rule Revisions, and now the AGO initiative are carefully designed and crafted by conservation organizations and bureaucrats in Washington, DC to restrain the intended flexibility of local managers. Local input is routinely ignored, and local land managers are rewarded for being "good soldiers" and supporting the Washington, DC agenda. The classic example is the AGO initiative. It is designed to get the answer that Beltway conservation groups want to hear -- specifically, that the Administration should designate some 13 million acres of additional National Monuments.

I am going to promote this idea, because these trail systems can provide extraordinary experiences for Forest visitors. However, these trail systems must be shared trails, including availability for appropriate bikes and OHVs.

I am opposed to Federal subsidies for nonprofit Land Trusts to purchase land. If Land Trusts want to purchase land, they should use their own money -- not mine.

I find it curious that while you advocate engaging all stakeholders, those you mention in your idea are all conservation groups -- no timber or mineral interests, no sportsmen or OHV interests, no Indian tribes, etc.

I love idea. In a world where intolerance seems to be gaining momentum, it is refreshing to hear a "live and let live" point of view. We also need to recognize that rewarding and enabling intolerant behavior breeds more intolerance. Segregating Forest visitors based upon who can make the most noise and/or file the most lawsuits enables extremist behavior.

If the consuming public wants more environmentally friendly landscapes they will ask for it. How do you propose to pay for a government-sponsored tax incentive program?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

If we wish to encourage people to reconnect with outdoor activities, attractive and appropriate opportunities need to be provided. What constitutes an attractive and appropriate opportunity for public access to public lands should be determined by how the public uses public land. Unfortunately, many of the ideas brought forward in the name of "conservation" effectively discourage public access to public land and contradict the stated objective of the America's Great Outdoors Initiative. For example, creating more Wilderness Areas denies access to at least 96% of Forest visitors, concentrates visitors into increasingly smaller areas (bad for the visitors and the resources). Virtually all Forest visitors pursue their activities by traveling significant distances on Forest roads or motorized trails. Limiting/eliminating these roads and trails discourages the public from reconnecting from the outdoors.

Land conservation has and always will be vitally connected to, and dependent on, private land stewardship. As a manager of a public land, conservation agency, I recognize the value of protecting and managing conservation lands for public use, education, and protection. However, I also co-own a small midwestern farm, which has limited production value given the non prime soils. Much of the farm is woodland/wetland complex in near pre-settlement condition. Development pressure is high as the area is a favored vacation and retirement area. As landowners, we struggle to raise the funds needed to pay the taxes. A better, less complicated program is needed to encourage conservation and continued stewardship of areas like mine. Private stewardship accounts for the great majority of privately owned conservation lands. Creating a program that reduces taxes or otherwise allows landowners to manage lands for conservation functions and values, without the burdon of requiring public access, will be a key aspect to future land conservation.

Lets not forget what Wilderness is all about: A portion of public land set aside where natural processes and ecosystems can be self-sustaining without human influence that provide opportunities for quiet recreation and solitude. Small parcels of land can't do that. Current regulations require a minimum size of 5,000 acres -- far too small an area to sustain its own ecosystem, and Wilderness advocates desparate for more Wilderness are continually ignoring the basic requirements for Wilderness by "cherry stemming" roads, utility corridors, and private land. In my opinion, Wilderness areas need to be very large -- perhaps at least 200,000 acres with virtually no evidence of human disturbance.

THANK YOU !!! I couldn't have said it better!!! 1:1 is NO compromise at all!

With the United States literally on the verge of bankruptcy, it is inappropriate to increase funding for these projects -- significant belt-tightening would be more appropriate.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I heartily agree! I don't think it would take much to re-tool the program so as to meet modern needs; abolish the gender/marital status rules, up the pay, make the Corps an independent government program as it was originally. Many glowing testimonials can be found from those who served in the CCC during the great depression of the 30s; providing jobs, reforestation and maintaining our natural resources, planting lots of trees (which eat up CO2) and having a fantastic training, learning and working experience for people of all ages..it's a win-win. No reason why this can't be funded, either; Nader's proposal of taxing the biggest polluters (BP comes to mind) something like 0.5% per CO2 amount output (with NO "credits"!) would provide plenty of money to pay a civilian corps. We could also levy a tax on the big banks that practice casino capitalism (Goldman-Sachs comes to mind) equal to the tax we citizens pay for gambling winnings; that would raise plenty!!

Man is a visitor in America's great outdoors, not the resident. A good visitor respects the wildlife and the wildlife habitat that are an integral part of the great outdoor experience. This means in America's great outdoors natural process control wildlife populations and wildlife habitat. If the presence of wildlife interferes with Man's enjoyment of the great outdoors, Man must yield to the wildlife and the preservation of the wildlife habitat. Man does not choose the wildlife numbers and species. Natural processes control the balance. The only exception is when Man must correct an imbalance greater by their intrusion into the great outdoors or pollution of neighboring spaces. And when making this correction no wildlife should be a loser. The Great Outdoors is first the home of wildlife, free from disturbance of Man. Man must be a benign presence in America's great outdoors. Private lands adjacent to America's great outdoors must be tolerant of the wanderings of wildlife onto their lands as those lands provide the buffer between America's great outdoors and Man's world where wildlife are sometimes the visitors. That is the challenge.

no more wilderness, we do not need more the land does not need to be taken away from the majority of people it needs to be used in a responsible manner, not buried in a hole for a select few.

Our greatest challenge is to plan for use by everyone, and not submit to extremists. Not everyone can hike deep into a section of public land, and not everyone wants to hear a quad runner blasting by. Everywhere does not need to be accessed by motor vehicles, and everywhere should not be accessible only by foot. Access needs to be for everyone - hikers, rock collectors, and even off roaders.

Separating OHV use from "other" uses would almost certainly result in a significant LOSS of areas for OHV users. The direction has been for more and more areas to be closed to OHV use, and by the time the "other" users had made all their choices, little would be left; no desirable areas would be designated for OHV use! Very BAD idea!

This idea is of little to no value, as the nature, scope, and goals of the so-called "ideas and projects" is what matters. Without knowing the details and goals of each "idea" and "project," it's impossible to support, or not support, the idea. The last thing most people would want is to help or support some idea or project that they didn't want to happen!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Urban families need urban parks, urban trails, scenic highways and pocket parks. The local governments know what the people need and want, but they need help with the funding. How can we raise urban children in central Los Angeles who have never been to the beaches of the Pacific Ocean? Or to the nearby Santa Monica Mountains? They need not only their own central parks (almost none now) but also public transportation to the available recreation 20 or 50 miles away, like the beaches of Santa Monica Bay and the wild state and federal preserves in the Santa Monica Mountains. The U.S. Government can help local governments (both the City and County of Los Angeles, for example) with the funding for recreation access to green space inside the inner city and transportation to recreation at the edge of the city. See what the Santa Monica Mountains Conservancy has accomplished on both of those access issues. Talk to its long time leader Joe Edmiston.

way to go guys keep our roads open it is not only ohv use, but hunting and fishing, closing existing roads will lead to the distruction of land, because like with every thing else there are those who dont follow the rules. so if you close them they will now have an excuse because you locked them out

We dont need people who have never stepped foot off of concrete to tell us that live in the country how to "protect" our lands. Nobody cares more for the land than we that have spent our entire lives here. So I say "NO" to more national monuments and wilderness areas. Give the ecofreaks an inch and they'll take a mile.

We recently visited the BLM lands in Southeastern Utah and, although we had been there before, our breath was taken away by the raw and unspoiled beauty that abounds there. Sadly however there was ample evidence of new impacts from those who want to use motorized vehicles off of existing roads and marked trails, which would be regulated if these pristine areas were designated as wilderness. Once these areas are shredded by ORVs or other damaging activities we, the American Public, will have permanently lost these wild features. There is plenty of room for ORV use in designated BLM areas - areas that do not have these wilderness characteristics - and a huge number of gas and oil leases that have never been utilized. There is no necessity to despoil the prescious wild areas that remain.

well I guess the answer is to take put all those atvs and motorcycles in your backyard and see what happens when you take away all the roads they used to ride on. I bet you would like that we need space for everyone,

While these ideas have merit, do you realize how extremely horrific they sound if you were to apply them equally and with the same verbiage to not only the plant kingdom but also the animal kingdom, including the human animal? If so then we have to send not only the Mexicans back to Mexico, but the blacks back to Africa and the whites back to Europe leaving only the true Native Americans. Who is to say what is an invasive species and what is evolution?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You are very well spoken and I agree with every word you wrote. I recently spent 4 days riding off-road in Nevada on my street legal dirt bike. Nevada has some of the most beautiful land that this country has to offer. I can guarantee that our dirt bikes did not harm the area at all. In all my years of riding in the back country the only areas that I have seen disturbed are areas where the herds of wild mustang congregate. B Meyer - OHVers have given up so much over the last 20 years that we are extremely frustrated that environmentalists are still asking for MORE. Please look at a map of the country and see how much is left to responsible OHV recreation. Better yet, look at one of those maps from 20 years ago to see the difference. Also, it frustrates me greatly that you say that you don't even go hiking in the back country yet you talk with authority how horrible OHVers are. All OHVers - you should have quiet pipes!! One question for anti OHVers - What happens when electric bikes become available - then will it be ok to be out there with the hikers???

I agree with quiet pipes and look forward to technology that continues to make vehicles quieter and cleaner. I also again want to state that we are just trying to stop you from taking MORE land and keep existing trails and roads open.

I don't believe anyone is advocating for more roads, I believe most people on this site are advocating for the ongoing use of existing roads. Wilderness designation means that there are no roads for you to park your car on and go hiking.

I love to hike, scuba dive and ride off-road motorcycles. I consider myself an environmentalist. Enjoying nature is incredibly important to me and my family. To all of you who think that the off-road community has been unwilling to compromise, you should look at the MILLIONS of acres that we have given up/lost over the last 20 years. 99% of the off-road community love and support the beauty and fun that is only accessible via motorized means. Much of this country is now completely inaccessible to human beings - unless you can afford to be dropped off and picked up via helicopter. It is even more frustrating to see how crowded the few remaining ohv areas have become. This madness really has to stop at some point soon. There seems to be no end to the "wilderness" appetite. I see far more cooperation and compromise from every group except the anti-access "wilderness" group. All citizens should be able to responsibly recreate in this country.

If they don't round them up the herds grow very large and push out native species. They eventually overgraze (is that a word) their territory and many horses starve. There is no easy answer to trying to manage mother nature.

It is so frustrating to read most of the anti ORV comments. First, you all need to realize how much land has been designated as roadless over the last 20 years. We are tired of losing land for a sport we enjoy. 99% of off-roaders are respectful outdoor enthusiasts. Conversely, the more land you close the more you force ORVs into a small area and the negative impacts become greater. Most people cannot hike 50-100 miles from a road. There are plenty of areas where existing dirt roads should be available to motorized traffic.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Maybe part of this is based on where you live. I live in California and every hiking trail I've ever been on has been at least 3 feet wide and well worn. This is true even 20 miles from the nearest road (in sequoias and mammoth areas). Dirt bike trails are usually narrower and rarely wider unless you are talking about an actual dirt road. I agree that people who drive through mud leave the road chewed up and I would prefer that it isn't done, but there is not much mud in California so it's not an issue that I see much. Also, I don't think that anti-ORVers realize that all we are asking for is to allow motorized recreation on EXISTING roads and trails. I am not advocating for unlimited cross country access. Nor does allowing access mean that there would be thousands of ORVers descending on the land. Just like hiking, not that many people go hundreds of miles from the nearest paved road.

Please, please, please, PLEASE realize how much land has been closed to ORV since 1970 and quit saying we are unwilling to give up anything. There was very little fighting in the beginning as we were all willing and agreeable to preserving land. But enough is enough!!! That is why you are seeing such an outcry on this site, we have given up more than any sane person should expect and I am tired of people like you saying otherwise.

Riding a dirt bike or ATV is extremely physically demanding. Believe me hiking is not better exercise - though please don't read that as hiking is not good exercise. I am just saying that it is no better than riding. I wish you and all the other anti-ORV people would quit painting the sport with such a broad brush. Yosemite National park is far dirtier than almost everywhere that I off-road and that is because a lot of people are concentrated in such a small area.

Where do you see all of this destruction that you keep talking about? I have been an off-roader for 40 years in California, Nevada and Utah and have never seen the widespread destruction that environmentalists talk about. I see far more litter and hear far more noise at the beach and at most heavily used hiking areas than I do in the back country. Even the ever smaller places in the desert that are open to off-roading are only impacted in that they have a lot of trails on them. How is that so different than places where there are a lot of hiking trails? 99% of off-roaders respect and maintain the great outdoors. I'm sure that most off roaders spend more time outdoors than most environmentalists.

I love to hike and I agree that there should be areas set aside for hiking, but truly it is the hikers that are least compatible with other uses. OHVers are happy to share trails/areas with just about anybody - miners, ranchers, loggers, bicyclists, rock climbers, snow mobilers, horse back riders, etc. etc. I also agree that all motorized recreation should be as quiet as possible - loud pipes on vehicles are just plain annoying.

The reason that you never see hikers and horseman hundreds of miles from a paved road is that it is almost impossible to get there without a motor. you are way far off base if you tell me that hikers and horseman want to be hundreds of miles off of a road but don't because they might hear a motor. That is an absurd statement that is exactly the kind of hyperbole that is out of control in the anti-ORV groups.

## Discussion Question 2

***(cont.)***

There are 2 electric motorcycles being made now. Just like with cars the technology is improving and may help curb the noise issue. As for now education is important and quiet pipes should always be used outside of racing events.

The old adage "Build it and they will come" works to a certain point, but if a community includes their own heritage, even more people will share in the project. Many of our communities are built around a historic theme--for us it was our 1900's Fort Thomas. The Fort was built just after the Spanish American War and was used as an induction center for WWI and WWII as well as the Korean War. The City was allowed to purchase nearly all the acreage and has turned it into a public park, complete with mountain bike trails and walking trails. In the past year we have added the Fort Thomas Military and Community Museum in a home built in 1905 for the administrator of the Army Hospital. We have already outgrown the space and need funding to add to our building. We also hope to obtain a WWI Army Stables Building to use for community events such as our farmer's market, a public kitchen where people will be able to can vegetables to sell at the market. That building is now being used for storage and we have received permission to purchase the building if we will construct something else for the Army to use. A mere \$75,000 is all we need to complete the transition. We want to use these historic buildings and build on the wonderful history to create interest, economic revitalization, and sustainability. Please provide the funding needed for our cities to achieve the goals of combining history with the great outdoors!

- Preserved Civil War battlefields are tangible links to our country's past.
- The 150th anniversary commemoration is expected to stimulate renewed interest in the conflict and generate unprecedented tourism to Civil War sites.
- Protection of America's remaining Civil War battlefields will leave a lasting legacy of national commitment to preservation and conservation.
- Preserved battlefields revitalize local economies and create jobs by encouraging heritage tourism. The more historic land that is preserved, the longer visitors stay in a community and the more time they spend patronizing local businesses.
- Battlefields are outdoor classrooms for this and future generations. They allow visitors to walk in the footsteps of the Civil War heroes and experience the landscape much as it was during the conflict.
- Preserved battlefields help protect water resources; sustain parks, working farms, forests and ranches; and provide open space for passive outdoor recreation.
- Battlefield preservation in Pennsylvania, Maryland and Virginia, where many significant sites are located, is also vital for protecting the Chesapeake Bay. Parkland created through battlefield preservation near growing population centers like Nashville, Atlanta and elsewhere can benefit quality of life for residents.

## Discussion Question 2

***(cont.)***

Establish a summer youth camp program within the national parks with an emphasis on urban youth. Make it "work-fun" experience by incorporating public service opportunities along with outdoor recreational fun. Most of these kids never consider careers in conservation, forestry, or related areas because they have never had a personal experience with natural places outside of the TV. Adult and college age volunteers (retired folks, NRCS Earth Team Volunteers, student interns, etc.) could supply most staffing needs. Campers could assist with trail maintenance, campground clean-up, even minor facility repair and upkeep, and other such things. This would help get these things done on a regular basis without extra funds and teach responsibility to a video clip generation used to having the world revolve around them. Offer travel grants through youth organizations such as the YMCA to make it possible for kids in Indianapolis or Los Angeles to experience Yellowstone or the Great Smoky Mountains. As a camper and backpacker, I would be willing to pay a small increase for park services to fund this venture. If our youth don't appreciate the need for natural areas, we may not have them for long.

-Local land-use policies that ignore the cultural and natural resources deserving of protection for future generations, and that ignore the value of maintaining authentic surroundings of presently preserved assets. A clear example is Mattawoman Creek, Maryland's most productive fish nursery, threatened by overdevelopment and unneeded new highways. -Lack of federal leadership in exercising tools like permit denial when proposed development projects like new highways would have unacceptable indirect and secondary impacts. An example is Charles County's proposed Cross County Connector that -threatens Mattawoman Creek and its protective forests with unbridled growth. -Federal subsidies to projects destructive of natural resources, like the Maryland Airport in Charles County, Maryland that would harm Mattawoman Creek

OHV use in the National forests and BLM lands is one of the few activities that me as a single mom enjoy with my young adult children, who both like to ride dirt bikes, quads, etc...I have a 16 year old boy and a 19 year old girl. there are NOT many activities that allow us to get out as a family and enjoy our Nations Beautiful lands...More and more of these lands and trails are closing....These lands should REMAIN public, and not just for those able to Hike only.....Keep the lands open, and Open more trails.

One of the problems with humanity is our tendency be egocentric in our belief that "if it doesn't center around human desires, then it doesn't matter". The old tree falling in the forest question shows our arrogance. Wild areas just can't be classified as useless unless I get to do whatever makes me happy in them. Motorized vehicles disturb more than the silence, they contribute to soil erosion and frighten wildlife, and allowing them on trails also used by hikers and horsemen can be a recipe for disaster. I work for a Soil and Water Conservation District in Indiana, and soil erosion is no joke. It can destroy trails, cause mudslides, and result in the loss of our valuable topsoil. Wilderness areas are not closed to the public. Americans are getting more obese by the day because we value convenience and speed over everything. Get off the dirt bike or ATV and walk, for heaven's sake.

## Discussion Question 2

***(cont.)***

The southwest is an arid environment that was never meant to sustain the millions of humans who have flocked there for the sunshine. Reality has got to set in sometime, folks. The sun shines in the southwest because it doesn't RAIN (i.e. limited water resources). Want a green lawn, showers, or a swimming pool - move to a wetter climate!

While the Farm and Ranch Land Protection Program is a great idea, it misses the mark in one important area. The requirement of actual funding from a land trust organization is unrealistic and is hamstringing the program. Most land trusts are non-profits and are not financially able to provide the cash necessary to actually purchase part of the easement from the landowner. The program should allow the landowner to donate the full amount without outside funding. Farmers and ranchers who do this are not in it for the money - such a decision actually costs them and their heirs any potential income related to the development of their land. My state of Indiana is blessed with lots of prime farmland, which we are losing at the rate of about 60,000 acres per year from conversion to commercial or residential uses. Let's make it easier for willing farmers and ranchers to protect their land from development.

I agree wholeheartedly about setting aside land for a "Great Plains National Park" or "Buffalo Commons National Park", whatever it will be named. The plains of Kansas is one of the most beautiful places on earth, I think. It begins in the Flint Hills and rolls west, north and south from there. I believe it really embodies the trials and tribulations of the people and animals that lived on the land long before it was "settled". I think that the area should be re-populated with the animals and plants indigenous to the area. The last thing we need in Kansas is another parking lot, apartment complex or strip mall. We need to preserve this land and our heritage for the next generations to come.

Youth and adults need social support systems and places in nature that they identify with positive experiences. Urbanizing populations need to experience nature close to home through frequent encounters over extended periods of time with supportive mentors as the major part of their recruitment and retention into nature. Community Conservation Clubs should be formed in every local community for persons to gather, to share programs, to plan, to support each other, and to have fun. Clubs should be supported through joint efforts of local, state, and national nature-based agencies and nongovernmental organizations and businesses. Existing leadership would be central to expanding their memberships and actions and they can add new Community Conservation Clubs locally. Businesses have a role to provide meeting spaces, program support, and participation by their employees.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I suppose it depends on what you mean by "functioning system". A landscape managed for cattle isn't necessarily a better home for wildlife, plant or animal. My admittedly limited experience has been that rangeland is a good place for cattle at the expense of native critters. We have to STOP accessing oil, natural gas, coal, and we have to stop trying to convince ourselves that we need to. As for other minerals, nothing trashes a landscape like mining. Seems like every place I go in Colorado I see ugly-colored water running out of the rock into streams, the leftovers from mining a century ago. Mechanized mining has not improved the impact any. And what about the value of functional watersheds to aid in flood control, forests for wildlife, groundwater recharge, space to find solitude and recreation. These things have value as well. Yes! I've made several trips to Germany in recent years to visit a brother that lives there. Germans love their forests. Love Them! But they waited waay too long to start loving them. German forests are like Disneyland - yes there are trees, but the blocks are too small to really work as a functional forest with wildlife and room to roam in solitude. America IS a special place, the first nation to recognize that undisturbed landscapes had value. I say let's keep those wild landscapes before we look like Europe. No offense intended, but wilderness should be BIG, not a little corner left over from the farms and factories.

Why not? Hunters have paid an excise tax on firearms and ammunition under the Pittman-Robertson Act. Funds are paid out to the States for use in wildlife preservation projects. As noted by Ron; I gotta read the other responses before running off at the mouth ;- ) I don't see why those of us who use public lands for things other than hunting shouldn't contribute. I can see where might be a bit wary of a fixed percentage excise tax. Let's face it - paying a percentage on a 4-wheeler is going to be a lot more than the same percentage on a backpack, even a really good one. I probably have the cost of couple OHVs in my basement if I count all the backpacks, tents, sleeping bags, ice tools, climbing boots, snowshoes, skis... The difference is I bought them a little at a time. If I had to plunk down that money all at once, an excise tax might be a barrier to entry. Even though I don't especially like OHVs, that does seem a bit of an unfair burden. I would suggest a sliding scale, with a lower percentage for items that cost thousands of dollars vs. ones that are only \$20, \$30, \$100, etc.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

ED OUT is an exciting new partnership that uses parks, forests, and refuges as outdoor classrooms to improve learning, enhance fun and learning during the summer, better prepare students for the next school year, and encourage outdoor recreation experiences that help America's youth fight the epidemic of childhood obesity. ED OUT resulted from discussions among Prince William (Virginia) County Schools leadership, senior federal executives and leading national recreation officials at a June 2009 awards program at the U.S. Department of the Interior honoring the school system's role in Monarch Live, a remote learning program highlighting the birth and migration of Monarch butterflies in the Americas. The Prince William County School District has some 80,000 students in grades K-12. It is the second largest, the fastest growing and one of the most technologically advanced school systems in Virginia. The system includes 88 schools – including 55 elementary, 15 middle and 10 high schools – and more than 5,000 teachers. The system is quite diverse in population: White... 39.7%; Hispanic... 24.3%; African American...22.9%; Asian...7.7%; Other...5.3%. ED OUT launched after less than a year's planning during Great Outdoors Month 2010, as nearly 600 students went outdoors on June 4 for education and fun. Students in 4th and 7th grades rotated through learning stations and activities during the day, just as they would during most school days. But the difference was that the instruction was provided by adjunct faculty drawn from NASA and the Forest Service, BLM and the National Wildlife Federation and many more. Science, art and history were presented in ways that tied to the coming year's curriculum – and a new website ([www.edout.us](http://www.edout.us)) provided even more information on how summer months could be used to combine fun and getting a head start on the next academic year. From learning about light spectrums and wetland mitigation projects to drawing entries for the Junior Duck Stamp Contest and learning about the music of nature, the students were attentive and very engaged. Healthy lunches – with carrots and fruit and juice – provided energy while special water bottles and ample refill opportunities kept the action going even on a hot day with temperatures in the 90's. The day wrapped with a mass swearing in of Junior Forest Rangers followed by fruit popsicles – and lots of smiles. The day utilized one of the closing days of the academic year - after traditional testing and teaching have largely concluded, and a time of significant challenge in most classrooms. The program also helps students understand more about career opportunities involving the Great Outdoors. When fully implemented, ED OUT will offer each child in grades K-11 a day of experiential learning outdoors. The day may involve outdoor activities in and nearby school campuses, including planting gardens, trees and introductions to outdoor fun. In addition, tens of thousands of students will travel to nearby recreation sites, where adjunct faculty will work with classroom teachers to deliver lessons ranging from physical sciences to history to art to forensic science. While in the outdoors, students enjoy a healthy lunch and learn more about good eating practices and the connection between eating and activity levels. This reinforces the school systems efforts beginning in 2007 to revamp school cafeteria menus to emphasize healthier eating habits, a process begun after the school system found itself a regional leader in the percentage of children classified as obese and overweight. Participating student are provided with (1) suggested summer break activities, readings and trips specifically addressing the academic program of the next grade, including suggested family trips and activities, (2) information about nearby summer fun at federal, state and local sites, and (3) special offers from recreation retailers and service providers. A new website, [www.edout.us](http://www.edout.us), provides information

and opportunities for students, parents and teachers alike to access the wealth of information about ways to make the outdoors an exciting and relevant year-round classroom. Following its successful June 2010 pilot effort, Prince William County is planning to drastically increase the number of its students invited to participate in ED OUT. Expansion of ED OUT to other school districts across the nation is also underway. Pilot locations are under consideration in the Denver, Chicago and Seattle/Portland metropolitan areas. Prince William County Schools' (PWCS) dynamic superintendent, Dr. Steven Walts, who participated in most of the ED OUT planning and the pilot effort, told the event partners that the day had overcome the challenges of making the final days of the school year quality learning time and proved to the students that great fun and adventure can be found beyond electronic screens – where studies now show American youth spend, on average, 7.5 hours daily.

Partnership Will Provide Campsites for Extended Care Patients LITTLE ROCK, Ark., July 29 -- The Army Corps of Engineers and University of Arkansas for Medical Sciences entered an agreement today to provide at least six new campsites in Maumelle Park to accommodate patients undergoing extended medical treatment in the Little Rock area. The Challenge-Cost Share Agreement outlines how the Corps and UAMS will share in constructing and operating the new campsites. Maumelle Park has historically been an economical source of lodging for out-of-town patients who come to Little Rock for medical treatment. "Throughout the past year, more than 81 people were documented in Maumelle Park as seeking long-term stays related to medical treatment," said Miles Johnson, the acting project operations manager of the Corps' Russellville Project Office. "The funding provided by UAMS will meet a definite need." UAMS is providing \$90,000 for the partnership to be led by its hospital, UAMS Medical Center, its Winthrop P. Rockefeller Cancer Institute, and the UAMS Myeloma Institute for Research and Therapy. "We see patients from around the world, many of whom must stay in Little Rock for weeks or months while undergoing treatment," said Peter Emanuel, M.D., director of the Cancer Institute at UAMS. "Having these campsites available for extended periods of time will provide patients and their loved ones with an affordable option for lodging in a beautiful setting and at the same time help ease financial burdens." "UAMS is very pleased to partner with the U.S. Army Corps of Engineers to make these campsites available for patients," said UAMS Chancellor I. Dodd Wilson, M.D. "We are very appreciative of the support and compassion the Corps has shown in helping make this possible." Current regulations limit the time individuals may stay in federal parks. UAMS funding will enable patients to enjoy extended, uninterrupted stays in the park, contributing to their recovery in a restive setting. The Corps obtained seed money to be used for construction management, septic needs and daily utilities and maintenance. UAMS funds will provide for the remaining campsite building needs. The extended stay campsites will be reserved specifically for medical care patients as recommended through Patient Advocates Services of Little Rock Hospitals. Maumelle Park is on the bank of the Arkansas River west of Little Rock. Take Pinnacle Valley Road off Arkansas Highway 10. The park's unique environment provides an excellent setting for camping, boating, fishing or getting away from it all. The park offers eight group picnic shelters and 129 campsites with electricity and water hook ups. Other amenities include a boat launch ramp, playground, hot showers, public telephones and a dump station.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Ah, you had my support until the last sentence. Government + money = disaster and deficit.

I also agree with Sheri's comment. A modern CCC would create a huge liability for a litigation happy society. Such a program would also cost the employed American taxpayer a fortune in taxes to support. Personally, I don't want even more of my tax money being spent to employ those that are currently unemployed, especially in a program run by the Federal Government. The current collectors of government entitlements should comprise this workforce, if there is to be one. As federal employees they should be mandated to not be capable of suing their employer, much like the military. History lesson: WW2 ended the Great depression, not the New Deal, the WPA, or the CCC.

I only wish there were suitable alternatives to plastic for so many other consumer items...like computers.

Grazing on public lands only helps to conserve that land. Ranchers are responsible for the fence upkeep, water condition, and, in many cases, the supply of water in the grazed area. Simply put, many of the wildlife species found in these areas would not be able to live there if it were not for the ranchers constant vigil over the land. Regarding #6; I believe this is more humane than letting them over populate the areas and consequently dying of starvation due to over grazing. Again you choose to make this about your own personal crusade against OHV's? Ridiculous.

I would like to see the subsidies removed all across the board. If the "goliath" farms and meat producers are the only ones that can survive, then that's a free market at work. Historically, however, this has not been the case at all.

I'd support this if it could be done through private funding, but involving government monies, no thanks.

Many hikers "wander off" their designated trails and on to private property. They also destroy some watering systems, fences, and scare horses as well as cattle. Breaking rules is certainly not limited to the OHV community. The OHV community, however, participates in massive clean up efforts. There are miles and miles of trails that are not accessible to OHV's, but are to horses and hikers alike. The Imperial Valley sand dunes are not frequented by hikers, but have had massive closures effected upon them. Simply put, OHV's are facing serious restrictions on riding trails that hikers do not use. Open these areas back up and the number of OHV users would probably decrease on the other trails. I live in the Arizona desert, and the "hiking" done by the massive influx of illegal immigrants across public and private land, is doing much more destruction than OHV's.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Since there is already wildlife in the areas that these trails exist in, isn't it reasonable to assume that the OHV community is not truly destroying anything except for your argument? The OHV community participates in more clean up efforts than the back packers, hikers, photographers, etc. do. Your opinion that "a OHV user is the very nature of his hobby is damaging to the environment and a downright nuisance to wildlife and others that enjoy the outdoors", is exactly that, an opinion. Why don't you support the opening of land that has been removed from OHV usage? Then we might not be so likely to recreate in alternative places that seem to upset you so much. You want us off of public land because YOU don't like us there? Now who's "greedy and uncaring"?

There are plenty of irresponsible campers, hikers and back packers as well. Most of the fires raging through my home state of Arizona, were caused by campers being careless with their camp fires, not OHV riders. The land allowed for OHV use is rapidly being taken away. How about just restoring the land already removed from OHV usage? I am part of a large group of OHV enthusiasts that recreate in the outdoors in order to spend quality time with our families. I don't want MY government to dictate to me how, when, and where I can spend this time.

Require voluntary action? It's not voluntary if it's required, it's forced.

Well stated. If solar were more profitable than other forms of power generation, they would be the norm and not the exception. Subsidies only encourage misappropriation of tax dollars.

What next? Are we going to build a refuge for all of the wild chickens running around Miami? How about a Pigeon sanctuary in New York? How long before a wild horse refuge will be another over budgeted, and poorly run government program? If someone wants to purchase large sections of land and run wild horses on it then more power to them. If it can be done profitably then it will be done by a sharp entrepreneur . Burdening taxpayers with this responsibility is irresponsible. As far as the ORV's scaring the horses; there are many, many places that wild horses can go that ORV's can't.

I would like to address the comment that public lands off-limits to OHVs are "empty, unused, lonely and desolate." Being an experienced backpacker and just returning from a roadless area I can tell you that these places are not unused or desolate. I come across deer, elk, pronghorn antelope, numerous species of birds, wildflowers, insects and reptiles which all live in these places. When you enter a wilderness or national park, remember it is there for you to enjoy, but it is not your home, treat it with respect and leave it as you found it. There is value in wild spaces even if they are not totally accessible to all people.

The future demographics of the country is changing rapidly but there is no representation of minorities outside to relate to media wise, even though there are millions spending money on outdoors expenditures yearly. We need the next generation to continue to be stewards as well but they must have visual messages to make a natural transition into the field and open opportunities to partake of. Outdoors is for everyone.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To get more urban dwellers out, there needs to be safety measures taken in order to spend more time in the city parks and neighborhoods. In the poor urban cores there is crime that families have concerns about when taking their children outside to play. Maybe gangs need to be made to be disbanded or qualified as domestic terrorist and dealt with accordingly so families can live and breathe again. These are obstacles in going outside or how does one even begin to think about conservation and the earth when being outdoors can cost your you life in the city. The future will be in the hands of these voters one day. What is happening in one neighborhood soon becomes the norm in more neighborhoods unless things change.

I would have no great argument against OHV designated areas so long as: One, the areas contained sufficient buffer zones surrounding them so the OHV noise could not be heard by persons living in, or using, nearby land, and Two, no taxes be used in their development (we have far greater needs than such areas, i.e., let those who want to use OHVs, and/or those who want to sell OHVs, pay for them.)

ignorance ah yes. i have seen hikers smoking, flipping ashes around, while complaining about motorized users. i have seen the trash left behind by a church group in a camp ground. so do not talk to loudly about ignorance. it is spread in both camps motorized and non. all of us need to use the outdoors with respect. to many are ready to close off wildness to all but the most fit. and there are too few who will fit that frame. when the day comes when i cannot easily walk i will be happily exploring on my atv enjoying in the best way possible but not from the parking lot.

OHV's are a big part of this discussion. OHV's have been using our public lands for the past 50 years. OHV use is a valid use of Public Lands. To say otherwise is either uniformed or biased. Restricting access is not the way we should manage our public lands. OHV folks are using our public lands for the same reason as any other American, to enjoy and appreciate the beauty and wonder of our great land. Muti-Use Land Management is the only way to be fair to ALL Americans.

This is such a critical incentive for all farmers and ranchers across the country that are interested in conserving their properties for future generations. It maintains bipartisan support, a rare achievement in modern politics. Making these incentives permanent is critical for the future of private lands conservation.

These trails are a piece of our national heritage and must be preserved. Once gone they cannot be replaced. They are under pressure from development, energy needs and lack of protection. There are workable compromises available thay will preserve this national treasure. Duane Iles

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

By far the greatest threat to American's access to public land is privatization and commercialization. On many rivers and lands owned by the public commercial outfitters are given preferential treatment for use. The Colorado River in the Grand Canyon and the Salmon River in Idaho are prime examples. In Montana you can witness this on an annual basis. Unrestricted commercial use on rivers, guaranteed hunting licenses (numbers are limited) for commercial outfitters and infrastructure built specifically for commercial operations are some of the symptoms. Public lands barricaded by private lands restrict access for the general public and allow public lands to become the wealthy's playground. If we are to save wildlands we need a broad constituency. Access to publically held land and waters should be a major priority. Meaningful restrictions on commercial operations on public lands is a second priority. This will help reconnect the public with the great outdoors. Limited or no access is a major roadblock of connecting with the great outdoors.

All this falsely and arrogantly assumes that pristine wilderness is an 'intrinsic value' that takes precedence over human values and human uses. "Industrial, economic, recreational, access, and user-based arguments" are most certainly not "irrelevant". It is bad enough that the political process is already being cynically manipulated for ideological purposes without in addition decreeing that "argument is irrelevant" so land fingered by political special-interests should be locked up without even bothering with Congressional approval. Under the Constitution unowned land was not supposed to be permanently retained by the Federal government at all, let alone controlled by a permanent bureaucracy operating outside Congressional processes.

Authorization for acquisition is not a mandate to buy everything in site regardless of the rights of the property owners. That kind of attitude creates, properly, more opposition to more funding and authority for government acquisition.

Conservation easements are controversial because they are so political. Viroso want them as a means to control land and undermine private property rights, and landowners are being pushed into them because it is the only way they can cut down on the horrendous taxes. In many cases, the wealthier, politically connected use easements to tie up land around their estates that they weren't going to use anyway, or couldn't use because of regulations -- at the same time they use them as a means of pressuring neighbors into giving up the use of their land by economic or regulatory strangulation if they don't go along with the easements. Large trusts like TNC and the Maine Coast Heritage Trust use easements to take land out of private ownership and out of the private economy forever by flipping it to government agencies. The whole system is very corrupt.

I would like to be able to return to my own "familiar" private property without the constant threat from land trusts, activist groups and government agencies maneuvering to take over my property and trample my rights.

Isn't there supposed to be separation of church and state in this country? I am tired of these religious fanatics pronouncing that I have to give up my own property because they think it's "sacred". This is the essence of the Obama "Treasured Lands" agenda -- they treasure what you own and want to take it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The original Congressional authorization for National Parks does in fact require that parks be "for people". They are not supposed to be for an arrogant elite of wilderness advocates, and would not last if they were. They are also not supposed to be deliberately chosen for the purpose of preventing development of energy resources and other human uses over "huge areas" as a tool in an anti-Industrial Revolution. Land now targeted for new parks is also not restricted to plans for "change of use" (i.e. to non-use) of land already controlled by government. NPS and other agency and activist plans include enormous amounts of private property, which is a threat to people all over the country. This expansionist political drive for government takeover of more and more land has as a byproduct caused the terrible neglect of maintenance in existing National Parks.

The whole concept of "stakeholder" is invalid because it presumes that those with a political interest in controlling other people's private property and resources have any right to do so. "Stakeholders" is an attempt to elevate pressure group warfare into something legitimate.

There is no sense of ownership of common property because we have no ownership when the government controls it.

These politically inspired "incentive" plans are filled with corruption as they attempt to manipulate private property out of the control of its owners. Once the government is involved, the property is targeted for acquisition and control. It is a sorry political substitute for the Endangered Species Act that has provided an "incentive" to landowners to "shoot, shovel, and shut up" even when they otherwise enjoy the natural features of their own property. Government and activist involvement means punishment, even when they are waving around dollar bills as an enticement.

We private landowners do in fact take care of our property. But the term "stewards" has the unfortunate connotation of taking care of it for someone else, and that is a false premise. Viros don't want us taking care of our land because we do it in accordance with our own standards and our own preferences; viros want to control everything for their own political purposes requiring worshipping of pristine nature as an "intrinsic value" taking precedence over human values and goals.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Return to a Multiple Use philosophy. Before the great (?) environmental and preservational movements of the '70s, this worked best. We all shared the land with respect for those who recreated on it and for those who produced commodity resources from it. Commodity production creates wealth. If we don't create our commodity resources, we must import them, exporting our wealth in the process. It seems hard for urban America to grasp that land, whether public or private, is the larder from which we derive all our needs to maintain our quality of life, but this we must understand and respect. The chief obstacle now to Multiple Use is the fragmenting of our public lands into special use areas. The Federal Government should cease being intimidated by vocal minorities and return to a Multiple Use philosophy for the common good. Our political leaders can assist in this by de-politicizing our land management agencies. These are staffed by trained professionals that we have hired to manage our lands. Let them do their jobs. One tool that would help in these regards is to allow no more life-time appointments for Federal District judges. Far too often, with no accountability to hinder them, they follow their own agenda, with little regard to the impact their decisions have on those trying to produce raw materials and on the rural communities affected by their decisions. Another tool would be to rescind the Equal Access to Law consideration for all of the professional protesters who seek to inhibit any further meaningful development of our public lands. Our public land management agencies must pay these court costs out of their own budgets. This seriously erodes their ability to meet their more important obligations. A third tool is to amend the NEPA and ESA laws so that only those appeals of public land management programs by folks who have standing and credibility, and whose appeals have substance, will be considered by the agencies. This would do much to inhibit the myriad of appeals filed by bored college students with nothing better to do on Saturday nights. Finally, with regard to public lands conservation, we need no more. We have National Parks, National Monuments, Wilderness Areas, Wildlife Management Areas, and Areas of Critical Environmental Concern, to name the most common. Enough is enough! It is time we start managing our public lands in a more realistic, responsible, and mature manner, and bring an end to the public land wars of the PAST THREE DECADES. Montana

Keep our public land open to the public. Many area's around moab are great to see using OHV. Local citizens in the state shouldn't have any extremist dictating how the lands should be managed. It is sad when and extremist organization like SUWA with less than 10,000 members dictate the land management in this country.

Motorized use of public lands is a legitimate use of those lands. Shared trails open to motorcycles/mountain bikes/horses and hikers are possible and can be highly successful. The Sovereign Singletrack Trail near Moab, Utah is one such example of this type of trail. All across the western United States we see trails being closed, often with no input sought from the public before the closure. Singletrack muti-use trails are a sustainable and legitimate use of public lands. It would be a truly great thing to see a nationwide network of such trails developed within all the Nation Forests and BLM holdings of this country.

As we continue to add more humans to the planet at the rate of 200,000 a day, there is an obvious need for more Wilderness to meet the demand of those who desire the intellectual fulfillment and relief from urban pressures that can only be found in such an environment.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The idea of "Wilderness" is not to exclude people from ANY lands. Wilderness is just a concept of some determined people - and the Congress of the United States - to try and preserve some small portions of our public lands so that we, and more importantly, future generations can know that there are some places where the human presence is minimal or non-existent. Places where the works and forces of nature are unimpeded by mankind. Places that we haven't impacted or destroyed. As Edward Abbey so simply put it, "The concept of wilderness needs no defense. It only needs more defenders."

Challenge – Our organization has been providing outdoor education programs over 35 years to youth in the public and private sectors and when trying to reserve “group sites” at some of the National Parks, these sites go very quickly because there are not enough. Group sites are critical when working with large groups of students. An example is Yosemite National Park, we need to solicit assistance from several of our staff on the 15th of each month to arrive in the office by 6:30, set up their computers to recreation.gov (the site that reserves for the National Parks) and at 7:00 a.m. SHARP, everyone needs to select a group site, these sites are taken within five minutes. Please increase the number of group sites available for so we can continue our mission of nurturing and educating these youth groups and providing an environmental stewardship inspiration.

I agree with; there's a good reason why many of the OHV trails are being closed. They negatively impact water quality and disturb wildlife. They also pollute. Some Off-Road events near where I live have so badly degraded the system (with human waste, oil, gas) that they have been closed by the local environmental management agencies for cleanup.

I disagree with this idea entirely. There are reasons we have environmental regulations - it's called the Tragedy of the Commons. While reform is a good idea, I think it also needs to be well-thought out. And as for your statement that we don't need land conservation anymore, I wholeheartedly disagree. As the populations of our cities and towns increase, we will need more public land to recreate on/ filter our water and air/produce our timber/protect displaced wildlife/provide ecosystem services. Many places are already overcrowded as it is - even wilderness areas! I can't even get a permit during certain peak times.

Although I agree with giving the OHV crowd a place at the table, the elephant in the livigroom is the impact you make: - noise, ruts, gas engine smell, not to mention the danger hikers face having to dodge being hit when you come racing through. These are the main reasons the others don't embrace your inclusion. The DOI has the additional issue of manpower. Hikers and equestrains are easily caputured if any wrong-doing. Going after an OHV is difficult. You hit a hiker, and DOI is responsible for the cleanup. I'm guessing the wildlife isn't real happy about the noise and speed with which you travel either. Address these obstacles and you'll have an easier time getting others who will be willing to listen.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I totally agree with your assessment. This isn't about conservation, for if it was, we'd have more scientists weighing in with long term issues to consider that lay people have no clue. The other factor is \$\$\$\$\$. Money drives and has driven this country off a cliff. The BP oil spill is America's wake up call, but apparently, people still want to sleep through it. It is as if all the naughty children are having their way, to put it in lay terms, and there will be no punishment. We cannot continue with this standard operating procedure, nature will not survive, nature is not surviving. But as with all things in history and going forward, it will continue, nature zero, humans take all. Guess we better hope nature doesn't bite back.

I am not a hot air balloonist, hence I am not experienced in their use or environmental impact. Would think, however, hot air balloons would be better for the animals because people would not be using gas engines, degrading trails, or encroaching on their habitat. I was hoping some balloonist enthusiasts would jump in and comment. As for a historical event - not sure what you mean? I have not seen balloons used in any parks or forests, therefore, assume there may be a reason why, but again, I am not sure.

BLM lands and portions of National Park land are in the crosshairs of gas drilling rigs. Go to [www.SUWA.org](http://www.SUWA.org), and here is an article from AP. My advice too is, watch Gasland to get a taste for what I am talking about. We HAVE to look for other ways other than fossil fuel drilling madness. It is slowly killing all of us, just like tobacco, we need to ween ourselves off. I am passionate as is everyone else about our natural resources. To loose them forever is more than a tragedy, it is a crime. I'm not linking multiple sites to my comments . . . Flooding the voting with my point of view through my various associations with conservation, I HOPE that the Rangers and DOI personnel can ferret out voting preferences and comments, and am certain they will / can. Arches, Yellowstone, Yosemite and all the other parks can never be replaced. The needs of the many outweigh the needs of the few, or the one --- be that moneyed interests or special interests or individual interests. Big Picture -- As conservation chair for the desert, the echoing problem was the impact people were making on a fragile environment. This is the case for EVERY DOI initiative. Which begs the question, when is this country or any country for that matter going to begin focusing on this problem. We need to address the elephant in the living room - overpopulation. The greater the population, the more the stress on the land and environment namely -- the resources.

