U.S. Department of Labor<br>U.S. Bureau of Labor Statisitics<br>March 2011

Report 1027

In 2009, according to the Census Bureau, about 43.6 million people, or 14.3 percent of the Nation's population, lived at or below the official poverty level. ${ }^{1}$ Although the poor were primarily children and adults who had not participated in the labor force during the year, 10.4 million individuals were among the "working poor," 1.5 million more than in 2008. The working poor are persons who spent at least 27 weeks in the labor force (that is, working or looking for work) but whose incomes still fell below the official poverty level. In 2009, the working-poor rate-the ratio of the working poor to all individuals in the labor force for at least 27 weeks - increased to 7.0 percent, up by 1.0 percentage point from the previous year's figure. (See tables A and 1, and the chart.)

Following are additional highlights from the 2009 data:

- Full-time workers were less likely to be among the working poor than were part-time workers. Among persons in the labor force for 27 weeks or more, 4.2 percent of those usually employed full time were classified as working poor, compared with 15.0 percent of part-time workers.
- Black and Hispanic workers continued to be about twice as likely as White or Asian workers to be poor.
- The likelihood of being classified as working poor greatly diminishes as workers attain higher levels of education. Among college graduates, 2.1 percent of those who were in the labor force for at least 27 weeks were classified as working poor, compared with 20.3 percent of those with less than a high school diploma.
- Among families with at least one member in the labor force for 27 weeks or more, those families with children under 18 years old were 4 times more likely than those without children to live in poverty.
- Women who maintain families were more likely than their male counterparts to be among the working poor.

This report presents data on the relationship between labor force activity and poverty status in 2009 for workers and their families.

[^0]The specific income thresholds used to determine people's poverty status vary, depending