Good idea. I only hope Ken Salazar can see the forest ..... through the small engine exhaust and drilling rigs.

List the places and revenues brought in by foreign oil companies such as BP - England, and Shell - Dutch to the DOI Website. The Red Rock area of Utah is also up for grabs. If many Americans were aware of the give away to foreign interests, maybe they would be more reticent to allow them access.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Preserved Civil War battlefields are cultural and historic landscapes that serve as a constant reminder of the sacrifices our ancestors endured to make our nation what it is today. These historic landscapes are true American treasures as well as the last tangible links to our country's most tumultuous conflict. Preserved battlefields become outdoor classrooms for today's visitors and those of countless generations to come. They provide environmental benefits, including the protection of watersheds and wildlife habitats. Further, studies have repeatedly found that visitors to preserved battlefields help generate revenue for local communities by spending money on lodging, meals and other travel-related activities. The need to preserve these battlegrounds is immediate ? the Civil War Preservation Trust estimates that 30 acres of highly significant battlefield land are lost to development every day. Timing is especially critical in areas of the country experiencing rapid growth and development pressures. Time is running out and opportunities are dwindling to forever protect these hallowed grounds. With the Civil War Sesquicentennial just around the corner, now is the perfect time to take action to save our nation's treasured Civil War battlegrounds. The 150th anniversary commemoration is expected to stimulate renewed interest in the conflict and generate unprecedented tourism to Civil War sites. The protection of America's remaining Civil War battlefields will leave a legacy of national commitment to preservation and conservation. These lands will be open spaces for the public to enjoy, preserved in their natural and pristine state, allowing visitors to walk in the footsteps of their Civil War ancestors. This experience will be unlike anything they could have read in a book or watched on television about the conflict.

7-12-2010 The country's many Civil War Battlefields at this time are under extreme pressures from developers and need the immediate attention at all levels of government where they exist. Not only are these historic/cultural landscapes "economic assets" for the local communities and districts in which they are located, but they are also invaluable natural settings that work to enhance our quality of life in protecting precious open space, working farms, stream valleys and surrounding wetlands. Now, more than ever, the Department of the Interior needs to engage along with the Civil War Preservation Trust and other private non-profit Civil War battlefield preservation/friends groups to aggressively work to save the remaining unprotected land where so many sacrifices were made as the 150th anniversary of the War (2011-2015) approaches.

American youth need to have access to the real places where their forefathers fought and died for their ideals. The Civil War was the defining event of our emergence as a country. To understand modern America we need to preserve those deadly, sacred spaces. Slavery, States Rights in a Federal system, the Battle for the West, Industrialization were huge issues of the time, and they still are. You can't understand the present without knowing the past. You cannot counter wrong information, prejudice and deceitful statements without knowing the real history of our country. Support Battlefield Preservation!

Ski Trails and Wildlife samples on Amazon give a pretty good idea what the book is about. I think teachers especially need to learn more about the boreal forest, as it is impacted more by global warming than forests to the south.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

ATV owners can install after market mufflers in addition to the stock muffler on an ATV. Manufacturers could solve a majority of the sound issue by manufacturing much quieter ATV's. There is no excuse for them to let this ongoing issue continue.

By all means this would be a positive step in reconnecting people to Americas Great Outdoors. It is not done nearly enough in my opinion. Most of all current living cultures such as Native Americans and even newly discovered living cultures such as Gladesmen Culture should be portrayed in a positive and uplifting manner. Often nowadays man within a natural landscape is portrayed in a negative manner by many agenda driven entities to suit their myopic narrow set of goals. That breeds hard feelings and contempt towards those entities and their goals. These backlashes can set conservation back years in attaining justifiable goals. Cultural respect and acknowledgement may well be the missing link in connecting Americans to Americas Great Outdoors. Google Gladesmen Culture to find out more.

Everyone should also know that in order for a highway to be designated the local elected officials with authority over the highway must give their authority to the Scenic Highway oversight group (Corridor Mg't. Entity) or whatever other name they use and adopt the Scenic Highway - Corridor Management Plan - for the highway segment being designated. That is how the Florida program functioned the last time I checked. This looks like a good idea until the bait of Federally funded amenities (boardwalks, scenic overlooks etc.) is swallowed and then the highway is reeled in under the control of the Scenic Highway group in charge. Elected officials in Florida have de-designated at least one National Scenic Byway after 8+ years in development after finding out they were having their authority removed. Suggestion - Be much more up front with elected officials in the beginning of the process and treat regular citizens that become involved with much more respect than what happened on the Tamiami Trail in So. Florida.

Federal and State agencies that provide services (e.g. primitive - RV camping) in locales where those same services are provided by private businesses need to be much more sensitive in seeing to it that their fee structure does not undercut a private businesses ability to at least compete with them on a level playing field. I have been witnessing for years a 2 generation family owned small campground in So. Fla. being financially devastated by a Federal agency's regulatory actions and camping operations at the Big Cypress National Preserve. NPS's fee structure is either free or well below cost. How would anyone here deal with that scenario? People need to understand receiving services for free or at below cost from a governmental entity can have some very financially destructive side effects upon their fellow citizens. I do agree that parking ones vehicle along side a road within public land and going on a hike should be not necessarily (free) but knowingly subsidized by other revenue generators so that everyone possible can experience nature thus drawing them possibly into supporting the place they're in or another similar place someday. Some here are concerned about overuse but many of the public feel that if they are taxed to pay for something called "public land" they should be entitled to enter that land. Without solid justification, limiting visitation should not be considered in my opinion.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Great idea but in these austere economic times it may not be feasible or advisable when so many more necessary programs are suffering for lack of funding. During this difficult economic period of our Nation's history Americas Great Outdoor program should always ask itself prior to funding its ideas "Will our action adversely impact more necessary National programs (e.g. health care, education, social security etc.)?"

Here is where the environmental communities hypocrisy is abundantly clear. Green folks want us off of oil but cry Crocodile tears when it begins to happen. Someone needs to grow up. We will never have our cake and eat it too. Life forms at ground level will adapt although birds may have a few more problems adapting but will over time. In fact cantilevered nesting platforms for threatened bird species might provide environmental mitigation for the windmills.

I did try to submit an idea on a different topic but the site did not accept it. The administrator said it was a site glitch and to try again. I may at some point but after wasting an hour and losing it I am shy to have a repeat of that. Upon rereading the idea I still see that DOI could determine the priority level and/or the Secretary would decide the targeted lands - that is a lot more power. Easements are not free either and the taxpayer unknowingly foots the bill for paying the landowner. Easements paid for with public funds are not but should be opened to public access proportionally to the easement payments relationship to gross value of the property. I must also admit that I do not accept all of the hoopla over bio-diversity and pending catastrophies predicted by folks like E.O. Wilson and his associates. I believe those involved are in it for money and control of others and I mean total control which I also believe will lead to a revolt in America. The tales of woe from loggers, ranchers and those desiring meaningful access to psuedo-public lands in the West tell that story. Private property rights and many freedoms guaranteed by the Constitution have been infringed upon by those seeking to supposedly protect our habitats. Most citizens outside these groups are not believing a word of that anymore. There is a backlash building within this Nation to what has been and is happening and I hope I am not here when it unloads.

I understand what everyone has said up to comment 7. It is all true but their is another side to this coin. Other tax payers must make up the difference for every tax exemption including a conservation easement. The President may be hearing from many tax payers that do not want to foot the higher bill put on them due to these type easements. He is probably trying to be sensitive to all sides or possibly just believes the government needs every dime it can get because of our wrecked economy. Many amenities available in good economic times are impossible during times such as the these.

I want to add my voice to those calling for increased OHV opportunities on public land. I hike, snowshoe, kayak, mountain bike AND ride an off road motorcycle. OHV's are a great way to enjoy the back country and explore the great outdoors. There are plenty of places on BLM and National Forest land to expand OHV opportunities in a sustainable way, while still addressing the needs of conservation and other outdoor enthusiasts.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I will go one step further. Non motorized 2 wheel vehicles should be allowed in wilderness areas on a case by case basis. My reasons for this are below: 1. Bicycles rarely do damage beyond what horses do, if ridden on trails designed appropriately. 2. Restrictions of travel to only hikers and equestrians cause hikers to congregate within short distances of the wilderness boundaries, concentrating impacts from their use in a few select areas. 3. Because of their greater range, equestrian enthusiasts enjoy the great majority of the wilderness to themselves. Horses are outside the budget of most citizens, limiting their ability to penetrate deeper into wilderness areas where human impacts can be spread over a larger area to reduce the effects of concentrated human use. 4. Allowing bicycles access to wilderness will allow more equitable use of the wilderness by citizens with limited means. Bicycles have a long daily travel range, and are relatively inexpensive, affording the possibility of a quality experience without the cost of owning or hiring horses. The public lands of the United States should be managed in a way that does not require great wealth to enjoy.

In Florida first the bicyclists had a strip paved for them all around the approx. 180 mile levee around Lake Okechobbee, then hikers came along and demanded a soft grass strip for their tender feet - at a combined cost of \$28,000,000 dollars to the taxpayer. I ask you - where does the waste of money stop for those who don't chip in but enjoy a free socialist ride off the labor of others. Those who canoe in Florida do not want to pay for a boat sticker as all motorized boats do yet they want specially designed and built canoe ramps. Who do you all think you are - the chosen ones. So called passive use sure as heck is not economically passive. I recommend that so called passive users of our American Great Outdoors begin to pay for what they get and stop being parasites as they currently are from what I've seen. The expenses caused by construction of designated trails is driven by those out to ban the ORV activities. I have never seen ORV or most consumptive users ask the gov't. for anything where I come from - So. Fla. Most if not all of us would prefer the gov't., outsiders and carpetbagging enviro-extremists to just leave us alone. As screwed up as our government is so far they have not caved completely to the enviro-extremists and use their extremism to create blue collar jobs for many that wind up increasing man's carbon footprint. Way to go environmental community and freeloaders.

Interesting concept but how do you get trees to grow in the deserts, oceans, mountain ranges and polar ice caps? It is innovative though and pretty common sensical.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It is always good to be supplied accurate statistics that are understandable by persons of reasonable intellectual capacity. The problem with the data at the link provided by comment 11 is that the actual data gathered was manipulated by weighting in many directions. This weighting process allows those who controlled this study to also control the results of the study. Dropping all the results gathered in the South Appalachian focused study (Version 12 of a 13 version study) was very regrettable. Many of the categories of recreation reported upon overlap heavily and unless the reader of this study has access to the exact questions asked of the interviewees one is not capable of ascertaining the level of bias if any built into the study and its results. People may hike but what they love the most is camping. A person that uses an ATV might only use it to facilitate hunting and game removal post hunt. Depending how and what questions were presented to participants drastically impacts the results. Considering the minimal info available at this link I would recommend the good citizens taking the time to participate here putting little faith in this particular study. It would also be nice to be more precisely directed to the stats referred to by the author of this reasonable and positive idea to attain goals of the Great American Outdoors Initiative. We all must resist allowing personal bias, bigotry or prejudice to cause limitations in our ability of hearing what others are trying to say. I have caught myself in both ends of that spectrum on occasion. Seeing the other persons side is difficult but we must pry our minds open sometimes to really hear others.

It is quite accurate to deem this idea as "pretty extreme". No surprise since extremists have seized the opportunity provided here by Mr. Obama to promote many extreme ideas. The bad part is that Obama and his team will use the extreme enviro ideas as a basis to promote these anti-human access policies throughout the Federal agencies. I have actually linked one of the top 5 innovators to a Defenders of Wildlife contractor verifying to my satisfaction that a lot of coordination is going on here. I must admit I wish more of it was going on the other side of the issues. I will commend some very good comments from the OHV community. If nothing else this site is good for identifying the foes. Of course that works both ways. I saw the other day on a different web site a full report on one of the listening sessions associated with this program. They were said to be a sham, mainly providing high officials a speaking platform with little or no opportunity for real public input or interaction from the audience suckered into attending. Thank goodness there were none in my neighborhood since I probably would have gone.

It is sad that you have such a negative bias against humans. We humans are a species like all others and have evolved right along all of them. We have every bit as much right as any non-human species to be anywhere on this planet we choose to be including Wilderness. I'm very new to this forum and will do my best to be polite. All need to understand that the multi-use groups will not be kept entirely out of this process. They already are disgruntled due to Obama's shunning them previously. They will either be in on the front end or organizing opposition should they continue to be excluded. Take your pick.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Many very serious albeit very (hidden)subtle problems are associated with the intermingling of environmental priorities within agencies who's name is indicative of a specific priority such as Transportation. A few worth mentioning here are that dollars collected from motorists through Federal gasoline taxes thought to be for improving Transportation are diverted into many projects having nothing to do with improving the efficiency or maintenance of our Nations transportation system and are spent on items such State Scenic Highway Programs which morph as quickly as their proponents can cause it into Federal scenic Byway programs. The sales pitch to sell these programs to an unsuspecting public are all of the freebies that come with the program (e.g. boardwalks, government visitor centers, wildlife underpasses etc. etc.) that contribute not one iota to the efficiency of getting people or goods from point A to point B. In fact these programs prohibit any of the dollars appropriated from motorist contributed tax dollars from even being spent on pre-existing necessary road repairs. If this isn't enough to bring question to programs such as these here is what happened on one Florida highway designated as a National Scenic Byway due the State's own Program Manual. The manual specified that authority over decision making on that segment of the highway was slated to be taken away from local elected officials and transferred to a group mostly comprised of Federal and State land managers along the highway. This was one of the State mandates controlling their program. Luckily in Florida when local elected officials found out 7 or 8 years late that this theft of their authority was imminent they quickly demanded that both the State and Federal designation be removed from the Tamiami Trail in South Florida. Elected officials were totally unaware of the onerous implications of such a nice sounding program they had supported years before. In the end the unimpeachable grassroots opinion was to retain the elected officials control rather than give it to a bunch of unelected folks in a back room called a Corridor Mg't. Entity (CME) with only environmental goals and looking to spend motorist contributed transportation dollars to attain them. Protecting the environment and bio-diversity is worthwhile but the funds to do that should be raised by up front programs rather than programs containing issues that are subtle to the point of being invisible to average citizens much less elected officials. In this particular locale attaining environmental initiatives was set back decades by the exposure of this programs real intentions in my opinion. From my experience with this intermingling of priorities I have witnessed it causing internal conflict at many levels within Departments of Transportation. What I have seen is that most folks go to work in a Tranportation Dept's. to build roads not boardwalks and visitor centers. That is very sad. I don't know how to put a link here but I would suggest participants to google the following topics to gain a better understanding what drives the idea here: The last 2 do not agree with the 1st 3 Agenda 21 Rio Summit The Wildlands Project Freedom 21 Sovereignty International Environmental Perspectives Inc.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

My experience with Wilderness in So. Fla. has lead me to believe serious harm can be done to natural areas by this designation. The lack of feasible access to Wilderness areas prevents public access except on foot and severely limits agency access for land management activities. The public are the eyes and ears of the environment and without them underfunded agencies don't have a chance of knowing what is taking place within the area as far as illegal activity goes. The lack of rapid access a Wilderness affords to agencies is very detrimental to fire supression as well as myriad other mg't. actions required. Considering that all the areas that truly met Wilderness criteria were designated many years ago, nowadays a new classification should be developed that would authorize off road vehicular access on limited prescribed multi-use trails for the public and land managers. That method would limit outlaw activities. Of course I'm speaking of large, not small land masses. One I know of now being considered as "W" is 147,000 acres. Without meaningful access this piece of land will have next to NO enforcement within its vast area.

One can demote this idea all day long but if the shoe fits the Feds need to wear them. On the other hand local folks with the most at stake must begin demanding exactly what they want in their comments to management plans - no more whining about how it used to be. That means when necessary the agencies must be supplied detailed maps of where desired trails should be located to facilitate hunting, fishing, OHV's, hiking etc. General statements to management plans do not tell agencies what they are looking for. The extremists know exactly how to work the comment system with precise comments demanding EXACTLY what they want and where they want it - LOCALS must do the same. Oh one more thing - don't waste time fighting the junk BS science citations touted by enviros since honest agency folks know it is BS. What the agencies can't do is give you anything you don't ask for specifically in comments because they can't prove you want it if it is not in their legal record of the NEPA process. Your comments are part of that record. We are doing this in Florida and it works. Good Luck.

One large source of the existing skepticism of myself and others is from witnessing the "precautionary principle" being used as some sort of scientific fact when it is exactly the opposite - the lack of facts. I have seen it used in many instances only to rid wild landscapes of many of the folks who actually fought to have those areas protected in the 1st place. In my mind the psuedo scientists that promoted those actions using spun citation sound-bytes are criminals of the highest order. Any education of impressionable youngsters must be balanced and speak of those who built this Nation utilizing its resources to do so, in a respectful tone at all times. If not the education is nothing more than brain washing propoganda. I did travel to the links above and noticed more of the sky is falling concerns over bio-d. I high school we learned of the Malthus theory claiming that we would all starve because the planet could not feed all that would inhabit the planet soon. In the meantime many very efficient methods of food production were developed so that we now have an overabundance of production capacity. Now getting it to those in need and starving is another problem. We could go on a road building campaign worldwide but Oh MY God that would fragment habitat and probably be prevented by those concerned about bio-d. Balance is what is needed in accessing Americas Great Outdoors and most other issues but bio-d promoters do not want any of that from where I sit. Balance and mutual acceptance of diverse desires could yield REAL hope. It is also maybe the most illusive of goals.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

One question that might get a LOL. What happens when our solar power scientists and us start drawing so much power (btu's of energy) from the Sun that we upset whatever balance or equilibrium might currently be being maintained between Earth and the Sun? I wonder if anyone has done those calculations.

One should be sure to include all land management agencies inanimate objects such as fire fighting equipment, ranger vehicles and their guns, helicopters to patrol the vast Federal holdings etc. etc. Yes, let's keep all that bad anthropocentric junk out. Then the pot growers, poachers, illegal aliens and other outlaws can have the solitude, peace and quiet I am sure they long for. Really good idea. LOL

Our governmental system is setup to be run by elected officials assisted not led by minions in the bureaucracy. Attempting to avoid elected officials or fool them to attain an eco-goal will backfire very badly when discovered. Ask the enviro-bureaucrats with NPS, USFWS, FDEP and FDOT folks in Florida who conned elected officials in an attempt to remove their authority over a main highway segment designated as a Nat'l. Scenic Hiway (Tamiami Trail) what happened when the plot was exposed albeit 8 years late. Answer - Brown material hit the fan and road was de-designated after 9-10 years of deceit. Federal government has no role in States unless they bribe the State.

Possibly a nice idea but any new taxes in today's economy may be opposed strongly from many directions.

Possibly the author could ponder the concept of people accepting one another rather than supporting the separation of visitors of different persuasions which prevents them from ever understanding each other's desires and different physical abilities. Merely a thought to promote everyone being able to at least see all of the wonderful sights our public lands hold in store for us all.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

SCORP data in Florida failed miserably to correctly guide the US Army Corp of Engineers(USACOE) with their development the Comprehensive Everglades Restoration Plan (CERP)/Master Recreation Plan (MRP). CERP is the \$20,000,000,000 Billion dollar plan to supposedly fix the Everglades or as some claim create a lucrative jobs program. Hopefully the science data for CERP is more accurate and timely than the SCORP data was. I surely hope SCORP data is of higher quality in other areas of the nation than it is in Florida. They need to learn to include active land use not only passive. Excluding active use breeds opposition. Luckily Florida's Gladesmen cultural community members came to the rescue advising them as to the SCORP data integrity defects and how to get in compliance with the Nat Historic Preservation Act as amended 2000 and avoid possible lawsuits. The Corps taking that advise to heart lead to them seeking out more accurate recreation data and conducting a comprehensive ethnographic survey of the Gladesmen Culture and Traditional Cultural Properties related to them in the entire CERP region including at least 14 counties of So. Florida. This is an excellent example of how culture and a governmental entity can respectfully cooperate to address land management issues and at the same time build a coalition of support rather than being the impetus for opposition. I have assumed here that SCORP is a reference to a State's, Statewide Comprehensive Outdoor Recreation Plan (SCORP). Possibly government employees writing here could explain acronyms used here for the benefit of all. Maybe even include the name of the government agency one is employed by if that is the case.

Should be but won't be. Nowadays between the economic woes and environmental priorities trumping all else it will be a fight for money.

Thanks to poster #2 for citing Mr. Reed Noss, author of the land management strategy for "The Wildlands Project" designed to prohibit any human access to more than 50% of the land mass of the United States. I must question the credibility of anyone who would support anything conceived of by this man who possesses an unbridled hatred for most the human race except his associates. I suggest that folks here google Wildlands Project to see for themselves what it is really about. I'm sure that poster #2 knows about it and enthusiastically supports this subversive philosophy developed by David Foreman and Reed Noss of Earth First that has been injected like a drug into the brains of unsuspecting college students for years having brought us to current totally polarized situation we are all in. Thanks again poster #2 for opening this door.

Wonderful idea. We must do all we can to save those remaining ancient forests, and encourage others to become ancient forests. We have a lot to make up for, after all the destruction, but it must start grove by grove.

Careful that "thinning and logging" don't mean profit taking, destroying wetlands, and leaving the forests damaged...

We absolutely need full funding for historic preservation! We not only need to reconnect to the great outdoors but to our history and culture as well. It is the sum of all this that makes us as humans unique. It is unthinkable to separate our physical world from our historical and cultural experiences and values.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Being just a "manager wanna be" but a user of the forests I have NEVER seen a Forest Fire remove all of the fuel after it is gone. Not in a managed Forest, Not in a Wilderness Area, no where. So in the aftershock of a Forest Fire, many forest managers, the Real Ones, have begged local and federal authorities to allow them to remove this fuel, which by the way becomes a terrific breeding ground for insects that damage the forests later, and these forest managers have been told NO. So the Managers are left with..."just leaving well enough alone" creating an "oil slick" of forest fire fuel. No amount of that corporate stooge Smoky the Bear will stop a lightning strike, causing massive destruction of our Great Outdoors. So what is needed is need to place Forest Management in the hands of the trained and experienced Forest Managers on the ground in the local area. Let them use what they have learned to grow, just as a farmer does, a healthy forest. They need resources and the ability to control the destiny of their local forest. Federal Management of the Nations forest is only need to give a guideline, not dictate each and every move.

Locally our USFS has recieved 1.6 million dollars from the Stimulus package. These funds needed to be specifically designated in a short period of time. Our local Forest Service used their "deferred Maintenance" list as a guide to specifically designate these funds. By reading the stimulus bill I noted that there were more than just 1.6 million for the Forest Service, so other funds must have gone into your local forests budget. As it happened these funds were equally split between the campground deferred maintenance and the wilderness area deferred maintenance. All other recreational use budget items received zero, since the local forest service felt that these uses were fully funded by OHV sticker and other fees and the use of volunteers for that type of recreation.

Nationwide easements also include buried utilities such as gas pipelines and fiber optic lines. Both offer long corridors that are so hard to put together from scratch for trail development.

\_\_\_\_ and her NoCasino Gettysburg (or as we call it No Anything Gettysburg) group will try to gain sympathy through any organization she can. She claims that this "... is ripping our community apart..." Untrue - SHE is ripping the community apart with her moral campaign against gaming in PA. By using any and all manners of groups to rally behind her "mission", she will associate with just about anyone whom she believes will further her cause. For so many people who profess to have "Christian Values", they sure have strange ways of showing it. We have seen more hatred spewed by this group than anyone. Truth is not in their vocabulary, and omission or skewing of facts is one of their main tools. There are three sites where you can find the actual facts if you care to: [www.masondixongaming.com/](http://www.masondixongaming.com/) The official Resort Site { [Link](http://www.pcac2010.org/) } is the official Pro Casino Site [www.BoroughVENT.com](http://www.BoroughVENT.com) is a local Gettysburg Site run by me [Venter] (caution: REAL discussions and dialogue on this site... get quite dicey sometimes)

## Discussion Question 2

***(cont.)***

Wind energy is good. But big wind farms should go as close as possible to population centers that will use the energy. Large-scale commercial-industrial wind farms and transmission lines should not be built near special places like Montana's Rocky Mountain Front. They should be constructed far to the east of the mountain front, where transmission already is available and there is just as much wind. Do not put big wind farms near prime wildlife habitat or special scenic areas!

Agree with the concept, but I echo the "multi-user" comments that recreational trails should be built for all non-motorized users. As for "speed limits" or "add one, subtract one," nope, neither of those forward the goal of creating more mountain biking opportunities. The first - speed limits - completely discourages mountain biking on the trail - most riders climb faster than 5 mph (heck, most can walk their bike more than 5 mph), and the second - closing existing trails when new trails are built - does not create more opportunities for riding. The key here is NOT closing trails to one or more non-motorized uses. The key is cooperation, courtesy and sharing the trails. All non-motorized uses are compatible when people act with respect and courtesy and follow established rules of the trail. Closing trails to one use - especially to bikes - does not eliminate conflict.

I don't see how using loud, high-impact, fossil fuel burning, polluting vehicles is being "responsible for your footprint" or a way to connect with nature. This is just a way for Americans to preserve the technological bubble they float around in while avoiding exercise and having the illusion of enjoying the natural world while actually destroying it. For some reason our culture seems to fear nature and uses technology as a buffer between individuals and the world.

I don't think this is a good thing, When the government bought up what is now Big Cypress National Preserve, the people were supposed to have traditional use. There are so many rules and regulations. You need a special Big Cypress License to operate a vehicle. You need a ORV permit on the vehicle and that cost \$50. a year plus you must bring it to be weighed and inspected and photos taken. If you change vehicles you do this all over again. You must get in a drawing just for the privilege of buying this permit.

In the past, offroaders went wild by riding on unauthorized routes across federal lands. That has led to erosion, damage to fish and wildlife habitat, and destruction of archeological sites. The Forest Service and BLM are correct to restrict ORVs to designated routes that have been determined capable of handling the traffic without deterioration. In some areas, offroaders collaborated with the agencies to reach agreement. Too often there have been loud objections to reasonable closures.

The "no more wilderness" policy was unreasonable from the start because it told BLM that every resource and every public use could be considered in its planning, except wilderness. Let's put wilderness back into the planning mix, so BLM and public can consider all options. For every acre of publicly owned land, there are some uses that are more appropriate than others. BLM field managers have to decide which combination of uses serves the public best on each specific area of land.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The red rock canyon country of Utah needs wilderness designation. The Bureau of Land Management has found 6.6 million acres there to have wilderness characteristics under the definition in the Wilderness Act. Utah conservation groups think there's more than that. Whatever the acreage, it's a national treasure.

Those with the most at stake are the people of the United States, because these are national treasures. They don't belong to the counties. The 6,600 residents of Kane County (Utah) should not be calling the shots for federal lands that belong to all of us? I worked for BLM and saw how local influence warped the agency's management decisions. It's time to put the national interest first.

Oh so it's okay to have a 'thrill' bike ride or a 'thrill' hike but not a 'thrill' ATV ride? Multiple use law does require sustainability. Trail systems are sustainable and thousands of OHV registration dollars (in Colorado, for example) are going to provide that service every year. Pfffft....

How can you justify keeping one group from enjoying the same land as everyone else? There are millions of acres available to people who can't share the land. Is there no limit to your greed?  
Glenn

Since the government doesn't 'own' land, they can't grant it to special interest groups. If you happen not to fish and you happen not to be a radical environmentalist, it's just another governmental abuse of discretion. Even groups such as Trout Unlimited are now guided by anti-access enviros. Enough already!

Studying military campaigns such as those that occurred during the Civil War by reading a book is fine but you can only really learn about a battle by visiting the actual battlefield. Then the book becomes a visual. Too much original battle field land has already been lost to "progress". Once it's gone it's gone and we cannot bring it back. We must preserve our "visuals" so our youth can better understand our history.

The problem would be that children would be indoctrinated by teachers with an agenda that did not necessarily match up with science nor would they present a balanced picture of man's right to use the land.

If wilderness does not remain wild it will be an industrial park, not wilderness. I do not want to pay taxes for someone else's cattle or someone else's mine or oil rig.

Obviously, a huge profit opportunity exists for powering ships with waste plastic, tar, tires, roofing shingles, etc. However, with the right temperature and oxygen conditions, such fuels could be burned cleanly. The solution is to require a third-party certification of clean fuel burning from all cargo ships docking in U.S. ports. This would cause minimal expense, as it would be just another document required by customs agents of all ships from foreign nations.

## Discussion Question 2

***(cont.)***

Actual reckless ohv use is so exaggerated by enviro-elitists on my home forest that their credibility is shot. Educational efforts by the land agencies to reduce impacts are miniscual by comparison to the money they spend on "Planners" leading many to believe that their goal is to throw their hands up and say, look we just can't manage this and close all roads. Law enforcement is also important, but how about some real balance?

Of course the Forest Service study is going to show a preference for hiking when first off, the survey is taken at hiking only trailhead parking lots and the questions are purposely skewed to get the answers the Forest wants. Hard to believe such a stumbling inept agency can actually achieve a closure agenda driven policy, but they do so with their unconscionably self serving use studies. The hypocrisy that hikers don't pollute and impact the environment just as much as the motorized community must stop. They climb in their SUVs and drive for hours from their suburban tract home, creating more carbon footprint than the folks who live near the Forest do when they simply wish to visit their Forest thru motorized means. If true to their ideals and visions, environmentalists would leave their cars parked and walk or ride a bike to the Forest they wish to visit and if that's not reasonable, then stay home and read their National Geographic for the next best experience.

The desire to preserve the Forest, as museums preserve art, is what is driving the Forest agenda and thereby their policies. what is conveniently forgotten is the Forest's original mandate was to manage the forests of this nation for reasonable resource extraction and public access. Environmentalists and their Forest associates, out of their fear of rampant Forest development (which will never happen thanks to protections already in place), have lumped motorized recreation into the drive to stop mining and timber harvest. Reasonable Americans realize that Forest resources are a very important commodity for the betterment of this country, so environmentalists prefer to attack motorized recreation to close roads, as recreation is seen as a luxury that they can make into their poster child for wilderness campaigns. The skewed unsupportable data used to attack motorized recreation make it blatantly obvious that the true agenda is merely to close the Forests to future resource extraction if the strategic needs arise. One look at the volatility in the world today and one can see that that strategic need will be upon us one day and we better not be stuck sitting on our hands!

This is pathetic sarcasm because if it weren't for those smokestacks you wouldn't have most of the products you progressives take for granted. The only reason you can drive your subaru from your urban guilt trip existence, to the mtns and strap on your skis while enjoying the heater in the lodge while you put on your plastic cross country ski boots and your fiber filled jacket is because of the energy and raw materials that our great country has graciously given up for your convenience. Are you all prepared to move back to the equator so we can survive without using any energy but the sun? If not then kindly sit down. Solar and wind have yet to prove themselves profitable and certainly we can't have nuclear power even tho it's been proven safe and your friends the French depend on it almost 100%.

## Discussion Question 2

**(cont.)**

What is the principal reason someone would want to build a casino in or around Gettysburg? Is it due to the battleground and the millions of people who visit it. Gettysburg is an outdoor classroom, allowing visitors to walk in our American ancestors' footsteps... To me, those who would visit because they have a free minute from gambling .. will not show the respect due.....  
greg haugens(9 July 2010)

This type of thinking by Federal wildlife officials is typical. I have seen officials drive two miles over the beach in a big four wheel drive SUV to tell me that I am not allowed to stand next to my kayak at the low tide line on sand that will be underwater in another hour. I'm not disturbing any nesting birds and certainly not harming anything as much as they are with their heavy vehicle. Their only policy is to make it a hassle and unpleasant to be in the vicinity of the very place they seek to protect. If I can't ever see it or ever go to the area without a hassle even when I am not impacting the environment, why should I or anyone else ever give much support to their efforts? Aren't these the same people who stood by while millions of horse shoe crabs were chopped up for bait to catch eels, bringing a 80% reduction to the very bird populations they proclaim they are protecting? Pay attention to what counts and loosen up on the stupid inflexible rules that make any appreciation of the outdoors a Nazi experience. "If no one but Federal biologists are aware of the natural assets, don't be surprised if local officials propose developing the refuge site for commuter ferry landings, school bus parking lots, or other inappropriate uses." Don't be surprised if people vote to cut back on the budget that hires all these guys either.

Quoting a list is not an answer to the question I posed. Is there a stated reason these things are on the endangered list set by \_\_\_\_\_ (fill in the blank). Are you saying, in quoting that list, that OHV's, road use by modern methods, are what caused this list? How big was that list say 50 years ago, 100 years ago, 200 years ago? Were the same organisms on it then. Honestly, I am not a biologist nor do I pretend to be, however, common sense tells me making wilderness areas that keep wheels out, (bicycles included), or any motorized equipment out is not an answer to saving the whales or planet. This time I say whales due to the endangered sturgeon on that list, especially the gulf sturgeon. Colorado is not home to sturgeon, wilderness areas are not going to save them. Inappropriate wilderness designations do not mean that suddenly any endangered species will then flock to the new wilderness en masse, as if in a great rush to save themselves through the benevolent graces of the worthy all knowing self proclaimed saviors of the endangered.

I keep reading the same mantra, "save the plants, animals, land, planet, etc" - (leaving out whales here). Can anyone please inform us which of these specifically are being endangered? I am not asking for generalities, rather, refer to Colorado Wilderness endangered species. How are they endangered? Endangered from what? When I backpack in a 'Designated Wilderness Area' in Colorado, aside from roads, I see no difference in the forested area than the neighboring National Forest Lands. What and where are all these endangered things that suddenly move to the new 'protected lands'. I honestly do not see the destruction of lands, resources, sentient beings as some claim. There are rare, isolated cases, yes, but not nearly on the scale to match the great Wilderness Land Grab of late.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Makes me sick to see all the 'new' wilderness areas, as though this land is only now being discovered. Hogwash. The real wilderness areas are where our founding pioneers didn't tread with carts on roads because those lands are impossible to build roads through. Leave those lands alone, as is, period. The lands with roads, many in the designated so-called 'roadless areas' are not wilderness material. The wilderness areas are unique, we know which lands those are and have already set them aside. NO MORE Wilderness Area Designations, least we put up a sign at the Cities exit boundaries saying, "Wilderness Area - Stay on Pavement".

No more Government involvement in any issues related to public lands, thank you very much. Especially with catch phrases such as 'steering committee'. What is wrong with land use now, other than all the restrictions on it, much of which were put in place by our esteemed governor himself. If the economy, due to recreation is placed at \$10 billion a year from the SCORP summary, is the goal of a 'steering committee' to cut that amount in half? We are living the results of our esteemed elected official through curtailing a booming economy on the western slope with HIS idea of land use. Enough already with the agenda based BS catch phrases such as; Award Winning, SCORP and so on. Again, no thank you, please.

To quote, "All roadless areas protected under Clinton should be in this category." These 'roadless areas' set aside under Clinton are not ROAD LESS. It is a misnomer. There are many roads in these areas that should be used to our advantage for forest access and responsible recreation. Forest access NOW and for future generations, not when congress decides. It is not the Kings land, it is public land for public use. Keep open areas accessible for family's with children, grandparents, physically handicapped or mentally challenged, everyone should be allowed to enjoy the great outdoors.

Wetlands in the Praire Pothole Region (PPR) are being drained for farmland at an alarming rate. These wetlands are vital to waterfowl and reduce flooding. They provide a vital food source for waterfowl in the spring and provide brood rearing habitat. Wetlands reduce flooding by holding back the surge of water in the spring time. Since drain tiles have been implemented, water is drained straight into river and lake systems causing floods annually. It is time to put an end to wetland draining and preserve the PPR for future generations. Please visit this website for more information!! { <a href="http://www.epa.gov/owow/wetlands/types/pothole.html" rel="nofollow" target="\_blank">Link</a> }

I have been privileged to tour three Civil War battlefields, Franklin in Tennessee, Vicksburg in Mississippi and Perryville in Kentucky. All three contributed greatly to my understanding of the Civil War. Without these sites being preserved, future generations will not be able to understand physically what happened in those four momentous years. I am strongly in favor of battlefield preservation so that they can truly have something more than books to understand the past history of the United States.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Designate the Long Path as a National Scenic Trail. The Long Path has been a work in progress for more than 75 years. It currently stretches almost 400 miles through New Jersey and New York, from New York City's George Washington Bridge to Altamont, NY (near Albany), where it abruptly ends at a stop sign on a street corner. Designation as a national scenic trail would give the Long Path necessary protection and would help efforts to extend the trail north to a permanent terminus in the Adirondacks (perhaps Whiteface Mountain, the northernmost point originally proposed by Vincent Schaefer in the 1930s). This idea was endorsed by the Schenectady (NY) Daily Gazette. The Long Path Trail Study Act, which would have create a study to determine the viability of this idea, was proposed in Congress in 2008 but never made it out of committee.

I don't think that's true, (I've never heard that claim before, and it doesn't seem like you can substantiate it either). Many local people don't know about the trail, let alone oppose it. A lot of people who I've spoken to near the current trail either didn't know the trail existed, or they did know about it and enjoyed hiking on it. Designation as a National Scenic Trail would give the Long Path more publicity, and the additional users of the trail would be supporting the local economies in upstate New York in towns near or on the trail. I agree that the glass is half full; but it would be great if we could fill the glass completely.

National dirt bike friendly singletrack trail system would be great! If dirt bikers were involved it would happy overnight and cost nothing.

The largest property owner pays no property taxes and increasingly does not contribute to the local economy. The Forest Service in Lassen National Forest (N. California) is crippling the local economy of Chester, CA by systematically reducing recreation, and timber harvesting. In Chester Ca the Forest Service has reduced several recreation opportunities.. -ripped out the local ski area -eliminated most off road riding through the Travel Management Plan... No single track. Off roaders can only ride on some dirt roads... Forest Management / Timber harvesting has been choked for fear of litigation. Management by across the board closure is not management

The idea of preserving more wilderness & historic areas is great except for one thing - the Federal government is BROKE. We cannot continue to borrow money and spend, spend, spend. The amount of Federal debt for every man, woman and child in this country already amounts to over \$30,000 per person. Why is the Federal government trying to financially break the US? What's the hidden agenda?

I live in an area surrounded by National Parks, wilderness, BLM, and Forest Service lands. That is why I am here. Keeping the people from lighting up the natural lands is hard. NPS has a good program, although it could be more extensive. NFS and BLM need to press their local supervisors to work with people and communities that want to control lighting and make the natural experience better. NFS and BLM should establish clear policies and develop practices for local supervisors so they know that it is part of their job, and know what to do about it.

The places where our ancestors fought. America is what it is today, for ALL Americans because of what they did. Hallowed ground that should be preserved.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We need to keep public lands open for all recreational use, and stop closing them off. Everyone deserves the right to enjoy the trails and take in all the spectacular wonders around them. We love to hike, bicycle and ride dirt bikes, but many of the areas are being roped off. We need to stop the environmentalist from shutting them down!

Section (d) (4) (2) of the Wilderness Act states: "the grazing of livestock where established prior to the effective date of this Act, shall be permitted to continue subject to such reasonable regulations as are deemed necessary by the Secretary of Agriculture." This also applies to BLM wilderness.

The spectacular landscapes of Utah's redrock country and other wild places throughout the West deserve permanent protection as designated wilderness. However, while Congress works on legislation, many of these proposed wilderness lands are at risk. In 2003, Bush Interior Secretary Gale Norton entered into a settlement agreement with the State of Utah in which the Interior Department adopted the novel and unprecedented legal position that the Bureau of Land Management (BLM) lacked power under the 1976 Federal Land Policy and Management Act (FLPMA) to designate new wilderness study areas (WSAs) on BLM lands. This "No More Wilderness" settlement dramatically curtailed existing and frequently used authority by previous secretaries (including Reagan Interior Secretary Jim Watt) to identify and designate wilderness-quality lands as WSAs. Instead, the settlement declared that the BLM's ability to designate new WSAs expired in 1991, when the separate provision authorizing the BLM's initial 15-year review of roadless BLM lands terminated. The "No More Wilderness" settlement opened the door for the BLM to essentially give away wilderness-caliber public lands to the oil and gas industry and motorized users in places the BLM itself recognizes as wilderness-quality. This includes 6 million acres in Utah; 650,000 acres in Colorado; over 5.5 million acres in Arizona and over 2 million acres in New Mexico. The settlement was inconsistent with every prior administration's interpretation of the BLM's obligation to designate new WSAs. However, even under the agreement's plain terms, the settlement did not bind future administrations to that faulty interpretation of the law. We urge the BLM to make sure the West's wild lands retain their wilderness character by overturning the "No More Wilderness" settlement and designating new wilderness study areas.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Every person who has commented on this idea has said something truly valuable. The importance of maintaining policies that reflect the diversity of lifestyles, spiritual and scientific values, and complicated recreation economics of rural communities is clear. However, that we may learn from each other, see first the possibility of a new friend before an old enemy, and use such policies pragmatically and for mutual benefit, is not so easy, is it? So what are the sticking points? I consider myself a member of wildlife conservation community that includes, rather than rejects, hunters and fishermen. I myself love to cast a line although I rarely do. Here are the aspects that make me uneasy, the things that make me think twice about promoting this idea: road access and OHV use; denial by some of scientific evidence that wolves benefit prey populations and 'run rampant' when they are not managed; and, most importantly, a tendency for us all to visualize a line drawn on the ground...us over here, and them over there. Irresponsible OHV use on public lands is not a hunter/non-hunter issue. It is a reverence issue. If, by some small chance, our policies and maps and access rules are indeed formed in the service of healthy habitats and wildlife, then everybody posting in this thread should be able to say, "No, it's not right that somebody decided to break their own trail on an ATV though that skunk cabbage patch in the dry season..." Ecosystem health. Science has never been about forming new and more insidious methods of arguing why hunter access to public lands should be restricted for the benefit of the leftist side of the conservation community. Science, for better or worse, serves itself. It's simply knowledge. It goes through a rigorous review process. It can sometimes be challenging to apply in real life. It is non-denominational. It can be incorporated by hunters, helping them to understand the impacts they are having on populations and anticipate the moment, if any, when those impacts become too severe for an ecosystem to endure. Likewise, the same science can attempt to confirm sustainable levels of harvest. It is reverent to seek knowledge that we may be better stewards, on either 'side.' It is terrible to contrive methods of twisting knowledge to support a preexisting ideological position. On the wolf question, there is no better book than Barry Lopez's, "Of Wolves and Men."

I went to Gettysburg for July 4th. What a magnificent Civil War battlefield experience. We honor those who fought by saving battlefield sites. Stop the developers and corporations (e.g, Walmart and Disney) who would impinge upon these sites. They are a legacy for future generations.

I believe many government agencies are trying to satisfy the public's need for more nature projects. However, I think the government should empower more people and organizations to steward lands beneficial to the public. For example, the BLM governs hundreds of thousands of acres and has little man power to improve these lands. "We the People," need to stop relying on the government to create these projects for our children and force the government to give us back our land. "We the People," can decide how best it should serve the public. We do this by land stewarding and land grants for non profits that benefit our communities. I am tired of seeing the government give more rights to big companies for drilling oil and natural gas, then using public lands for projects that could help our children.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I believe private land owners and non profits organizations have a better idea of the public wants and how best to suite its needs. We need to take back our lands and use them. I am tired of watching the government give big oil and gas companies full rein of public lands. I see a lot of OHV trails closed for rehabilitation with a natural gas tank sitting in the middle of it. I guess this means its okay for a tanker truck to run over habitation, but not a four wheeler?

Unfortunately, for every one path open to OHV, I find at least a dozen closed for habitat conservation. The government seems to think that land conservation is buying big chunks of land and limiting anyone access to use it for anything. I strongly believe that non profit organizations, with the help from the public, could do more to improve public lands.

".....how about simply equal access and a sustainable plan for our use." Well said! There are many of the "green" ilk who, for all intents and purposes, would like to see every area possible turned into wilderness. I saw a bumper sticker that I thought spoke volumes  
..... Wilderness --- Where NOBODY goes ! As for electric-powered vehicles, everyone should read the reports on the TRUE carbon footprint of a Prius or other such vehicle. See the spot in Canada that processes the nickle necessary for the batteries. Figure out the electricity necessary to charge said vehicle and realize that it is produced at coal or gas fired plants. Soon you will understand the "Law of Unintended Consequences"

Ban Off Road Vehicles (ORV or OHV) from National Forests near water. These vehicles are only used by a few but they destroy the trails and streams with mud and runoff. These noisy vehicles make quiet enjoyment of the outdoors impossible and should only be allowed in limited areas that do not have ecological significance.

I'm in favor of keeping designated wilderness wild, and identifying and protecting more wilderness. Designated wilderness still will be a small part of land owned by the taxpayers. Designating it was wilderness will make sure that it is (1) not developed and (2) kept for the protection of water supplies and wildlife habitat. Please note that hunting is allowed in DW if it is allowed in the lands from which the wilderness was designated. Which usually means yes for national forests and not for national parks, for example.

For 10 years my family and I camped in the Imperial Sand Dunes Recreational Area in our "second home" on the edge of the dunes. In 1994 Sen. Feinstein helped to pass S21 and now that area is Wilderness. Some of our best memories happened there and now we can't take our grandchildren there unless we hike in. We have plenty of Wilderness areas in my opinion. These areas are set aside for "future" generations but there is no time frame as to WHEN.

Here in CA the "Green Sticker" program does work when the state doesn't steal from it. They owe us now over 70 Million from our long term fund. And another 50 Million from years ago they never paid back.

Here in Iowa the state steals the money or sequesters it to show a balanced budget. Either way it is not used for the purposes it was collected to fund.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

HistoriCorps is an idea already in action. It's purpose is to save special places on public lands by teaming preservation experts with volunteers to work on the restoration of cabins, ranch houses, and other types buildings on or eligible for the National Register. Participants get to work on historically significant publicly-owned buildings on U.S. Forest Service lands with the purpose to returning them to productive use as rental facilities that can be enjoyed by hikers, equestrians, campers and others. Along the way, participants learn preservation and building trades job skills, get to work in the great outdoors, meet interesting people and have fun while making special places on our public lands more accessible and useful to anyone who wants to experience them. Colorado Preservation, Inc, the U.S. Forest Service and Volunteers for Outdoor Colorado began to pilot this new initiative in the Rocky Mountains in the Fall of 2009 (over one third of Colorado's lands are owned and managed by state and federal agencies). Mandated to preserve the historic resources under their control, our public land managing agencies, like the Forest Service, have core missions that often make it difficult to meet their legal obligation to safeguard our cultural resources. HistoriCorps is a solution to this problem that extends the capacity of our state and federal agencies to preserve historic resources while also reducing the costs, ultimately shouldered by the taxpayers, to get the work done. Although initiated in Colorado, HistoriCorps is an initiative that will work anywhere in the U.S. and with any agency (BLM, DOD, NPS, etc.). You can help by asking your public officials to learn more about HistoriCorps by going to [www.historicorps.com](http://www.historicorps.com) and/or contacting Colorado Preservation's HistoriCorp manager, Jonas Landes, at [jlandeshistoricorps.org](mailto:jlandeshistoricorps.org)

I like \_\_\_\_\_'s idea, and I agree with \_\_\_\_\_. Celebrities, more often than not, detract from the message. I would rather hear from the scientist or engineer.

It is very hard to change the public opinion of Off-Highway Vehicles (OHV). Our media does a wonderful job highlighting the 2% of idiots that give our recreation a bad name. Over a Thanksgiving weekend at the Imperial Sand Dunes will see over 150,000 visitors. The media will highlight the idiots, not the thousands of families that come together to have a fun time and respect the rules. It is not uncommon to see 3 or 4 generations of a family at the dunes, it isn't just about the OHV use, it is about the camping and being with nature. You can see much more in a day of our beautiful country on an OHV than hiking. We hike as well, ride bicycles over 50 miles a week and always leave an area cleaner than when we arrived. Pack it in, Pack it out!

Nothing can replace the educational and patriotic value of walking the ground over which Civil War soldiers fought. These precious lands must be saved before they are lost.

Public lands are FOR the people and not to be closed to the people. I am one of the people of this country and I want, demand, access to my public lands!

Stop that darned WalMart at the Wilderness. Good heavens, once it is paved it is gone forever. And that Casino at Gettysburg! What are we thinking! J.R. Reddig

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The American bison is largely listed as an agricultural species in most states. Usually, at best, it is listed as both a game and agricultural species. This idea is to have it listed as a game species only in all states, and therefore managed as such. Part of this idea is to euthanize ANY bison, private or public) that are not 100% pure in their DNA(basically, no bovine DNA allowed). Treatment as a game species, as it should be, would create the push for habitat to be set aside much as we do to any threatened species. As bison are a keystone species, protecting it, will protect and promote other threatened and endangered species. The estimates for pure bison population in the United States are shockingly low, and illustrate the need for protection.

The biggest challenge I am running into is pollution, and specifically a form of pollution that knows no boundaries: CO2 greenhouse gas pollution. You can draw whatever boundaries you want and say "This is a National Park" or "This is a Designated Wilderness Area" but CO2 will still go there and destroy the environment, and do so a rate which is so fast and so expensive to US citizens that any other effort you take Except real CO2 reductions will amount to vacuaous "Greenwashing." For example, environmental economists have done an inventory of the economic value of the Puget Sound environment to its residents and that value ends up being about \$1,000,000 per citizen. But climatologists are saying that our fossil fuel consumption is destroying the planet at a rate of about 1% a year. This means \$10,000 real economic loss per year per citizen of the Puget Sound Region due to CO2 pollution. Compared to about \$100 a year per citizen to get started with Cap and Trade. This means investments in reducing Fossil Fuel Consumption PAYS BACK to each citizen about \$100 in reduced environmental economic damages per each \$1 invested in cleaning up our act! Climatologists say the planet cannot wait any longer! Let's Go! Use the President's EXISTING Authority under sections 115 and 615 of the Clean Air Act and DO IT!

The Civil War battlefields bring history alive to the visitor and preserve the memory of the of the brave and valiant soldiers who fought in those many battles. In honor of those who sacrificed so much we need to preserve those battlefields.

The United Desert Gateway is a perfect example of a partnership between the local communities and the BLM at the Imperial Sand Dunes Recreational Area in CA. It recognized that the management of public lands in the region presented a significant opportunity to build collaborative stewardship that will allow participation by the local Gateway Communities, the off-highway vehicle community and other interest groups in public land management planning, stewardship/education/outreach programs and to respond to impacts of public use on public land. This works and works well. Read more here: { <a href="http://www.blm.gov/ca/news/newsbytes/2006\_partners/udg.html" rel="nofollow" target="\_blank">Link</a> } We need more of these that let the local people decide how best to manage their backyard and not a one size fits all approach from Washington DC.

## Discussion Question 2

***(cont.)***

There are many areas that are essentially ghost towns on the Great Plains, north to south, that could use such an economic boost. This would need to be implemented as several vast restored to pristine condition tracts of land, connected by migration corridors managed in a human co-existing fashion. In the end, the park size should salvage, and restore, the uniqueness, of the Great Plains, in all of its locations(north, south, east, to west). As our largest biome, the square miles of the parks and corridors should reflect that fact, and eclipse all other national parks in this aspect. To accomplish this, thinking outside the box of the national park constraint should be considered. For instance, restricted land use(no cattle, no non-native farming, wildlife friendly building) should be considered rather than eliminating human settlement. Allow Native American reservations to participate. Rather than just having land set aside in a park(there should be at least 1 park for nature preservation sake), allowing and working with private land owners to create environments for native wildlife to thrive and migrate in the plains should be part of the Great Plains Biological Conservation System. The goal should be to restore the plains to near pre-European occupation beauty, diversity, and wildlife population counts. In areas of co-existence, obviously this would be a compromise to gain migration corridors. Think of it in terms of preserving biology rather than just the land. Connecting the park land via non-park but restricted migration corridors.

There are millions of acres of designated wilderness lands that are already off-limits to "the oil and gas industry and motorized users". So can somebody explain why we need bills that seek to expand these areas thus further limiting public lands from benefiting the general public?

This sounded like a good idea until I read, "Our hope was to one day encourage the government to create a national program called Take Care of Your Share " Keep the government out of it and maybe it will work, let them get a hand-hold and it's a flop, worse than a flop, it will become detrimental to the cause and goals you are seeking.

We bike along the San Gabriel Riverbed. There are so many parks along the trail I can't see the need for any additional open space. We bike the whole trail too, from Seal Beach to the Angeles Forest. Would like to see a bike trail on Walnut Creek, that would be nice. We really don't see the need for the Duck Farm property plan, its only a couple miles to Whittier Narrows and Legg Lake parks.

We have plenty of areas now set aside that our government can't take care of and puts so many restrictions on. There is Threatened Species in the Imperial Sand Dunes, the Peirson's Milk-vetch, yet you can't water it, take seeds to grow them or transplant them. Does this help the plant survive?

You do a wonderful job \_\_\_\_\_, nice to have seen you at the LA listening session. And thanks for your hard work on the video that everyone should see. { <a href="http://www.trailsintrouble.org/" rel="nofollow" target="\_blank">Link</a> } We have members that can only explore our beautiful lands by vehicle. These folks can not enjoy any Wilderness areas due to there non-mechanical restrictions.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

This is probably one of the best ideas yet! The NPS and USFS have good programs that have languished because of a lack of funding for projects and personnel.

Since many years I take particular interest in the study of the American Civil War which gave birth to the Nation as it exists today. In remembering the Past, we of the present day can build a better future for generations to come. Therefore the preservation of the hallowed grounds of the Civil War is of paramount importance. It is our sacred duty to fulfill this obligation to those, both Blue and Gray who fell for the defense of the values and rights they were told to fight for.

The government is already encroaching in the San Juan Mountains. Over 120 forrest roads were closed last year. Barriers are up in the form of burms, huge boulders and barrier gates. All access roads off of Rock Creek, for example, in the eastern San Juan range are closed with barrier gates. No access allowed. The only access is via walking or horseback to maneuver around the blockades. The roads have become "cherry stems" with access on the main road, turn around and come back. Huge disappointment. The aging population and the younger population cannot access this magnificent area. What purpose is possibly served? Only those that are young & physically agile can have access. Logic is lost.

My family and I are avid campers and backpackers. Over the years, we have learned to avoid some of our previously favorite places as they have been opened to OHV use. OHVs turn previously pleasant trails into mud pits or dust wallows, depending on the weather. OHV noise makes it impossible to listen for wildlife, and negates the whole purpose of getting out into the quiet of nature. It is heartbreaking to hike out to a favorite meadow or creekside to find that some OHV user has been there mudding, turning patches of delicate wildflowers and pristine streambanks into a churned morass. OHV use disturbs wildlife, destroys trails, and spreads pollution and noxious weeds. It should be limited to already disturbed areas, not promoted as a viable use of our already limited wild lands.

The only problem with opening public lands to OHV use is that it makes it impossible for other users to enjoy them. OHVs scare horses, destroy hiking trails, and spread pollution and noxious weeds. Also, too many OHV users see no problem with riding through streams and delicate meadows, turning as much of the backcountry as they can reach into eroding disaster areas.

The good ideas are all here ... connect and finish the trails ... make them as urban population accessible as possible. I would add ... how about sections of the trails that are bike accessible and maybe some as motorized accessible if there were noise level restrictions?

"Experience on every continent has shown that only in strictly protected areas are the full fauna and flora of a region likely to persist for a long period of time." What is meant by strictly protected areas? "limited human access" From Noss, et al., *Continental Conservation*. This is why conservation proposals sometimes revolve around excluding certain types of access. We need other species for our own continued existence. Yet, we are quickly losing many of them because we are too often unwilling to limit our activity.

***(cont.)***

Sadly, there are conflicts here that run deeper than what can be resolved in this forum. I think the point about the statistics, though, is that choosing numbers from different studies involving different methods, definitions, time frames, age groups, etc., doesn't lead to accurate conclusions. You have to look at each study one at a time, and see what conclusions the numbers in that study lead to. For example: The US Forest Service's study: { <a href="http://www.srs.fs.usda.gov/trends/Nsre/Rnd1t13weightrpt.pdf" rel="nofollow" target="\_blank">Link</a> } Scroll down to Table 2, which shows a comparison of the different types of recreation for ages 16 and up, revealing that 17.4% enjoy ORV, ATV or Motorcycle use, which is actually exceeded by hiking (32.7%), birding (31.8%), and a number of other outdoor activities. It's admirable that you want to share an activity you love with others, but I see no data that support your statements.

And why should the uses be exclusive? If someone enjoys birding and also enjoys motorized use, they check off both uses. If someone enjoys hiking, biking and motorized use, they check off all three. Therefore, the results should reflect ALL the people who enjoy motorized use, even those who enjoy other outdoor activities, and the 17.4% should be accurate. Capiisce? I never said that participation in motorized rec. is exclusive of non motorized rec. I'm not sure where you got that.

Dear Secretary Salazar, With the massive oil spill threatening to kill marine life across the Gulf of Mexico, please withdraw your approval of Shell's plan to begin exploratory drilling in the Beaufort Sea, off the coast of the Arctic National Wildlife Refuge. With the polar bear and other Arctic wildlife already suffering the terrible impacts of global warming, the last thing they need is a devastating oil spill that cannot be cleaned up in the ice-bound waters. The American public has voiced overwhelming opposition to oil development inside the Arctic National Wildlife Refuge--and we won't stand for a backdoor attack on its sensitive coastline. Please reject Shell's reckless scheme, which would endanger the spectacular wildlife of our greatest unspoiled Arctic wilderness and its coastal waters.

Do you really mean bring back recess, or would it be better to expand physical education? Middle and high schoolers often spend recess standing around socializing. Physical education on the other hand, involves a required, supervised activity. I would support expanding the latter, and incorporating more outdoor nature-type activities.

Euthanize ANY bison that is not 100% pure? Seems like a waste of DNA to me. There must be a better way to protect the bison.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

Funding more NP and NF rangers, esp. backcountry rangers, would go a long way. It's great that people are eager to head out into the wilderness, but many do so without the knowledge or education of how to treat/respect the wilderness or even how to survive in it. The presence of rangers (w/o guns please! they shouldn't be cops!) helps to educate people and will help to preserve our lands. I see so much trash in the backcountry, tp under rocks, fire rings in meadows, people cutting down tree branches, food left out so bears & other critters can get at it, etc, etc, but there's no one around to explain why these behaviors are detrimental. In the past 10 years, I've seen a backcountry ranger maybe 2 or 3 times, but many many people being thoughtless and careless. President Obama -- you want people to get outdoors? Great! But please provide the support to maintain the outdoors at a level it deserves. The land needs to be managed, i.e. fuel reduction for decreased wildfires and trail maintenance, but why should that "management" include logging and grazing? How does that serve us or the land?

I agree. Some excellent ideas have been posted on this site, but teaching ecology is potentially much more far reaching than many of them, because it arms future generations with what they need to make informed decisions about resource use and management, to recognize that their own activities impact many other species, and to understand that we humans actually need those other species for survival. Ecology needs to be part of standard public school curricula. This can easily be incorporated into science classes, and even history, as \_\_\_\_ points out: How did past civilizations use resources, and how did that lead to their rise and/or decline? What did it have to do with the disease that wiped them out? Why did they thrive and then starve? And so forth. Go here, and promote, so future generations won't need a forum like this one: { [Link](http://ideas.usda.gov/ago/ideas.nsf/0/AF9E289C790DF2B68625772100497AE4?OpenDocument) }

I agree. Consumptive use does not equate with better stewardship. Much more effort to teach stewardship should accompany any effort to encourage consumptive use. In my neck of the woods, discarded pieces of fishing line are almost as common as blades of grass around any fishing area. During deer hunting season, you can find trash bags of decapitated deer on the side of the road, punctuating the collections of discarded beer cans. That said, I think encouraging fishing and hunting CAN be a great way to reconnect people with the outdoors.....BUT stewardship does not follow naturally for many people, and needs to be actively taught if the ultimate effects of fishing and hunting are to be positive.

I agree, also. I am constantly amazed at how many easy, EASY things we could do to reduce and recycle, yet we do not do them. Carry our own water in reusable containers. Bring our own reusable containers for restaurant leftovers. Reusable shopping bags. And so on...

I agree. We do not need to make OUR PUBLIC LANDS more restrictive.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am not a lawyer, but did a little reading on this issue of wilderness access for the disabled. It is a good point that wilderness areas are generally not accessible to people with certain disabilities. On the one hand the American with Disability Act requires access, yet the Wilderness Act requires wilderness preservation. From what I can gather, the consensus, to the point that there is one, seems to be that access should be made possible to the extent that it does NOT degrade wilderness. This can include widening trails, if that will make them wheel chair accessible. But, since motorized vehicles do degrade wilderness, they are generally not considered an acceptable solution to handicapped access. I hope people are aware by now that this argument of handicapped access to wilderness areas is an argument frequently used by able-bodied, ambulatory individuals who are simply seeking motorized access for their own use, not for disabled people. If motorized access is allowed in a wilderness area to accommodate the disabled, I would argue that ONLY the disabled and their traveling companions should be granted motorized access. If you can walk, you have no need for a vehicle in a wilderness area.

I am not a mountain biker, but this is too extreme even for me. (I am assuming you are talking about non-motorized bikes, by the way, so if not, please clarify.) "Any natural area" is too broad. Does that include, for example, even a several hundred acre piece of conservation land in a suburb? Surely we can accommodate mountain bikers in some natural areas. Yes, mountain biking is more harmful than hiking, but it is still small potatoes, relatively speaking. Let's devote our efforts to bigger battles, such as the more harmful vehicles. At least people get good exercise when mountain biking.

I don't know where those statistics come from, but I know many, many, many more people who regularly enjoy hiking, than OHV use. OHV use has negative environmental impacts. It's not what I would want to encourage young people to do, and should be limited or excluded in some locations.

I guess some of us are interpreting the great outdoors initiative more loosely than others. This idea certainly relates to protecting and respecting our environment, so it works for me, even though it doesn't address how to get people off the couch and out the door, or how to protect a piece of land.

I think Patricia went overboard in some of her statements and language, thereby alienating many people. This is unfortunate, because the thrust of it, especially what is enumerated in her second to last paragraph, is spot on. If we want to halt, or at least slow, the current extinction crisis, we DO need large core areas of wild land, far better connectivity, and a return of large predators in meaningful numbers. I also agree that wildlife should be managed with "general public funds". Try to get past her zeal and extreme language, and focus on what she actually suggests, before voting on this one. All of it will better protect biodiversity, a good thing for all of us and for future generations.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I think some people like to reduce the how-much-wilderness-is-enough debate to a question of how much land hikers need. They avoid the question of how much wilderness is needed for wildlife to thrive, because the answer to that question is in conflict with their own desires for land use. An abundance of scientific data has shown beyond any reasonable doubt that large wilderness areas are necessary to maintain the full diversity of species. And by all accounts, the 5% of land in the US that has been designated as wilderness, is not enough, nor does it represent an adequate diversity of habitats.

I think we need to consider the use of land not just by people, but by other species as well. It is well documented that we are in the midst of an extinction crisis. It is also well documented that an ecosystem functions best when its full complement of species is present. Because we are dependent on healthy ecosystems for clean water, clean air, and food, it is in our own best interest if we limit access to land when it helps preserve other species. Some human activities cause more disturbance or damage to wildlife than other human activities. Generally, ORV use, mountain biking, and horse back riding cause more disturbance than hiking. That is why they should be restricted in some areas, not because one form of recreation is somehow superior than any other, or because one group prefers one type of recreation over others.

Incorporate ecology into public school core science curricula. Encouraging outdoor recreation is a great thing, but in the absence of environmental education, one's interest in the outdoors might be limited to his/her chosen form of recreation, and good stewardship is not a given. Further, not everyone enjoys outdoor activities, and many people see little or no intrinsic value to nature. But everyone has an interest in human health. People need to learn about the connection between biodiversity and human health. The public needs to be made aware of the link between habitat degradation and loss of ecosystem services, such as clean water, clean air, flood control, etc. They need to understand that many medical treatments were initially derived from plants or animals, and that species loss is a loss of opportunity for future medical innovation. They need to understand that our current food plants and animals, as will any future food plants and animals, ultimately derive from wildlife. They need to know that all over the world, habitat degradation has been linked to outbreaks of human infectious diseases. Those who have some knowledge of this will be more motivated to be good stewards. This information is already finding its way into public schools, but it needs to become more of a central focus, not limited to enrichment programs, extra credit projects, or aside activities. What could be more important for human survival?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

No, not worried about the risks of showing reality. But this idea specifically addresses after school nature clubs, which are elective, voluntary programs. Bringing in rehabbers and other presenters simply does not attract many kids. Even if they bring in wild animals, maimed or intact, for show and tell. Any sort of humane education should be done during school hours, for all to experience. What you suggest would be only a small part of what needs to happen, but it would be a start -- more than what is currently done about it. Which, in most schools, is nothing. I totally agree that kids who respect the animals around them will better appreciate the big picture. For a great (in my opinion) educational video on treatment of farm animals:  
[http://www.ciwf.org.uk/resources/education/farm\\_animals\\_us.aspx](http://www.ciwf.org.uk/resources/education/farm_animals_us.aspx) If you are aware of anything similar to the above involving wild animals, please enlighten.

ORV users might argue that this contradicts the goal of "reconnecting" people with the outdoors. But I believe that, in addition to your point, Mark, about restoring calm and peace, this pushes people to understand that "connecting" also means recognizing that whatever you do affects other people and other species. That is, reconnecting is not merely about getting out the door, but also about acknowledging our interconnectedness with all other species.

Please note statement above: "I do not accept all of the hoopla over bio-diversity". There are still many Americans who believe this is not science, but some sort of conspiracy. Others don't even know what the word means. This is not their fault. Rather, it underlines the fact that this most important information, which is necessary for people to make informed decisions about resource utilization and management, has not been formally taught in schools. Let's change that and make Ecology a required part public school education so our kids will make better decisions than we have. And try to educate older folks yourself. Go to these ideas and promote: { <a href="http://ideas.usda.gov/ago/ideas.nsf/0/E118891F73A7045D862577350048ACC8?OpenDocument" rel="nofollow" target="\_blank">Link</a> } { <a href="http://ideas.usda.gov/ago/ideas.nsf/0/AF9E289C790DF2B68625772100497AE4?opendocument" rel="nofollow" target="\_blank">Link</a> }

Right on. Because part of the problem has been lack of role models. Kids no longer pursue outdoor adventures because the last few generations have become disengaged from nature, and there is no one to take them back packing or rafting, to teach them to hunt or fish, or to tell them how exciting all of that is.

Those were not "my" statistics, they are from a study by the US forest service. The idea author himself referenced a USFS study in support of his claim, and in a subsequent comment implied that we should trust a study by such an entity, since it is not an off road organization. But when we found that the numbers from the USFS study do NOT seem to support his claim, several of you actually turn around and discredit the study as misleading, biased, or hard to interpret! lol!!!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Well heck, I'm not much for readin' books, but they tell me I can't use my skateboard in the public library. So let's close all the public libraries, too. If I can't use them for what I want, then no one else should be able to use them for anything. lol Quite honestly, it would be perfectly fine with me personally if designated wilderness areas were closed to everyone. I hike a lot, but almost always locally, and often on multi-use trails. My interest in restricting use is for biodiversity, which is somewhat selfish because it is ultimately good for people, but also because I think animals should have some space away from human activity. I think that's what they would tell us if they could. We've caused them enough pain and suffering, and driven enough of them to extinction. 5% of the land is not too much to give them, in my mind. We think of all the land as belonging to us, but it is their land, too. Call that selfish and greedy, if you like, but I see it differently. Such is life...

Yes, I agree. Further, while I think these programs sound absolutely wonderful, and love all of this enthusiasm, I am afraid that other equally valuable ideas are getting buried beneath the swamping of comments and repeated idea postings on the TMNP. Also, I wish more of the TMNP folks would take the time to vote on the other ideas, after posting their own comments. We get it. TMNP is an outstanding program, but I don't think continued swamping will be helpful to anyone.

Yes, ORV users should be held accountable for destructive behavior. But those who act badly are only a small portion of the numbers that enjoy OHV use. The answer is NOT TO RESTRICT the areas that can be used. What that does is concentrate the use to smaller areas, thus increasing the impact on the lands. Education and Penalties should be implemented, not closures and restrictions.

- The 150th anniversary commemoration is expected to stimulate renewed interest in the conflict and generate unprecedented tourism to Civil War sites.
- Protection of America's remaining War Between the States battlefields will leave a lasting legacy of national commitment to preservation and conservation.
- Battlefield preservation in Virginia, Georgia, and Mississippi where many significant sites are located, is also vital for protecting local waterways. Parkland created through battlefield preservation near growing population centers like Nashville, Vicksburg and Atlanta and elsewhere can benefit quality of life for residents.

There is already a push to set aside habitat for wild bison. This movement threatens our wild prairies because it ignores the other keystone species: humans. Humans kept the bison moving, which reduced overgrazing. Currently, ranchers prevent overgrazing by herding the cattle onto new grass several times a year. Humans controlled the bison population by hunting, just as ranchers control the cattle population by shipping calves to the feedlots each fall. There is little difference between bison grazing habits and cow grazing habits. The big difference is in how the herds are managed. By declaring all bison to be wild, you remove the tools that ranchers use to ensure that the land is grazed sustainably. The result would be an ecological catastrophe. The best way to preserve our remaining prairies is to preserve the cultures and land management practices that have protected them from the past century of development. To help prairies AND bison, find a way to make bison ranches more economically viable.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The smell of exhaust, the taste of dust and the noise of a motorcycle/ATV makes me crave a hike OHV land.

The State Historic Preservation Officers (SHPOs) and Tribal Historic Preservation Officers (THPOs) cannot effectively do their job of preserving and revitalizing the places of our past without full funding of the Historic Preservation Fund. Linkage with the Land and Conservation Fund only makes sense because cultural resources and natural resources are irreplaceable and part of our heritage and history.

Access carries with it a broad and dangerous definition. It doesn't mean by any means possible. It shouldn't mean "roads" or motorized access-this does nothing by change the definition of wild places into nothing more than motorized trails. Foot and horseback travel are the only two means of access that will keep our wilderness areas preserved. Roads that are being closed don't "close us out", they keep the wilderness areas wild, they give wildlife a chance to survive. You can still walk, hike, camp, ride and leave nothing but footprints. Motorized access is NOT the answer. Science has proven without any doubt that pollutants such as ATV's, Motor cycles, jet boats, snowmobiles and automobiles dismantle and change our pristine wild areas. If you believe motorized access is the answer, you are selfish and unconcerned about wilderness.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

ATV's, motorized vehicles have NO PLACE in our Wilderness areas. There is NO NEED for roads as access. Access should not be used as a means for this sort of destruction, decimation and abuse. In southwest Montana, one of the greatest wilderness areas in the world near Yellowstone Park has seen a dramatic increase in ATV and motorized access. I've yet to hear one valid reason for this type of access. Fact is, as more motorized pollutants like ATV's enter our wilderness areas wildlife is displaced, gone, perhaps forever. The damage done by the people who ride these machines is a disaster. I've heard the arguments that these machines allow access to handicapped, older hunters, etc., -that's all CRAP and an appeal from scumbags who obviously don't care or even understand what it means NOT to hear these distractions when we're "out there". As an outfitter, I continually hear public land hunters complain that there's "no elk left"...one actually rode up to me on his atv and asked if I'd seen any elk. Misinformation, marketing to the lazy, that's how these companies continue to get their way. While reading through my "x-favorite" hunting magazine I came across an add for an ATV, the add showed two camo clad, helmet wearing wingnuts tearing through what looked like my favorite trout stream...there was no "designated trail". Anyone with an ounce of integrity should be feeling humiliated by this sort of marketing and write to any magazine editor who takes the money from the very machines that are taking away our wild places. When it comes to hunting from these machines...they use the "getting from point A to B" argument...once again, more CRAP. You aren't going to see, hear or smell anything wild as you gun through the hills and you can bet everything within 5 miles of "point A to B" is gone-you've also ruined hunting for how many other countless hunters who know what hunting means. If you need an atv to pack out your game, your fat and lazy, inconsiderate and misinformed-you're an idiot and I'll be the first to fight against you. I'm asking anyone who cares about wild places to re-think your thoughts on these machines, take a stand for what's right for wilderness, not for selfish interests. Keep riding and you'll keep losing what you never took the time or the first "step" with your own two feet to hear, see, and smell...to enjoy! Nuff Said!

Many of our battlefields are being swallowed up by development and urban sprawl. While I realize we can't halt progress, there must be a balance between new land use and preserving the past. The American Civil War battlefields are worth preserving. Building a casino at Gettysburg, or a WalMart within a stones throw of the Wilderness will bring down the historic value and solemnity of these historic places. Have you ever been to Arlington National Cemetery, which was started after the Civil War? It's on the flight path for one of Washington DC's major airports; it was disheartening to stand on that hallowed ground, trying to pay respects to the dead with the noise of a jet plane flying over! Flashy casino signs and WalMart sprawl have no place near these sacred fields.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

In many urban environments (such as my hometown of Los Angeles), the problem is not only a lack of parks but equally importantly a lack of good bicycle connections to those parks that do exist. In an era of limited funding, bicycle infrastructure can be provided at a fraction of the cost of new parks. Not only do family-friendly bikeways improve access to parks, they can serve as recreational facilities in their own right. They improve access to schools and libraries. Unfortunately, they do not make good photo or naming opportunities for elected officials. We need a concerted effort by the federal government to require local governments to make bicycle improvements a required component of receiving federal funding.

Regardless of what one may feel about different recreational activities, it is certainly in my opinion a correct criticism that this Initiative did not start with inclusion of recreational groups as stakeholders invited to the table to speak about conservation from the recreationist viewpoint. The initial "recreation" representatives were institutionalized well established conservation groups whose openly primary, even secondary, missions had little to do with recreation. "Freedom to Roam" is not a recreation model as far as I know unless pronghorn migration corridors are considered a way to get young pronghorns in touch with the outdoors and exercise. It is not however the fault of preservationist organizations that the Administration considered "recreation" to be all about watchable wildlife and not about active or even semi-passive recreation other than the ever popular sloganism around "hunters and fishermen" (as long as they don't shoot or catch anything). Politicians need to know that there are citizens actually on their public lands, more than there are fighting them in their courts, and that those folks recreating on the lands have opinions worth listening to, and most are indeed good stewards and can be equally passionate about wildlife. They also pay lots of taxes and vote - you know, authentic Americans. I do know what some recreation representatives had to do to drum up an invitation to the start of this initiative in D.C.. Same is true for the USFS Forest Planning process. Clearly there is a target audience for both of these national efforts, and that audience has not been the recreation community, including all of those that have spent thousands of hours of volunteerism on stewarding public lands and maintaining the public lands trail systems. I just feel that if you want to debate things like motorized use on public lands, have the courtesy to debate it with motorized users (of which I'm not) - don't just stack the deck with identically minded folks. That isn't a conversation - just a monologue.

There are millions of acres of land out there and it's impossible to access most of it due to it being so remote, hard to get to. I completely agree with you! We need more dirt bike trails and jeep roads. Let's enjoy the land while preserving it.

This post illustrates the kind of lies and subterfuge we are up against. Fanatical radical greens want humans locked out of all land because they are selfish, elitist and misinformed.

Until policy changes are made to include fair practices for all use groups no further wilderness designations should be allowed. Period!

Civil War battlefield protection is a great way to honor our American history AND create more green spaces which families can visit and enjoy. It is a win-win proposition!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Invasive species are a threat to diversity. They colonize and create stands of mono-cultures. This not only decreases native plant diversity but also decreases natural resource values including water sources, grazing land, farmland, wildlife habitat, and recreation.

My husband and I are in our mid-fifties and we both have physical ailments that make most outdoor activities impossible. Off-roading in our Jeep allows us to see areas that would otherwise be completely cut off to us. We know many people who off-road and they, like us, never leave the trail or drive over vegetation. Also, there's a saying off-roaders go by, "Please take out more trash than you bring in". There are thousands of off-road clubs that maintain trails and educate people about responsible off-roading. There is a very small percentage of irresponsible and ignorant hikers, campers, and off-roaders out there. Please don't punish the majority because of a small percentage of the population. We love and respect nature, that's why we love off-roading.

This is an understatement. We have so many places where mining claims have never been cleaned up. Dangerous mine shaft abound in the desert, and suck up money that should have come from the miner who paid so little for the privilege of making the mess. Cattle grazing has also left costly damage, and continues to do so in many streams. Damage from off road vehicles is the new and most costly of all the current damage. Motorcycles rip up every hill destroying all vegetation, leaving scars seen for miles and that don't soon go away. People come in large groups to camp and denude the areas, creating dust bowls, killing vegetation, compacting the soils causing erosion, and destroying habitat necessary for wildlife. Some aggressive riders harrass wildlife, cattle, residents, trespass on private property and threaten government employees. With helmets to cover their faces, and no way of identification they feel immune to any type of control. They are out there to "conquer". That type of "off road enthusiast" leaves far more damage in far less time than many of the miners. This hidden cost must be adequately addressed and no longer subsidized.

I grew up riding in the outdoors with my family and friends and loved it. I just go back into the sport again. I am so sorry to see a lot of the riding areas closed that I used to enjoy. My wife has physical limitations that would keep her from seeing a lot of out great outdoors if it were not for our off road vehicle. Going off roading with family and friends always brings us closer. We always have left the areas we ride in better shape that when we got there. I always hear about all the bad apples but rarely see them. I think most people just want to have fun and enjoy themselves. Our taxes have payed for these areas so we should all be able to keep enjoy them.

It is stated by the environmental industry that the objectives of creating the Siskiyou Crest National Monument are: Protect the environment. Enhance wildlife habitat. Protect threatened and endangered species. Improve water quality. Increase salmon populations. Increase recreational use. Creating the Siskiyou Crest National Monument will favor none of these objectives. A major result of the creation of such a monument will be huge and intense wildland fires. By removing the existing roads in the area, fire suppression will be both expensive and inefficient. There will be no access for fire crews, fire tankers, water trucks, nor heavy equipment. They speak of restoring the fire regime; that will take a long time and will require road access. The fuel loading and extensive brush fields within this area is such that fires can't be constrained to the area and intensity of fires in the pre-settlement times. Such large and intense fires will degrade, not protect, the environment. Wildlife habitat will be grossly reduced with devastation of old growth habitats required by many threatened and endangered species. These fires will increase soil erosion, thus degrading water quality. The sedimentation of the creek beds within the monument area will prevent salmon from spawning decreasing salmon populations. By removing the roads, recreational use by children, the aged, and the disabled will be abolished. Experience has demonstrated that following these fires most of the land will revegetate to brush. There seldom are more than three species in these brush fields, so the biodiversity will be severely reduced. Yes, the brush provides cover for wildlife, but these brush fields are so extensive that food becomes the limiting factor. No, creation of the Siskiyou Crest National Monument will not accomplish any of these objectives. I would describe the creation of such monument as a "biodisaster."

Because land-use decisions are controlled by local government, too often these decisions favor well-connected financial interests over an interest in conserving the nation's cultural and natural heritage. Overcoming this challenge will require federal and state incentives, such as (i) fostering smart growth in an urban core (e.g., with mass transit dollars), in exchange for local officials' vacating their objections to preservation of deserving areas; (ii) exercising the little-used tool of permit denial when the secondary and cumulative impacts of development projects merit it; and (iii) ending subsidies to destructive development projects in sensitive areas like new highways, airport expansions, tech parks, and massive new town centers. Otherwise, we will leave future generations with little more than a degraded landscape overcome by development. A pointed example is western Charles County in Maryland. This area, bordered by the Potomac River and extending south of George Washington's Mt. Vernon located on the opposite shore, is remarkable for a dense array of historical and natural attributes. Among the natural assets are two globally rare Magnolia Bogs; wetlands of special state concern; a state Sentinel Site, with the greatest reptile and amphibian diversity in Maryland's coastal plain; a state Stronghold Watershed; Tier II streams; Audubon Society Important Bird Areas in Chapman Forest and the riparian forests of Mattawoman Creek; and Mattawoman Creek itself. For years, the Mattawoman has been documented as Maryland's most productive spawning and nursery ground for migratory fish in the Chesapeake Bay, but is now showing signs of a long-predicted decline that correlate with development of the watershed. Among the historic resources are rich archeological grounds predating the colonial era; Araby, the colonial home of George Mason's beloved first wife Ann Eilbeck; Mt. Aventine, a fine example of antebellum architecture and the manor house the Chapman family, who occupied their Potomac plantation and farm from 1750 to 1912; the brick shell of Marshall Hall, a mansion from the early 1700's; General Smallwood's retreat; and extensive land within view of Mt. Vernon across the river in Virginia. The need for additional preservation is widely recognized. On the federal level, the area is squarely within a Treasured Landscape designated through the Chesapeake Bay Executive Order. On the state level, past preservation efforts were admirable, but appear to have stalled when county officials declared intentions to urbanize the area as part of a "development district" 30% larger than Washington D.C. At the NGO level, the Smart Growth Alliance of Washington has, twice, designated the area as a conservation priority to preserve the historic viewshed from Mt. Vernon and to protect Mattawoman Creek. Mattawoman is at the heart of the area. In 2009, it was listed as the 4th most endangered river in the nation by American Rivers because of development pressures that would follow a proposed four-lane highway funded solely by Charles County. Mattawoman is also the focus of the Smarter Growth Alliance for Charles County, a consortium of 23 organizations including the Chesapeake Bay Foundation, Clean Water Action, 1000 Friends of Maryland, and the Sierra Club, who urge the denial of wetland permits for the highway in favor of smart growth alternatives focused on revitalizing the county's urban core in Waldorf. In spite of state and federal agencies recognizing the historical and environmental importance of western Charles County and the threats from over development, county land-use policy has aimed to jumpstart a new urban core here, 11 miles to the east of Waldorf. One aim is to instigate a new Potomac River bridge just south of Mattawoman Creek as part of the outer Beltway that would surely demolish the natural and cultural resources over a wide swath of southern Maryland and beyond. When the site of the massive Potomac-shoreline development

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

of Chapman's Landing was purchased as Chapman Forest (to protect Mt. Aventine and a cornucopia of biodiversity), county plans simply moved a mile north to Bryans Road, a one-stoplight town now proposed to become an even larger new town center of over 22,000. And that's just the beginning. Coupled to this proposal are intended growth magnets in the form of the new four-lane Cross County Connector, with its numerous proposed attached highway spurs, an industrial park on 268 forested acres that blanket one of Mattawoman Creeks finest tributaries, and an airport expansion intended to divert business jets from Reagan National Airport that would no doubt also divert investment from revitalizing the existing urban core in Waldorf. A major challenge to preserving this area are the federal funds directed toward subsidizing inappropriate development, despite the federal status as a Treasured Landscape. Maryland Airport, a small private airport is slated for expansion with 30 million federal dollars. The direct impacts are egregious, with hundreds of thousands of cubic yards of soil expected to be displaced over four years, in part to fill a stream valley. These impacts pale compared to those that would ensue if the airport were to become a reliever for Reagan National, one of the aims of the financial interests and their county government allies, because airports attract massive development. Yet this particular case is hemmed in by Mattawoman and located on a dead-end highway. Alternative sites nearer potential rail infrastructure were never considered—an example of how federal oversight is failing to promote the goal of preserving our heritage. The loss of Mattawoman Creek is assured if business as usual continues, according to a study by the Army Corps of Engineers. Yet Mattawoman's plight and charisma could be used to demonstrate smart growth solutions for the greater Chesapeake Bay. It is not too late to implement smart growth solutions that would preserve the majority-forested watershed by concentrating growth in the existing urban core of Waldorf instead of sprawl development into western Charles County. But federal leadership is needed. Rapid transit between Waldorf and Washington D.C. languishes as county officials steadfastly prioritize highways over mass transit on their list for state and federal funds—lobbying in particular for a Waldorf bypass, yet another new highway to open rural areas to development and part of long-range plans for an Outer Beltway. Federal transportation dollars should be used to leverage preservation and to upgrade the U.S. 301 through Waldorf, rather than be used for bypasses and airports in extremely sensitive area. Overcoming the challenge of local government's opposition to preservation, even as citizens favor it, could occur if federal agencies exercised existing tools. Federal transportation funds represent a powerful lever to implement smart growth principles, because roads and airports nucleate growth. And when considering permits for development, agencies should conduct a comprehensive examination of cumulative impacts that include costs of future restoration, loss of ecological services, climate change impacts, loss of historic authenticity, and a truly substantive alternatives analysis, and should be willing to deny unworthy permits for the sake of present and future generations.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I disagree. To begin with, grazing on public land is allowed by a permit, not a lease. The grazing by permit is paid for at less than one tenth of its market value. Many of us have seen our "lifestyle," or occupation change radically, and perhaps adversely in recent years, why should the rancher be protected when the rest of us are not? Do I understand correctly that, we are being asked to sacrifice the productivity of public land for wildlife, watershed, and recreational values so that we can go to the grocery store and pay more than \$10 for one steak that weighs less than one pound? The public's cost in degradation of public land and the cost in water resources to raise beef is just too high in the arid West. Still, I sympathize with the ranch family to the extent of wanting to try to help prolong the viability of their operations by looking for ways to purchase easements, compensate for loss of grazing permits, and decrease subdivision of open landscapes.

I thought the rhetoric sounded familiar. For those that don't know, \_\_\_\_\_ for many years has determined that of all the problems on the planet, mountain bikers would get all the blame that he can possibly garner and throw on them. Discussing this with him is useless. Not sure what the end game is, but you can verify by doing a search on his name. When you look at both sides, someone is clearly "out of touch with reality"... Good comments were elicited though by many of you--to name a few!

It seems that some people want to shut people out of the forests and other outdoor recreation areas over that last few years. Gates are going up all over. Some companies that own parts of the forest are closing their section off unless you buy a \$35 or \$60 pass to get through their gate to access the forest. Rather than cut a tree up and get it off the road, a gate goes up and the road is closed. These National forests are our National forests; and we should have the right to use them responsibly, not be shut out or have to be rich so that we can pay \$35 or \$60 or what ever the cost is so that your family can go through a forest companies gate or paper companies gate to get to the National forest because they bought up the land around it. My family uses OHV to enjoy the outdoors. We go huckleberry picking. We just go for rides to see new areas of the forest that we have not seen. We check out the wildlife. One summer we rode to every fire look out on the map we had. Our children noticed real fast that they were all different, and that it was because of the surrounding area and the hill they were built on. My parents love to take the grandchildren on rides to show them the beauty of the forests, to see animals, and go berry picking. They have shown them many historical places, and old mining places dating back to the 1860's. They have seen where Wyatt Earp had his White Elephant Salloon and gone through ancient cedar groves. I also use my OHV to get to a base camp. Then go out on foot from there to hunt. I ride responsibly, and teach my kids to do the same. Every spring the OHV shop that I bought my OHV from holds a clean up ride. They make it fun for the whole family while everyone is out riding, cleaning up trails. This is all volunteer work. We should not be shut out of the forests, forest roads should not be closed because some one does not want to remove a fallen tree from the road, and we should not have to be rich to be able to have access to our National Forests and recreation areas. Furthermore, OHV allow people with disabilities to experience the great outdoors. I have a friend who got paralyzed falling off a two step ladder, with an OHV, he can experience more of the forests now rather than see just what he could wheel himself through or we could push him through.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

OHV use promotes economic growth and gives the American people a way to see and enjoy our National Forest lands. Wilderness promotes nothing....except the potential for more job loss as more area is locked up.

If you don't like the OHV, then please, go where we are not allowed, which is almost everywhere. There are fewer and fewer areas where OHV use is allowed and we are getting shut out of existing areas every day. Why is it that so-called "nature lovers" all come to OHV areas and try and recreate there when there are millions and millions of areas set aside where OHVs can not be, then they complain about OHVs being there? Well, it is because our areas are so clean, pristine and accessible that they are great places to get out and enjoy the outdoors. They are not the horrid places that "nature lovers" claim we create. Because we all love being outdoors and all strive for the same thing. Yet the few of you, your hobby is to get rid of us. Strange since we all want the same thing, great outdoors to play in.

Off Highway Recreation is a legitimate, sustainable use of appropriate public lands, particularly on National Forests and Bureau of Land Management Units. And once you drive your car on a dirt road, you are one of us, so don't write off OHV so quick. Because the perception of OHV use is often associated with irresponsible use and is not consistent with the majority, most casual users stereotype OHVs. The majority of OHVs are conservationists, who seek to preserve the same outdoor experiences they enjoy for children and grandchildren. We want the outdoor open spaces and we enjoy using them like everybody else, yet we are being herded into smaller and smaller areas while our numbers are growing. OHVs are volunteers. OHV clubs and organizations groom and maintain trails, trailheads and other facilities as well as adopt trails and provide the tools and experience needed for constructing and maintaining all sorts of recreational trails; not just OHV opportunities. Millions of Americans responsibly enjoy motorized recreation on public lands and you may be one of them who is going to have your recreation taken away from you don't realize how important having this opportunity is.

Thank you all for your comments. I am familiar with the Late Successional Reserves for the Northwest Forest Plan. A positive step, a fine goal, but most of those reserves are far from the population centers of our country. What do I tell my students in Salisbury Maryland when they want to see "old-growth"? Fly to Washington State? The Old-Growth Forest Network will identify an ancient forest (or ancient forest to be) in every county. Reachable by every school child. A drop in the bucket, yes, I agree. But I for one would like to try to put a few drops back into that bucket. If you would like a 5 page proposal of the idea please email me at: jemaloofsalisbury.edu

The BP oil fiasco will shine a spot light on the corporate pirating of minerals from our public lands and waters without adequate compensation. The exposed corruption of the Federal Minerals Management Service will also mean that the time when this can happen will be over soon. As for the farmers and ranchers currently camped out for several generations on Federal lands and paying 10 cent on the dollar to do so, they too will be in the spot light. That may or may not be fair or just, but it is on its way.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The Northern expansion of several tree killing insect species is a function of a shift in the climate belts to the North and is currently occurring in bands all the way to the Arctic. Yes, the trees should be removed so that they do not provide fuel for forest fires, but re-seeding with the same species is a waste of time. It would be much better to let the natural sequences now occur that will over time will lead to a new but different climax forest. Above all else we must resist corporate pressures to artificially create plantation forest.

"industrial development is hardly taking away any of Montana's heritage....." Sorry Mr. Pippin, but you should see "gasland" and how Dick Cheney allowed the gas co's to bypass the clean water act. Let the public use public land! The big corps already are.

Without conflict they can't gain more donations. They are in the business of creating and marketing ecological conflict! Which is contrary to your suggestion!

As a veteran and former ROTC instructor who took cadets to Gettysburg as part of their professional development I have to say that I've been disappointed in the amount of development that is already in place at Gettysburg (and several other Civil War sites). In several of the areas it's almost impossible to tell how/why the battle flowed because you can't "see" the terrain anymore. If the casino is going into an otherwise empty building I might be able to understand, but what else will be added? Billboards? Parking? additional lanes on the roads? I grew up in western PA. I know all about the need for jobs in the state. I'm just not convinced a casino in Gettysburg is THE answer.

Your argument is factually flawed. Elk are large herd animals subject to the same diseases and land use as bison, yet they are accorded game status. Bison do not "damage" the land in any substantive way, any more than any other large herbivore does. To say that the existence of brucellosis in bison is reason not to accord them game status and to push to protect their range is spurious. Brucellosis is a livestock disease that has spread to bison and elk, not the other way around. Unfortunately, there are only about 6000 genetically pure bison in North America. Managing the brucellosis problem is a major concern, but not reason to dismiss this idea.

Boasting a statement of "Even the OHV crowd should support this, greater habitat and animal populations means some areas now off limits can be opened up to you." is a wolf in sheep's clothing!

Connecting with America's Great Outdoors requires one key element - the ability to get "to America's Great Outdoors". That requires access to public lands. That access is being restricted. Enough wilderness. Manage lands to provide recreation opportunities - motorized touring, camping, hunting, fishing, hiking, and other activities.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Cost should not be a barrier to spending time outside, yet it is cited time and again as a top reason for not getting out and spending time in the great outdoors. This is a very legitimate concern as a family of four may spend \$800 - \$2,500 for camping gear. For many that would like to try camping, but aren't sure how often they will camp in a year, this may be a prohibitive expense. Companies such as mountainsidegearrental.com or lowergear.com rent great gear for a fraction of buying gear and make it very easy for people to get out into the wilderness. Too bad more people aren't aware of these resources as they may finally get the family out on that camping trip.

I also had a bad audit experience with an IRS engineer who made false and erroneous statements in reviewing our conservation easement. We had to fight it up to the appeal level where they admitted that the engineer had made mistakes and they dropped the audit. There are certainly some landowners who have abused the conservation easement process with inflated appraisals, but that's no excuse for shoddy auditing. Sincere folks are getting punished along with the abusers. I hope it is not the intention of the IRS to discourage legitimate easements.

I question how another report will help. We already have cabinet level coverage that is responsible to do exactly what you propose. Adding more folks to the Federal level to create/manage the report will only take funds away from where they belong.

I think a fee based use for open space is appropriate. I use the trail so I should help support it. Everyone should pay a annual park permit to use the trails. Currently the only ones who pay are OHV.

I would gladly agree with this having used the PCT in the past for years. Now that I have the age and physical problems that often come with age I can no longer enjoy the trails. I now have to use off-road vehicles and ATV's. In these days of lower funding for recreational needs the government should give "more government recognition" and funding to these types of trails. But more importantly is to realize there is a stronger need by larger user groups than hikers in ATV'ers and Off-roading community. Create separate but very similar multi-use trails to be used and enjoyed in a responsible and environmentally sound way.

In the area we live we are under constant threat and loss of the multi-use off-road trails. There should be a stronger demand for creating safe, well managed, environmentally friendly riding areas for the largest user groups that now use our National Forest for recreation – the ATV and off-road community. With programs put into place along with better enforcement it will greatly reduce "the irresponsible users" on single use type of trails (hiking). Established hiking trails should be enforced and protected as such, but where the strong user need is for other than a single use trails – multi-use trails that all can use should be developed.

It is a win, win situation for preserving our Civil War Battlefields! Not only do we honor our heritage as a GREAT Nation, by preserving the battlefields of the very war that ultimately UNIFIED our nation, but we help the commerce and trade of the very towns that have this heritage. We don't need another casino, nor another Walmart, nor another housing development encroaching on these sacred grounds that must be preserved for our present and future generations!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Much of the cause of the increase in damage to public lands caused by reckless and criminal OHV use is due to lack of funds to patrol these areas and prosecute OHV riders who are where they shouldn't be. If we begin to throw some of these criminals behind bars, or take their OHVs away, then perhaps other riders will stop ignoring the law too. And if there is less destruction caused by OHV riders, then the rest of us will have less reason to object to the creation of new OHV routes. OHV users on this site claim that transgressors are a small minority of all users. This idea gives us all an opportunity to see whether they are being honest about that appraisal.

Not sure I want any more governmental licensing in my life. I know that most (if not) all manufactures' when selling an ATV offer a free course for proper and responsible use of the customers new vehicle. I do see abuse in the back country occasionally by ALL TYPES of users. Should we now require a license to hike, horseback ride, mountain bike or even picnicking? I understand your reasoning, but my denote of your idea is we have too much government in our lives now.

The concept is good, but the use is limited. A multi-use trail system serves the need to everyone that wish to use it, where a single track mountain bike only trail does not. Granted there will be fewer hikers on a multi-use trail. But a multi-use trail will be used by far more people to responsibly access the back country.

There are lots of hiker only trails but I have yet to see a mountainbike only trail.

These trails and the way they interconnect all of our country provide safe, wholesome, family friendly, affordable to every budget opportunities for every American to rediscover the natural world, explore the story of America, relax, get fit, shed complexities and develop a greater appreciation for life's simplier joys. These trails can truely provide solutions for so many of society's ills and short comings. When completed and recognized by the majority of our country's citizens their popularity will be unsurpassed and treasured by all. This is something we need to make happen now. The rapid change taking place today in America's landscapes means everyday we loose opportunities that would make the system even better. Let's not loose any more opportunities.

This idea is exactly wrong. To promote people's use of the great outdoors, we need to create more wilderness areas so that people can enjoy peace and quiet in an unspoiled setting. There are still many beautiful areas in the US that should be protected before they are ruined by ORV use, road building, oil and gas leasing, etc. etc. The threats to land preservation are many while options for adequate protection are few. And any motorcycle rider who says that his loud machine doesn't bother hikers has his head up his tailpipe.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While I strongly promote the use of public lands for recreational purposes, we must be vigilant about avoiding an implied expectation that we should spend a lot of public money (that we don't have) to do so. We must stop spending public money like a drunken sailor. An important part of this is that we users must be good stewards of the public resources and clean up after ourselves. When we all use the resources respectfully there is really no need to spend public money. Our recreational use of public lands at no cost to the public is important to our continued use of public land. The cost of providing access (cleaning up after us) is the rationale that will be used to restrict access.

Why should "environmental non profits" voice be any stronger than my own or yours. This country is for the people, not the loud select few! I without question say we need the "environmental non profits" view point and expertise. But to say they are "much less likely to take bribes or trade off land rights for drugs and prostitutes" is a slap in the face of many which is so wrong to say. I have seen where groups pressing for wilderness areas have come right out a lied about facts. These are NOT groups, nor any group, should have a voice more important than the average citizen of this country.

Yes we need to stop draining every low spot for farming! That is how these corporate farms operate and push out the small farmer.

As Taxpayers in this country OHV users of anykind always get passed bye in the issues here. I being handicapped Cannot hike or ride a horse and most public lands are OFF Limits to me, because the only way I have access to these lands is an OHV. Why do us OHV enthusiasts always Lose in Issues like these talked about here? In the last 20 yrs in my area I've seen nothing but fences and Signs Prohibiting OHV's Our OHV Park ( Hungry Valley OHV Park) gets Smaller and Smaller each and every year. Statistics taken are always based on what the Enviromental Movement want the Public to hear, not the real facts! We all pay taxes and as The President says, There will be Change! In Who's Favor? Certainly not ours! By closing these OHV areas, Everyone Loses! From the OHV enthusiast to the Businesses that we Support, A.K.A, Hotels, Campgrounds, Motorcycle Shops, RV Businesses, AfterMarket Manufacturers, And You the Government in taxes Recieved! Open your Eyes To All Groups, Not just the ones Lobbying you!

California is Backed by Non OHV people who vote out everything to do with the OHV Comunity, We Lose More and More Each year to them or Stupid laws set forth by them. I say Vote on it and let both sides spend Equal amounts of \$\$ to do so if thats what it takes!

Wilderness is fine, the political Wilderness designation is not! Taking land that has been productively used by man since the end of the ice ages and restricting it to limited hiking and "controlled" burns just isn't responsible. Properly managed multiple use of our public land is needed.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I see federal managers compromising wilderness ecosystems when dealing with lightning ignited fire in wilderness. Locally, the forest service suppresses or modifies lightning ignited fire to isolate endangered species habitat. These modifications are contrary to the intent of the wilderness act and results in a slow degradation of the wilderness ecosystem over time. In addition, suppressing wildfires to protect threatened species is used as a justification to do prescribed burning, all at heavy cost to the wilderness ecosystem. What happened to ecosystem management as an approach to decision making rather than species management, i.e., doing what is best for the ecosystem rather than what we think is best for one of two species? I would like to see a wilderness stewardship plan for each wilderness that would guide actions to serve the wilderness ecosystem rather than a plan that forces actions to deal with one or two special status species. We have some large remote wilderness areas where we can truly let natural processes unfold including high intensity fires. When we modify wilderness ecosystems with a heavy handed approach to fire management we loose the opportunity to study and learn from nature. There seems to be a mind-set that wants to remove high intensity fires from wilderness ecosystems but high intensity fire is a part of natural processes. As much as possible, we need to let wilderness manage itself with our role as stewards of the process. We seemed to have lost the ethic of restraint embodied in the Wilderness Act. Lets get away from manipulation of nature in wilderness and instead empasize the safeguarding of natural conditions and ecological processes to the maximum extent possible.

Im onboard with preservation of these pristine and often sacred lands forever. Most of what mankind does is but a whish of dust in the air of geologic time... when mankind finally comes to in the future ... and realizes that we are the 'stewards' of this planet... not the 'users' .... then all attempts as preservation will be forever regarded as steps toward our future with the planet.. not our ultimate extinction against it... may God bless all impacted by the gulf of mexioc disaster.... which may change minds more than 3 mile island and cherynobel did.....

Preservation of Civil War battlefields saves a vital part of our national experience.

Walking battlefields with my son were some of the most enjoyable times of my life. A great environment to teach history, politics, life lessons, spatial analysis, geography, etc., and very healthy to be outside walking and climbing. Preserving battlefields is a very cost effective way to create tourism and promote healthy activities.

Grazing rights on lands overseen by BLM and the Forest Service are privately held pieces of property that DO NOT belong to the federal government or the general public. Ranchers legally purchased these grazing rights, thus making them a privately held asset. They are no different from surface rights, mineral rights, your car, home, or any other belongings. Taking them away would amount to stealing, end of story. The truth is most BLM and Forest Service land with privately held grazing rights are already being well taken care of by individuals with a vested interest in its well-being. We can't let a few folks who have probably spent a very limited amount of time on land with private grazing allotments skew the reality of the situation.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I can't speak for everyone else, but I can say why I voted against this idea. Non-profit conservation organizations have no place being the only members of the general public in a group like this. For starters, many of these organizations are largely funded by people from other countries. Any organization whose has most of its funding coming from outside the US should not have that much power in an American commission. Many of these organizations have a very radical point of view. While this is their right, radical opinions should be largely left out of a committee such as this, as they can often lead to more harm than good. I would not be opposed to a commission such as this if it included only neutral ecologists and biologists from many different areas of the country making logical and informed conclusions. I don't feel like this is "thinking only myself", but is instead avoiding putting radicals and non-Americans in charge of our greatest resource.

I have a huge problem with the government using eminent domain to perform land grabs. Presidential eminent domain was originally used by Teddy Roosevelt to save great American landmarks such as the Grand Canyon. Since then it has been used primarily by presidents at the 11th hour before their term has expired to conserve land they couldn't get public support for during their presidency. Remember, eminent domain has no checks and balances, no listening process, and almost no way of being revoked. If land is to be preserved, studies should be done and input should be taken by all those around it, including the landowners themselves. I am NOT against land preservation if it is done in a fair and reasonable manner. However, I would not call the big hand of government swooping in and removing private landowners (a.k.a. Eminent Domain) either fair or reasonable. Just think how you would feel if one day the government came knocking on your own door and said they were going to take your home whether you like it or not.

It is also a great example of wildlife population devastation. I'm not sure if you are a regular visitor of Yellowstone lately, but I am, and let me tell you it is not better off than it was before the wolf was introduced. Deer, antelope, moose, and elk numbers have been so greatly reduced that I seldomly see any of these animals anymore. Before the wolf was introduced, they were quite abundant. Now the only thing I am assured of seeing is a massive heard of buffalo and land that has been overgrazed by them, all because somebody got a wild hair to introduce a few wolves.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

I think your view of many of these so called "non-profits" is a little off. Many of these organizations have gone the way of corporate giants such as Exxon, General Motors, and BP. They have lost all touch with reality and are only out for personal gains, posing as wildlife sympathizers. For instance, according to their 1998 tax form the Sierra Club spent about 50% of donations on actual preservation. The rest went to wining and dining the fat cats at the top of their corporate ladder. { <a href="http://www.sovereignty.net/p/ngo/sac-1.html" rel="nofollow" target="\_blank">Link</a> } Another example is the Nature Conservancy, who made nearly \$400 MILLION dollars after expenses in 2000 alone. Remember, because they are classified as a "non-profit", no income taxes were paid on any of this money. As of 2009 they had \$5,637,205,000 (that's over \$5.5 billion) in assets, a number I'm sure has only gone up since then. That is some serious cash, enough so that I have a tough time calling them anything but a corporate giant. { <a href="http://www.undueinfluence.com/nature\_conservancy.htm" rel="nofollow" target="\_blank">Link</a> } { <a href="http://www.nature.org/aboutus/annualreport/files/fs\_fy2009.pdf" rel="nofollow" target="\_blank">Link</a> } I don't know about all of you, but I am tired of big business calling the shots. Don't let these companies pretend to care about the environment so they can line their pockets. If you want somebody on a federal committee, how about asking a neutral source such as an independent biologist. That way actual facts and figures would be heard by those in charge, not just extremest ramblings by environmental corporations looking to make a buck (or 400 million).

The clock is ticking... the "No More Wilderness" is terrible policy and does not mirror the desires of the American people. We can choose to protect these prestine outdoor spaces now for generations to come, or give them away and be destroyed forever. So many of our prized public lands are at risk, but what especially come to mind are the most unique canyonlands on Earth, the redrock country of southern Utah. Let's reverse "No More Wilderness" now and preserve what we have because it's disappearing faster than you think!

Older adults and persons less physically able also have the right to access our public lands. Motorized access is the only possible way I and my husband can continue to enjoy access to wild areas, to photograph wildflowers, and to fish in mountain creeks. We have been privileged to observe eagles, deer, pronghorn antelope, and wild horses while sitting quietly in our OHV and using our binoculars. We have been lifelong conservationists, birders, and are responsible users of our NFS and BLM lands. Do not deny us our rights and our access by removing motorized access to so much of our public land.

We seem to have ignored the fact that we are striving to be self sufficient in energy production. Tying historic preservation to oil leases may be lucrative, albeit it appears only one half the promised amount is delivered each year, but will funding of historic preservation with oil lease money hold this important work to ransom and delay that of conversion to alternative energy sources?

## Discussion Question 2

While it is important to educate and engage our youth as future stewards of our ecosystems, it is also important to educate and engage adults. Most adults will not go back to school, but with this program they can easily participate in a well-rounded education that covers many aspects of ecology and the connections of these fundamental concepts in our local ecosystems. The more we know, the more we care, the more we'll be engaged and active in managing our local resources. This program is adaptable to any ecosystem in any state and specifically promotes local participation, which in the long run has far reaching impacts on our natural resources.

An effort should be made to better engage young kids with wildlife in their areas. This can include textbooks on our nation's wildlife, organized trips to conservation areas, and customized learning programs to teach kids about the ecosystems within their specific region. I remember some of my best memories as a child were being outdoors, exploring nearby forests, finding frogs and strange insects – why do we tend to move away from this as we grow older? We learn so many things at an early age that do not seem to register with children, but perhaps if more effort was put in the schools to teach children about the local wildlife and natural environment, many of us today would get out of our cubicles and go explore America's Great Outdoors more frequently.

And the funding for these signs comes from???

As an office manager of a construction company I couldn't agree more! Tamarack Construction in Montana has been building energy efficient homes for more than 15 years, and continues to educate the public and clients about the "building science" of how buildings live and breathe and the importance of building and retrofitting for energy efficiency. Visit [tamarackconstruction.com](http://tamarackconstruction.com) for more information . . . sign up for our quarterly newsletter. Tamarack Construction is a Northwest ENERGY STAR partner, being 100% committed to building ENERGY STAR certified homes. To my knowledge, there are currently no educational or certification requirements to become a "builder" or "contractor" in Montana; just a fee and registration with the State buys you the right to build homes. Pity the customer seeking to build their dream home who doesn't check references!

Congratulations Lori J . . . you took the words right out of my mouth! I'm troubled by the fact that conservationists never seem to think of those who are handicapped and unable to hike into public lands. A physical handicap shouldn't prevent one from being able to enjoy what has been set aside for public enjoyment.

I'm waiting on a listening session to come to the Bitterroot Valley of Montana.

What? Obama can't print more money?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

While it is true that geocaching is a great family activity, I don't feel it should be implemented by the USFS, or any other governmental agency. Local outdoor recreational clubs in many areas already provide this type of activity. I would much prefer to see those who are interested in geocaching to take the initiative in their area and make it happen! STOP the insanity of expecting the government and its agencies to entertain the likes of us!

Aquaculture fish farming started small with the best of intentions. Goliath bought them out. They pollute sensitive ecosystems, and threaten wild fish. Farmed salmon are fed several times their body weight fish based food. They need antibiotics because of the cramped living space. Herbicides are needed to control algae produced from their feces. Pesticides are used in a fatal attempt to control parasites. The wild smelt leave the river and pass the farms, they die from parasite infestations. Escaped farmed salmon can have a catastrophic effect on native fish, and could have irreversible consequences. Plus, would you really want to eat that? Please help preserve one of nature's most magnificent creatures, and perfect food! Wild Salmon!

I am the descendant of a Civil War soldier. I grew up on the stories that my grandmother told about her grandfather. Now that she's gone, I wish I had paid more attention. However, I live in Virginia now, and have had the opportunity and privilege to visit several nearby Civil War Battle sites. I can even look at my Great Grandfather's diaries and find out if he was stationed anywhere near these sites. I can actually walk where he may have walked. How could I do that if there was a WalMart or a casino built on top of the site. Even if these modern monuments to greed were built nearby, the traffic and noise and lights would do so much damage to the ability to visualize and understand what happened there not all that long ago.

I don't understand the practice of waiting until lame duck time. Save some now, in the middle and the end!

Many states already implement this. Michigan, for example, has a large trail system for OHV use. As an off road motorcyclist, I see the 'damage' done by OHVs as well as selective and clear cut areas of forest. Clearcutting and selective cutting erases any evidence of trail... trail that has been rerouted around for a year is nearly impossible to find. Deer and other wildlife utilize the trails. This 'damage' is not nearly as bad as some people would like you to believe. There are also many many volunteers who put in hours of their valuable time to maintain these trails... I'm sure the state ends up ahead from the ORV licenses it sells every year.

More people getting out is a good thing. More cars in the parks, not so great. California is proposing a bill that would put a park fee on our DMV. All CA cars would be pre paid for state parks. I hope if it passes they use some to fund mass transportation into parks. We should also find a way to keep pollution down in National Parks. Limiting personal vehicles, and having a convenient alternative will help in over crowding, and aid in enjoyment.

Planting native trees, ALWAYS good. A huge problem is, we and many other countries are cutting down way more trees than we could ever plant. Habitat needs to be protected. Alternative resources must be used.

## Discussion Question 2

***(cont.)***

I really like the idea of using these existing utility lines, but my experience tells me it would be very difficult to get all the utility companies to agree to the use of their lands for public recreation. There are liabilities involved and the right of way for the easement is routinely mowed and maintained so they would likely just mow over the gardens and trees. Utility companies typically require frequent mowing to prevent tree establishment so the root system does not grow into the pipeline.

Sustainable communities to me mean communities where people can create, grow, nurture and make the basic essentials needed for life; where people care for each other; where people support each other for instance by buying from their local farmer, the local store rather than Walmart, where schools are able to buy food from their local farmers so that students really receive wholesome meals. Where small scale industries such as a plant making solar panels makes such panels for local consumption; where others have businesses installing such panels and where ordinary people can afford to put such panels on their houses and barns. It would also be nice if people were able to grow flax and use it to make clothes and to grow hemp & use it to make paper.

These outdoor products are already expensive. Hunters take away "product" from their environment, so naturally the product has to be replenished. A hiker/camper is only taking away memories (hopefully!). Additionally, most "green" products, such as organic, energy efficient and sustainable are already significantly more expensive than standard products. I am afraid that taxing products that are used in "green" recreation will not encourage the people that have not discovered the outdoors and discourage current users. The small tax is a good idea, but it needs to encourage people to make "green" choices such as taxing fertilizers and insecticides. People toss these chemicals on their lawns and gardens. Both insecticides and fertilizers are bad for the environment by adding chemicals that pollute our waters and kill wildlife. Let's tax the stuff that destroys our environment.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I believe we need to stop maligning our urban wildlife to the point that we have created excessive, unjustified fear and demoted the animals closest to us as "nuisance" wildlife. We have become brainwashed about wildlife to the point that we do not value the animals as individuals, but as an entire "system" being left to the management of agencies who are operating much more as a business than of an agency originated to protect. Wildlife is not a "thing". It is not a renewable resource, but that is how the majority of our species are treated. Wildlife abuse is rampant, and we are ignoring it - IF we even know about it as it is hidden behind a veil. What is this telling our children, what does it say about our society? If we don't appreciate the wildlife closest to us, how much and for how long will we really care about wolves, whales, or polar bears? Or even environment? Our pesticides continue to create immune issues for our bees and now our bats. But what has changed? The meaning of "Ethical" has it's own definition now in the wildlife world. Non-sporting wildlife enthusiasts greatly outnumber sportsmen, but who has all the say in our policies? Which contingency makes up the staff of our decision makers? These "nature conservation" groups must do much more than preserve lands for ample hunting. Respecting and appreciating wildlife must begin closer to home. There are more than birds and butterflies in our yards and town parks, but what class is studying those animals and their value to our ecosystem? Meanwhile, blood "sports" like Penning, trap-n-shoots, steel jawed traps, and youtube videos depicting hoodlums drowning and crushing wild animals is setting a standard for our children to grow up with. This is NOT ok so long as hunters have "preserves" of deer conserved for their next season. There is a serious gap in all of this, and it falls between the butterflies and the polar bears.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

thank you for your reply. I appreciate your viewpoint. "Brainwashed" refers to the fact that our society today knows little about animals beyond domestic pets and livestock. Our grandparents lived with wildlife that we are continually told today is loaded with disease and parasites. Our ancestors helped distressed wildlife far more than they killed it simply due to overstated facts. We are told and thus we believe that culling of species is needed to control populations. It is not, it in fact has the opposite effect on most species. We are evolving. We ARE becoming more aware and compassionate. Less than a couple decades ago there was no abuse protection for animals at all. Now there is. Domestic animals have been accepted as sentient beings, capable of suffering and accepted as having emotions. Why do wild animals remain exempt? From that point begins a barrier, a veil deliberately kept between the public and urban wild animals via exaggerated risks, lack of education or appreciation classes. Why? Several state wildlife agencies are right now receiving an unprecedented amount of comments regarding outrage about wildlife penning. What the public did not know has incensed them now; that any state agency would allow OUR wildlife to be illegally transported around the world and placed, wounded and weak, into pens for hundreds of hound dogs to chase and shred alive, purely for sport. That young animals such as raccoons and opossums are placed into flimsy hamster cages and allowed to be torn apart by dogs... Dog and cock fighting being outlawed was a start. Why do we still allow these "hunting" activities that have nothing to do with hunting - and are not even predator control! What about "ethical" hunting practices? And what do these blood-sports have to do with anyone's survival in the USA? Perhaps some of us are a long way from viewing animals as more than a resource, but some of that is deliberate to maintain funding and recreation that WE as a society today would not approve of if we knew about it. Which is my point in regard to this original post - that we need to stop maligning and abusing certain species while believing we are truly teaching our children about conservation - when it is primarily the so called "conservation" that behooves an industry dependant on it for funding and recreation. We are not going to advance as a society, or towards genuine conservation, until we open our eyes to the suffering we allow and even promote. I am not opposed to ethical hunting. I am opposed to barbaric, inhumane, deliberate suffering we allow to continue. And I am opposed to what we are allowing our children to believe is ok, just focus on birds, bees, and climate issues....pay no mind to that truck full of starving coyotes and foxes on their way to be mauled, never mind steel jawed traps, or that 56% of bow-hunted prey is lost to die a slow, miserable death... All because there is a tiny percentage of people that enjoy blood sports, and are backed by special interest lobbying? We really want to do right by our children's conservation training? Then let's get real about it. Let's teach them about the politics behind the crises, lest they grow up and continue our mistakes. We created a monster, don't teach our children how to keep feeding it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Regarding #7 - competing with sports and programs children find more exciting? Bring in wildlife rehabilitators with a few wild animals, orphaned babies, animals wounded by fires set in chimneys to "exterminate" them, or poisoned by anti-freeze or bleach, that have a leg missing from a trap. Show our children firsthand what not having patience with the world around them causes. The struggles and pain that myths lead to. The mistakes that humans make, and the better ways to deal with conflicts in our natural world. Worried about the risks of doing this? Well, case-in-point! And voila, the fear is perpetuated, is it not? Rehabilitators and other wildlife workers are working with these animals every single day. We survive it! Let the realistic perspectives be taught. If children respect the animals living among them every single day they ARE GOING TO APPRECIATE the bigger picture faster, better, and more proactively (better than our generation has).

Is the issue with this idea the word "all"? The idea to promote renewable energy alternatives is important. Converting all facilities may not be advisable [for example historic structures including New Deal era].

In addition to the myriad imperative reasons for preserving and maintaining these crucial historic sites for future generations, it also makes good economic sense. History-related tourism can be a big revenue generator for local economies and would probably have more impact as a economic "stimulus" in the long term in creating than a lot of the short term public works / development projects being funded in the name of economic recovery.

I think one of the hardest parts about that is it's hard to get people to conserve and protect what they don't understand and can't touch. If you don't give people a chance to connect with a place, they might be less likely to want to protect it. That being said, I definitely think there are ways to manage access and use of lands, but it seems to be an interesting problem.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I recently attended the President's Great Outdoors listening session in Missoula, Montana. As a professional forester of over 40 years, I appreciate the emphasis on encouraging public use of our public lands; however, I remain dismayed by the lack of attention to the unhealthy nature of much of our national forestlands. Not unlike the BP oil spill that is currently spreading through the gulf waters... insects and disease has been spreading through western forests for over a decade: 18 million acres west-wide, and over 5 million acres in Montana. We are but a perfect storm away from a catastrophic wildfire that will devastate lives and property... yet, Congress and this administration remain ambivalent about this impending calamity. I lay the blame at the feet of Congress because they refuse to give federal land management agencies the financing and manpower they need... and I blame the Administration because they refuse to include adequate funding in their annual budget. Therefore, I recommend the following: 1. Direct the Chief of the United State Forest Service to send a letter to Congress acknowledging that federal land management agencies lack the manpower and financing to manage the threat of catastrophic wildfire near many local western communities. 2. Allow state and local governments to identify national forestland that are at significant risk from wildfire near local communities... and give them the authority to manage that risk through fuels-reduction projects. 3. Set up a fuels-reduction fund—similar to the BP reimbursement fund for the gulf area—adequate to allow state and local governments to address national at-risk forestlands that threaten their communities. I have grown weary of listening to members of Congress—most of which have no national forestland in their districts—refer to our national forests as “national treasures” that need to be managed for future generations... when in fact too many forested acres out west are a “national disgrace” that future generations will be denied beneficial use of. In states like Montana where the forest is largely owned by the US government, it is long past time that federal land management agencies became good and responsible neighbors... and the steps listed above are the best way to move towards that objective.

Right On!! Multiple use management is good for everyone. It helps sustain local economies tied to public natural resources as well as provide the direction for sustaining those natural resources into the future. Locking public lands in designated wilderness areas causes degradation of the natural resources proponents claim they want to protect. We have a God given responsibility to be good stewards of our lands. No management is mismanagement. I congratulate you on doing what you can to make our public lands accessible so all can enjoy them.

"so I have no sympathy for families of OHVers or their fond memories" I hope you can see that your comments are as arrogant as you claim OHV exhaust noise to be. If your issue is with noise then why support the closing of large riding areas? This only confines more people to a smaller area which in turn causes greater wear on trails and more "noise" for other recreationists. Also the large majority of these trails that are being "destroyed" were created and maintained for many years by OHV clubs. These same clubs have no issue sharing these trails with others who respectfully use them and are willing to help keep them around for future generations. Keep in mind an overtraveled trail will cause excessive wear regardless of whether an OHV, horse, mountain bike or hiker is the one using it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Just like you cant ride a motorcycle into a museum you cant take pets. Why then can you take a dog into a Wilderness area or state park? Dou you think a wild animal is more scarred of the noise of an engine then of a predator? Public access is restricted for the use of many people in Wilderness areas. Many people chose to recreate in a different fashion then you. This is called diversity and should not be ruined by those clubs that have more influence to shut large amounts of users out of land that should be shared.

This forum is to help contribute ideas for reconnecting to the outdoors. What is stated above is a idea to ban those people who have been exercising their right to use public lands to provide food and recreation for themselves. Recreation is diverse in our parks and should continue to be this way. Take the time to consider how lucky we are and ask why we should not allow others to take part in this great resource.

America's historic places (whether sites, structures, landscapes) deserve all the support and funding we can give them. So many important sites, especially in rural regions, are in desperate need of protection/preservation if they're going to survive. Those places are part of our shared story, and are worth maintaining.

FLTFA is a dedicated funding source for federal land acquisition in the Western states, helping conserve BLM designated areas, National Forests, National Parks, Wildlife Refuges, Wild and Scenic Rivers, the National Trails System and other critical areas. FLTFA is a "land for land" conservation program, generating revenue through the sale of BLM lands identified for disposal through a public process to purchase priority lands for conservation. Since enactment in 2000, FLTFA has generated over \$113 million and the FLTFA account has provided funding for over 18,000 acres of strategic conservation projects, often complementing Land and Water Conservation Fund (LWCF) support. Unfortunately, FLTFA expires July 24, 2010. We hope this successful and noncontroversial conservation program will be permanently reauthorized, in order to have funding to protect treasured lands for fish and wildlife conservation, cultural and historic preservation and outdoor recreation. See [www.fltfa.org](http://www.fltfa.org) for a brochure, maps, and more details.

Long overdue. We could have a major nationwide listening effort on this idea alone.

Public lands belong to all the public and should remain open to all the public. People in this century choose motorized transportation 100 to 1 over walking or horseback. This is the peoples choice, leave public land open to ATV, Snowmobiles and other of the publics chosen method of acces to public lands. Ken Dunn

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As a disabled vet, OHV Instructor and father of 6, ATV riding has been every family vacation for the last 8 years. There is no way I could have walked to the places we have seen as a family. Most of my kids best memories of vacation revolves around riding. Look at the facebook pics. Yes we have done amusement parks, cruises, etc.. but all of them remember the ATV trips we have taken in CA, NV, CO and my favorite UT! Locking out certain groups of OUR public lands is a terrible idea. We can all share them doing what we all like to do-whatever it is. Its bad enough with the impending USFS travel management rule implementation, we will lose trails we will never get back. We in CA have been robbed of more than \$5 million of OHV funds to help others, not our trails. How many legislators have actually been out in the wilderness just exploring or walking around? The are just puppets of the lobbist in DC.

I agree. Most of the areas are not available to OHV's and the amount of available land for OHV is being taken away for Wilderness designations and expansions of National Monuments with bills by Barbara Boxer or others that sit in their ivory towers and take land away from people who've used them for generations. And, believe it or not, most OHV users are actually outdoor enthusiasts and support the leaving of open spaces actually open instead of being bulldozed over by the millions of acres for crackerbox houses. Think about the land lost due to OHV riding? It's insignificant, a small 4-8' swath of land throughout open space. This is a major difference in comparison to land being lost forever to development. It just floors me that there are extremists out there in Washington that can systematically shut major populations out of vast regions of land that belong to the people of the United States. Having land open for hiking only that is miles in the middle of nowhere and is not particularly spectacular realistically shuts it out for everybody. Lastly, if kids are not out recreating in the open lands, then they grow up not caring about the land and not appreciating it.

## Discussion Question 2

***(cont.)***

Reserves needed where? NOAA reports show all west coast fish populations steadily re-building WITHOUT reserves, just based on good fisheries management NOAA recently published this report ... { <a href="http://spo.nmfs.noaa.gov/olo6th-edition.htm" rel="nofollow" target="\_blank">Link</a> } Check out Unit 15: Pacific Coast Groundfish Fisheries ... { <a href="http://spo.nmfs.noaa.gov/olo6thedition/26--Unit%2015.pdf" rel="nofollow" target="\_blank">Link</a> } excerpts: A number of dramatic changes have occurred in the Pacific Coast groundfish fishery since the last publication of Our Living Oceans (NMFS, 1999). Between 1999 and 2002, nine stocks were declared overfished, with spawning estimated to be below 25% of unfished levels. Rebuilding plans were implemented, reducing allowable fishing mortality for overfished and associated species throughout all sectors of the groundfish fishery and resulting in historically low allowable harvests. In addition to lower allowable harvest levels for overfished species and co-occurring species, major portions of the Continental Shelf off the U.S. West Coast have been closed to fishing since September 2003. Two of the overfished stocks, Pacific hake and lingcod, have since been rebuilt to target levels. Stock status has been estimated for nearly 30% of the groundfish stocks throughout at least a portion of their Pacific coast range. Of the assessed stocks, more than 70% are near or above target levels. However, many of the assessed stocks, whether currently below target levels or not, experienced declines in biomass throughout much of the 1980's and 1990's. These declines coincided with a period of reduced productivity of the California Current that lasted from 1977 into the late 1990's. It is likely that this decline in ocean productivity contributed to the decline in overall abundance, but the effect appears to have been variable across species and is not well understood at this time. In the most recent period of improved ocean productivity, increases in recruitment and abundance have been observed for many species. In addition to the role of ocean productivity, harvest levels have contributed to the current status of these species. In the 1980's and 1990's, harvest rates for many Pacific Coast groundfish species were based upon knowledge of the productivity of other, similar species. This was a reasonable approach in the absence of species-specific information and given the paucity of fishery-independent trend information, but many Pacific Coast rockfish species now appear to be less productive than originally thought. As a result, managers set harvest rates for many species at levels that, in hindsight, were too high. Harvest metrics were re-evaluated during the 1990's and again in 2000, resulting in lower harvest rates for most species. Not all rockfishes have declined in abundance over the past two decades. A number of species such as chilipepper, yellowtail rockfish, gopher rockfish, and blackgill rockfish are above their target levels, with estimated spawning biomass ranging from 52 to 97% of unfished levels (Figure 15-3). These rockfish inhabit a wide range of habitats which span nearshore, shelf, and slope depths. Although relatively abundant, landings for some of these species are near historical lows as a result of catch restrictions associated with rebuilding species that co-occur with these abundant stocks.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The saving of our history should be of high priority even in this current economic conditions. This is an investment in ourselves. If the lands in question are able to be recovered in the future, and there will be questions on that (how do you knock down sub-divisions to bring a battlefield back to how it was? Even if you do you have ruined the ground from a historical/anthropological sense. Buy it before it is lost forever, or at least as cheap as possible. Every dollar we spend today saves us dollars tomorrow. I believe one of the best program is the type of matching grants so that there is both public and private cooperation on the issue. It has worked well in the past. We are willing to do our share too!

Too often there have been unreasonable closures.

Well here we are again and again and again. Everyone wants their own way. Typical of all our groups as well as I am to! Sure, I want to access everything on my motorcycle that the Hiker, Mountain Biker, Horse Rider, Naturalist, Environmentalist and every-other outdoor enthusiast thinks that it is their right to enjoy! Sorry but our life and world is not that way and if it stays that way it just breeds hate and discontent with our fellow Americans and friends. Until we are able to all sit down and come up with a plan that works for everyone, these land and conservation bills will never work Period!!! All I have seen in the past couple decades is either one group gets their way here and then another group gets their way there and so on and so on in fairness. Nothing changes. And the groups that have the most money to put in their representatives campaigns or political careers are the winners and it doesn't matter at what cost that it might be to thousands of people and economies, it was all about the triumph and again not the cost to all other parties involved. Here is my idea and solutions. All groups need to sit down at the local and state level, (Not Government Level), to decide what areas need to be looked at and then instead of just closing areas off we figure out how to set schedules of those areas for multiple use. Each week and each area would be set aside for the group or parties that could enjoy that area together in harmony for 52 weeks a year. Example: one area would have all groups that enjoyed the outdoors in the peace and quiet there way and another area for a week have all groups that enjoy motorized access to their outdoors there way. You could change weekly so that it just doesn't limit all groups to one location. We could set up different trail systems for all groups to use as their own and would have to be maintained by those groups. You could have a registration fee for all users to go into each groups funds to maintain their trails and routes. You could combine the fees if needed and there are all ready federal money's available every year to all states in keeping up these programs that we could tap into. There are many ways and ideas that could make this possible if we could all sit down! I know there still all the haters of all groups that are not in their way of thinking that say this would not work or do not want this to work, but it is time for all of us to change for a solution and not to stay the same. I agree that there are areas that do not need to be accessed not just by motorized vehicles but all people! I believe that if any human can be in any area then all users can be there to. What's fair is fair and not for the chosen few. That is how you bring americans back to the outdoors, Make the outdoors available to the americans in any form of outdoor activity they enjoy!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Without adequate, quality (easy and difficult) OHV trails illegal riding will increase. Wilderness closures cause more damage than they protect.

Historic Preservation is great. But isn't this IdeaJam supposed to emphasize "The Great Outdoors?"

Do State historic parks such as The Red Clay State Historic Park (area) sacred council grounds of the Cherokee Indian ever need to be reauthorized to be protected from annexation/rezoning occurring in the area, etc.? If mega substations, and other incompatible environmental attributes are added to an area that has been otherwise very backwoods and rural, and part of a scenic loop drive tour of this kind of historic area, can something be done to ensure preservation? Can there be new laws ensuring preservation of this area as a rural farming known for its Native American history and other civil war history also?

There needs to be more laws or ways to re establish this kind of important historic park and area and prevent rezoning and bigbox sprawl, etc. in the area the park is in on all levels.

In most communities, land use ordinances are outdated, requiring developers to build "cookie-cutter" style subdivisions that destroy water quality, natural areas, wildlife and working farmland. To help communities preserve natural areas and clean water, and update outdated land use ordinances, LandChoices ([www.LandChoices.org](http://www.LandChoices.org)) a national all volunteer nonprofit group I founded, is offering the free online guide, "Top 10 ways to preserve land and water in your community" at { [Link](http://www.landchoices.org/toptenways.htm.) } Tailored towards professional and volunteer citizen planners, it also includes a link to additional information for citizens interested in bringing land conservation to their communities. "Many communities make the huge mistake of requiring developers to submit detailed, expensive and so-called 'preliminary' plans as a first step in the development process," says noted planner Randall Arendt, considered the nation's expert on conservation subdivisions and a member of LandChoices' advisory group. "This is extremely premature, akin to bringing a diamond ring on a first date," says Arendt. "Instead, municipalities should require a simple inexpensive sketch plan, often drawn by hand but to scale, as an overlay on top of the base map showing the locations of all significant natural and cultural features. This way any deficiencies can be corrected prior to submission of the detailed, expensive preliminary plan," adds Arendt. To preserve land and water, LandChoices recommends that communities make the following 10 items mandatory for new developments: 1. Inexpensive Conceptual Preliminary Sketch Plan Prepared According to the Four Step Design Process for Creating Conservation Subdivisions 2. Site Walk on the Property 3. Involve a Qualified Landscape Architect and Physical Planner 4. Existing Features Site Analysis Map 5. Safer, Less-Wide Streets 6. Preserve a Minimum of 50% of the Buildable Land 7. Conservation Subdivisions 8. Conservation Subdivisions Designated as a "By-right Permitted Use" option 9. Create Interconnected Open Space Networks 10. Workshop on Conservation Subdivisions Learn more and a download a free checklist at [www.landchoices.org/toptenways.htm](http://www.landchoices.org/toptenways.htm) .

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Accountability is a huge problem. We are increasingly being asked to "pay to play" on public lands we already own and it's just about impossible to find out what they do with the money.

All of the land management agencies receive appropriated funding from Congress, and a portion of that is for managing recreation. These budgets have gone up steadily, the Forest Service for instance over 60% since 2000. There is plenty of funding to manage recreation. The problem is getting it to the ground. Far too much is sucked up into administrative overhead. The agencies have legal authority to charge for camping in developed campgrounds and for use of specialized and highly developed facilities and they can retain that revenue to manage the site where it was collected. I think those kinds of fees are appropriate. But to say, as one commenter did, "If you can't pay \$3-\$5 to spend a few hours outdoors, then your [sic] not really serious about it" that is so arrogant and elitist it just takes my breath away. There are plenty of people in this country who have to watch their pennies never mind their 5 dollar bills. You would deny them the chance to take a walk in the woods? If the agencies put half as much effort into enforcing the laws about trash, vandalism, and other misuse as they now dedicate to catching people who don't have the right "pass" to be there (Achtung! Papers please!), those problems would go away. In southern California they issue so many "Notices of Non-Compliance" to people without an Adventure Pass that they have had to set up a special website and contract with a private company to collect all the fines. This is a waste of effort that would be much better invested in education and resource protection.

Many popular areas have used permit systems since the 1970s to limit use to what the resource can support, and I am all in favor of that. However since 1997 almost all of these permits cost money, and I think that is wrong. Also permit systems are being put in place where they are not really needed, just to generate revenue. (Example: Cedar Mesa Utah, less than 10,000 visitors per year - brand new visitor center in the middle of the desert built with permit fee money they couldn't find any other use for since the actual land is managed for primitive recreation which doesn't cost much.) As to BWCA, you failed to mention the \$12 reservation fee to reserve a permit, which is for all practical purposes required because you won't get one without a reservation. The fee started out at \$10 but was raised to \$16 (60%) in 2007. If fees are the tool to be used to limit use, then we can expect the most popular places to soon become affordable only to the wealthy. Is that what we really want our public lands to be? The lands belong to all of us and we should all have reasonable access. Limiting use to what the resource can support is one thing, but using money to determine who gets to go and who doesn't is something else entirely. It's not whether any particular fee is "debilitating" or not, it's the basic idea of selling access to nature. If we want our young people to truly learn to love their public lands, we cannot allow them to be commercialized and privatized just like any other market commodity. It's like the difference between sex for love and sex for money. Do we really want our public lands to be whores?

When will we get to see the schedule of these town hall meetings and listening sessions? So far all the talk of public outreach has not been backed up by any visible action. The meeting in Washington was for only the chosen few. When will ordinary citizens get our chance to be heard?

Historic Preservation is sustainability: cultural, environmental, economic. The Historic Preservation Fund provides funding for State and Tribal Historic Preservation Offices, which administer Federal programs that support cultural heritage efforts in their States. Every year \$150 million in off-shore oil and gas lease revenues (the same source as the larger sister-fund, the Land and Water Conservation Fund) is deposited in the HPF, but the full amount has NEVER been appropriated. In fact, the appropriation is usually less than one half of the amount available. Full, permanent funding of the HPF would make a dramatic, positive difference for local preservation, reaching every community in the country. The historic preservation movement has kept its promise to enhance, enrich, and inspire the American nation through preserving historic places of local, state, and national significance. Through enthusiastic and enduring efforts, preservationists have achieved near miracles in retaining historic places; but there is more, much more to be done. Full funding for the HPF is essential if we are going further the work already underway.

***(cont.)***

In addition to full and dedicated funding of the Land and Water Conservation Fund, it's important to establish full and dedicated funding of the LWCF's smaller sister fund, the Historic Preservation Fund, which is drawn from revenue from the same source (Offshore Oil and Gas Leases) and authorized at \$150,000,000. Unlike the LWCF, the HPF has never been fully funded. The much smaller HPF complements the goals of the LWCF, promoting environmental, economic and cultural sustainability through investment in existing infrastructure, neighborhood and community revitalization. While the LWCF is largely a land acquisition fund, which requires federal investment in management and maintenance in perpetuity, the HPF works within the community to encourage private investment. Just one program supported by the HPF, the Federal Rehabilitation Tax Credit, has been credited with creating 1.8 million jobs, \$71.7 billion in income, \$197 billion in spending, \$97.6 billion in GDP, and \$28.7 billion in Federal, State and Local taxes. All this with a cumulative expenditure of \$85 billion. Historic preservation programs, as supported by the HPF, encourage smart growth, promote land and water conservation measures, reinvest in older communities and offer a means to capitalize on embodied energy and carbon in existing buildings and on existing infrastructure. Reusing buildings reduces energy use and carbon emitted through building teardown and construction, and historic buildings can meet or exceed today's highest energy efficiency standards through simple installation of "green" technologies. In fact, buildings built before 1920 are MORE energy efficient than any building built between 1920 and 2000. The Brookings Institute projects that by 2030, America will have demolished and replaced 82 billion square feet from it's current building stock, which will create enough rubble to fill 2500 NFL stadiums. The energy saved by rehabbing just 10% of those 82 billion square feet would power the entire state of New York for more than a year. So fully funding the LWCF is important, without a doubt. But don't forget the HPF, which has it's own fullyfundhpf coalition, that I would encourage you to join.

So far, the Obama administration does not have an amazing track record for environmental protection. Please don't misunderstand, the emphasis on reducing global warming from the Obama administration has been excellent, but the emphasis on protecting endangered species and funding our national parks has been sadly lacking. While community parks, streams, and other natural areas are also very important, fully funding our national parks and fully protecting endangered species on a federal level is one of the most important roles the federal government must fulfill. I hope we will see better protections for our wild places now that preserving nature for future generations is high on the president's agenda.

This should include best practices for rehabilitating old houses, which is essential to mitigating climate change and energy uses. Houses built before 1920 are more energy efficient than houses built between 1920 and 2000. Helping builders to learn what builders of the past knew, while understanding how modern innovations can be integrated seamlessly into historic structures, would go a long way towards helping energy efficiency efforts. Consider promoting full funding of the historic preservation fund.

***(cont.)***

I work with a very large group of off roaders that volunteer thier time, money and strong backs to maintain remote areas of forest in the Los Angelese area. The forest service allows us to manage our respected areas with regards to hydrology, geology and safety. The Forest service has the final say in every aspect, but by allowing us to make decisions and suggestions based on our experience with the local area, it relieves them of some of the work involved in keeping back country areas open and accessable to the public. Because of this involvement, volunteers are proving every day both thier committment and dedication to the program, as well as exhibiting strong management skills within the related areas. By utilizing these volunteers as, say associate land managers, linked closely with the Forest Service, EPA and other agencies, land that is already accessable to the public can stay that way. By involving the public more in the decisions of how pulic lands are managed, the true spirit of land management can be realized. And the best part of this type of program is the very low dollar cost. All of the tools and people are mostly already on place and ready to be utilized. Public lands managed by the public. What a concept!

How much land do hikers need to themselves? Currently I have to drive 200 miles to ride my dirtbike on woods single track trails. The bay area is surrounded with hills and mountains that I can never set a tire on with my bike but hikers have full access. Give the ohv riders equal rights, a little diversity and more trail access.

The idea of Federal Wilderness is not a good idea as it prevents proper land management and public use is limited to only the rich and young.

I totally understand there are groups out there who want enjoy the great outdoors by having a nice peaceful walk in the woods. Me too! But, I also enjoy riding dirt bikes responsibly (quite 96 dB mufflers, spark arrestors, staying on designated trails) in the woods. There are a lot more places where you can hike and ride horses than you can ride a dirt bike responsibly. There our groups of people, and you know who you are, that would like to have ALL of the forests to themselves so they can enjoy it just the way they want. It is very selfish to impose their values on everybody else and take, take, take away. The OHV (dirt bikes, quads, 4x4's, etc.) community has been severely attacked in the past and much more so in the present, and it is not fair. Fourteen percent of the state of California has a registered OHV. If we don't have a place to recreate that is designated for OHV, then we will find a place to ride illegally. Keep that in mind next time you vote to band OHV on public land.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The inefficiency of federal bureaucracy is a significant challenge. Disengaged or uninterested land management staff is also a challenge. The problem known as "analysis paralysis" is a major concern. It should be a priority to review the reasons the U.S. Forest Service is having problems writing Forest Plans. More and more land is being placed into protective designations. The increased focus on conservation in these areas lead to restrictive land use plans. In Wilderness for example, there are many restrictions including a group size limit. These group size limitations hurt scouting and other youth programs. There are two key challenges related to funding federal outdoor programs. One problem is that much too much money is being spent on overhead and infrastructure and not on recreational infrastructure. The initiative should find ways to focus agency budget spending on recreational infrastructure, including roads, trails and winter sports areas (including ski areas). The other problem is the lack of funding, especially appropriated funds. The initiative has ambitious goals but we must face the fact that federal budgets aren't going to be significantly increased, and may be decreased in coming years. The initiative must focus on locally based cooperative efforts to accomplish its goals. An excellent example is leveraging the various State off-highway vehicle programs. Many states benefit from millions of dollars made available for OHV trails and snowmobile areas via these "user pay" programs. The initiative should enhance these programs where they exist and encourage their formation in states where they lack an off-highway vehicle program.

The famous San Juan Trout fishery is an irreplaceable public resource that was once estimated to bring as much as \$40m a year to the regional economy. Much of the fishery is now smothered under sediment/silt caused by a combination of a new low-flow plan by the BOR and increased erosion from rampant oil and gas activities on the surrounding BLM lands. Unfortunately, the environmental impact studies for the low-flows were flawed and misleading and the mitigation goals of no net-loss of in-kind aquatic habitat established by the Fish&Wildlife Coordination Act Report (FWCAR) were ignored. The BOR now says that the fishery is not a priority and the BLM denies that any of the damage is caused by oil and gas operations. Nothing meaningful has been done to correct the problems and things are going to get much worse as the flows continue to be cut. This is an opportunity to show that we can protect these priceless places by practicing responsible water and oil/gas development. To properly address the problems on the San Juan river will require that environmental protection of the San Juan Basin lands, the river and the fishery is made a top priority for the BOR and BLM. And, they must seek federal funding to complete the fishery silt transport/deposition and habitat mapping studies necessary to develop long-term mitigation measures to meet the FWCAR goals. That would be a huge win for all including the sportsmen, state, federal agencies, and our unique natural resources.

Historic areas & Battlefields should be preserved and all WalMarts, Malls, Casinos and the like should be kept out of our historic areas.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The following is an idea posted on behalf on an e-mailer: --- This is an idea for conservation and to encourage Americans to use the outdoors but I do **\*NOT\*** want my name on any Web site: - Utilize the existing nationwide network of utility easements, particularly those linking all the highrise electric towers as a cross-country pedestrian pathway/network for walkers, hikers and cyclists (or at least mountain bikers since the existing trails underneath them are dirt). Then promote the trails. This would encourage Americans to walk more, as in Europe, because it would be a safe and fairly scenic, extensive network. These easements could also be used for community gardens and to plant orchards for public consumption, to feed our homeless citizens. Local garden clubs could even have contests to beautify these corridors (designing so they do not interfere with vehicle access to service the towers).

Conservation education is one of the most vital tools for shaping long-term conservation and enjoyment of fish and wildlife resources. With the profound impact of human populations on fish and wildlife and their habitat, Americans of all ages need to better understand and take responsibility for the health of the natural world around them. The North American Conservation Education Strategy was developed by state fish and wildlife agencies to help people of all ages understand the value of our precious natural resources and how they are conserved and managed; become stewards of nature; and learn outdoor skills so they know how to (lawfully) enjoy resource-related recreation like fishing, hunting, shooting sports, boating, bird watching and more. Each state fish and wildlife agency offers a variety of programs to educate children and adults about the conservation and of fish, wildlife and other natural resources. Some of these programs include instructions on how to participate in recreational activities; but, more and more, state agencies are focused on integrating conservation into K-12 education as a critical part of their efforts to develop an informed, involved and healthier citizenry. We recommend that the Administration: (1) Support the inclusion of natural resources agencies in the No Child Left Inside legislation and ensure they are eligible for funding or other resources. (2) Encourage educational agencies and schools to partner with state fish and wildlife agencies to achieve conservation and environmental literacy from grades K-12 - connecting students more closely with the natural world, while developing 21st-century learning skills and addressing academic standards across disciplines. (3) Support the inclusion of Outdoor Skills in the education process as a tool for team building, stewardship, personal health and life-long recreation. (4) Ensure every child have access to a natural area (no matter how small) within walking distance of his/her school; and educators acquire the skills, content knowledge and tools to use that area as an outdoor classroom for field investigations. When young people have the opportunity to experience direct contact with natural habitats on a regular basis in their formative years, they are far more likely to grow into adults who will value those environments and make informed decisions to help sustain them.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Preservation of Civil War battlefields is vital as a reminder and link to our nation's past, that is all too quickly being forgotten. Honoring the struggles that America has gone through to become such a great nation and remembering our heritage can help to keep our current problems in perspective and knowing where we have come from can help us move forward as a nation. We must never let our national history, or the memory of so many who died, disappear and battlefields are a wonderful way to teach and "see" that history that must be passed along to future generations. Without a past, we have no future.

Sorry-- "How to Teach in your School Forest" workshops are impossible to do online. They need to take place outside in the actual School Forest (outdoor classroom).

Funding for historic preservation preserves our country's culture, educates youth about our nation's history and raises awareness of what it means to be a citizen in a democracy. Jobs are created to rehabilitate historic buildings. Even more important, historic preservation is green. By preserving existing buildings, construction debris is not added to landfills. By decreasing the amount of new construction, natural resources that would be used for building materials are conserved and energy consumption to manufacture and transport building materials is decreased.

don't we have enough meat in the markets of this country?, why must people continue to kill where there are food factories for this purpose.. it seems rather barbaric and some type of psychological problem

Hasn't the American bison been desecrated enough for their skins and tongues? Why must we continue to kill off natural animals in this country? I think we have enough "game" animals for those who continue killing other life forms for their skin, head trophies and whatever other abstract issues they have within their mentality.

Nature is perfect within itself..why must mankind inflict their unnatural conditions? Look at Yosemite and the Grand Canyon,,they are perfection

Recently the National Forest Service has allowed logging in the national forest directly behind my home..Pike Natl Forest in Colorado.. It had closed the 2 sections of the park where logging was established and recently reopened the sites.. but one in particular i went to see recently and it is a mess with logs, and pieces of wood from the choppers, all over the ground..should there ever be a forest fire in this area, there certainly would be enough fuel for it all over the 5 acres where they logged.. why didn't they accommodate cleaning up? They had given reasoning for it, due to forest fire prevention or beetle kill..which there is little of in this area. Better to use manpower to cut down the infected trees (which are few and far between) as the wood can be used for flooring, walls, furniture etc. as the beetle kill has a very beautiful blue tinge in areas of the wood. I think it is just plain desecration of our standing forests and i have been in this area 14 years and never seen a forest fire here..In addition, living trees roots provide storage for water in rainfall and run off.. Must everything be destroyed for profit which it seems was the reason truckloads of the logs went over the roads twice a day(2 lane country roads already potholed) and the heavy trucks making the roads worse than nature does. Decisions like this we could live without.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Well said. The same is true at Yellowstone National Park. The park is overrun with bison which causes them to become easily infected with brucellosis. This in turn affects the ranchers whose herds must be vaccinated with the very expensive vaccine. The park service cannot and will not control their herd and are unable to effectively vaccinate for this disease which is running rampant through their herds. Ranchers would not be able to remain in business and would be turned in for animal abuse if they ran their cattle the same way the park service is running their bison herds.

No topic is more prevalent in hunting and fishing circles than the problem of access – to both private and public land. Even though some of the good ol' days of healthy wildlife populations, wild trout fisheries, and unfettered landscapes are still here today, thAT means less and less if the pubic cannot get to them. Recreational access is exponentially becoming more endangered. The seriousness of the situation is obvious to even the casual observer. As population grows, hunting, fishing, and recreating on private land will become rarer and the demand for access on our public lands will explode. The solutions to these conflicts will be difficult and many questions must be answered. How many access points to a national forest and public lands are necessary? Do we pay landowners to allow an easement across the property? What is a public road? If the public cannot access a large parcel of land managed by our state or national entities, should a private landowner be granted that privilege? Should he or she be allowed to benefit commercially, by guiding hunters or selling them access to it? Should the public through government assert public trust property rights? The Forest Service (and other government agencies) need to get far more involved with illegal and unreasonable closures of back country roads leading to public land. Here are some things they, congress, and the administration can do: 1/ Generally mandate Federal Land management agencies the mission of increasing access to boundaries of public land. 2/ The agencies need to step up and be party to litigation when roads historically used by the public are closed by private action. As it is now, the burden of litigation is often placed on private parties. (A \$15 padlock can trigger a \$150,000 lawsuit to correct.) 3/ The Forest Service and other agencies must rigorously research and enforce easements for public access across private land. 4/ Roads on public land should be open to everyone or closed to all - no private access roads on public land. 5/ Provide special funds to assist land management agencies in the construction of short new access roads to public land that will circumvent private land which blocks access. 6/ Use Eminent Domain to acquire access to public land when other options are exhausted. This is important for firefighting as well as access and conservation. Landowners often paint the conflict as an attack on private land rights. Even though I am a proponent of upholding private land rights, it is difficult to side with the landowners in many cases. Public property rights and the public trust doctrine of resource management are equally important. The Forest Service and other agencies need to be the point of the effort to enforce and expand those rights. ( This is not a one sided plea for more OHV access. That is a separate issue to be resolved after we get folks ON to the public land. )

## Discussion Question 2

***(cont.)***

A casino next to a national battlefield - you have got to be kidding! That is like putting a casino right next to cemetery. Why is it the promoters can't find another property in the area? I have been to Gettysburg and I feel that there is way too much commercial development as it is. If Gov. Rendel and the legislature wishes to aid economic development in Adams county they should help find another property a significant distance from the battlefield.

Much of the legislation proposed is by big city legislators who have never even seen the areas that they are trying to regulate. The citizens of each state should have more say in how there public lands are managed. States with small populations like Wyoming and Montana get run over by legislators from heavily populated states back East.

Somebody has to pay for it. NPS doesn't even have enough money to complete routine maintenance.

Please help us preserve our CW Battlefields > They are our heritage and > besides > my ancestors fought and died there !

My family of 8 includes 4 boys and 2 girls. The age spread is 14 years. Dirt biking proved to be a GREAT family activity that appealed to all 6 kids -- and still does. It provided wonderful teaching moments, ranging from astronomy, map reading, and navigation to self worth and teamwork. Our kids learned to appreciate and respect the great outdoors. Dirt biking allowed us to spend many hours of quality time together. As OHV activities increase in popularity we need more approved riding areas. Reducing riding areas concentrates users into smaller and smaller spaces that ultimately does unnecessary damage to the environment.

I agree. There's way too much conflict of interest in DOI and DOA!

I agree with the idea that controlling invasive species is imperative if we are to keep our native species thriving. I would also like to extend the definition of "invasive" to include rogue GMO seeds that wind up where they are not intended (usually carried by the wind or on tires, etc.), resulting in theft lawsuits against the property owner (who had no idea they were even there) by the seed company.

I agree with the lack of real oversight where the Dept. of Interior is concerned. I do think certain areas need more funding and they would have to be held accountable with full transparency or give the land back to the states so we can attend hearings in person and have a voice. Otherwise, can we make the financial institutions and the car manufacturers pay back the money and funnel some into the DOI? Sorry, I'm bitter.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I take exception to #5- banning ranching on public land. Here in New Mexico, ranchers have used what are now "federal" lands since long before this was even a U.S. territory. I know many seventh and eighth generation ranchers with small herds who, for them, this is a way of life. They are the ones who, year after year preserve the land so it can sustain them. If they couldn't ranch on public land, their way of life would end. They do more to take care of the forest, even to the extent of putting out other people's campfires on a weekly basis, than anyone I know. I suggest we not paint everyone with such a broad brush that we miss the people that we would like to hold up as good examples of responsible stewardship.

Riders might need to take responsibility for their image here. Manufacturers love to advertise their vehicles mudbogging, riding through streams, spraying dirt, etc. Riders could stop other rogue riders by agreeing to licenses that are readable from a distance, making sure they and their friends register each vehicle (with \$\$ going to repair trails and enforcement), and finally, holding those accountable who ride off the trail or misbehave. If you don't want the black eye, you will have to do more to prevent it. Meanwhile, I guess it just doesn't make sense for the Forest Service or BLM or any land mgt. agency to dedicate more trails than they can maintain or enforce.

Wonderful yet incomplete idea. Where does the money come from? Who administers it, etc.?

YES! YES! YES! We are KILLING this planet with plastic! I always use my canvas bags for EVERYTHING! I just believe it makes sense to not waste anything or put more stuff into the garbage (I have to haul mine to the dump- no garbage pick-up) and the landfills than I have to! Now what do we do about that plastic island in the Pacific? { <a href="http://www.independent.co.uk/environment/the-worlds-rubbish-dump-a-garbage-tip-that-stretches-from-hawaii-to-japan-778016.html" rel="nofollow" target="\_blank">Link</a> }

Many of our National Park units and other public spaces that Congress authorized years and decades ago are still incomplete. This is because Land & Water Conservation Fund (LWCF) appropriations have been pitifully low and unpredictable over the years. Developments that might occur in the unprotected private inholdings could seriously harm the units as a whole. The inholdings must be acquired and the areas completed as intended. The LWCF must make available the intended \$900 million each year without having to go through the appropriations process.

Many people think that since they are not hikers, or bicyclists that trails don't matter to them. The National Trail System is important for everyone as one way to remember our heritage, our history, and to connect important places in our history and eco-diversity, every bit as much as it is important to hikers and other trail users. Most of the work done on any national trail is done by volunteers who care about their place in America. I would also ask our legislators to continue to support and fully fund the purchase of land from willing sellers to work toward completion of all the national trails.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I agree that opportunities for all to enjoy our public lands must be provided; that includes opportunities for people to enjoy a quiet, natural, non-motorized experience. For some, that's what "refreshes" -- not the sound of motorized vehicles. As for grazing on our public lands, in Southern Utah we've seen the effects of that in broken down soils that invite invasion of things such as cheatgrass, which combined with dry, hot summers promote a fuel for fast burning, destructive fires. Grazing also destroys riparian areas critical to healthy streams and rivers. The damage caused by grazing has to be remedied by dollars that don't come from those who are able to graze these lands since they pay so little for that opportunity. I have no problem with local economies benefitting from multiple management policies, but the grazing fees need to be addressed to help support these areas.

I can't imagine why anyone would demote this idea, unless it's due to the fear that protecting biodiversity would force that person to think about something other than themselves. It's amazing that in this day and age, humans still have a hard time acknowledging that their economy and way of life is built upon the health of the natural world. Civilization cannot prosper if the natural world is falling apart. Protecting biodiversity ensures the health and strength of the natural world -- and yes, the human world as well. If individual Americans can't understand this fact, then it needs to be taken to the highest levels of government for consideration and action.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I would like to suggest that anyone who is making this suggestion come out to Montana and learn what you're talking about. Just drive the 150 miles between Roundup and Malta and see what it's like to go past one town -- Grass Range that has maybe 25 homes there and then not be able to see more than 10 houses in that drive. Look out and realize that in some places for 70-100 miles on either side of the road, there is nothing but open landscape to the casual observer, but actually know that there are ranches producing beef and farmers producing wheat that may have been part of your meal this last week. You don't need to waste government money taking our ranches to "preserve it" -- we've done it for a 100 years already. Years ago, when I was living in Missoula I had a roommate who was working on a masters in wildlife management. She was from New Jersey and her boyfriend was from back east. She was a nice girl but she got her masters by doing a study on what kind of animals are predators of duck eggs. When she told me she was going to do a study like that I asked her what it was going to prove. "Everyone knows what kind of animals eat duck eggs -- racoons, skunks, coyotes... And what will you do with that -- you can't teach ducks to build their nests in different places?" I asked her. I wasn't upset, but I just thought that if you were at a masters level program that you should be working on figuring out something new not just coming up with something that a 5th grader could tell you. Well, she blew out the insides of 144 eggs, filled them with wax and even "duck scent" to make them real. She thought that when the animal bit into the egg, it would leave a tooth mark and from the tooth mark she would know what animal was preying on the nests. See anything wrong with that idea? Think you're going to learn something that most native Montanans who lived on a ranch didn't already know? Well, first of all those of us who know animal behavior know that if you've got a mouth full of wax, you're not going to carefully extract the wax egg from your teeth and gently set it back in the nest. Nope - you're going to break it up and do whatever you can to get rid of the wax. I asked her what her results were after she had carefully planted these nests of fake eggs all over the state in a variety of reseviors (using grant money of course). The answer: She couldn't get any valid results because the wax was too broken up to tell what it was. (My suggestion would have been to look at the tracks of the animals but that evidently didn't occur to her) . But she's now probably one of these idealistic geniuses who want to play in someone else's backyard and take over their ranch and do nothing more productive than sit on a ranger station with a nice salary and benefits to "watch over the buffalo". Her boyfriend's study was about some kind of ferret that he wanted to transplant to Montana. So he went out to MN, spent 3 mos. living in a cabin and cross country skiing and finally came up with 6 little critters to bring out to the Yaak. Well, he got to stay in a beautiful 3 story cabin and outfitted them with radio collars to see how they'd do. Do you think a radio collar slows down a little animal? Well, one by one in short order they were all eaten before spring -- but he still got a masters degree out of it and is now qualified to make decisions like this. I asked her one time if any of the wildlife majors were Native Montanans and she thought about it and said no. It explained everything to me then -- and it explains why we're having this conversation today. People from back east come from places where development is guaranteed -- populations grow and stay there. But in a ranching area, most ranches don't support more than 2 families. They support the family who started it -- and then the one son or daughter who's going to take it over in the next generation. Those people don't get it -- our growth is limited by the ability of a ranch to sustain a family. And as for wanting to come enjoy it -- well come out during hunting season and you can enjoy our

## Discussion Question 2

***(cont.)***

hospitality. I doubt any of them would let strangers onto their land to walk around fairly freely for hours on end. So here are my questions when you're examining feasibility. 1. Exactly how many people do you think are really going to come out here to watch these buffalo? And how long would you actually spend watching these herds? 5 minutes, 10 minutes, maybe 20? My cousin had buffalo on his farm in Illinois for years -- right next to a highway with 10,000 cars a day going by. Less than 10 cars a year ever pulled in to simply watch the buffalo. 2. Did you know that some of the Indian reservations have buffalo herds. Why not offer your money to those tribes to develop and increase their herds. Wouldn't it be nice to give them back the staple of their diet that was taken away when the white man came? I think it'd be cool to see them use a buffalo jump the way they did a couple hundred years ago -- if they wanted to. If the tribes were open to it and were allowed to hunt them and money was given to them to vaccinate them, build fences, even process the meat -- this would become a win/win/win situation. Frankly, I think this is an idea that's used to con people out of their money and then scam our government out of more money. It makes a really cushy job for someone to sit on a foundation, pull down a good salary and benefits and work people up into a lather about a romantic idea of buffalo running on the plains. But if you took those same people out to a buffalo herd, I doubt they'd stay entertained for more than half an hour -- and maybe 3-4 hours for the truly hardcore -- provided they were sitting on the back of their camper, or maybe hiking on a groomed trail looking at some of the great scenery in Yellowstone Park. You can't justify destroying an entire county or two for that.

If we want to connect Americans to our outdoors, our cultural landscapes, our diverse cultures, and our history, we must not forget preserving the places that make us special. These places include not only the cultural landscape, special landscape features such as stone walls, but also the built environment that tells the story of who we were and where we've come from. Historic preservation, preserving the built environment, should be an integral part of reconnecting with our culture and history.

Our community has used historic preservation funds in many ways to promote, preserve and educate the public about our historic neighborhoods, architecture, downtown and other resources that make living here a quality experience. Let's not forget the lesson of "urban renewal" where large swathes of neighborhoods and downtown were bulldozed into oblivion and never recovered. Historic preservation makes for thriving communities.

Our experience in Southern Utah counters this. The grazing on our public lands breaks down soils that promote a healthy, stable soil and instead invite invasion of things such as cheatgrass, which combined with dry, hot summers promote a fuel for fast burning, destructive fires. Grazing also destroys riparian areas critical to healthy streams and rivers. The damage caused by grazing has to be remedied by dollars that don't come from those who are able to graze these lands since they pay so little for that opportunity.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The government should be paying what's due. Our public lands are critical to the tourism dollars in many areas, so that needs to be considered when chastising the govt for public lands. In places where there are few public lands and most property is in private hands, the tax dollars on that property may be coming into the local govt, but what opportunities have been lost for many people to enjoy open areas for fishing, hunting, hiking, etc., without having to pay exorbitant fees to private land owners?

There are many challenges to preservation of Civil War battlefields. The most critical challenge is urban creep and expansion. Much of this land is being purchased by real estate developers for both commercial and residential projects. Once we lose the land to these developers, it most probably can never be regained. So, time is of the essence, we must act now to preserve these outdoor classrooms for future generations. These outdoor classrooms are an important tool for explaining the sacrifices free men made to uphold our union and defend freedom in America. Let us not lose these national treasures to urban sprawl, let's act now to preserve our heritage.

Agreed, too many of the "conservation" proposals revolve around excluding certain types of access. Our aging citizens should not be excluded from enjoying Our Lands because they require the use of modern conveniences such as ATV's or other motorized vehicles. Why is it that discrimination is only acceptable if it is disguised as an "environmental initiative"?

The study in the link from comment 11 concerns outdoor activities in ALL settings including urban, suburban, rural, etc. Therefore, the statics comment 11 cites are misleading: "Scroll down to Table 2, which shows a comparison of the different types of recreation for ages 16 and up, revealing that 17.4% enjoy ORV, ATV or Motorcycle use, which is actually exceeded by hiking (32.7%), birding (31.8%), and a number of other outdoor activities." Of course the percentage of all participants was higher for hiking, the study did not limit what locations were considered for the activities. Hiking is available basically EVERYWHERE from city sidewalks, city parks, and all the way out to Wilderness trails. So hiking participants in ALL locations would outnumber OHV participants who are extremely limited on where they are allowed to ride. The same idea applies to birding - you can go birding in any environment. I am an avid motorcyclist but if I count how many miles I walk, it far outnumbers the number of miles I ride because I walk everywhere and only ride where I am allowed to.

There is already an overabundance of Wilderness compared to the number of people that are willing or able to visit said Wilderness. We do not need more Wilderness, we need more accessible open areas for more people to enjoy their preferred form of recreation in a dispersed fashion. More Wilderness simply eliminates vast areas of land from use by a majority of American's. Less Wilderness would allow more Americans that enjoy motorized access a more dispersed recreational opportunity thereby decreasing the impact of overcrowding on the lands available. Wilderness is simply another way for the Fit American's to discriminate against those of us that are aging and losing their ability to enjoy the lands of America the only way we can.

Why is this separate from "Protect Wildlife Migration corridors"??

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

“We have met the enemy and he is us.” This popular quote came from the comic strip “Pogo” by Walt Kelly published on Earth Day in 1971. Since then this comic has been quoted and misquoted by many a teacher, politician, and cocktail party comedian. I remember hearing the Pogo quote in an environmental studies class in the seventies. It was a time of great environmental concern; a discouraging time of burning rivers, oil spills, and an unpopular war. It is hard for me to believe that was 40 years ago. As we look ahead to the next 40 years, I would like to propose a new quote to guide our efforts to get along on this earth: “We have found the solution and it is us.”

I believe this country's public lands can be used to produce the food that people need, as well as providing wildlife habitat and watershed protection. Beef production can be balanced with other goals for public lands. I would like us to manage our public lands in a way that allows for food production and also protects the natural resources on which we all depend. Recreation is another use of the public land that can be very valuable, but it is also not without impacts. Let's look at the long-term health of the land and work to balance the human uses of the land. I don't want to destroy the mother who provides us with food and shelter.

If states truly want to work with ranchers and farmers on private land conservation, which can also benefit wildlife, states need to implement programs that work for the farmers and ranchers. These landowners need to be able to continue to make a living from their property by producing food for our country. If the programs are not tailored to the needs of working ranches and farms, I foresee two outcomes. Either the "protected" lands will no longer be available for food production, or the only landowners who will participate will be wealthy individuals who do not earn a living from agricultural production. I believe it is possible to design such a program, but farmers and ranchers need to be involved in the design and the details of each project.

Many ranchers in our area of Colorado have protected their private land with conservation easements, but they are still dependent on grazing permits on BLM and US Forest Service land to produce food and to make a living. If the federal government wants to protect productive agricultural lands, they also need to support the continued use of federal lands for livestock grazing. The two issues are connected. There are ranchers in the region who are concerned that if federal grazing leases are further curtailed or eliminated, they will not be able to continue to make a living. These landowners are reluctant to place conservation easements on their land because of this fear of losing their grazing permits.

## Discussion Question 2

***(cont.)***

Many state's are looking at closing their parks, eliminating naturalists and programs and deferring maintenance just at a time when we need to connect people to the land. There needs to be a national impetus on nature learning and fostering an understanding of ecosystems and their relation to humans. State and National Parks are the ideal place to interpret nature and teach how we are all connected but for years they have suffered from reduction of staffing and budget cuts. These are special places set aside to give people a chance to connect with nature but there are so few opportunities for people to learn about what they are looking at and many of these places are now shabby and unattractive. Full funding of the LWCF would go along way in bringing these palces back to what they should be and additional funding for environmental educationa and interpretation would give those who visit an understanding of what they see. People will not value what they don't love and they won't love all of nature unless they understand it. We need to understand more than the warm and fuzzy to preserve the whole of an ecosystem. WEeare coming up on the 100th anniversary of the National Park Service. What a great opportunity to engage a nation in reviving our parks.

Parks both national and state/local have suffered from substantial budget cuts over the last decade and most are now at a critical point where deferred maintenance is resulting in loss of facilities or park closures. LWCF needs to be fully funded for both national programs and for stateside programs. With the 100th anniversary of the National Park Service rapidly appraoching we need to put the emphasis back on what we as a nation have preserved and conserved for future generations and we need to expand our recreational opportunities so every citizen has a near his home. You can't expect the public to get outdoors if there is no place nearby to go or the place is not safe or functional.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

A couple thoughts come to mind some of these thoughts may have been mentioned in one manner or another... • Education and Re education - I believe the future of conservation will rely within the will of the people, but unfortunately large aspects of our society are disconnected from the land value of open space/wilderness. There needs to be constant/consistent reminders about the positive values of land/open space/wilderness. People need to understand the linkage between riparian buffers and water quality. I would think that the government could partner with the talent of colleges and university programs to educate the masses. There needs to be a more organized/aggressive effort to encourage people to embrace the outdoors and to support the land/sustainability of the land. • Government organizations/restructuring/promoting cohesiveness – I think there should be some heart to heart discussion about creating teamwork/vision between the Forest Service, the Park Services, the Land Management Bureau, and Fish and Wildlife Services. If there is going to be a national dialogue about conservation in America, the individuals within these departments need to be willing to work together. It seems that the visions of the Forest Service could sometimes go against visions of the Fish and Wildlife Services. One groups "vision/role" could hamper/take away from another departments. If these groups are unable to work together in a fruitful manner, why have these discussions? • Continue to Reward individuals/companies who choose easements. We face the reality that in order to encourage conservation - the private landowner plays an enormous role. I think that greater opportunities/creative economic & tax incentives should be given for small farmers, companies, individuals willing to put their land into an easement. With this said, I believe the government should make sure that organizations caring for easements meet national/state regulations. I would even suggest that open space easements should be encouraged within urbanized regions/near wilderness & national/state parks. Easements provide a great opportunity to buffer between open space and developed regions. • I would encourage the president to expand the national parks and designated wilderness areas. • Eco regionalism and wilderness corridors should be a priority within the focus of conservation/wilderness expansion. Within this topic, I would even suggest finding ways to create conservation routes to link different areas nationally. This will require compromise and willingness to work together. If government organizations are willing to work together, if easements are encouraged, if there are aggressive education efforts, and a variety of organizations like The Nature Conservancy can assist with data...I think there can be great progress towards conservation within America.

According to the "organic Act" and the Supreme Court (Sierra Club v. Hardin) the purposes of the National Forests are: 1) to insure "a continuous supply of timber for the use and necessities of United States citizens"; and 2) to secure favorable conditions of water flows. The Forest should also consider the economic well-being of the citizens of a state wherein timber is located in administering national forest lands "for the use and necessities of citizens of the United States.") In U.S. v. New Mexico, SCOTUS specifically rejected assertions that the Act established a third purpose for which forests could be created - "to improve and protect the forest within the boundaries.") So why have carved out giant sectors of the Forest for non-use or restricted use. Why have we stopped harvesting trees and now use fire as a principal management strategy. If we return to multiple use, sustained yield, we will have much healthier forests and communities.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I like your idea for promoting managed land use with real outdoor careers. The problem is that what the government promises it refuses to do for political reasons. Look at Anwar - bought to provide the country with oil and other resources. Those activities are supported by the people (both indigenous and new arrivals) yet the federal government won't allow the use for the purpose the land was bought. This is true in CO, WY and other states. Look at the promise of water to the farmers in CA - cut off for a guppy they don't even know if it's a native fish. Look at the 80 mile stretch of about 6800 acres along the AZ border that's supposed to be federal land for camping, hiking and vacations. It's posted with something like: enter at your own risk bandits/drug gangs control the area. You cannot believe in the promises of the federal government. And it's alot harder to take the land back from the federal government than from a state government. The best way to conserve land is through Nature's Conservancy. The land is privately held and cared for. It's traded and used to encourage habitat and common usage. Federal acquisition is not a good idea.

When the Forest ceases to be actively managed, it burns. My district saw in excess of 200,000 acres burn in 2008. Now those lands are acres of dead sticks waiting for the next lightning strike to set them off. Not a pretty sight for tourists. My communities live in terror of fire and smoke. Tourists don't come. The way it is being managed today, the Forest is not a good neighbor. In fact, our County has declared local Forest lands to constitute a public nuisance in the way they are being managed.

Limiting the use of excessive light which causes light pollution is central to almost every goal in the environmentalists' lists. It endangers many species because of the unnatural diurnal cycle. It endangers humans with research on breast and prostate cancer now full underway. It steals our dreams by limiting our vision to the day time and robbing us of the stars which have been an inspiration throughout our history as humans. It also puts excess pollution in the air which does not need to be there for any reason (one 250 W light puts one ton of carbon dioxide in the air per year). Generally it is simply wasteful and dangerous. It also has a fairly easy fix - turn it off or if necessary cap it so that it illuminates the area that is necessary and doesn't stray into the sky.

Global warming is not man made and it is extremely fat-headed for humans to believe they can have significant influence on a system so much bigger than mankind. The hoax is over. Get over it!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

If we want to address the "dredging of human minds" we need to take on the teaching unions so that you can fire teachers who do not teach. We also need to get away from the model that teaches to the level of the masses, thereby shortchanging the very brightest and those most in need of help. Also, focus should be redirected to the basics instead of promoting so many "community action" activities... I send my daughter to school to learn how to read, write, compute, and investigate -- not to raise money to buy livestock for those less fortunate or dig wells for people in countries who's governments are too corrupt or inept to take care of their own citizenry. I prefer to address charitable giving (and sex education) at home. I submit that's MY RIGHT! Incidentally, my daughter watches TV and plays computerized games, but she also plays outside with her friends or dogs, goes swimming, climbs trees, swings, rides her bike and scooter, and swims regularly. We'd spend more time doing such things if I didn't have to spend so much time correcting the misinformation she gets at school.

"what our history of economic development has gotten us is the security and economic ability to even have arguments about how our resources should or should not be used." I'm having difficulty seeing the truth of this statement. I generally agree, that economic development has been harmful to both wildlife and nature (seen in farming practices and development of our communities as well as logging, mining and other methods of "extracting" resources) and doesn't necessarily benefit a significant number of Americans. When you're homeless, jobless or incarcerated it's difficult to participate in or contribute to our economy. It seems to me that our constitution and government allow the debate about how resources should/should not be used. Help me understand the statement quoted above. Thank you!

"The negative environmental impacts of your machines just need to be added into the equation for there to be real fairness (along with the negative impacts of ANY type of use)." Seems to me this is the crux of the matter. the small number of OHV riders who don't obey the rules can do a lot of damage to land that is supposed to be around for future generations to enjoy. I agree with Anthony that a sensible solution is needed, and don't want to outlaw an activity that some enjoy responsibly. I'm not sure what that solution might be, except that some land -- it seems MORE land -- needs to be designated for OHV use. If what's said in these comments is true, there area enough responsible folks in the OHV community to take responsibility for the upkeep of land set aside for OHV use.

Light pollution control is very much needed for the following reasons: 1. It wastes energy, all the light that does not go where intended (such as up into the sky), is wasted energy. 2. wasted energy contributes to greenhouse gasses, and global warming 3. wasted enrgy is wasted tax dollars 4. light trespass onto neighbors is rude and unwanted 5. Glare from badly designed lights is a safety problem, blinding drivers, and this gets worse the older you are. The AMA supports such LP control for this reason 6. excessive nighttime lighting is bad for the environment and many species, such as birds. 7. there is no reason to have so much sky glow, and that sickly orange glow over most towns and cities. Lets bring back the real sky. Mario Motta, MD

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Can you provide some background for your claim that "There is 900,000 sq miles of desert in the US western states. Currently less than 1/10 of 1 percent of that area is available for any type of OHV use in any form." Its an interesting statistic.

Full appropriation of the Historic Preservation Fund would mean more resources into rehabilitation and conservation of America's prehistoric and historic sites, districts, buildings, structures and objects. Historic Preservation funding is jobs funding. Every dollar spent on historic preservation leverages private dollars to stabilize and rebuild America's infrastructure. Historic Preservation is labor intensive and promotes re-cycling of useful materials. Full funding of the Historic Preservation Fund does not increase taxes, it provides incentives for property owners to maintain property and in the process create good jobs for trades, crafts and businesses located in sound historic buildings.

great comments here. Wilderness is too restrictive a designation. Unfortunately, wilderness activists fight fiercely against any more reasonable tool to protect lands. Candidly, they will admit the reason is because they want to close trails to bicycles and motorcycles.

Historic preservation has consistently not just been a "giveaway" program. It has sought to provide matching funds where needed, often \$2 or \$3 (if not more) for every dollar provided in grant funds. The HPF should be funded at \$150 million, and local communities and NGOs will add many hundreds of millions in private funds to restore nationally important landmarks. This has worked successfully with the Preserve America and Save America's Treasures programs, and would enable HPF to be even more successful than its been in the past. I've been disappointed in the Obama Administration's level of support for preservation, and this is one place they can step up. With HPF funds originating from oil leases, and the mess BP is making of our country, Mr. Obama should see this is a consolation prize for our nation's communities.

I believe that all public land is to be accessible to the citizens of the United States of America and special interest groups should not be allowed to force there agenda on others.

i see the same 4 or 5 people making anti OHV complaints on every idea. Let us have our areas to connect with the outdoors the way we see fit. There will always be disagreements about this stuff....best way to build a better future is to co-exsist, not alienate a group of people.

I would like to see hikers have the same restrictions placed on them.

If you had the choice to keep riding for the rest of your life but at the cost of making a single species extinct, would you?

Lest we forget: The ground on these battlefields was soaked with American blood!!! Would you build a McDonalds on the cliffs overlooking Omaha Beach??? How about a Walmart??? What kind of American would even propose developing land on which American soldiers and civilians fought and died??? It is unfathomable! Yet it is happening now. Please protect this hallowed ground.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Lets call them what they are, Feral horses or strays? Why support an invasive non-native species? Their natural habitat is europe and asia, not america.

We have been going to southern Utah for over twenty years. I don't feel that the trail system that exists today is unreasonable and should be protected. It allows the public to access and see some of the most stunning scenery without degrading that very experience. The trails exist and should not be closed. I don't believe in wilderness just for the sake of wilderness. But also do not believe there should be any new trails, whether for hikers, bicycles, motorcycles or 4-wheel drives.

We must stop digging up our past under the guise of making way for the future. Remaining civil War sites MUST be preserved!

Yes, it is OK to be the "hypocritical, rabid environmentalist" when it suits your needs, i.e., from your statement above: "... 80% of open space land ..... and if such a place exists I would surely like to go there and even live there when I retire." It's OK for you, Robert Redford (with his huge ranch where he built his home), Barbara Streisand (with her huge air conditioned garage and water bill in the thousands per month), and Al Gore (with his redwood lined office), but not for anyone from the general public to enjoy this same luxury. The difference between a developer and an environmentalist is the environmentalist already has his home in the woods and doesn't want you to have the same.

5% is hardly marginal and would likely put many manufacturers and retailers out of business. Most of us in this country already see half or more of our annual income sucked up by some form of taxation. More is not the answer. As another example, look at the effects of of using increased cigarette taxes for health care funding. Every time the tax rate goes up, revenue decreases as more people give up the habit. Taxes are an excellent way of discouraging a particular activity.

the areas like those you describe above are far more worthy of designation than many of the areas currently under consideration that are roaded, have been mined or logged in the past. Concentrating efforts on these types of places is much more in keeping with the wilderness act than is trying to designate areas that don't meet the statutory definition of wilderness.

An excellent idea. The federal government wields entirely too much power and influence. Reducing that in all aspects is a good thing. Public land planning should be carried out as much as possible by those who are most affected by it--the ones who live closest to a particular place.

Beautiful website with wonderful photographs. It's good to see someone using black and white imaging, it is so much more dramatic. I'm lucky to be living in Central Arizona where so much history and pre-history is still accessible. Shameful that so much of it was bulldozed in the 70's by BLM and USFS, like the old towns of Cordes and Venezia. I hope you got a chance to get a meal at the Cow Palace on your visit to Amado.

By and large this is a good idea, so long as eminent domain is not abused and there is a recognition of the difference between legal and physical access.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Collaborative efforts can be effective. The problems arise when individuals are unwilling to see past what could be termed as their own "recreational prejudices". There are many who can't seem to see that people who choose to do different things or may have different goals in mind than they do still have a significant role to play in planning processes and should not be ignored.

point is an all too common problem. His is only one example of the federal government closing trails and areas despite the presence of organized maintenance efforts. There have also been numerous instances of the federal government blocking these efforts, often due to the onerous requirements placed by the courts and those higher up the chain of command in the executive branch, (and not just the current one) who are often completely out of touch with reality on the ground. In principal, I support the idea, but without significant changes, there can't be anything resembling a partnership.

For the most part, I agree with you here. The problem I have is that it sounds like you are advocating that government be given the authority to regulate what people watch on TV or what games they play, if they are allowed to. That's the only part I really don't like. And since I believe that government's role should be strictly limited, that issue alone overrides everything else.

Good and well, but keep in mind that some of this land contains large reserves of oil, coal, other energy sources and minerals. We need to be able to access these things for the foreseeable future. Additionally, many of the areas in question, (I'm guessing that the lands being referred to are those potentially slated to surreptitiously being designated as national monuments and similarly protected areas by executive fiat) are highly valued as recreational areas by hikers, mountain bikers, equestrians and OHV users and others. Most notable the areas in Southern Utah and Arizona. Locking away resources that will likely be needed and further reducing recreational access is foolish. There are clearly areas within the area described that are suitable for wilderness, but not all of it is. Nor should all of it be barred from mineral and energy extraction. Like it or not, we need these things. One does not plant crops, maintain them and then let them rot in the fields while people starve.

Good ideas. A lot of it comes down to what people's priorities are, too. Most of us can probably afford more than we think if we prioritize our spending better.

I don't know what kind of ATVs people use in your area, but I have yet to find an area that was passable by ATV and not on foot. I have, however seen the converse of this many times. Be that as it may, I agree with most of what you're suggesting. Many times damage occurs because of a combination of irresponsible use and lax enforcement. It's also possible that the place you live does not have a statutory provision for the destruction of roads. My state does. A person can be arrested for criminal damage for causing damage to a muddy road surface, for instance. Try getting in touch with your local OHV groups and see if there can be some agreement and then approach the land management agency with your mutual concerns. Most OHV operators realize that the type of damage you refer to is what causes problems for us and will be willing to work with making repairs and working on ways to prevent future damage.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I don't see anything wrong with ballooning, and it can be a good way to get a look at a wide area. The only issue I have is that, like every other group, there are some balloonists who are not considerate. Near where I live, a private landowner had to fence his property off to prevent a balloon operator from using it as a launch point. I understand that they may not always be able to control precisely where they come down, but like everyone else, they need to act responsibly.

I don't think that we need a new designation, I think that we need to use current designations properly. There are many areas that have been declared wilderness that do not fit the statutory definition of it. Many wilderness areas contain such features as man made stock tanks, existing roads and trails, mines, and other cultural features. Areas such as this do not fit with the definition of a wilderness.

I hike trails, bike trails, and use my OHV on trails. No one is suggesting we turn anyplace into a theme park. Clearly there are some here who simply refuse to engage in any meaningful discussion about land use if the use suggested does not fit within their narrow views. If someone wishes to further restrict access to a particular area I suggest that they purchase the land fence it off, and do so without using my tax dollars to fund it.

I think that many of you are missing the point here. I don't see the author suggesting that we create a paved pathway up your favorite canyon. My understanding is that the whole point of this initiative is to find ways to bring people back to having an understanding and appreciation of the natural world around them. For some, it is different than others. Not everyone is capable of, or desires a 5 day pack trip into the Hell's Gate Wilderness, or wherever happens to be your favorite place. What I am seeing is someone who has some ideas about using widespread technologies as a means of increasing knowledge, visitorship and stewardship. From what I have seen here, however, there appears to be a strong contingent of individuals who believe that their way of enjoying the outdoors is the only way that is correct and permissible. This type of attitude will not lead to anything productive.

I think that these types of operations could succeed on their own through the use of cooperative slaughterhouses and packing facilities that could serve several of these operations. As a matter of personal preference, I prefer grass fed beef. This type of operation also allows for less standardization in the breed of cattle and allows for more consumer choice. An additional selling point of beef raised in this manner is the availability of beef that has not been given steroids or growth hormones. It is also typically a healthier choice as it is leaner and lower in cholesterol. They may need some assistance in the beginning, but I think they can ultimately succeed on their own.

I would actually go a step farther and eliminate it altogether. There's no reason a group of people cannot get money together, either on their own or through donations by like-minded individuals.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I wouldn't say that just because someone who wants to preserve preserve wildlife habitat or primeval areas that they are anti access. Unfortunately, many groups who seek to preserve what could be considered primeval areas are also actively attempting to remove OHV users from public lands that have been historically used for this purpose. These actions, along with a failure to recognize that vehicle use and wildlife habitat can co-exist, have co-existed and currently do co-exist in many areas leads to the anti-access label. As far as profit making, the BRC is one of very few multiple use advocacy groups that has been successful in getting a foothold in lobbying efforts. To call them profitable, I think denies reality. If you want to see profit motive, take a look at groups like the CBD and PEER. These are some of the groups who have made a living at taxpayer expense by suing the federal government under provisions of the ESA that require we the taxpayers to foot the bill for their lawsuits, even when they are proven wrong. As for \_\_\_\_\_'s idea, I have no idea where she stands on OHVs or anything else. But, I completely agree that the current planning process is severely broken and outdated. It should not be as difficult as it seems to be to integrate real or near time data into the planning process. Often, the current methods rely on outdated or incomplete information about all aspects related to conditions on the ground in and around whatever area plans are being made for. This doesn't serve anyone. I would, however, add that the economic impacts of planning decisions, both to the federal and local budgets, and to local economies needs to be considered in the planning process as well.

If you were actually paying attention instead of of spouting the typical anti OHV rhetoric, you would note that no one has suggested OHV access to protected wilderness, parks and similar areas. Rather, what we are asking for is the cessation of the continuing loss of access to areas that have been enjoyed by OHV enthusiasts and others for decades.

Intentional or not, it has and does happen, although over the past ten years things have definitely improved in this area . I would also agree that most planners, regardless of their personal stance on things, make substantial efforts to elicit comments from all (who should be) involved. Unfortunately, this is not always the case. The reasons behind this happening, are less important to me that the actual outcome. While I don't expect a personal phone call from the XXXX National Forest Headquarters, there needs to be improvement in noticing the public.

It is time for overreach by the federal government to end. For too long, the federal government has imposed its will on the states and local governments, often through what amounts to legalized bribery. States, local governments and individuals must no longer allow the federal government to dictate the terms of their existence.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Keep in mind that the 96dB limit applies to measurements taken at 20 inches from the exhaust outlet. Reductions in noise are also something that is already happening due to market forces. Many currently manufactured OHVs produce sound in the area of 85dB. Manufacturers have also been able to tune motors to the exhaust to maximize power and efficiency and many newer ATVs are using electronic fuel injection which further decreases fuel consumption and emissions. In my state, a street legal OHV must meet the same emission standards as passenger cars. The reduction is already taking place without additional government interference. I have a friend who does dyno work on ATVs. He has found that many of the louder aftermarket pipes actually reduce power output. OHV clubs and advocacy groups also encourage their members to at least meet the standard. Most clubs won't allow you to ride with them if you're not in compliance. Organizations like quietbike.org also provide information and encouragement to comply with the regulations.

Let's define some terms. You cannot "make" an entity donate anything. The proper term for that is robbery, unless of course you are a government, in which case it is called taxation. At least have the courtesy to call it what it is. In January, the largest tax increase in the history of our nation is set to take place. This along with the impending mess created by an unconstitutional health care scheme will likely cause severe economic hardship for everyone. Adding to the potential disaster is beyond unwise.

Local land use policies are exactly that and they should remain so. State and local governments have the right to administer their lands in the way they see fit. The practice of federal intrusion in to the arena of state, local and most especially private land management needs to come to an end. If you are in area where your local elected officials are not doing what you think they should, address the issues with them. You have far more control over them than you do anyone at the federal level and they are the ones who should be making decisions about these issues in the first place. There is sometimes a lack of federal leadership in this arena because that is how our constitution was written. It's supposed to be that way. Federal bureaucracies are detached and generally lack knowledge of local issues.

Many of these groups already receive entirely too much federal money and support. I can think of no other arena in which the federal government actually pays attorneys fees so that these groups can sue them, causing of course, the government to have to spend even more of our money to defend itself. All organizations and people, including corporations and other businesses should have a voice, but that voice shouldn't be subsidized by taxpayers.

Many of us who hike, bike, or ride horses also enjoy riding or driving our OHVs. When used responsibly, OHVs can be a great way to explore, especially in the western US where we have vast and varied open spaces, old mines, ghost towns and the like. An OHV can also make a great way to access remote trailheads that may be difficult or too time consuming for most to reach if done in other ways. The reality is that most of us have to work during the week and have limited weekend and vacation time to get out. An OHV can be another tool for accessing the places we want to go, even though it may be only part of what we are doing.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Much of the "roadless" areas declared by the Clinton Administration were actually "roaded", and do not qualify for wilderness designation per the statute. The same is true of many areas of the land mentioned in Southern Utah. The only portion of ANWR not currently protected due to its status is the less than 1% that was supposed to have been available for energy exploration. As has been suggested before, if you wish areas to be designated as wilderness, carefully select them based on the statutory criteria and lobby your elected representatives to make it so. This is the only LAWFUL means of designating wilderness. Why not use it, instead attempting to create unlawful designations via executive fiat?

NEPA and ESA need serious reform. A good start would be to bring an end to the trial lawyer welfare system created by the provisions that require taxpayers to cover legal expenses for litigation under the ESA, even in situations where the plaintiff loses. We as taxpayers should not be forced to finance lawsuits against ourselves, which is the general effect of these provisions. If an organization wishes to sue the federal government, they should foot their own bill. The lawsuit problem is at the root of many other difficulties in land management. Imagine being the BLM, in the process of writing a RAMP. The DRAMP is released, comments accepted, RAMP produced. Then it's reviewed by the USFWS who issues a no jeopardy opinion in reference to a listed plant species that is actually in the process of being delisted. Along comes Public Employees for Environmental Responsibility and the Center for Biological Diversity. Their attorneys file a lawsuit at our expense. The BLM defends its position at our expense. A temporary settlement is reached and 8 years later, we have a new DRAMP and the same threats of lawsuits. This cycle has to end. The endless raft of lawsuits paid for by taxpayers, who very often disagree with their premise, is not a responsible or effective means of land management.

we're talking about OHVs here, not pick ups. The amount of fuel consumed by OHVs is negligible when compared with the amount used by other vehicles. They typically get between 40 and 60 miles per gallon, and their numbers pale in comparison to standard cars and trucks. I add the street legal because there are relatively few areas in my state where you can legally ride without carrying registration and insurance. I'm not obscuring the noise issue. I'm pointing out the facts that appeared to be unaware of. More area? No.. I've never asked for that. I've asked for a cessation in reduction of area and mitigation for what is taken away. There's a difference.

what our history of economic development has gotten us is the security and economic ability to even have arguments about how our resources should or should not be used. It is easy to claim anyone's argument is invalid, but it doesn't say much. I also do not see where I said anything about developing and strip-mining everything in sight, regardless of consequence as you seem to want to suggest I have. All I'm saying is that we need to proceed in a way that does not limit access to resources in such a way that it endangers the ability be able to make those decisions. Simply blindly closing everything to any kind of development will ultimately lead to the inability to protect anything. My voting record reflects my beliefs in individual liberties and a government that lives within its financial and constitutional limits.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

you have clearly never participated in a clean up of an area off limits to OHV users. Fossil Creek in Central Arizona was completely trashed by hikers and other non-motorized visitors AFTER the area was closed to motorized travel. Prior to that, clean-up efforts were rarely necessary. Every group has its problem individuals, but I don't hold you accountable for what other non-motorized recreationists do. Being in both camps, so to speak, I can sympathize with some of your concerns. But, placing blame on OHV users for everything that has gone wrong is logically flawed and counterproductive.

On the other hand, a lightweight sleeping bag with a silk liner and a bivy sack will keep you plenty warm and dry if you're smart about it. And as an added bonus, you don't have to carry around 50 pounds of gear. Even Colorado has deserts, which can make for great winter camping experiences if you can't afford what you think you need for cold weather, or just don't like it. Hanging out where the wind blows at 40 knots all night and it gets down to -5 is not mandatory. There are other options.

One of the biggest problems in land use planning has been the exclusion of and animosity toward certain user groups in planning processes. I have seen this problem in the transportation management planning process in various national forests. In some instances, it appears that the exclusion of OHV users, mountain bikers and even equestrians and other groups has even been intentional. The public notice of planning and scoping meetings has sometimes been tailored to attract only those who participate in certain types of recreational activities, even though other users were severely effected by the outcome. There have been numerous instances of areas historically used for motorized travel being closed to that purpose without input from the users. The inclusion of ALL user groups is absolutely necessary in public land planning. Those who are engaging in planning should be required to ensure that all groups are represented and an end put to the elitism that seems to exist in this area. The land belongs to all of us, every taxpayer bears a portion of the cost. Excluding any one group from planning processes is not acceptable.

Our elected officials already know what the general public thinks. They and their massive campaigns keep track of this. Unfortunately, of late they have not been paying attention to this. The last 18 months should be very illustrative of the fact that roughly 60% of the US Senate and a similar portion of the House of Representatives has not a care in the world what you or I think. The best answer is, as always, to make sure that those whom you believe support your views are elected or re-elected and that those who do not, are not.

Please point out specific instances where OHV trail systems have been expanded where it was not the result of agreed upon mitigation for lost trail miles elsewhere.

Remember that we need to be able to access our natural resources in order to survive and prosper as a nation. Part of the job of the BLM is to make sure that activities like mining, drilling and now setting aside areas for other sources of energy like geothermal and solar, and to make sure that these are carried out in a responsible manner. This is on top of their duty to preserve unique landscapes and habitats, as well as recreational access. While the BLM is not always stellar at what they do, and at times outright fails, putting economic development in the back seat is dangerous and a mistake.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

you have a clear misunderstanding about what most OHV operators do, apparently. Both of my machines being street legal are required to undergo an emissions test every year and are subject to the same emissions and sound requirements as any other vehicle operated on a public road. In my state an operator of a vehicle can be arrested for criminal damage for driving on a wet road and can face similar criminal and civil sanctions for any activity that damages roads, water crossings, as well as speeding, etc. (yes, traffic laws apply on many FRs) Wilderness Areas, by their very definitions are not supposed to contain roads, nor are motor vehicles permitted within them. You have created a straw-man. I also defy you to do 200+ miles off-road on a motorcycle or ATV or even in a buggy for that matter, and claim laziness. I typically find myself more physically and mentally tired after a 150-200 mile ride than I do after a 2 day, 30 mile hike. Again, you guys seem to be missing the point. We're merely asking that areas that have historical use of a certain type be allowed to continue to be used in the same manner. That's all. Nowhere is anyone advocating opening up wilderness and previously roadless areas to new roads and trails. You hit the nail on the head. The fix is in and everyone knows it is, but only some are willing to admit it. The time has come for honesty, openness and reasonableness in the TMP process.

Thank you. The other problem that I would like to point out, is statement about how little power the UN has. While this is generally the case, it has been clearly demonstrated that every once in a while officials are elected who seem more than willing to give away out national sovereignty. This is why all of us must always be watchful regarding ideas that may be out there. This topic could just as easily be about someone's plan to lease the areas in question to ARAMCO. Perhaps equally unlikely, but also equally bad. Do not trust that every elected official has our national interests in mind. This has been proven time and again and in many ways.

That sounds like an excellent idea. This is an opportunity that is overlooked by many states. You will need the cooperation of several different agencies, including the jurisdictions responsible for the roads, leadership in the cities and towns, the state agency responsible for motor vehicle regulations, and quite possibly the state legislature. If you can get the local people behind the idea, none of this is insurmountable. Utah has a similar program. As you have probably already seen, you will see numerous specious arguments presented against your plan and much in the way of false and irrelevant claims and misinformation from those who think that OHVs are the root of everything evil. Programs like this have had good success in other places, there is no reason Nebraska should be any different.

The ending of the unlawful designation of wilderness by executive fiat was a good thing. If you wish wilderness to be designated, lobby your elected representatives for it. You may have more support than you think if it's done the right way and in the right places.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The goal of this blog, for lack of a better term, is not banter about ideas that will lead to the economic devastation of our nation by addressing problems such as health care, which are none of the federal government's business, nor to attempt to find ways to address what is in all likelihood a natural phenomenon. I do not expect that everyone here will agree on everything, but I would expect that most would agree that preserving access to our nations outdoor treasures is equally important as preserving the treasures themselves. Without the ability of people to responsibly use and enjoy public lands in a multiple use and access paradigm, I would not expect any large scale initiative in this arena to be successful.

The issue as I see it is that most OHV folks tend to think that if a spot can be reached by mechanized means then it should remain open OR be opened for their use. This completely disregards the major impacts that ORV's have on the land. There is ample scientific research that shows that the vast majority of wildlife species benefit when their habitat is not crisscrossed by roads, where they have ample room to roam. Soil compaction, noise, degradation of water quality and quantity, erosion, poaching, and increased looting of archeological and historic sites are all impacts that increase when ORV use opens up an area to motorized access. I do a fair amount of camping, hiking and backpacking in the national forests, on BLM land, and in national parks and the negative impact of ORV's on the public lands has noticeably increased in the last 20+ years. There are far more ORV's and their capabilities to access very rugged country have increased and areas that were formerly roadless have now been "claimed" by ORV's. I was in the Coconino National Forest north of Phoenix, AZ last summer and was astonished at the major increase in "roads" that have been created compared to 10 or 15 years ago. There are just so many more miles of these routes than there used to be. It's created such a spider's web of unmarked roads that in many cases it has gotten difficult in some cases to follow the correct forest service road that appears on the map. They get driven on in the spring and become rutted and torn up. The Forest Service tries to close some of them and they get illegally reopened by ORV drivers soon after. There are over 300,000 miles of designated Forest Roads (8 times bigger than the interstate highway system!) and probably a like amount on BLM land. How on earth is this not enough for ORV users? I drive a 4 wheel drive truck and use it to access trailheads and dispersed camping sites but I stick to the roads on the forest service map. Even if the USFS closes some of those roads for natural resource protection there are still more miles to drive on than one person could hope to drive in a lifetime. I don't begrudge ORV users from enjoying the forest but when "roads" are closed by the federal agencies or wilderness areas created by Congress it has NOTHING to do with creating playgrounds for the tree huggers and everything to do with erosion control, habitat protection, endangered species protection, watershed preservation (kind of important in the arid west), archeological and historic preservation, and myriad other natural resource reasons. It's our playground but it's the wildlife's home.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The primary cause of damage to roads is actually lack of preventive maintenance and overuse to salt for road clearing in areas that are plowed. Typically some settling of roadbeds occurs, after construction, usually due to inadequate preparation and compaction, which seems to be rampant on many park roads, probably to save on initial cost. Once a small crack develops in pavement, it allows water (and in some cases salt) to infiltrate. A few freeze-thaw cycles later and you start developing significant problems. Add in salt crystallization within the paved surface and another destructive process begins. Proper surface preparation, appropriate materials and the sealing of any cracks or defects that develop will go a long way toward increasing road and parking area longevity. The average interstate highway may go 30 or more years without much in the way of damage, especially if salt use is limited. They experience a far greater volume of heavier traffic than is typically seen in a park setting. Now, I will agree that once the process of pavement breakup has begun, a heavier vehicle will accelerate that process more than a lighter one. But, placing the blame solely on a larger vehicle will not in reality solve the problem.

The problem with these fees is that the money collected often does not go back into facilities and maintenance. I don't have an issue with the concept of pay to play, but these programs are often poorly managed and seem to have little oversight. There are some areas, however where the programs have worked well, providing additional facilities, construction of a new road to access camping areas that became inaccessible when a private landowner closed the existing access, and other needed infrastructure. Rather than entirely eliminating this, I think an examination of where the money goes and putting appropriate rules for spending in place would be a better solution.

The problem with this bill is it that it appears to have become part of an omnibus land bill. Omnibus bills are tools used in the legislative process that may force elected representatives to support bills that contain both good and bad ideas. Many of the places in this bill under consideration for wilderness designation are areas currently open to OHV use and in some areas snow mobiles. Other areas, are better suited to status as wilderness as they do not contain roaded areas, or areas that have historically been accessed by motor vehicles. The NCA proposed in New Mexico is part of the legislation that makes more sense as it is a different type of designation that allows for route planning and public input once it is implemented. Issues like this need to be considered on a case by case basis, under their own, individual bills, instead of being lumped into an omnibus package that may contain things that no one wants.

The right to own private property is one of the founding principles of our nation. Eminent domain is something that all too often abused by government, be it local or national. If anything, legislation needs to be passed limiting this practice. When an individual owns a piece of property, it belongs to them. If an preservation organization wishes to purchase property, and can come to an agreement with the owner, this is fine. But it is never okay for a government to commit what often amounts to nothing more than legalized robbery of its citizens.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There are actually numerous incentives already in place for solar. In addition to federal tax credits, some states also offer similar credits. While adding solar to a business or residence can have a significant up front expense, much of the cost is defrayed through these credits. Additionally, depending on the system, electricity can be sold back to the utility during times you are generating it but not using all of it, resulting in a decreased power bill. Unfortunately, while solar has made strides in efficiency, it still remains a rather inefficient way to generate electricity. This will no doubt improve over time. Using deserts for giant solar and wind farms has been suggested. This has created concerns, however, from those of us who live in or near these areas or recreate in these areas. Just because it's a desert does not mean it's devoid of life or usefulness. Dispersed generation at individual residences and businesses may be a better solution. As for carbon, keep in mind that during the late ordivician period, there was an ice age. At that time, CO2 levels in the earth's atmosphere were roughly 12 times higher than they are now. That aside, there are plenty of other good reasons to reduce fossil fuel emmissions. Unfortunately, until something that gives equal bang for the buck comes along, it's the best thing there is. Aside from nuclear, at least.

There are similar groups in Arizona and at various designated OHV recreation areas in Southern California. It often makes a good partnership with the managing agency that goes beyond enforcing the rules in to areas like maintenance and administrative improvements. The fines collected should should be used to help fund OHV enforcement and rider education.

There are three conditions: Growth, stagnation or decline. Anything else denies global economic realities. Security and stability require growth. The United States is not the only nation in the world and as such must be in a position to protect itself and its vital interests. Without growth, our natural resources would be being pilfered by China, or some other nation while our population served whatever their interests happened to be. Happiness is not a government function, other than to the extent government leaves me alone so that I may pursue whatever happens to bring me happiness. The number of children I have, or do not have is none of the government's business, so long as they are properly taken care of.

This is one of the issues at the root of some of the OHV community's problems in getting organized. Most of us are by nature, not the type of individuals prone to joining groups. Finger-pointing at other, similar users is not going to help us. I can point to examples of irresponsible use and abuse is every group ranging from hikers and equestrians to 4wd users. What we need to be doing is making sure that we educate everyone in the off road community to be responsible users and standing together when groups seek to lock us out.

This so-called federal supremacy is at the root of many of our nation's current problems and goes against many protections in our constitution. A government's first job is to protect the liberties of the people it governs. This is not accomplished by using the over reaching authority of the federal government to force decisions and management schemes on the locals. Kudos to those fighting the good fight in Utah, and elsewhere.

This would be a great program if it did not stipulate that only a few, hand-picked individuals know what is best for the rest of us.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Twenty years ago in one of my geology classes, the professor lectured about this. He cautioned that yes, climate change is absolutely real, but disputed our influence on it. The greenhouse effect is very real and Earth would be like Mercury without it. But, all greenhouse gasses put together make up less than 1% of atmospheric gasses. The big, evil CO2 makes up less than .04% of our atmosphere and more CO2 is produced by wetlands than all manmade activities combined. Looking at the geologic record, a sound argument can be made that Earth is currently CO2 impoverished. Keep in mind that during the late Ordovician Period an ice age took place. Atmospheric CO2 was 12 times higher than it is now. This is one of two points in geologic history when global average temperature was cooler than it is now. CO2 also has a relatively low specific heat, especially when compared with water. Water vapor is by far the biggest contributor to the greenhouse effect. What you will not hear is that orbital eccentricities of Earth around The Sun and variations in the Sun's output are the most likely culprits. Although, I might buy into the idea that releasing millions of years of solar energy as heat over the last few hundred years has had some effect. As has the placement of temperature sensors used to monitor ground temperatures as they are often near urban areas that have become heat islands over the last hundred years. Not that 100 years can provide any kind of accurate measurement of anything for a system that is billions of years old. Regardless, average global temperature has risen less than 1 degree C over the last 100 years or so. Those facts combined with what appears to me to be a deliberate loss, or at minimum sloppy record keeping by those who promote the idea that CO2 is what's doing it, make me very suspicious. Records don't just disappear in scientific research projects. For that matter, I don't lose the inane emails on my home computer. It's all backed up off-site. Surely any reputable project would do at least that to preserve their data. Unless they didn't want you to know about or were just plain ignorant.

Unfortunately, running off the regulars really isn't the goal. We just want to make sure that our interests and concerns are not ignored. The fact is that most of us who ride also hike, mountain bike and engage in other forms of outdoor recreation, too. None of us wants to see our wild places destroyed, but we also have concerns about standing by and watching as one of our passions is relegated to less and less space. For the most part we are not asking for more. Just seeking to make sure that the access we all have now will always be there.

Very good idea. We need to make sure that important historic and cultural sites are preserved and properly researched. There is so much history in this country that we don't even notice, sometimes even when it's right under our noses. It's important that our heritage remains preserved and accessible to all.

We also need to make sure the right kinds of trees are planted. Planting high-water use species in desert areas is probably not the best of ideas, however there are numerous native trees that could serve this purpose. I'm inclined to agree with Devlin as it relates to funding. Why not make a way for people to donate money and/or trees, as well as labor to help defray costs.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We could easily go very far afield from what's intended here, so I'm going to do my best to make this my last comment on this issue. The government often has a role in drawing attention to things. The problem I see with this, though is where does it end. Smoking is a great example. In my state it is unlawful to smoke in business establishments. My problem with this is that it infringes on private property rights. If I own a business and desire to smoke in it, others are free to avoid buying things from me and free to not work for me. If I own the building, I shouldn't have to kow-tow to the desires of others when they can avoid the situation entirely. That's a fictional example. I enjoy a good cigar now and again, but I also find it refreshing to go into an establishment and not have to deal with cigarette smoke. It just makes me nervous about where this type of intrusion ends. At what point does someone else get to control my television, reading material and anything else. I understand what you are saying about bringing attention to the issue, but what happens when the issue being attended to is something that you feel differently about? I just think that areas like this are best left to parents, families and private organizations. People making poor life choices is one of the hazards of living in a free society. But, I still think it beats the alternative.

Well, Rebecca, that is why this idea also advocates an enforcement and education component. My primary disagreement with wilderness designations is that it restricts access to something that belongs to all of us. This is the kind of idea that can be successfully implemented as it does not seek to lock out certain groups or seek to force everyone to recreate according one group's narrow idea of what that should consist of.

While I can understand where you are coming from and know that there are times when professionals in a variety of fields need to be consulted, additional mandates are not the answer. There are already too many hoops to jump through with any project like this. Adding another layer of regulation and bureaucracy to an already overly complex and overly regulated arena does not strike me as a good solution.

While its good to promote these things, I think this idea addresses the symptoms more than the problems. It's no wonder we all have a hard time saving both time and money when half of what we make is siphoned off through state, federal and local taxes. I know that this goes beyond the scope of this project, but hacking at the leaves will not have long term effects on the roots of some of our problems.

Yes, by all means, endorse the theft of private property by the federal government. This is exactly the kind of extremist rhetoric that undermines reasonable efforts to curb habitat destruction and sprawl. I also take issue with the statement that wildlife and residential development cannot coexist. Being one of the individuals in an area "around a large urban area", from whom some people would apparently like to steal, I can tell you that dispersed residential development in my area has had little impact on wildlife. The deer, coyotes, bobcats, etc., that were here before are still here. In some cases, they are here in larger numbers than before.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

A core challenge for all educators is to promote a sense of ownership for common property resources of any kind. Another challenge gaining access to wild places during the school day. Another challenge is to create opportunities for immersion (either long-term or multiple opportunities over time) in wild areas for the purpose of the promotion of a lasting sense of connection to wild places and a sense of belonging.

I am a member of the off road community and my local enduro club. We have a long term relationship with the USFS to use USFS land for an annual event in the SE USA. The big push in the western US to shut down OHV use is moving east and it needs to be stopped. People that never use USFS land are influencing politicians to close land. The off road community in the SE is alive and well and contributes millions of \$\$\$\$ to the economy. It is also a great family builder and keeps young people out of trouble and in excellent physical shape. There is enough land for everyone to have a place to enjoy their sport. Please don't tread on us.

So many businesses, especially in urban fringe areas, own vast lawns which are mowed and fertilized and generally unattractive. Could they be encouraged to convert these wastelands into natural prairies? Landscape services need to be educated wilderness management.

The Federal Historic site near Washington, Ks about the Pawnee Indian encampment and story from the past tells how the Pawnee Indians lived and hunted the Great Plains for Buffalo. They hunted in Western Kansas for Buffalo. I believe Kansas is a place to include as part of the Great Plains National Park. Most people think Kansas is flat because of driving only on Interstate 70 through Kansas and not stopping to enjoy the Plains for the beauty it really has.

Historic Preservation is very important the preserve all historic buildings to keep history alive and funding is extremely hard to come by. Please help make funds available to everyone including small museums.

To All It May Concern: A battlefield is a sacred place. It should never be forgotten about, and thrown away like garbage. I think not just battlefields, but all historical places should be cherished and preserved for generations of eager, learning minds to be able to reflect, learn, and enjoy. It seems like this world is being built upon greed, which money can only buy. I think it is time that we all stood together, and finally did away with the notion of developing every single piece of land that exists. That we are not going to take it anymore. Send a message to all those greedy developers out there, that every piece of our land doesn't have to be developed, and won't be. It is a shame that some people have no respect for the past, and what it has meant to so many Americans.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

To All It May Concern~ Hasn't enough damage been done in the Gulf and in other places in past years? This planet is so crucial to our survival. It was made for us so we would have a place to take care of and to enjoy. We have got to find a different way to get our resources from the land. We must find a way to make the best of our resources, but at the same time take care of our land, as well as sea, and all that lies within it. This drilling, I think is unnecessary, and has gone far enough. It is about time we stand up for what is right and give up what is wrong. That we stand for preserving life and livelihoods, and give up on all the greed money has to offer. Please reject Shells plan to drill for more oil in the Artic. This would be even more of a great tragedy for a place that has been relatively untouched before now.

As Secretary Salazar, Secretary Vilscak, Administrator Jackson, and Chair Sutley hold town hall meetings and listening sessions across America, I hope one of them will consider hosting an event in Georgia. As we start a national dialogue on the twenty-first century conservation agenda, Georgia has an important role to play.

How about if we look for people to head our agencies who have character and are not out to promote an agenda. I don't want a leader of either the Sierra Club or Weyerhaeuser Corp placed in an agency to promote an agenda.

I actually find my self in agreement with a lot of what says on this one. I think he would take it more to extremes than I would, but we are a wasteful people.

I fully support accountability as long as it does not turn into a witch-hunt. Many government entities suffer from lack of funding and, as a result, lack of qualified personnel. If accountability is to be examined perhaps we should also look at funding levels and determine how best to maximize every taxpayer dollar.

I may not know what I'm talking about here, but don't companies that use resources from federal lands pay for those resources? I know my company paid competitive market prices for the timber I have bought from the national forests, Corp of Engineers, and US Fish and Wildlife Service. The problem then becomes that the funds all go to some black hole in Washington. The federal budgeting process then determines where it is used.

I share the frustration of this post's author. As Americans, we own and have a right to access publicly-owned land. However, the problem of overuse and misuse is a significant one. I very much like Andree Herbert's comment about a refundable deposit fee. Encouraging people to contribute to the maintenance and upkeep of natural resources in exchange for free access is a great proposal. This is also a great way for someone to feel real ownership of a natural resource. Sure, we technically "own" the land as a taxpaying American. However, if someone actually devotes their own time and energy to its preservation then that ownership becomes more tangible.

## Discussion Question 2

***(cont.)***

I think this is an excellent idea. Anything that gets young people interested in nature and healthy eating is a good thing. Food Deserts are a real problem in urban areas and I think a program like this could go a long way towards combating this problem. Is anyone aware of organizations that focus primarily on urban/community gardens?

Jobs in logging and mining are "green jobs"? The writer is delusional and probably watches Faux News a lot. Their motto is "it doesn't have to be factual- if we say it enough times, it becomes accepted as truth."

Just as prior generations saved land for our benefit and enjoyment, we need to preserve battlefield sites while we can. We created the world's first national park and we should maintain sites of our heritage for the benefit of our citizens.

Leave the dams in place. Stop trying to turn the Klamath River into something it never was. Klamath means stinking water. The very first explorers described the river as a stinking fecid trickle. It has been a "hot" oxygen deprived nutrient rich river. It is in the best shape it has ever been in! The salmon are not imperiled by water quality nor habitat loss. They are imperiled by by unregulated over fishing by native american indians!

Logging doesn't make land go away. You can't save trees. They all fall some day. You can make responsible choices about when, where and how much to log, which include consideration of species that live in and around timber stands.

Lots of other people enjoy (or should enjoy) the outdoor opportunities that logging areas provide. Anyone who has actually visited and spent time in a well-managed forest through the various stages of cutting and regrowth should know the great bounty of nature. Throughout the stages there are fantastic opportunities for wildlife observers, hikers, hunters, botanists, ecologists, OHVs, and myriad other groups. Literally a perpetual wealth of natural, recreational, and economic potential. Read between the lines, here. Again is proposing shutting huge groups of people out of public land, and denigrating huge tracts of valuable natural resource to narrow or non use. Again, the goal of this initiative is to connect people to the outdoors. We need constructive ideas in that vein, not counterproductive drivel.

OHV enthusiasts...watch out, this is a trap of reverse psychology being set by. Designate 10 million acres as OPEN to OHVs...by all means. Designate them ONLY for OHVs as is proposing...no way...that would shut out a vast number of people from a spectacular expanse of our public land. Exactly the opposite of what this whole initiative is about. We need to get more people outdoors, not less. your absolute opposition to the use of OHVs is obvious from so many of your other postings. Pushing your agenda of shutting certain groups out of our public lands is not being productive towards the goal of conserving our outdoor heritage and wealth. I am demoting this idea, as it is destructive to the common good and conservation of our outdoor spaces.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Preserving historic land, especially Civil War sites is crucial to helping future generations to understand our national character and history. The conflict tore our nation apart and helped to build the country we know today. These sites are disappearing every day because of suburban expansion and development. We can never recover a piece of developed land or a Civil War site that has been destroyed. Finally, a battlefield is a classroom for every American to learn about the carnage, devastation and horror that ultimately led to the creation of the America we each live in today. To allow these and other sites to disappear without an effort to save them is a tragedy from which we can never recover. We owe our children and their children the chance to learn about these places by visiting these places. Our President, leaders and our government must surely understand this....

Preserving the Great Outdoors is about preserving what naturally occurs in the Great Outdoors--our heritage of native biodiversity. The impact of invasive species must be stopped and reversed if we are to preserve what makes this land our land.

Are you for real? If I want to recreate on my ATV then I should take up the cause of overpopulation? Please. Most OHV trails in that 80% open space west of the Mississippi desert. There isn't much in the way of water displacement. And, where ATV's go through water, it does cause more impact, but it doesn't pollute the water. Much has been made of this; but I've never seen the claim backed up. The manufacturers build these vehicles to hold the gasoline and oil in the tank and motor. Even if I fell over in the stream, I won't lose oil or coolant. You could lose some gasoline but the bike would have to be upside down awhile, and even then you might lose what? One or two ounces. Look at a public pool with all those kids in them. The bears pee in the river while waiting for salmon to come up river. You've made some contentious statements to another posting; something about all watercraft and OHV's should be made illegal. It's terrible. Some of us like going deep, deep enough that hiking isn't practical. Should we stay out of the great outdoors until we have a week, rather than just a couple of days?

That's funny, I've been riding motorcycles all my life, and I've yet to scare a horse. Seen quite a few of them, too. And, no one riding their horse has ever expressed the attitude that I was wrecking their day. And I've come across some hikers, too, and no one has ever expressed a negative attitude, either.

The federal government used to use funds from oil revenues from drilling on federal lands to buy and protect lands for conservation and recreation. This was stopped by Republicans in Congress and the White House-- even though it maintained a very conservative principal. If we are taking resources from our future generations, we should preserve something for them in return. The writer is correct that parklands do not have adequate funding. This should be corrected by directing more federal funds to the parks.

The textbook definition of conservation is "wise use". As a forester, my role is to determine what constitutes wise use and to carry it out. Interference by people who don't know what they are talking about is preventing wise use of public lands. Much valuable resource is being wasted under the guise of "conservation".

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The writer overlooks the fact that our management practices have led to "un-natural" buildup of fuels, which in turn, leads to un-natural devastation if fire is allowed to roam free. What research has proven that suppressing or modifying fire has led to "degradation"?

This is a great idea. I'd really like to see more school programs such as this.

This is a very interesting idea which I had not considered until now. I like the idea of making our natural resources (and specifically our affect on them) relatable to average people. In lieu of a physical sign in front of or near a natural resource, do you think alternatives could be as effective? For instance, a podcast that could be downloaded and listened to while on a nature walk that gives the listener the information you describe as they walk through the site. Or perhaps a map or a simple diorama in a visitor's center or an information booth that depicts the location of the resources you wish to highlight with corresponding text boxes. I propose these alternatives because my concern is that we could end up having too much signage in our parks or other natural resources.

This problem - of disease and diminution of wild salmon where fish farms are near wild populations, is an international problem. Serious losses are occurring in British Columbia and Chile due to parasites deadly to young salmon entering the sea. Salmon are endangered in Contiguous US areas because of water diversion, pollution, damming of historically rich salmon rivers. 2/3 of the world's agricultural lands (cleared and taken from natural ecosystems) are rangelands, used for cattle, sheep, and other livestock. Reforestation of much of this land is vital for biodiversity and to combat atmospheric greenhouse gas additions made by human activity.

This would be fine if the billion dollars came from taxes on ATV's.

We as a nation must preserve our historical places. If we forget about our past, how can we have a future. We must expand our Civil war battlefields and protect them from development. These fields are sacred places and hallowed ground were past generations spilled their blood. They must not be forgotten. We must put aside the greed of the almighty dollar and protect our nation's past, present and most certainly our future.

What you are referring to as "multiple use" is actually multiple abuse. Wilderness is true multiple use and allows grazing, fishing, hunting, hiking, snowshoeing, rafting while minimizing the negative impacts.

You have some very good ideas. I particularly like paragraph two. Attracting young, skilled, and educated people to rural areas where they can "put down roots" and contribute to the community for a significant period of time is very important. Regarding paragraph one, I agree, in principle. My only concern is that one community's access to water or mineral rights can have an effect (sometimes negatively) on surrounding communities. I live in Georgia and have seen the difficulties that can be caused when one state feels they have a stronger claim to water than a neighboring state.

## Discussion Question 2

***(cont.)***

The Texas Master Naturalist Program: A program model for developing a corps of natural resource volunteers aiding in the conservation, education, management and research of our local public lands. The short supply of dedicated and well-informed citizens and volunteers is often cited as a limiting factor for community-based conservation efforts. The Texas Master Naturalist™ program works to address this need by developing local corps of “master volunteers” to provide service dedicated to the beneficial management of natural resources and natural areas within the volunteers' own communities for the State." Communities and organizations across the state rely on these skilled volunteers for implementing youth outreach programs; for operating parks, nature centers, and natural areas; and for providing leadership in local natural resource conservation efforts. In addition, private landowners depend on the expertise of these volunteers to help them gain a broader scientific understanding of the ecology and management of their biological resources. This partnership among the Texas Parks & Wildlife Department, Texas AgriLife Extension Service and over 300 local partners has resulted in a unique master volunteer organization. At the state level, the organization is directed by two program coordinators and a steering committee responsible for providing training guidelines, program marketing and promotion, curriculum resources, and advanced training opportunities for the chapters and their volunteers. At the local level, chapters consist of our trained volunteers aided by personnel from the partnering agencies as advisors and partnerships with additional community organizations sharing our mission. For an individual to gain the certification and designation as a “Texas Master Naturalist,” he or she must participate in an approved training program with a minimum of 40 hours of combined field and classroom instruction, obtain 8 contact hours of approved advanced training, and complete 40 hours of natural resource-related volunteer service—all of which is provided through local Master Naturalist chapters using guidelines of the state program. Upon enrollment into the initial training program, trainees have a maximum of one year in which to complete their 40 hours of volunteer service and 8 hours of advanced training. To retain the Texas Master Naturalist title during each subsequent year, volunteers must complete 8 additional hours of advanced training and provide an additional 40 hours of volunteer service coordinated through their local chapter. Founded with the first Master Naturalist chapter in 1997 and officially established as a statewide program in 1998, the Texas Master Naturalist™ program was the first of its kind. Since then, the program has grown from just four chapters and 150 volunteers in 1998 to 42 chapters and over 6,300 volunteers serving Texas' diverse communities across the state. To date, Texas Master Naturalist Volunteers have provided over 1.22 Million hours of service valued at more than \$25.6 Million. TMN volunteers have impacted more than 135,000 acres of habitat; developed and/or maintained some 1,100 miles of trails; and reach more than 200,000 youth adults and private landowners annually with outreach and education efforts. The Texas Master Natrualist Program has become a model program by which 25 other states have come to develop. Just think of the national impacts if agencies had the ability to implement these programs in every state of the nation!

## Discussion Question 2

***(cont.)***

Champion the following clarifying notions! I. We don't have "economics" we have a suicidal chrematistics pillaging life-support systems. CHREMATISTICS The branch of political economy relating to the manipulation of property and wealth so as to maximize short-term monetary exchange value to the owner. Despite our use of the word "economy," industrial societies currently practice chrematistics, without understanding what it means to manage the household. OIKONOMIA The management of the household so as to increase its value to all members of the household over the long run. If we expand the scope of household to include the larger community of the land, of shared values, resources, biomes\*, institutions, language, and history, then we have a good definition of "economics for community." \*Biomes: a major ecological community type (as tropical rain forest, grassland, or desert). In Merriam-Webster online, 30 July 2008. Page 59, The Ecology of Commerce--A Declaration of Sustainability, by Paul Hawken, HarperBusiness (c) 1993 II. The sane option is to raise the consciousness of humans about the first-order rules of environmental sustainability and develop them into our shared "rules of the road" for living on planet "Eearth" (Earth is gone!). Go to [www.thenaturalstep.org](http://www.thenaturalstep.org) and [www.350.org](http://www.350.org) for plenty of detail....

Although I do believe the system in place now is 'manipulated by special interests' and 'fails to use valid science', the remedy is not to allow everyone until it is proven limits on public access is needed. The remedy is just as arbitrary as the problem. As I biker, I agree open more land for MY purpose, regardless of what hikers have to say. However, I would like to have some places to ride without OHVs or Horses. As an angler, I prefer rivers without motorized watercraft or paddlers; but as a PWC rider, I want all rivers open to all users. As a wildlife advocate....I believe we need some places that does not allow any access. Public resource visiting should remain a privilege not a 'right' or 'mandate'. However, the justification for access restrictions should be more transparent.

Local area politicians usually speak for local citizens, and local citizens should be given more weight as to how federal lands in their area are managed. Too often national lobbies organize a public comment campaign designed to alter park policy. These organizations usually distort or misrepresent facts in order to get members to write the majority of the public comments favor their position. What is needed is balance! Local authorities should never have the only voice,, but they should be weighted more heavily since they better understand local needs and concerns.

1 for 1 staring today is not a fair solution as a generality. I would wager to say that most western states already have far more wilderness on "public" lands than all the OHV areas combined in there respective states and nobody is opening up wilderness they are just closing down access to ALL users little by little. Just my \$.02 I am sure I will get some change from some... In most places in my state hikers, bikers, and horseback riders do not have to pay a fee to access these areas in the form of registration like OHVers do yet they look down on the ones who pay for the maintenance and are often members of groups and clubs that privately go out and take care of the trails everyone uses. I would think everyone would appreciate that.

is trying hard to creat a diversion from his true beliefs. I do agree the idea is to make more land available for more people not less. You Loose! Try again.

## Discussion Question 2

***(cont.)***

Bicycles should not be allowed in any natural area. They are inanimate objects and have no rights. There is also no right to mountain bike. That was settled in federal court in 1994: { <a href="http://home.pacbell.net/mjvande/mtb10" rel="nofollow" target="\_blank">Link</a> }. It's dishonest of mountain bikers to say that they don't have access to trails closed to bikes. They have EXACTLY the same access as everyone else -- ON FOOT! Why isn't that good enough for mountain bikers? They are all capable of walking.... A favorite myth of mountain bikers is that mountain biking is no more harmful to wildlife, people, and the environment than hiking, and that science supports that view. Of course, it's not true. To settle the matter once and for all, I read all of the research they cited, and wrote a review of the research on mountain biking impacts (see { <a href="http://home.pacbell.net/mjvande/scb7" rel="nofollow" target="\_blank">Link</a> } ). I found that of the seven studies they cited, (1) all were written by mountain bikers, and (2) in every case, the authors misinterpreted their own data, in order to come to the conclusion that they favored. They also studiously avoided mentioning another scientific study (Wisdom et al) which did not favor mountain biking, and came to the opposite conclusions. Those were all experimental studies. Two other studies used a survey design, which is inherently incapable of answering that question (comparing hiking with mountain biking). I only mention them because mountain bikers often cite them, but scientifically, they are worthless. Mountain biking accelerates erosion, creates V-shaped ruts, kills small animals and plants on and next to the trail, drives wildlife and other trail users out of the area, and, worst of all, teaches kids that the rough treatment of nature is okay (it's NOT!). What's good about THAT? For more information: { <a href="http://home.pacbell.net/mjvande/mtbfaq" rel="nofollow" target="\_blank">Link</a> } .

Did you get the reaction you wanted? The National Monument designation is going to do what for you? What would it do for any of us? Nothing!

Great idea but it needs to have a way of grading the need to cost ratio of a project. This could be a big stumbling block for a government run project. Preseving our NPS is a must.

He and I both are of the same thought that we need to keep in touch with the outdoors. This means we have access to it and lots of it. When we have a chance to break away from our urban, make life easy to survive homes and neighborhoods we need to remind ourselves and teach our children the basic needs to survive and enjoy life. If that means getting 100miles from a cell site and others in the woods than that should be able for us to do. In the Our great country we have worked, died and fought for We should be able to access the land We own.Restoration should not mean shutting us out.

I agree if your collectin a check from us then you should go work to benefit us. I would like to think that would happen but it won't, so if they are going to spend "OUR" money anyway it should at least go towards something worthwhile like a revised CCC type program, or maybe somehow insentivise private industry to take on the task....govenrment always spends too much to get too little done.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I live on the west coast. I take multiple trips every year to visit Civil War Battlefields. I would rather go to places such as Gettysburg than anywhere else. This is sacred ground. North and South these were all Americans who fought for a cause that they thought was just. We must remember their sacrifice and teach these lessons to future generations. Not only do these battlefields teach history they also are great open areas for hiking, bird watching, etc. How many Walmarts, Casinos, and shopping centers do we need. We need to do everything in our power to save these places and to limit encroachment. There is a saying, for those who don't learn from history are bound to repeat it.

I recently visited Wilderness Battlefield and Spotsylvania Court House in Virginia. Both are battlefields where my g-g-grandfather fought. It was an incredibly moving, informative and personal experience for me to walk across the battlefields, re-tracing his steps as I read from his regimental history. Because the NPS has been able to preserve these battlefields and their surrounding viewsheds, I was able to connect with a part of my family's personal history, and the collective history that I share with all Americans, without the interference of modern American life. Now, the Wilderness Battlefield is threatened with commercial development led by Walmart. Other battlefields from this and other wars face similar threats. There is plenty of space for commercial development located at a distance from these battlefields. Once these battlefields and their immediate surroundings are developed they are forever lost. The landscape will be devastated, archaeological resources will be destroyed, historic buildings will be minimized, and our chance to develop further understanding of these battles and educate our populace about the significance and sacrifice of our ancestors will be squandered. The President's initiative to preserve America's Great Outdoors must include battlefield preservation as a significant portion of its scope. These open spaces are incredibly important to the country – particularly as our population becomes increasingly heterogeneous. We need to remember what it means to be American – and historic battlefields help us do that.

## Discussion Question 2

***(cont.)***

In response to comment #8: I agree that hikers are responsible for some of the multi-use trail problems. I am a hiker, x-country biker that spent years riding a dirt-bike. I think each activity has it's place an because of the variation in speeds at which they travel are better suited to designated single-purpose trails. This will likely result in fewer hike, bike and Off-road trails, but a safer and better experience for each user type. I do not agree that because an activity move more quickly, it deserves a larger area. Numerous ways Off-roaders and mountain bikers can improve trail use is by improving the traffic on exisisting trails. A: One-way trails (especial down hills single track) would greatly limit trail near-misses. B: Maximum speed areas and unlimited speed areas could improve multi-use trails, especially near access areas. C: Trail design associated with curves, steps and banks can physically limit access for some activities; these are most effective when located near the trail head. Each activity should have a place in the outdoors, but only by limiting access to foot-travel only areas Less controversial to those on this sight is the idea that water trails require limitations. Certainly limiting PWCs from fishing areas would benefit fishing. Also keeping paddlers from swimming areas might be less dangerous to those using a rope swing. This all comes back to allocation of use for various uses. From timber harvests to nature preserves, the agency is mandated to provide recreation, conservation and sustainable natural resources. These multi-uses can only be provided by allocating the resources to a variety of uses with a variety of use patterns.

Instead of trying to create even more wilderness areas and national monuments the Federal government should spend their time and our money to staff the parks and rebuild the sagging infrastructure that has existed since FDR. My recent visits to area parks and forests have shown that the Government is seriously neglecting the maintenance of these national treasures. Stop trying to grab more without taking care of what you have! Also, let's develop ANWR so we can at least attempt to stay solvent with our oil supply now that the administration has seen fit to ban off-shore drilling. We can develop our resources and still provide for improved habitat for wildlife and protection for the environment. The wildlife are so much better at adapting than we humans are.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Natural areas are wildlife's home. Wildlife should be given our top priority, because they can't protect themselves from us. In particular: Bicycles should not be allowed in any natural area. They are inanimate objects and have no rights. There is also no right to mountain bike. That was settled in federal court in 1994: { <a href="http://home.pacbell.net/mjvande/mtb10" rel="nofollow" target="\_blank">Link</a> }. It's dishonest of mountain bikers to say that they don't have access to trails closed to bikes. They have EXACTLY the same access as everyone else -- ON FOOT! Why isn't that good enough for mountain bikers? They are all capable of walking.... A favorite myth of mountain bikers is that mountain biking is no more harmful to wildlife, people, and the environment than hiking, and that science supports that view. Of course, it's not true. To settle the matter once and for all, I read all of the research they cited, and wrote a review of the research on mountain biking impacts (see { <a href="http://home.pacbell.net/mjvande/scb7" rel="nofollow" target="\_blank">Link</a> }). I found that of the seven studies they cited, (1) all were written by mountain bikers, and (2) in every case, the authors misinterpreted their own data, in order to come to the conclusion that they favored. They also studiously avoided mentioning another scientific study (Wisdom et al) which did not favor mountain biking, and came to the opposite conclusions. Those were all experimental studies. Two other studies (by White et al and by Jeff Marion) used a survey design, which is inherently incapable of answering that question (comparing hiking with mountain biking). I only mention them because mountain bikers often cite them, but scientifically, they are worthless. Mountain biking accelerates erosion, creates V-shaped ruts, kills small animals and plants on and next to the trail, drives wildlife and other trail users out of the area, and, worst of all, teaches kids that the rough treatment of nature is okay (it's NOT!). What's good about THAT? For more information: { <a href="http://home.pacbell.net/mjvande/mtbfaq" rel="nofollow" target="\_blank">Link</a> } .

People use water and the more people you have the less potable water you are going to have. isn't it time to have a "0" population groth and no more immigrants to this country or the good water will be gone

Providing an atmosphere at home, school, and in the community that fosters a connection to the outdoors is a place to begin. Supporting existing youth groups such as scouting and wilderness 4-H, and church programs with a bent towards back country experiences, is a place to begin. People are so busy making ends meet the necessary adult leadership to actualize the experiences is getting fewer and further apart. If the federal and state government would implement volunteer tax incentives (beyond the current mileage and expense deductions), more people could afford to not work second jobs or cut back on overtime motivations, or even take time off.

Require agencies to publicize the demographics of an area along with the number of acres -and trail miles- to the various types of activities within a geographical area during every planning process. IF 2% of the public land acres is available to the 2% of the population that enjoy motorized recreation, the agency is likely managing the area correctly. Use similar formulas for hiking, equestrian and bike trails. Use similar formulas for river access limitations where motorized, paddling, swimming, fishing and wildlife needs are likely to conflict with one another.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

That sounds great and all but the cost of a project needs to be relative to the available funds you have or in the savings it will create. If it was your money and you had to pay for the work being done and the money spent to run a facility would you be able to provide fiscal responsibility to your auditor (wife) or anyone else that would like to see that it was worthy of doing what was done. In most cases it's not there yet. In some it is. You can't just say that all facilities should be done because the tech is available. It has to make money sense.

The gray area is not explored. All OHV use 'near" all waters, need NOT be closed down. 1st: Off-road Vehicles 'near' water could be OK if the trails are well designed and bridges allow for crossing. 2nd: Not only motorized but most all recreational activities near sensitive ecosystems need greater limitations. Some areas should be closed from Paddlers overuse of riverbeds and banks, especially during lower water conditions. Many riparian trails that encourage hiking, bikes and horses also create erosion near streams especially after heavy rain fall. ORV should not be the only activity restricted from sensitive eco-systems.

The wording here 'next to' the park tells everything. If it is not IN the Park, not in violation of the clean air or water act. Why would this be discussed in the context of park management. This is a local zoning issue. Turn this ridiculous argument around...What if a Casino complained the NPS was planning to build a parking lot on NPS land because it offered free parking? Should they be allowed to stop the park from building a parking area?

There was a lot of environmentalist that pushed the plastic bag. paper or plastic is a question still asked. if we had stayed with paper there would be over 1,000 good paying jobs left in SW washington and the trees that were replanted when this started would just about ready to harvest. We need to use our renewable resourses. this is an area where it has cost familys alot.

Under 3% of the population participates in ORV riding on public lands. Therefore no more than 3% of the available space should dedicated to OHV use. A 1:1 ratio is excessive

What percentage of the population use ORVs? hike? mountain bike? ride horses? want no access for preservation? After that is determined, the agencies should restrict and allow access to areas accordingly. What percentage of river recreationalists, swim? fish? paddle? jet-ski? view-wildlife? hike the area? ..allocate access and zoning restrictions to rivers according to the demographics and interest. There should be places for ORVs, but not everywhere. Sharing trails with ORVs while hiking or biking is a miserable experience. The idea that 'access for everyone everywhere' is the 'best policy' is usually a selfish argument from the more aggressive/loudest/quickest types of visitors. We need Balanced management of our resources.

What will all the people who are for shutting down these areas do when the electric motorcycles and atvs become more popular in the next 5 to10 years. I plan on going electric in less then 5 years. With no noise issues they will only have erosion issues.

## Discussion Question 2

### *Written & Online Comments*

*(cont.)*

You bring a tear to my eye with the info you have written. I too enjoy sharing the outdoors with my family in that very same way. There is not a better way to bond a family together and to learn so much about them and our country. Great Job!! Now if we could only get others to have the same experience we have been blessed to have had.

It is essential that the stateside Land and Water Conservation Fund be increased and dedicated so Americans will continue to have access to outdoor recreation close to home. With child obesity a national problem and young and old suffering from stress related problems, Americans need to be able to connect to nature more than ever before.

Millions of people visit Gettysburg for the historic value of the park. The park is a National Park, which means it belongs to the American people, not just the residents and developers in and around Gettysburg. All National Parks were meant to be protected--none of them should have casinos right at their doorstep--especially one that is a memorial to lives lost. We need to protect what we have and we can't keep using the economy as an excuse for development. Our National Parks need funding and they are a great place to add jobs that can help a community--that would be a much wiser way to solve the economy problem.

Our American public lands belong to every American equally. But, most Americans have no voice or choice in land use decisions! Instead, federal agencies rely on "Collaborative Groups," or "RACs" to advise on and initiate land use planning. The privileged people who are on these committees are called the "Stakeholders." But they are almost all people who happen to live close to the land in question, and who have been making money off our land for decades. And they want to have the rules set to allow them to continue to do so, whatever the damage they may be causing. They don't want the rest of us to be heard. BUT, EVERY AMERICAN IS A STAKEHOLDER. Who speaks for the rest of us? LET OUR VOICES BE HEARD FROM THE START in planning for our land!!

This is an excellent idea! We MUST protect our wildlife. I hope our grandchildren and beyond don't say "Why didn't they save our animals when they could?" It's up to us to do something about this.

Problem is: The FS needs to spend time and money to maintain and patrol these extra roads.

Regulate Exhaust systems!!

This is a tough problem, reservations quickly fill up and it's always a gamble in finding a first come first serve site. I use the, ditch the camper trailer and use a high clearance vehicle method, in getting back into remote sites to ensure availability.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Wilderness designations are far too restrictive. We already have enough wilderness. The National Forest service does well managing our open land. The existing network of trails and roads needs to be protected, and some that have been shut down need to be revisited. The money that is being wasted on law suits could be better used to protect, and maintain the avenues that we use to enjoy the great outdoors. All forest users need to be educated on stewardship, and as the owners of the land, we need to enforce good practices, and educate those who don't follow them. Please stop further wilderness, National Park, and National Monument designations.

I was interested until I read your last comment. There will always be a need for protected areas, with more to come as the population grows. Clearly, reading your last paragraph suggests to me that your agenda is less about multiple use and more about returning to a time before conservation became a priority for the people and for the government. And, as long as you bring it up, I wonder how those lifetime appointments for judges worked before conservation became a consideration in the way our public lands were being used. Sorry - I can't support this idea.

Under Section 319 of the Clean Water Act, states have access to Clean Water State Revolving Funds (CWSRF's) that may be used to upgrade local water systems but also to reduce nonpoint source (NPS) pollution. Low-interest loans are available to local governments, water systems, and qualified nonprofit borrowers such as land trusts. In some cases there have been 0% loans, and in other cases state agencies have obligations to provide "additionally subsidized" loans; this means that some portion of the loan is, in effect, a grant. For example, in Maryland loan applicants "undertaking an eligible non-point source, green infrastructure, water or energy efficiency improvement or environmental innovation project that does not have a dedicated source of revenue, such as a user charge system to repay a loan are eligible to receive up to 50% of the project costs as grant." (MDE) In other states, the rules may be different (?) Data on this is hard to come by, but it would appear that very little of the CWSRF funds are being spent on land conservation and restoration projects to reduce or prevent NPS pollution. On the front end, private entities, such as land trusts and watershed organizations, do not receive a formal mail solicitation to apply for CWSRF loans - as local governments do. In Maryland a few such loan transactions have been successfully completed, helping to protect the waters of the Chesapeake Bay and restore wildlife habitat lands, but such projects are little known. State agencies need to hear from land trusts and other conservation groups who can bring project proposals to their doors. We need to demonstrate demand for NPS project funding, shine a light on this resource, sit down with the agencies that have the Section 319 money, and work out some land conservation deals.

The 'NATURE' is now becoming aggressive than ever by showing her anger to us in her way of Cyclones, Tornadoes, Floods, etc. The first reason for this situation is global warming which is mainly caused by great reduction of green shade through out the world day by day by human being. The time has come to improve the green shade by at least doubling the shade. Every possible single square inch of the earth has to be covered by green ... BECAUSE ONLY GREEN CAN CONVERT THE ENERGY OF SUN IN TO A DIFFERENT MEDIA AND THEN CAN REDUCE THE NATURAL DISASTERS BY REDUCING THE NATURAL HEATING BY THE POWER OF SUN. So the green the global airconditioning is the only answer for the global worming

The Blue Ribbon Coalition, Stewards of the Sequoia, and Save the Trails are one in the same. Destroy all habitat and the reason many people go to the forest for peace and quiet. You may be loud and powerful on your motorcycles, but pretending that closing the illegal trails created by your organization members is not locking you out. There are many, many more kind courteous motorcyclists who ride where they are permitted and do so lawfully. Their trails will always remain open, unless those who believe they have the sole right to every square inch of the forest. The 37,000 acre Piute Fire in the Sequoia National Forest was started by a motorcyclist and then the Stewards had the audacity to blame environmentalists for the fire because they did not want the rest of the fire-retardant old growth trees to be cut down by the forest service.

ohv is a sustainable way to enjoy the outdoors. closing trails to ohv use is only making criminals out of innocent people. motorcycle's and atv's are here and people are going to ride them, so we need places to ride. my local trail riding club helps the forest service in building and maintaining trails. not just multi-use trails but all types of trails. i consider myself a conservationist and i don't like to see land destroyed by irresponsible ohv use. however that is not the majority of our community and most ohv users are not destructive. i think this could problem could be solved easily through education. riding dirt bikes is a very healthy form of exercise. i'm tired after every ride. there is plenty of room for everybody. no one group should be left out of their hobbies. this may require splitting groups up in seperate areas and require more work or construction, but i think its very necessary. i put recreation on the top of my priority list. i think most people do.

An tremendous waste of our tax dollars. Many non-profit groups have absolutely ABUSED this loophole and left organized recreation groups unable to defend ourselves using FEDERAL money because they do not have non-profit status! Many of these groups are under 10 people and formed with the SOLE intent of continually filing lawsuit after lawsuit using FEDERAL funding! Let them pay for their own frivolous lawsuits and see how quickly this ridiculous and irresponsible behavior stops!!

As an aging American that has been a hiker, horseback rider, cyclist, canoe and kayaker I can no longer continue these activities to enjoy our great outdoors. BUT what I can still do is 4x4 recreation to get out and see our spectacular country. Denying access is discriminatory and should not be allowed to continue! Please keep our public lands open and accessible to all who wish to recreate! We are the people and we are responsible for our land! Thank you for listening!

Keep public lands Public! The environmental movement has helped raise awareness and consciousness of land stewardship. Now it is time for recreational groups to demonstrate how far we've come and allow us to be active stewards and teach others how to preserve our land! Denying access goes against our rights as Americans! Thank you for listening!

Keep public lands Public! The environmental movement has helped raise awareness and consciousness of land stewardship. Now it is time for us 4x4's to demonstrate how far we've come and allow us to be active stewards and teach others how to preserve our trails. Denying access goes against our rights as Americans! Thank you for listening!

***(cont.)***

Large animals such as elk, bears, antelope, and bison generally have natural ranges larger than the protected area in which they may be located. We need to provide corridors between natural areas to permit large animals to migrate between such areas without crossing highways or disrupting or endangering human activities. Solutions such as passages over or under highways and keeping natural migration routes free from obstacles are available. We just need to make the effort before too many obstacles are erected.

"Don't mindlessly transmit your chosen faction's talking points, but use your actual experience to mold your opinion." I do use personal experience to mold my opinion and I would venture to guess so do most others here. I have seen first hand trails rendered impassable to hikers because of OHV use, seen animals I was watching run away as a motorbike buzzed by, seen streams and meadows torn apart by 4wd vehicles and motorbikes alike, seen trails off limits to motorized vehicles with motorbike tracks on them and have many times picked up and carted out trash left behind by OHV users. Seeing all these things personally it is not hard to imagine others stories or pictures that show the damage OHVs do. That is why I oppose giving more access to the OHV crowd not some sound bite or "political buzz word". As far as not going to places where ohvs have access that may be easy on the west coast but here on the east coast between the lack of wild places remaining, the amount of access given to ohvs and the fact so many bikes go where they are not supposed to go it is hard to find places to hike where you do not have to share the area with an ohv. This forum has also been very enlightening in terms of exposing the ohv crowd. To give credit where credit is due a few have tried to come up with common sense ideas to help out and minimize the damage they do plus have expressed and shown a desire to protect and preserve nature but the overwhelming majority have proven that they not only do not respect or love nature but that they are just as or even more happy to see it drilled into, mined on or driven over as seen it preserved and would just as soon see all wildlife extinct as saved. How do you support someones ideas when they are so ignorant and totally opposite your own views? To be fair though I will say I have picked up trash obviously left behind by hikers and have once seen a meadow that was been damaged by a camp site and even though I have never seen a trail degraded anywhere near the extent of OHV trails I suppose it could happen if there were enough people using the trail over many, many years. That is why I have stated time and time again, as someone who loves and respects nature and sees it's importance far beyond my own self centered enjoyment, that there should be areas that are off limits to all human recreation and encroachment and I do not need a "political buzz word" to tell me that is one true way to go.

***(cont.)***

I guess you missed my point and sarcasm? Money, that's what it all comes down to with you people right? It is not what's right, it is not what best for the people or the planet or the animals that call our wild lands their home it is what brings the most profit right? As long as it brings a profit who cares if every last tree is cut down, every last river poisoned and every last animal killed right? Since you asked though I will tell you my interests bring something a whole lot more important than money. They bring clean water, clean air, a healthy eco system and a sense of well being and peacefulness in an other wise cruel and inhumane world. They do that and bring a small amount of money to my local economy in the form of people who come to my town to hike or enjoy the peace of nature and then visit the local stores, pubs or restaurants afterward. You have a nice day too and trust me I would like nothing more than to run into you on a trail someday, I really, really would.

Charging such a small fee would not even put a dent into the amount of damage allowing OHVs on trails and then others would be responsible for paying for the repairs. Maybe if you made the fee \$1000 it would even out but even then the loss of wildlife and habitat is not worth any amount a fee would bring in.

I did not say you do not deserve some areas to enjoy your hobby. You do but what you do not deserve is more areas and especially not areas designated as wilderness areas which are made to preserve a species in decline. There are literally dozens of ideas just like this one that want more and more and more and do not care what becomes of the land or the animals that live on it. Since you voted to recommend this idea I have to think you are one of those people so answer my question. Is it that you are just too ignorant to realize how important these lands and animal species are or do you just not care? You are right I have never had to participate in clean up efforts on hiking trails mainly because the trails in my area are clean. Yes I have picked up things like water bottles, soda cans and candy wrappers along trails but other than the occasional litter nothing else. On the other hand as a member and volunteer of a local land trust I have gone to OHV trails and cleaned up bags worth of garbage. I have also had to restore trails and streams damaged by OHVs. I have also witnessed things like refrigerators, dryers and tvs dumped along side of OHV trails and I gaurantee you that was not a hiker doing that unless he were inhumanly strong. I do realize there are some idiots posing as hikers out there that are just as bad as OHV users if not worse and that is why I wholly agree that many areas should be off limits to ALL HUMANS!! That being said that does not change the fact that no matter how responsible a OHV user is the very nature of his hobby is damaging to the environment and a downright nuisance to wildlife and others that enjoy the outdoors. Maybe you are a responsible off roader and that is great but why is it you people want so much? Why is it you cannot understand that just by the very nature of your vehicles (the weight, engine noise, emissions, etc.) that you damage the land you claim to love or that some areas of land need to be protected from all people including OHVs? Why is it so many of you people are so greedy and uncaring?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I see the destruction everywhere I go where OHVs are allowed. Just this past weekend I was hiking with my wife and we had to hike a little over half a mile on a shared trail before turning onto a protected wilderness area where only hikers were allowed. In that half mile I saw dozens of large ruts carved out, a few very deep puddles where rain water had collected in even deeper ruts that made the trail impassable on foot, rocks dislodged, beer cans and plastic cups strewn about (which I picked up and carried out on my way out of the forest by the way) and 1 dead deer which had either been hit by a OHV or shot by someone driving a OHV. Once I turned onto the trail I could plainly hear the motorcycles and atvs as I hiked into the protected area and could continue to hear them till I was over a mile into the woods. In my time I have seen entire parks ruined by OHV use and while I am sure there are some hikers who do not respect nature and fellow nature lovers that number is dwarfed by the number of OHV users who do not. I have seen full trash bags, tvs, old refrigerators and dryers discarded on trails used by OHVs and unless Lee Haney was around I highly doubt it was a hiker doing that. I have yet in my 40 years of hiking seen a trail used exclusively by hikers that ever had the destruction, noise or pollution that trails shared by OHV users has and that is plain fact. It is just a blatant lie, and a foolish one at that, you would say hikers damage trails as much as OHVs. If off roaders do spend more time outdoors than environmentalists it is only because they can continue their laziness sitting and driving around while hikers like myself actually have to expend energy moving about the forest and dealing with the elements. Plus we have to deal with the ignorant OHV users who think they own the trails and the outdoors which is never fun.

I would not call it unfair at all. OHV use ruins trails and wildlife habitat not to mention promotes the use of fossil fuels and increases pollution in forests and wild areas. Any price they pay for the destruction they cause is not enough if you ask me so if I have to pay a flat tax for my backpack or wag bag then they should have to pay the same flat tax for their noise making, pollution spewing, habitat destroying monstrosities.

I have news for you. The wild horse round ups ARE being paid for by tax payer money as is the upkeep of the horses in the pens. I would much rather have my tax dollars going to preserve these animals and their habitat than having them round up and sold to the highest bidder and then killed or tortured wouldn't you? Maybe you should learn a little something about these things before you open your mouth and show your ignorance to the world.

Devlon- Sure its a win-win situation for ohv users. Not so much for the townspeople who have to traverse the degraded roads on a daily basis and listen to the increased noise and deal with the increased pollution. Not really a win-win for tax payers responsible for paying the increased taxes for road maintenance either.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You have got to be kidding me that a hiker watching a deer, elk, bison, moose, bear or any other animal by standing still and being quiet scares it more than a loud, polluting motorized vehicle. I have watched literally hundreds of animals in my lifetime from the solitude of a hiking trail and I can count on one hand the number I have seen run away because of the noise I made or my mere presence and I would guess most of them do so because of experiences with human hunters more than my presence scaring them. Yet I have many times seen animals run once the noise of a motorized ORV has spoiled the quiet and peaceful sounds of nature. I once watched a moose for nearly 15 minutes as it ate grass near a pond, with it knowing full well of my presence I might add, only to have it run away as a motor bike drove by. I can also recount sightings of elk and black bear where the same thing has happened. As for the ruts breaking animals legs, no I have not seen it myself but I have read accounts of it and since I have tripped in ruts myself and nearly turned my ankle more than once I can plainly see that this could easily happen if an animal were running at fast speeds which happens often in nature. Sadly running from an ORV many times. I would gladly go where ORVs are not allowed the problem is they are invading all the trails. I had two trails I loved to go to with my dog but both were destroyed by ORV users and if you think ORV users are lovers of the outdoors you could not tell from these places. Within a couple years of opening it to ORVs the trails became almost impassable because of ruts, the wildlife had all but disappeared and the amount of litter and trash strewn about was nothing short of sickening. It indeed was a "horrid" place and hikers stopped going there. In fact it became so bad that while I was still going there I would have to carry my dog across some parts of the trail because of broken glass from smashed beer bottles. If this is an example of ORV use and what you call "pristine" and "clean" then I would hate to "horrid". It saddens me to this day to know those trails I enjoyed so much are destroyed forever but it does my heart well to know the ORV use is being restricted. You have only yourself to blame for destroying what you had! NOTHING good would come of increased ORV trails as this proposal states. Not only would it destroy wildlife habitat and drive away the animals it would destroy the outdoors experience for the hikers and campers which far outnumber ORV users. As I said before if you are too lazy to actually get off your butt and walk it then maybe the outdoors is not for you and you would be better off staying to the ORV parks that have been built, the wildlife areas already destroyed by oil drilling, logging, mining and your presence or the city streets. Plenty of two legged animals to see there and they do not run away from your noisy, polluting vehicles either.

Exactly what I was saying. We need to save our public lands not destroy them for mere pennies.

Forget getting any support from the ohv crowd or the right wingers that have invaded this site. They think wildlife is a nuisance and an obstacle in their pursuit of getting access for their machines into wilderness areas and everywhere else for that matter.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I think a couple of your tea bags have broken. You must have had to look real hard to find an environmentalist on an environmental forum. It would be like being surprised if you went to a site dedicated to the Red Sox and then were surprised to see people from Boston posting on it. I guess you thought this site would be full of fellow tea baggers and right wing wackos like yourself? Obviously this site is going to be full of people who love the outdoors for something other than profit or the destruction by man's hand. If there are any "extremists" here or any "coordination" it is by the OHV crowd who has all but ruined this forum and has demoted every idea that does not include greater access to OHVs. I have seen actual ideas (very poor ones) from OHV organizations and links to their sites posted here. I have yet to see one from the Defenders of Wildlife, Sierra Club or NRDC though. Our public lands, national parks and wildlife refuges were not made so people could build more roads and drive through and over them. They were made so some wild places would survive no matter how bad man's greed got and it has gotten pretty bad. While OHVs do deserve some areas they DO NOT deserve every last inch of wild space. I am fine as a hiker and backpacker that some areas are off limits to me so why is that not okay with you that OHVs are not allowed everywhere? YOU are the "extremist" here not others!

Haven't we seen enough of what deregulation can do to a wilderness area with the Gulf oil disaster? If there was a no fishing sign in Yellowstone NP you can be certain it was there for good reason. Maybe a certain species that is endangered or threatened lives there, with over 40% of fish species now either threatened or endangered that is not hard to imagine. There are hundreds of streams, rivers, lakes and ponds in Yellowstone so if you "simply gave up" after not being able to fish in the first stream you went to you obviously were not trying very hard so do not blame the government for not being able to fish. Regulations are fine and if anything we need more and stricter enforcement as well!

I agree 100% with this. Ranchers for years have killed endangered species like Grizzlies and Wolves. Have shot Buffalo for grazing on their land and left the carcass to rot only to have Eagles and other animals die from eating the meat which has been poisoned by the lead bullets used to kill the poor animal. They have run off or rounded up wild horses and sent to "containment areas" which is nothing more than a nice word for slaughter house. They have clear cut forest to turn into pasture and polluted streams and ponds with run off from fertilizer and manure. Loggers have built roads through pristine areas and clear cut entire forests while Miners have polluted streams and destroyed entire mountains in the search for coal. It is time all these people paid and paid dearly for their destruction of habitat and wildlife. Penalize them enough so they never even think of doing the destruction they do again.

I agree. Hunting for food is one thing but hunting so some idiot can get his jollies shooting a defenseless animal is just a cowardly act no matter how you look at it and hunting threatened or endangered species should NEVER be allowed no matter what. Sadly though as we have seen with our other governmental agencies, money far outweighs what their agency was intended to do. The only thing that could help is transparency and greater penalties such as extended jail time for people within governmental agencies found guilty of dereliction of duty, fraud or accepting bribes.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am demoting this idea for the same reason and that is because of the bird deaths. I would think making them appear like the background would cause even more deaths. Someone should do some research to see if a certain color would be easier for the birds to see making it easier for them to avoid the turbines.

I believe the map noted would be the Coffman map, produced several years ago. It's still in circulation, but there are many federal efforts that are catching up with it. For instance, we have the US Fish and Wildlife Service entering early implementation stages of the corridor and buffers program outlined in their 2009 Climate Strategy and Climate Action Plan. Their problem is that they are way out on a limb without adequate statutory authority to support their implementation. The authorizing language for the wildlife corridors information systems program is contained in Section 481 of HR 2454, the Waxman-Markey climate bill. Very similar language is included in Section 6009 of the Kerry-Lieberman draft climate bill. The language is again included in HR 5101, the Wildlife Corridors Act of 2010, which was introduced in April . . . Now awaiting calendaring in the House Natural Resources Committee. This bill extends from the information systems provisions and into implementation authority. The Wildlands Project has become the Wildlands Network, and in their versioning, wildlife corridors are now to be known as "wildways". Their overview map remains largely unchanged from the days before TWP moved to Vermont, the primary difference being branding. The Y2Y corridor and buffer system already exists, and is shopping for state or provincial formalization. What I'm curious about is the fact that Mr. Sutherland is so darn sure that the Coffman map is "completely and 100% false", or that it was made intentionally alarming in order to stir up some "lunatic fringe" . . . When he can't even articulate the map's source or presence in current discourse. How can he know it's BS when he can't even tell us who prepared the map and for what particular purpose? I ask this in the full knowledge that corridors visioning has moved well beyond where it was in the TWP days of concentrating on keystone predators to the point where we are now discussing entire suites of species, nearly an entire food chain, as needing the extensive corridor and buffer systems reflected in the continental-scale system vision. We are now immersed in the creation of corridors and buffers at all scales to the point where the Coffman map appears to be increasingly prescient.

I could not have said it better myself Ron. The survival of our dwindling forests far outweighs the need for a group of lazy americans to get their jollies by destroying wilderness areas. When will you people grow up?

I do not see how destroying forests and prairies is connecting anyone to the outdoors. If anything it would seem to disconnect people to nature because all they will see it as is another area to be used for profit, although that is not much different than how it is seen today sadly.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I love idea of using volunteers to clean and maintain a park in exchange for a free yearly pass. I would take it one step further and say that take one week a year and do this gathering volunteers and assigning them a specific duty such as trail maintenance, rubbish removal, roadside maintenance, etc, etc, This would be a great way for people with a love for the parks to not only enjoy the beauty of it but to relish in the knowledge they are taking care of something they love and will be rewarded for such. In my town we had a very nice park right on the river and it was free but teenagers and adults alike ruined it by leaving their trash behind from their picnics and beer parties. The loud noises from their radios and drunken mouth's scared both the animals and hikers away. At first I would take a bag and pick up cans and rubbish but over time there became so much litter it was useless. Even the trails I loved to walk with my dog became treacherous from all the broken glass and with no money to fund clean up the mess remained and I left to find another park to enjoy. Because of things like this I hope there is always a fee to use the parks. Those who love the outdoors will gladly pay the small cost to enjoy it because they know it takes money to maintain such beauty while those who only want to use the park with little to no regard to its natural beauty will just have to fork over the fees or find someplace else to ruin. To just let anyone in without paying will lead to overuse and in time the park will become destroyed by those who do not love the land as we do.

I think presently there are more than enough trails for people but what we do not have is enough land and protected habitat for our wildlife population to survive never mind thrive. For that reason I cannot promote this idea. I am all for protecting as much land as possible but nothing good ever comes from introducing man to areas that have been off limits for a reason.

I totally agree. Some areas need to be off limits to ALL HUMAN CONTACT!! That includes hikers, backpackers, campers, ohvs, mountain bikes and anyone else. Rangers can be allowed in to monitor for poachers and biologists can be allowed in to monitor wildlife and of course in case of emergencies like wildfires or plane crashes exceptions would have to be made but otherwise no human contact at all. You missed the entire point of this idea. The importance of nature is not to "bring in \$\$" but to be preserved for future generations at all cost. A very daunting task considering the rampant, needless and senseless amount of development going on. Nature does not need our help to sustain it with logging and burnings, it survived and flourished very well without mans help for millions of years but it does need man to stop destroying it if it is to survive.

If the government would close all the tax loopholes for the rich and the corporations and begin charging big oil, gas, coal and the logging industry appropriately for the destruction they do and the obscene profits they make there would be no problem coming up with the money needed to fund our parks and protect our land and wildlife. Education is important too but sadly it is one of the first things republicans like to cut when they are in power.

If we did that it would mean american parents would actually have to become parents instead of plopping their child in front of the tv or video game counsel. Shame on you for even suggesting the thought that parents might actually have to do something with their children or teach them something.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

If you open "minimum maintenance roads" to OHV use they will not be minimum maintenance for long. OHVs tear huge pieces of earth out of dirt roads and trails, without monthly maintenance these roads would become impassable to normal car use. Plus inspiring more people to move to farming towns and small villages will only destroy the places you hope to help. Increased population bring increased traffic which brings paved roads, increased crime and drug use, increased taxes and the farms you speak of will be bought out and turned into big box stores and strip malls. An all to common occurrence here in CT where I live. Leave Nebraskas small villages and farming communities alone, sometimes you do not know how good something is until it is gone. Lets not make the same mistake here as other states have

If YOUR idea of preservation includes protecting land and wildlife then I am with you but looking at your voting record it seems like you are only interested in YOUR OWN self centered pleasures.

It is a true shame that the ORV lobbyists are so active on this forum. This started out as a great idea on how to improve the great outdoors for people to enjoy but it has turned into anything but. Driving heavy, fossil fuel burning, emissions spewing, loud noise making machines over dirt paths which at times and in many areas are wet damages the outdoors and you do not need a scientist to tell you that, ask any hiker or backpacker, or anyone with eyes and common sense, and he will gladly tell you so. Obviously you do not need a scientist to tell you loud noises scare animals either or that continued loud noises will chase animals from that habitat. Leave the outdoors for people who love it and respect it, the animals that need it for survival and keep your loud, polluting machines at home!!!

It makes me sick to read so many idea centering around ORV use. I thought this was supposed to be ideas on how to save americas wild places not ruin them? ORV use does NO good for the environment, the forest, the animals or the people that actually enjoy the peace and solitude of the outdoors. Why must the laziest americans always make the most noise?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

As far as I know I am not doing much damage to the human race, certainly less than most but maybe I am. Lets see, I drive a high millage vehicle with low emissions so I pollute the air as little as possible. I recycle everything so my garbage does not end up in some landfill, ocean or incinerator further polluting the environment which would cause even more harm to mankind, I have high efficiency products in my home and regulate my energy consumption plus have signed up to get my energy from wind and solar even though it costs more so my carbon foot print is much smaller than most which again will cause less air pollution which will decrease lung disease, I am a vegetarian/vegan so I do not promote further green house gas buildup from factory farms. I could go on but that seems like enough for now, is that enough for you? Please though tell me how you help mankind since you are such an upstanding and obviously intelligent member of society. As far as me being injured in a wilderness area, if the area is off limits to everyone how would I be there to get injured in the first place unless I were an irresponsible person going where I was to supposed to be? Plus I never said emergency vehicles should not be allowed into wilderness areas, of course they should. I would venture to guess more animals are harmed and killed by habitat degradation caused by ohv use than wildfires but I would have to look that up to confirm it. The goal for everyone here who claims to be a "responsible" person who enjoys the outdoors no matter what their choice of recreation is, is to enjoy the outdoors WITHOUT DOING ANY HARM TO CREATURES otherwise it pretty much makes your argument of being "responsible" moot! I have seen many a child smile at the sight of an owl in a tree, turtle in a pond or rabbit in a meadow, all things that are pretty tough to do on a noisy, speeding ohv. But maybe those smiles are not as important since they come from kids who walk to enjoy nature? No I have never ridden a ohv nor do I want to. My enjoyment of the outdoors is to hear the wind in the trees or the babbling of brook, the call of a bird or elk, the sound of a moose or buck cleaning his rack on a shrub or tree or the noise a black bear makes as he eats blueberries. All things I could not do from a noisy ohv. Who exactly is "a lot of you" anyway? What group do you want to label me in? I will make multiple choice since I know you must be busy. A)environmentalist B)animal lover C)democrat D)educated and intelligent american E)all of thee above Why is it you ohv people come up with the same ludicrous arguments? Is it really all you can come up with or do you get it from the same book? I never said we should ban ohv use altogether, go ahead and look up my comments before putting words in my mouth. You have your areas so enjoy them but you, nor anyone else, deserves to go into wilderness lands, disrupt and possibly end the lives of endangered species. If that is too much for you to give up then it is you that is self centered, greedy and just plain stupid. PS-the answer is E, cannot get any easier than that for you

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I have said time and time again but I guess for you I will have to say it one more time. If an area of forest is put off limits to me as a hiker and backpacker because it is deemed to be an area that houses a threatened or endangered species I AM FINE WITH IT!! Is that clear enough for you? Above all else I am a lover of nature and wildlife and I would like to see it survive as long as possible and I personally feel that is much more important than my own self centered desires. As has clearly stated there are literally hundreds if not thousands of animal and plant species that are now endangered. Do you not feel like their survival is just a little more important than your desire to ride your ohv everywhere? Your protests as far as elderly and kids is a very weak one as well. I do not know any elderly person that want to ride a motorbike or 4wd nor do I know any that could handle the rough ride but I do know a few that like to hike and do as often as me. As far as kids go they have more energy and more spirit of adventure than I do so I see no problem with them hiking either. Yes it is a problem for disabled people but there are more than enough places now for them to go so I see no need to add more.

Nobody is trying to force their views on you. They are just stating plain and simple fact. We are losing more and more open space every day, to the tune of 5000 acres a day, and more and more species are becoming threatened or endangered every day. That is just plain and simple FACT not someones opinion. You can bury your head in the sand and pretend nature is doing fine or maybe you do not care one way or the other if nature survives past your lifetime (that would be my guess) but if we do not start preserving what little nature is left all you and your family will be riding your precious ohvs by and through is clear cuts, oil rigs and strip mines. Is that what you want?

## Discussion Question 2

***(cont.)***

I failed to mention it because it does not exist. While it does mention wolves killing each other nowhere in the article does it state that the MAIN reason is wolves killing each other. Read again and tell me WHERE in that article you read that the main reason is wolves killing themselves? Here is the quote from the article that proves it is YOU that only reads what he wants to read.. "While parvovirus and mange continue to reduce the population, part of this year's decline can be traced to the fact that wolves lost protection in the Northern Rockies under the Endangered Species Act in 2008. Wolves, like all wildlife, are protected inside the park, but when they roam beyond the borders, they fall into the state's wildlife management practices. Idaho and Montana, which border Yellowstone, permitted hunting of wolves this fall. Idaho recently extended its hunt until March. The Yellowstone pack hardest hit by the hunt is nicknamed Cottonwood. Hunters killed four members of the pack, including the breeding female, her mate and her daughter in a Montana wilderness area bordering the park." The article also clearly states the plans to increase hunting to wipe out 1,200 wolves... "The group faults the states' management plans to reduce wolves from 1,650 to 450. State officials state the need to balance the wolves with the habitat and other wildlife." How come you do not mention that? Let me guess, because it proves you wrong? Also the article plainly states that hunting and extreme weather (brought on by climate change no doubt) is a large contributor to the decline in elk. Here is the quote to prove you wrong ONCE AGAIN... "The winter elk numbers in the park have dropped from 17,000 to 6,800 since the wolves were reintroduced. Hunting and weather factors have also taken a toll, Smith says." No mention of the Buffalo slaughter from you? Gee, I wonder why? Thank you for proving my point on just how much we DO need environmental non profit voices in the government because extremists like yourself either cannot understand or choose not to understand what is going on out there and would rather just use nature for your own self centered enjoyment regardless of the damage it does.

## Discussion Question 2

***(cont.)***

I was not talking about you, I was talking about the author of this who obviously did something which is why every idea promoting conservation has been heavily demoted while every idea promoting ohv use or development has been heavily promoted. Since you stated how you feel about protection of wilderness areas how do you feel about the supreme court ruling that says government can seize private property if it can prove it is for economic development? This causes people to "pick up the pieces and in many cases move" as well. I highly doubt that is what our founding fathers wanted either would you not agree? As far as Americas private land rights being the cornerstone to what made the country great tell that to the Indians who we killed and stole the land from. Sorry to hear about your wife. Most people who oppose ohv use, myself included, are not saying we should ban use altogether but restrict it to areas where there impact will not cause harm to threatened wildlife and plant species. You have a right to enjoy your hobby as much as anyone but you do not have the right to go everywhere and you shouldn't. If you are looking for someone to blame do not blame me for being closed minded. Blame it on the rampant over development that is pushing animal species into smaller and smaller areas and causing many to become threatened or endangered. Do you not want to have your children and grandchildren to have the opportunity to see a bear, wolf, buffalo or eagle in the wild someday? Hopefully with land restrictions not just to ohv users but hikers and backpackers as well they will. I am more than happy to give up some of my access for the greater good, aren't you? I agree our founders are turning in their grave but it is more because of how ignorant, self centered and destructive our society has become than any other reason.

Joshua- In 2008 1,600 buffalo were slaughtered outside of Yellowstone NP and plans exist to reduce the wolf population by 1,200. In fact the hunting of wolves is so rampant that Yellowstone has seen their wolf population reduced from 174 to 114, the smallest in over 10 years, because of killings outside the park of females and pups. Of course we all know of Sarah Palins disgusting aerial hunts and who knows how many of those poor animals were brutally gunned down. If you want to read about it you can go to the USA Today web site and find it.

Joshua- It takes a lot more than some moron linking this site onto his facebook page or ohv site and getting all his "friends" to come here and promote ideas to destroy forest and wilderness areas to get the president to all of sudden open designated areas to ohv use, oil drilling, mining and logging. Tell me though since you are so hot and bothered to see wilderness designations go away where will you ride your precious ohv when all the forests are destroyed or developed on?

Just about everyone on the road has a license but how many have respect and courtesy for other drivers not to mention follow the laws at all? It is nice you are trying to find a common ground but it is just not there. The very nature of a large, heavy, polluting vehicle on a soft dirt trail, loose rock stream, tall grass prairie or wild flower laden meadow means destruction for the trail, stream, prairie or meadow no matter what. Still I will give you a promote for at least trying.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

Margret- So global warming is a hoax? Okay lets say for minute that the planets highest temperatures have not been occurring over the last 14 years with this year the highest ever recorded. Lets say for a minute that the storms are not getting worse despite the massive loss of lives across the globe from the record number and severity of tornadoes, typhoons, hurricanes and heat waves. Lets pretend areas are not having record droughts while other areas are having record floods and lets ignore the fact that small island countries are being swallowed up by the oceans. Lets pretend all of that does not exist. Does that still mean we should continue to trash the planet the way we are or should we look to other avenues to preserve and protect the only world we have?

I disagree! For too long america has put economic development first and foremost and what has it gotten us? We have more oil drilling, coal mining and gas extraction than every before yet prices remain high and corporations scream for more and more access to public lands and wilderness areas everyday despite the fact hundreds of wells lie capped since the recession . Millions of homes lie abandoned or foreclosed on yet developers want more and more public lands everyday. Pristine forest is cut and road less areas are developed on so resorts can be built for millionaires. Who does this benefit? No one except the developer and the rich who can afford to stay there. Even with the huge push for development of all kinds the last 8 years under Bush we see huge jobless numbers and more and more people becoming homeless everyday. I know what the duties of the BLM are so I do not need a history lesson from you thanks. I also know that the BLM totally ignores existing laws to grant access to our lands and that benefits very few while harming many and completely destroying the ecosystem, biodiversity and beauty the country once had. Many animal species are down to their last 1 or 2% of their range and many, many more are either threatened or endanger of becoming extinct yet time and time again the BLM ignores scientists recommendations and gives the land away. You talk about responsibility but does that sound like responsibility to you? Corporations have more access to our lands than ever before and yet we are in the midst of what truly is a depression, a quickly dwindling middle class, record numbers of homeless, near record numbers of jobless, deflating wages, increasing energy costs, etc. etc. so how exactly are we prospering now that we have put economic development so high and preservation of land and wildlife so low? Looking at your voting record I can plainly see you are no fan of nature, wildlife or the preservation of either so I am not surprised by you comments but the least you could do is provide a valid argument.

The reason why these groups sue the government is because the government does not follow the rules and break the laws set up to protect our wildlands and wildlife. If you actually loved nature you would agree that is a worthwhile cause but of course you think our wilderness is something that should be drilled through, mined on and driven over and our wildlife should be gunned down or run out of the country. Funny how you have no problem with our tax dollars subsidizing oil, coal and logging companies, roundups of wild horses and the execution of thousands of buffalo and wolves but you have a problem with tax dollars going to help environmental groups protect or wilderness and wildlife. Want to try and tell me how you love and respect nature again?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

When I see many animal species down to their last 1 or 2% of their range and hundreds listed as either threatened or endangered while many have already gone extinct it pretty much tells me that not a whole lot of thought or action has gone to preservation. We have given away more and more land and access and we have gotten nothing in return so maybe it is time to start thinking of other ways to stimulate our economy. In many states including my own it is nearly impossible to find a backwoods hiking spot without hiking across a road or through a neighborhood after only a couple hours. We are losing more and more of our public lands to development everyday and nobody but a few corrupt politicians, a few corporations, a few developers and few energy producers are benefiting. We are losing our forests, streams, lakes, parries and now even our oceans with the Gulf oil disaster and it is all because our governmental agencies refuse to do the job they are supposed to do. Even if you think you do not support "developing and strip mining everything in sight" you actually do because there is not much land left that is not developed. There are millions of homes sitting empty, hundreds if not thousands of wells sitting capped and millions of square miles of industrial areas sitting in decay yet time and time again pristine forest and land is cut down and bulldozed for more roads, more drilling, more homes or more industry? It is time for the stupidity to end! This country worked pretty well before Regan came in and started giving everything away to the corporations. It is time for this country to once again start preserving the things that matter and the things that made it great and that includes our public lands, our national forest, parks and our wildlife!

Maybe if wild horses were not being round up so ranchers can use the land for their cattle, maybe if threatened and endangered species like Wolves, Grizzlies and Buffalo were not being gunned down by the dozens if not hundreds by and for ranchers I would have more sympathy for their plight but as it stands as much as I am an environmentalist I share nothing with these so called environmentalists as you like to call them other than a love for their land. Sadly though I see their land as something of beauty for not only humans to enjoy but animals as well and all they see it as is a way to make money. Protect the land sure but let the ranchers, or at least those who practice the rounding up and killing of other animal species, fend for themselves.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Maybe the roads would be more chaotic but still it comes down to the individual and sadly there are more "self absorbed jerks" on the road everyday and most have licenses. I agree with you that a responsible person like you seem to be will do much less damage than the "self absorbed jerk" but still that does not change the fact that no matter how responsible you are you are still operation a heavy, noisy, polluting, gas burning machine into wilderness areas and in the majority of cases that has a detrimental effect on the environment in many areas. You are right also that a dirtbike will not have the damaging effects of a suv or 4x4 pickup truck but again it is the operator to keep his damage to a minimum or to stay on designated trails which all too often is not the case and I have several times seen hiking trails and areas restricted to motorized access damaged by dirt bikes. To be fair I have seen damage done in the form of litter or a camp made in a meadow that has obviously been a self absorbed jerk hiker or backpacker and it makes me sick. I pick it up, cart it out and hope that some day I run into the jerk who did it so I can show him how a responsible hiker treats someone who has no respect for nature but overall I have never seen anything close the trail and habitat destruction I have seen by OHVs. There is bad everywhere and if we hikers can be no better stewards of our precious remaining wildlands then maybe access should be taken away from us as well. Again I give you a lot of credit for trying but I have seen first hand trails, habitat and wilderness areas I loved to hike on totally destroyed by OHV use after they were opened up to them and I have see trails I enjoyed damaged even though they were restricted areas to dirt bikes and atvs. I am not a jerk or uncompassionate to your plight but until something can be done about the weight, noise and pollution levels of your vehicles and somethign done about the irresponsible members of your community I could never promote an idea that grants more access to OHV users.

I have NO desire to go to YOUR park. There are plenty of places I can go to see strip mining, logging and oil drilling or have my enjoyment ruined by the noise of an ohv. I do not need a lesson from you on what public lands are for either but the overwhelming desire for this country to develop on those lands has created a tremendous loss and destruction to those lands causing a severe imbalance between nature, preservation and development. While this may be fine to someone who does not respect or love nature like yourself that is not fine with me. I have said time and time again on this site that if hikers and backpackers are not better at preserving the environment then they should be banned from areas just like ohv users so get your facts straight before opening your mouth and proving your ignorance. How is my wanting to protect lands and wildlife self centered anyway? I get no money from that and I am willing to accept restrictions and regulations that affect me unlike yourself. If anyone is self centered here it is obviously you. Finally this is not my 1,340th post so I have no idea where you get that number from. I may have a few dozen comments, maybe 300 or so votes and a half dozen ideas or so but nothing near 1,340. That is what happens when you love nature, you actively try to save it, something you obviously know nothing about.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Forgot to mention I live in New England as well. CT to be exact and we have not exactly had "a new climate everyday" have we? Pretty much been one heat wave after another. Streams dried up on the trails I hike, waterfalls nothing more than a trickle while rivers have more grass growing on them than water flowing through them. When it does rain it is torrential downpours accompanied by high winds that down power lines, uproot trees and tear roofs off houses. We have had 3 or 4 reported tornadoes already and something like 20 days of over 90 degree weather when the avg. is under 11. And it's not even August yet! You're right though, everything other than that is normal. No worries.

Yeah, yeah, yeah. I know, Al Gore is the devil and Obama is Hitler. Heard it all before. If you do not mind though I will take the word of the worlds greatest scientists and what I see with my own two eyes over what you say. Still you have not answered the question that whether global warming is man made or not the trashing of the planet is definitely man made so should we continue to do it or no? In case you have not noticed there are more and more areas unable to grow crops or raise cattle these days. I guess that is Al Gores fault also, or maybe Obamas?

Which is why I said that we need stricter enforcement. Sign off on the Deepwater Horizon project came in 2007, long before Obama took office and it was Bush's non stop push for more and more drilling and his non stop gutting of regulations that made it possible. While Obama must share some of the blame for not cleaning up the MMS quicker this disaster is just more proof of the how big a disaster Bush was as president.

More ignorance on the part of you, not exactly surprising reading many of your other statements. Many of the horses round up are auctioned off to slaughter houses and then "turned into dog food". Again, some of you really need to learn your facts before you open your mouths and prove your stupidity. I am not going "racial" either. I happen to be white but unless you are a native american you can not call this country your native home and that is just fact. As far as having "firepower" what a idiotic statement. I would love to see you try to survive in the elements the wild horses do even with your precious gun. You would not last a month. They are not "feral" either, they are wild horses that have been born free living off the land for hundreds of years. I suppose next you are going to say wild elephants, tigers and bears are feral because they are not in zoos or circuses. Wildlife should not be killed just because they do not have "firepower", you are the most ignorant person on this site or certainly among the top 3. Typical of so many of you tea baggers, scared to even venture from your home with the safety blanket of your precious "firepower". Here's a new flash for you, a gun does not make you a man! Why are you even here if you hate wildlife and nature so much. Oh let me guess, to skew the votes because you are a bitter republican who hates Obama.?

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

No, the fact that some animals live in areas where ohv use is does nothing to my argument. The argument is can a threatened or endangered species survive in an area with ohv use. They cannot, ohv use chases them from areas of food, it destroys their habitat, pollutes their water supply, changes reproductive rates and can cause them injury by falling into holes and ruts created by ohv tires. None of this is an opinion either, it is fact and you can read all about it if you like. The reason why I do not support the reopening of land for ohv usage is because it has been closed for a reason. Either the preservation of a species or because you have already degraded it to the extent they had to close it. I guess you have a problem with comprehension or did not read my post entirely because if you had you would plainly see I said ohvs deserve areas but not areas that are protected for wildlife habitat or have been set aside for hikers. You have enough land, you do not need or deserve more.

OHV use in wilderness areas or the Gulf Oil Disaster....Which is worse? I would lean towards the Gulf Disaster but it is close!

People certainly are selfish. Ignorant and stupid too. Just look at the majority of the OHV crowd on here. While a few have tried to come up with legitimate ideas most are just promoting everything that includes greater access to them regardless of whether it is habitat for an endangered species or not. They have little care if all of nature is destroyed as long as they can drive over the remains. Then you have the right wing loons who think this is another conspiracy by a president they hate because he is black and think we are all enviro-elitist or some other word they do not understand. Sadly much like religion and politics in this country this forum has become everything it was not intended it to be and for that we all have to thank the selfish and ignorant people of this once great country.

Since \_\_\_ is gaining nothing but protecting something she believes in and you two stand to profit from the building of a casino I think it is \_\_\_ that is telling the truth. If money is involved you are sure corruption and lies are not far behind. Economic development is just another word for destruction of public lands in most cases.

That is a start but it is a very small step forward. What can you do about the weight of the vehicles that tear up the trails? How do you stop OHVs from degrading habitat, food sources and the beauty of a meadow or stream when the very nature of the vehicle does that? How do you change the fact OHVs burn fossil fuels not only deepening our dependance on them but polluting the air and water in the forest? OHV users and non users cannot co exist period. One loves the solitude and beauty of nature and one likes to drive over and through it, the two are just complete opposites.

The problem is one certain group, OHV users, are responsible for most of the destruction. Next to energy extraction OHV use is the next largest contributor to destroyed open space. Protected space is dwindling away at such a rapid pace most animal species cannot cope and are becoming more and more threatened by extinction every day. Opening up vast areas of protected space to OHV use will certainly tip this even more towards extinction and away from any hope the animals and forests have to survive.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The problem with your argument Bryan is that less than 1% of this country is remaining wild and that is with either a capital W or small case w. The problem with ORV users is they want it all. They are not happy with the millions of acres designated for them or the hundreds of miles of trails, they want more and more and more. Developers are not happy with what they have access to and neither is the oil companies, coal companies, loggers, etc. etc. Hunters want higher yields and limits while poachers kill indiscriminately. What you and the author of this proposal are forgetting here is that animal species NEED this land to survive. We have cut, bulldozed, driven and built many species to the brink of extinction and many to extinction. Would you like to send the rest to extinction just so you can ride a dirtbike or drive a 4x4 on land they need to survive? As a hiker, backpacker and environmentalist I wholly understand the need to keep ALL HUMANS out of certain areas so animal species can live an undisturbed life and that includes keeping me and my fellow hikers out. Just because you fought in a war or live in this country does not give you the right to destroy the last wild places in this country for your personal enjoyment!

The same could be said for our factory farmed beef, chicken, pork and turkey not to mention most of our dairy products. I became a vegetarian and largely vegan (I do eat yogurt from a local farm that uses pasture grazing cows) because of the deplorable conditions the animals are kept in. Fish is no different. Will america ever stop putting profits ahead of doing what is right and what is best for the animals, the people and the planet?

The UN and the Wildlands Network do not have sovereign power in the United States. A key point to be aware of, though, is that the wildlife corridors program is provisioned for in sections of the House and Senate climate bills, as well as in HR-5101, The Wildlife Corridors Conservation Act of 2010. I am aware of the Coffman map. Simple awareness of that map does not necessarily infer subscription to Coffman's or anyone else's use of that map in their individual advocacy. Derision of either end of the advocacy spectrum really does not do much in terms of advancing the conversation, though, does it? Coffman's map appears generally to be a compilation of the several corridor-based conservation programs around the nation. It represents something of a summary of visions and plans that have been made known to the public. It does not include additional programs, such as the Baja to Bering Initiative put forward through the Marine Conservation Biology Institute, et. al. As an aside, a larger-scale version of Coffman's map accurately depicts the small-scale corridors established by the local land trust and municipality where I live. While the concept of the UNEP and other UN organizations "mandating" these programs is a leap, we cannot say that these organizations and others more local to the United States and down to the locally-based advocacy groups have not been "visioning" these things . . . because they have been and continue to do so. Everyone's mileage varies according to whether we think this is a good thing or not. Simply talking about these things does not imply hard and fast attitudes toward any of them. The discussion is important to have. Ridicule toward others who hold contrasting views is not useful.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

There are already several excellent organizations devoted to getting young people into the outdoors, and they are providing outdoor and environmental education without dipping into the public purse. While there are many others, Scouting, Campfire, 4-H, and YMCA spring immediately to mind as organizations that operate programs year-round. One of the problems with recruitment into these programs, though, is the peer pressure coming from the cool kids deriding them as being so totally uncool. We would have a lot more of our youth in these programs if there was a concerted effort toward dealing with that peer pressure element. How about we work harder on what we've already got in place before we go running around inventing new programs that are beholden to the public purse and all of the strings that come firmly attached?

This is pure stupidity. Have any of you ever even been to a national park? The wildlife is abundant there and one of the greatest pleasures is seeing the wildlife. If hunting were allowed this would not only cause a huge decrease in the number of animals it would cause the animals to fear humans and avoid any contact what so ever making it very hard if not impossible to see wildlife. Why are ideas focusing on the destruction of our great outdoors through increased ORV use or ideas as ludicrous as this even accepted? This is a forum on ideas on how to improve our great outdoors for the majority of people not ruin them for the enjoyment of a very small and ignorant minority!

This is the way development should go. There are millions of degraded acres out there that can and should be developed on but all too often it is pristine areas that are destroyed for drilling, mining and now even renewable energy source development.

Those are some pretty scary stats about kids. I am glad I never had any and never will. Is it the laziness of the parents or the laziness of the kids I wonder. I am sure the OHV crowd will chime in and complain that they cannot take their kids outside because their access to the outdoors is being taken away by the evil government but in reality is driving your kid around in a SUV or pick up truck really connecting him to nature? I say no which is why an idea like this is so well thought out. It actually gets them outdoors and into nature where they can see it, hear it and touch it!

I beg your pardon it is obvious that you have no idea anything about ATVers in America most are families out to enjoy the forest and not to destroy nature. Grant there are those bad apples as in Your Greeny side but at the last time I went as a ATVer to a community input about the destruction of our forest it was found that the damage was not from ATV but Vehicles. The most destructive words did not come from ATVers BUT GREEN Tree huggers. Such as Snare lines to cut our heads off, bobby traps to disable us. So get a clue we all want to enjoy the woods.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I would gladly leave OHV people alone if they would stop trying to destroy nature. I never said OHV use should be completely stopped. I have said though that wilderness lands should be off limits and if the land is considered so vulnerable that hikers need to be restricted then so be it. I am first and foremost an environmentalist that wants to see nature survive as long and as healthy as possible. So many of you people want more and more access including protected lands and national parks. This should never be allowed and that is what I say. You have your areas, enjoy them, take care of them and stop asking for more and more. Once again you totally miss the point. Having your OHV have the same emission standards and mileage means nothing. Our mileage and emission standards are a joke. 15 mpg (or worse) suvs, pickups and jeeps are still burning tremendous amounts of gas furthering our dependence on fossil fuels and further polluting our water and air. Then you add on "street legal", how about those that are not street legal? What are their standards? Trying to obscure the noise facts does nothing either. The machines are noisy period as clearly pointed out. I give you credit for recognizing problems and trying to find solutions and common ground but as long as you have people acting as the voice of the OHV community and making excuses and asking for more and more access even to the extent of destroying habitat and further causing our wildlife population to suffer all your efforts are for naught. You may be one of the 10% or so of honorable, responsible OHV users but sadly too many of your fellow OHV users do not care about nature (check their voting records and you can plainly see they demote most ideas on wildlife and land preservation) and only want to use it for their own self absorbed enjoyment regardless of the laws and the restrictions which all too often causes destruction and brings a bad light on people like yourself. Maybe someday the OHV crowd will be weened out and more will be like you and then we can discuss more land but until that happens you should only have the areas you have and if you destroy those they should be taken away as well. To be fair I want to state for the record that this includes hikers and backpackers too, if we cannot care for our land any better than the OHV community then our access should be restricted as well!

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

We are on a path of destruction of our own making. Americas lifestyle is unsustainable. We use over 20% of the worlds oil despite our relatively low population, we are the worlds worst polluters, while other nations strive for zero waste we recycle a disgustingly low percentage of our garbage, while other nations take measures to combat climate change we in america cannot even agree it exists and is a problem, european nations have cars that get 60mpg but in america we have more vehicles that get less than 20mpg than get 30, we are responsible for the loss of 110,000,000 trees every year much of which goes to junk mail. Our education system is broken, our governmental system at the local, state and federal levels are either corrupt, uncaring or both. These are just a few of the problems at the core of everything that is wrong with the country and we can blame our government for it all but we really have to look in the mirror and realize that we as a society can do much, much better. We are an obese, lazy, stupid and ignorant society but it does not have to be this way. Wanting our government to follow and enforce the laws while listening to our pleas is fine but we need to get past the ideological differences, the right wing controlled air waves, the endless political firestorm between republican and democrat and realize that this is OUR country and if we want it to survive and remain beautiful WE have to do a better job as a society to take care of it. Right wing extremists will scream socialist or communist while tea baggers will wrap themselves in the constitution they cannot understand and left wingers will just complain but if they do really love america and want it to stay beautiful we all have to change our lifestyles. Drive smaller cars, have less kids, regulate your heating in the winter and your cooling in the summer, recycle everything you can from the smallest bottle cap to the largest cardboard box, carpool if you can, forget the huge 5 bedroom McMansion and buy a house you can live in without going broke, conserve as much as you can like your life depends on it because not only does YOUR life depend on it so does the air we breathe, the water we drink and the forests and wildlife we love. If we want to reunite people with nature the most important thing is there needs to be nature to reunite with and that responsibility falls to us all!!

Welcome back. I support your idea and I agree with what you are saying but I do think a balance can be found. It will take a LOT of sacrifice on americans behalf but it can be achieved. My wife has made great strides since we got married as has other members of my family so it can be done. Sadly though I do not believe americans have the will power or the intelligence to make those sacrifices until it is too late.

Well Said Jana, very well said and all too true. OHV users like to say they are "responsible" yet they take no responsibility in any of the things you mentioned or the many, many more they are responsible for. They have all the access they need or deserve and no more should be given until they do learn to be responsible for something other than destruction of wild places.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

What a dumb idea. ORVs ruin the landscape not improve it. The noise from the vehicles scare animals and ruin the solitude of being in the outdoors, the ruts produced by the tires cause deer, elk and other animals to break their legs which results in death in most cases and ruins trails for hikers. The fumes and odors from the exhaust spoil the air quality for everyone from the smallest chipmunk to the biggest bear. If you are the type of person that only enjoys the outdoors from a motorized vehicle or does not want to see wildlife then maybe the great outdoors is not for you. I am not looking to build walking paths down the middle of a highway so nobody should be looking to ruin what little wild lands remain with more ORV use.

What a greedy proposal and so typical of the lets ruin americas wildlands OHV crowd. And why pray tell do you deserve to destroy americas last wild places and send many more species of animals to the brink of extinction or beyond? Simply because you are an american? Because you can since riding in a 4x4 takes no effort at all? Some areas are better of protected from ALL human interaction (including hikers and backpackers like myself) and some proposals (and their author) are better off ignored or this case demoted!

Whether it be the larger, more devastating wildfires, the surge in beetle populations or drought, just to name a few, our public lands, forests, national parks and our wildlife are being ravaged by climate change/global warming. Anyone with a brain can see that climate change/global warming is happening now and is getting worse every year we do nothing about it. Do something now or pretty soon there will be no nature left to connect with and pretty soon after that there will be no human population left to worry about!

While this sounds like a good idea how do you decide who gets what? If 10 hikers, 5 mountain bikers and 1 ORV user helps clear a trail does that mean everyone gets to use it? It only takes one ORV user to ruin a trail but does that mean everyone else has to pay the price for it? Maybe it is just my bad experiences with ORVs destroying trails, scaring away wildlife, creating noise pollution in the forest and in general trashing the entire area with litter and broken glass but if there is such a thing as a "responsible" ORV user I have yet to meet him.

While this sounds like a sensible plan it does not include all the damage that will be done to the forest. Roads will have to be built to accommodate the heavy machinery and trucks to enter the forest and of course the noise will disrupt wildlife. For every acre of forest cleared dozens will be damaged. Of course the OHV crowd loves this idea since it will give them more roads to drive on and further their access into wilderness lands at the peril of the forest and wildlife they care nothing about. If a sensible plan to limit the destruction done to the forest could be implemented I could vote for this idea but since I see none I have to demote it.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Wild horses are a beautiful and majestic animal. They are also part of Americas heritage and they need further protections and a place of permanent protection to keep them safe from the ranchers and developers that are running them off their land. Madeline Pickens has proposed buying a large area of land and rescuing a large number of wild horses to set up a sanctuary for the animals that are now being held in BLM pens awaiting auction. This needs to be allowed immediately as does the government setting up guidelines to stop the roundups and land grabs. Also land should be set aside as sanctuary and refuges in states that wild horses now live, money can be charged to visitors with the money going to purchase more land and maintain the roads and trails. Rangers should also be hired with the money to protect the land and the animals. Upon a recent trip to Yellowstone and Grand Teton my wife and I went to see the wild horses in the Green River section of Wyoming but there were no information booths, no rangers and no one there to collect money. We also saw people racing around in ORVs scaring the horses, damaging the landscape and trails. This is a waste of what could be a huge money maker and tourism attraction to the area.

Yes things are being done globally to combat climate change/global warming but sadly in America little is being done. President Obama has taken some bold moves to get the country moving but with the republicans obstructing everything and still throwing out the same old arguments that are so false and ludicrous but believed by the idiot sector or our country baby steps are the best we ever do and then when republicans take charge they move the country 10 years behind again. WE need to do more and we need to start now! Remember when this country actually used to lead the world in things like this? Now we are nothing more than a laughing stock to the rest of the world and a scourge to those that do not think our over consumption of everything and wanton destruction of the environment is funny.

You are right and right now most areas are available to everyone but sadly ORV users are not happy with that. They want access to protected wilderness areas, land set aside for endangered species, national parks, trails set aside for hikers and everywhere else for that matter. While most outdoors lovers, hikers and environmentalists like myself included, are more than happy to put aside their desires for the betterment of animal species, forests and open spaces ORV users greedily want it all and more and really do not care if every trail is ruined, forest destroyed, stream dammed up, or every species goes extinct. How do you make a group of people like that happy with compromise? You simply cannot without ruining it for everyone else and for most animal species as well.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You cannot totally blame politicians for this. Open space is disappearing for everyone and for every animal species in the world not just for OHVs. Urban sprawl, over-development and energy extraction has ruined what once was a beautiful country with room for everyone's hobbies. Now open space is very limited as is areas for animals to survive. Everyone must make sacrifices for the better of the planet not just OHV users. Secondly you have only yourselves to blame. Your machines get bigger and bigger, heavier and heavier and ruin more trails and open space everyday. If you were more responsible, littered less, destroyed less and actually respected nature maybe you would not have so much area taken away from you. Start showing some responsibility and some respect for nature and maybe you will get the politicians to start paying attention to you again.

You made some good points and I agree a couple extra bucks on a product would not drive me away, especially since I ignore cost for the most part and buy products from companies that use environmentally safe practices and give a percentage of their profits to environmentally sound causes. You have changed my mind I will change my vote.

You OHV people really need to stop whining about access, you are starting to sound like oil executives. If a trail you used or worked on in the past is turned into a Wilderness area and becomes protected because a species of plant or animal is on the verge of extinction then too bad. It is good for the planet and you need to accept that. As a hiker I get it so why is it so hard for you people to understand that? You want to experience frustration? Try lugging a chainsaw 3 miles on foot through moderately hard terrain to clear brush and fallen trees on a hiking trail and then return a month or so later to see the trail ruined by a group of idiots on motorbikes.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

You OHV users must have brain damage from bouncing around too much. Your ideas are really puzzling. This is supposed to be a forum aimed at having more people enjoy the outdoors yet every idea you people have is one to either destroy the outdoors, take away protections that insure in some way that nature remains for future generations or one that destroys wild life habitat which in turn will surely make that species chances of survival that much less. Just to make it clear to you....Nature, the outdoors and wildlife are not only for OHV users to enjoy. It is for a great many people like hikers, backpackers, campers, photographers, fishermen, etc. etc. who also enjoy the outdoors and do not enjoy having trails ruined, peace ruined, clean air ruined, meadows ruined, streams ruined and polluted and in general have the entire reason for heading outdoors and into nature ruined by OHV users. More importantly it is for animal species that need those forests, streams, lakes and meadows for survival! Wildlife does not enjoy having their habitat ruined either, being driven away from a food source by constant noise, they do not enjoy wading through trash left behind by a OHV party or drinking from a stream that has become polluted from OHV use. Wilderness needs to be protected because it is disappearing at an alarming rate. The protections are put in place because a certain species has become either threatened or endangered and that space needs to be preserved as pristine as possible so the species may survive. As a hiker and backpacker I am fine with losing space so a species may survive and exist for future generations so why is it so hard for your OHV users to do the same? Are you that ignorant or is it that you just do not care about anything but your own personal enjoyment? Just because you are an american and can drive a vehicle does not give you the right to destroy nature and wildlife not to mention other peoples enjoyment of both.

Generally speaking, economic development - important as it is - poses the most significant and consistent challenges to wilderness conservation. Subsequently, public policies that promote low-impact, responsible and sustainable natural resource exploration and recreational land uses are needed now more than ever. A common challenge to these types of progressive policies is the general mindset that we have to continue doing things in the same outdated ways that we've done them for years. Nothing could be farther from the truth. High quality wilderness conservation makes for more pristine lands, higher real-estate values, and better recreational opportunities. Off-road vehicle use, hunting, and natural resource exploration do not necessarily have to take place in the hearts of wild places, but can rather happen in designated areas on their outskirts. Some examples include: directional drilling, sustainable (closed loop) logging, off-roading on low productivity tracts of land, and regulated seasonal hunts. In addition, ecotourism and agrotourism present limitless opportunities to promote conservation and low-impact economic growth in rural communities across the entire country. In short, wilderness conservation and economic development are still primarily at odds because of old ways of thinking. If we promote a civil, intelligent dialogue that includes multiple stakeholders and a focus on innovation, Americans can continue to both enjoy and benefit from their public lands.

There must be a middle ground, between destroying everything in sight and building a fence around an area to keep the human race out. There are zealots and bad people on both sides for this argument. Education of the ramifications of our own actions is the best policy.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

the savings in energy, health care (lungs, skin cancer), reduction in crime, longer pavement life, added property value, water retention, soil erosion prevention..... i am sure there will be funding....we will pay for it somehow. combine all that with bicycling infrastructure and of course... "the right tree in the right spot" .....who said money did not grow on trees.

Should focus on small rural and urban areas where there is less access; to often they are forgotten. If you want to decrease obesity, health problems; these are the places that should be focused on; where there is a deficit in knowledge, healthcare and parks, walking trails and other recreation for the community

We enjoy spending time in our great outdoors with our RV trailer. However, the variety of websites and terminology used in researching and making reservations has been cumbersome. We need a uniform style of website and reservation system, ideally for all campgrounds: city, county, state and federal. At least all the federal sites should be consistent in the website signup procedure. This same concern applies to other outdoor opportunities as well, such as hiking trails. With our current technology available, we could significantly improve our "advertising" and communication to outdoor connection opportunities.

Light Pollution or Skyglow or Light at Night (LAN) is the wasteful lighting of the night sky due to poorly shielded and and inefficient light fixtures that shed light horizontally causing glare and above the horizontal causing the very air and clouds to glow. In addition to lighting up the undersides of Clouds, Birds and Aircraft, it also causes the needless death of Birds and can cause sea turtle hatchlings to die because they turn towards beach lights and not to the light reflecting surf. In human beings it can cause cancer by hindering the production of the hormone Melatonin which prohibits cancer.

Green sticker vehicles need good places to ride. Those places should be provided by the benefactors of the profits gained by the vehicle sales, accessories, RVs, trailers---. These smart entrepreneurs get rich and don't have to provide a place to ride! Privately run CONTAINED parks should be affordable and safe. Public land is not suitable to this destructive and noisy fun.

thanks for the comments. Yes, it was a confusing comment, lumping the 2 together. The only thing ORVs and feral animals (domestics gone wild) is that they both have a propensity for water sources, washes and sensitive habitats and can be destructive. As of now, certain locales have experienced damage from wild horses and burros, pigs, and to some extent wild turkeys and hatchery-raised trout (a few examples). Humans have placed these animals in places that are not suitable for them and they can suffer or compete with native wildlife. The idea of preserves for the wild horses and burros where they can live a healthy life is a good solution. As for ORVs, they need their own space too. I would love to donate for wildlife preserves. ORV sites should be paid for by the users, since the vehicles are destructive, sometimes driven unsafely and create a nuisance to other public land users. Touring at low speeds is the only public land use that should occur.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Our public lands are being destroyed as the natural resources, native wildlife and cultural sites are being trampled. Equines are beautiful domestic and feral animals that deserve to live in appropriate habitats where they can survive without a struggle. Private lands should be set aside for these creatures where water, forage and shelter are available. Special interest groups need to foot the bill and the lands can be given special easement status. Recreational off-road parks should be placed in similar places and sponsored by the users and vendors that should be supporting them. Touring off-road areas should be the only recreational vehicle use allowed on public lands.

Please remember that grazing on public lands is an important management tool and must continue to be part of the equation. Here in the west, the fuel load has become a significant problem, particularly with the massive beetle kill now occurring. Western forests are a very different beast than those in the east and a one-size-fits-all approach will not work throughout our country. Also, because of the settlement patterns and land uses with which our western states evolved, many of the most productive lands in the here west are private lands that serve as base properties for grazing permits on federal and state lands. If those permits go away, or are reduced to the extent the ag operation is no longer profitable, those private lands have no ag value and are extremely susceptible to development. Let's value grazing and logging for the important tools that they are.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The 2012 Farm Bill will be challenged to continue funding at current levels, especially for private lands conservation programs like FRPP and GRP. These programs provide excellent return on federal investment through private and state match.

- Private lands are the most productive throughout the US - agriculturally as well as from a broader biological perspective as they typically encompass riparian areas, migration corridors and provide winter range and breeding grounds for many species. For these same reasons, they are also highly sought after for development.
- Ranchers and farmers are hit hard with regulatory programs – voluntary, incentive programs like FRPP and GRP have the potential to do far more good in the long run, at less cost.
- These programs ensure unfragmented landscapes into the future, at a one-time cost to the tax-payer.
- Purchased conservation easements provide landowners with capital without liquidating acreage and keep ranches and farms intact, and at ag values, for future generations of producers. These dollars get turned into local economies, too, as willing landowners use funding to pay down bank notes, purchase additional acreage, improve breeding stock, develop water supplies, or improve infrastructure.
- FRPP and GRP funds help private land trusts ensure that community needs and values are also conserved. The cost of conserving private lands costs taxpayers just a fraction of the cost of federal land purchase and administration.

How we can make these funds go even further:

1. Allow for an increased percentage of landowners' contribution of value. Many landowners are willing to increase their in-kind contribution of 25% of the value of an easement or more. Cash match is much harder to come by.
2. Consider funding the transaction costs for donated easements. Many landowners would be in the position of donating a conservation easement to a qualified organization if the cost of the appraisal, minerals report, attorney fees and stewardship contribution could be covered. Local land trusts would be able to make dollars go even further if this opportunity could be realized.

Every minute, two acres of farm and ranch land are lost to development. The average age of American farmers and ranchers continues to increase, leaving many working lands open to fragmentation and uncertainty. FRPP and GRP help conserve our working farms and ranches and the food, fiber and natural resources for the stewardship of future ranchers and farmers -- and the benefit of us all.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

The United Nations 2006 agricultural report states that ANIMAL agriculture (the production of slaughterhouse animals) produces more global warming than ALL transportation. In fact, cattle growing is the scourge of the earth and is destroying our water systems, desertifying the land, and ranchers are destroying wildlife and wildlife habitat to proliferate MEAT for heart disease, obesity and diabetes, kidney failure and a host of excess protein and animal fat human health problems. The subsidized hamburger is not only totally suspect for prions and Mad Cow disease, but it would cost about \$30+ per pound if the government did not give megabucks to those who destroy our land to produce it. The Taylor Grazing Act back in the 1930's gave out massive leases on our PUBLIC lands, 10 cents on the dollar in perpetuity to western ranchers who hung wolves and coyotes along fence posts, have brought groundhogs and small mammals near extinction (mistaking them as they come out of their holes because you cannot have a hole dug that might cause a cow to break its leg), and generally destroyed biodiversity massively to monoculture production of unlucky "farm" animals. We are killing a million farm animals an hour in slaughterhouses for our unhealthy lifestyle and that is not enough for the obesity and heart disease of this public. We continue to import millions of TONS of dead carcasses out of rain forest countries in Central and South America for the cheap (subsidized) hamburger. We are destroying the lungs of the planet, the last remnants of biodiversity that support all of us, and contributing massively to global warming. We need to move to a plant based diet. Please read the Declaration of the Rights of Mother Earth and All Beings - ALL BEINGS, not just humans have the right to exist, to not be harmed, and to fulfill their role in the ecosystem. This was put together by indigenous people in Cochabamba, Bolivia this year at their Climate Conference (since Copenhagen failed) with input by people from all over the world. It is revolutionary in its reverence for all life, sadly needed in this time of human overtake. We are presently using 1.4 earths every year. It is unsustainable and raising animals for slaughter is the biggest part of the abuse. Link: { <a href="http://pwccc.wordpress.com/2010/02/07/draft-universal-declaration-of-the-rights-of-mother-earth-2/" rel="nofollow" target="\_blank">Link</a> }

Create a public stock exchange for watersheds. The number of shares issued would equal the number of acres in the watershed, e.g. USGS 4th code HUC. Share values would increase or decrease depending on how well the watershed was managed. Activities that tended to conserve resources while profiting the communities would tend to drive share values up. Activities that degraded resources or communities would tend to drive shares down. A mechanism would need to be in place to discourage share values from increasing in response to watershed degradation. Watershed groups would be the issuers of the stock. They would have to give up non-profit status, but would likely achieve a more stable source of funding than from short-term grants. Why would anyone buy stock in a "corporation" that does not produce anything? To make money from a system that promotes the protection of resources and communities within a watershed. An effective watershed council would tend to increase community prosperity and ecosystem health, thereby increasing the value of the finite capacity of a watershed to sustain ecosystem services. I am not a lawyer, economist, or business person, so I can't provide much more detail on the financial aspect or whether this idea is even legal.

## Discussion Question 2

### **Written & Online Comments**

**(cont.)**

Create more public campgrounds and rental cabins/yurts. The demand for campground space during the summer months, especially in national parks, significantly exceeds the supply. This discourages people from "Reconnecting with the Great Outdoors." Campgrounds and cabins should be strategically developed in order to alleviate this problem.

I have been around hundreds of ranchers for 20+ years and have never witnessed or heard stories from ranchers of them doing the following things: 1.) Rancher killing a wild buffalo 2.) Rancher killing a wolf (outside a designated and legal hunting season) 3.) Rancher killing a grizzly bear 4.) Rancher "rounding up" wild horses like John Wayne for slaughter (horse slaughter for human consumption is illegal in the US, this article discusses the law { <a href="http://www.cbsnews.com/stories/2006/09/07/politics/main1982770.shtml" rel="nofollow" target="\_blank">Link</a> } ) 5.) Rancher clear cutting a forest 6.) A stream or river polluted enough by manure that it could be considered detrimental to other animals (wild animals poop in streams too, remember) 7.) A dead eagle (or any other scavenging bird) found with a consumed lead bullet in its remains If you have knowledge of a rancher performing numbers 1, 2, or 3 above you should contact the proper authorities, as they are not legal activities for anyone, let alone a rancher, to do. You may even be committing a crime yourself by not making these activities known to the police. While I'm sure some of these things have happened in the past, saying they have been happening for years is absolutely absurd. Many regrettable things have happened in the distant past: using African-Americans as slaves, placing Native Americans on reservations, not allowing women to vote, etc. But to blame people living now for those acts makes no sense. This is exactly what you are trying to do to ranchers. Ranchers do not wish to destroy wildlife or pollute the land they live on, it would be counterproductive. If you did find your information from a credible source, I would like you to direct me to it. I would be interested to read about where ranchers are being able to get away with these things.

I'm totally against this federal land grab. This is my home this lands is full of people that depend on farming and ranching, good stewards of the land. Why do you want this land if it is so abused by us? The way you make it sound. You people with your big idea's of forcing all people from the land so you can have your big wildlife playground so you rich people can fly out and say "look at wht we've done, removed all the people from the land so we could run buffalo, deer, elk, wolves, and antelope." Take all land out of agriculture so we can have our wild kingdom just like it was when Lewis and Clark was here. You people are going backwards, this land is settled. There's many jobs her in a time when there are not so many jobs. Just because there is a lot of BLM grazing here you think you have the right to take it away. What public good are you doing? How many people are you going to feed? How many jobs are you going to make? You can make many lies about it, I'm sure. How many people visit all your wildernesses you have now? Not very many. I'm sure somebody's going to put a backpack on and hike in 30 miles and say this is really great. The people that live here now are the ones that truely love the land and the wildlife that we take care of.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Mr. Moffatt, by your logic farmers and ranchers should then be compensated for "public" animals such as deer, antelope, and moose consuming crops or grass on their private land. Fair is fair, and if farmers and ranchers are expected to pay the public for wildlife habitat damage, then the public should pay ranchers and farmers when "public" animals graze private land and affect their livestock's habitat. If that were to be implemented, I would be willing to bet farmers and ranchers would come out ahead. As to how logging and mining effect public land I cannot comment, as I have little knowledge in this area and am unwilling to make assumptions. As for ranching, though, I can guarantee the land is not being damaged in most cases. Often times wildlife habitat is improved though such additions as reservoirs and ranching practices like cyclical grazing. Please do not assume ranchers and farmers are destroying rented public land when you have not witnessed it yourself.

"Lets be sure living things are protected so they can flourish into the future,..." Um, well, people are living things and require intellectual depth to flourish into the future. Maybe a better understanding of how they have developed - as the lessons of history provide them and cultural sites amply illustrate - is something that is not out of context with conservation. Eco-centrism can be as damaging as ignorance of the web of life. Without comprehensive conservation we leave gaps that result in future damage that we then scramble to correct. Better try to keep things now than bemoan their loss later.

As a history teacher, I know the difference between reading about or talking about a historical place, and actually going to see it. Every spring I take my 8th graders to visit over 15 battlefields in Virginia, Maryland and Pennsylvania, in order to show them the places where Americans gave the last full measure to protect what they thought was worth dying for. Some of those battlefields become a little smaller every year. Our nation has so little history compared to the world, and we need to save what we can. Obviously we cannot save every house where Lee slept, or every road that Washington rode on, but we can dedicate and memorialize those crucial places where men gave all that they had so America could continue.

I agree that America's public lands should be available for a wide variety of recreational uses including OHV use within reason. OHVs can have a significant impact to the land especially if people are not acting responsibly, and the noise from OHV use certainly does affect wildlife and the opportunities to interact with it. So I think careful designation of OHV-use trails is very important. Many people like me prefer to enjoy wilderness with as much wild character as possible. I want to get unplugged, away from motorized vehicles, and in a setting where I can encounter wildlife in a peaceful setting, and I don't think I'm in the minority here. So to me the important factors are minimizing impacts to wildlife and designating OHV trails that don't compromise the experience for non-OHV folks.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

I am new to this discussion but just want to add my two cents worth. To begin with I am not a "tree hugger" but I do sympathize with the point of view expressed by some who have been labeled as a TH. I live in a rural area that is being spoiled by the increasing use of ATV's to cut across the fields and ride the trails through the woods. I don't need to itemize what this does to the quality of life of us who live here, (noise, ruts in trails, trash left behind, etc.) If you want to explore the "wilderness" do so on your own two feet or on the back of a horse! Why do you need to move about motorized? I don't believe other countries have a problem with their citizens who are so sedentary that they have to get their outdoor adventures on the back of a motorized vehicle. If you feel the need to ride about, wait until the mall in your suburban locale closes and the cars are all gone...then you can ride all night on your ATV in the parking lot. Lets keep the outdoors for people who truly appreciate nature and keep the so called OHV vehicles on concrete. Who knows, it won't be long before they have concreted over the wilderness areas with the mentality running this country today.

It is very difficult for young people like me (a 22 year old recent college graduate) to obtain jobs in government organizations like the National Park Service and the Forest Service. Due to a strict point system, veterans consistently outcompete other (potentially more qualified) applicants. The point system makes it difficult for young people to enter the government work force for environmental jobs. I think that they should either do away with the point system, or think of a way to award points to people for things like work experience. Particularly, I think points should be awarded to people who participate in organizations like the Student Conservation Association and Americorps.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

It seems to me that we are going from one extreme to another where we give a section of land the status of wilderness or national monument or it is open for public mining or industrial use. Somehow Mountain Bike and OHV use has been lumped into the mining and industrial use category. In Utah we have a lot of land that is simply too large and environmentally unfriendly to hike (Remember, Mountain Bikes cannot be used on a Wilderness designated tract of land). The San Rafael Swell area has been promoted as Wilderness status worthy, but for anyone remotely familiar with this area knows that only 5% of the population is in good enough shape to explore it. Let alone get to see all of it's beauty. That doesn't seem very accessible to the public and only fits the needs of a small percentage of the population. It also needs to be noted that the most beautiful places in this area are not even remotely accessible to motorized vehicles. My point is let's create a new designation that fits the needs of most people, especially tax payers. This designation could be called a general public access area. The goals of this area are to... 1. Preserve the natural environment with designated motorized use. 2. Promote public clubs/groups in maintaining trails. There are more OHV volunteers preserving trails than any other group. 3. Allow no mining or industrial use of the lands, except for tourism. 4. Promote responsible riding through clubs and state laws. 5. Managed access leads through the majority of these lands, so restrictions are not so heavy that a small portion of the land is accessible with motorized vehicles. The whole point is to get out and see the land, not wonder what's on the other side of the sign. I love the outdoors and don't want to destroy the environment and OHV use is the means to be able to explore and enjoy a lot of beautiful land. Let's face it, we need moderate laws to fulfill the rights and needs of the majority of the public. Just say "no" to extremism and pass laws that make sense.

OHV recreation is a very positive family activity BUT it MUST be done properly in order to not create conflicts with non-motorized recreationists and also to keep speed-related safety problems from occurring. To the first point, keep noise levels down is ABSOLUTELY essential because nothing upsets a "posey plucker" more than hearing the ominous buzz-saw cacophony long before they even see the vehicle. It just completely ruins their day. Just as a smoker has rights to puff away, he or she does NOT have the right to blow smoke over everyone else in public places. So must the OHV user be as quiet as possible and not increase the sound levels of his or her OHV above the manufacturer's stock exhaust. Regarding speed, too many OHV users consider the trails on public lands to be their private race track. Speeds on mixed-use forest or BLM roads must be kept to a reasonable level not only to enhance safety but also to keep dust down.

Presently, federal funds from the Land and Water Conservation Fund supply the money to federal and state agencies to acquire land (and at the state level create recreation facilities). Fully funding LWCF to it's \$900 million authorization is a first priority, but LWCF should also be opened up to qualified conservation organizations (land trusts) to fund projects that achieve the mission of LWCF. Land trusts have a proven track record of protecting important lands, and a grant program similar to the current Stateside LWCF program (that funds municipal, county and state projects) should be established for competitive grants to land trusts. These could be matching grants that would encourage land trusts to leverage private and non-federal funds toward the protection of critical wetland, riparian, agricultural, forest and recreational resources.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Young people have little connection to the food that they eat. It is no wonder that obesity is an issue when what is most affordable and available is low nutrient, high caloric foods. Bringing back school gardens makes sense from every angle: nutrition, academic standards, hands on, kinesthetic learning, empowering young people, building community, beautifying and greening our campuses, etc... Students need opportunities to foster land stewardship and why not on their very own campus. My first hand experience is that gardens bring something very alive in the heart of young people and teachers alike. Fund and support agricultural, horticultural and gardening programs in all of our schools!

Dirt bike riding on SOME public lands should exist, of course. But, NOT in wilderness areas or areas that could be designated wilderness. Dirt bikes are incredibly destructive, especially in desert areas. Luckily, there's plenty of land to go around.

I live in south central California and have been kayaking the Kern River for most of my life. A couple of years ago the Sequoia National Forest proposed requiring entrance fees for most of the public lands surrounding the town where I live, including all access to the Kern River. The local reaction to this was summed up well by the local paper in their front page article "Mob Scene at Forest Service Fee Workshop." What most everyone was disturbed about at this meeting was the complete lack of accountability, financial and otherwise, on the part of the US Forest Service. Googling "GAO" and "Forest Service" will yield multiple reports to Congress documenting this. What about government accountability?

It should be noted that wilderness-quality land is still usable for non-motorized recreational use--designating land as wilderness does not mean it is no longer for human use. Hikers, bikers, equestrians and others still have access. The mandate of the BLM is to manage public land for industrial AND recreational use. The simple presence of minerals does not and should not mean that land should automatically be slated for exploration and extraction. Considering that extractive industry irreparably damages wilderness areas when that land is put into production, good policy would dictate setting aside some of this land for future generations' use. We will be glad we did.

OHV use should happen on some public lands, yes. However, as everyone knows motorized vehicles are incredibly destructive on the land, especially desert habitats. Hence, a lot of public lands--lands that are wilderness quality--should be off-limits to OHV use. Period. Fortunately, there is enough land to allow motorized vehicles to have some land and allow others to remain wilder--with only human-powered transport. I'm thinking especially about the millions of acres in southern Utah that desperately need wilderness designation and are at risk from irresponsible ATV, OHV users.

## Discussion Question 2

### ***Written & Online Comments***

***(cont.)***

Students at all levels need to be taken out of the classroom and into their environment by their biology teachers. Nothing is more inspirational than finding a new creature that you have not seen before, photographing it, identifying it, and teaching others about what makes it interesting. Everybody should know the common local plants and animals in their neighborhood, and be able to recognize a healthy ecosystem and distinguish it from one that is depleted of native species and/or contaminated with exotic species. Numerous non-profit groups are working hard on monitoring and restoration of habitats, as well as education and research.
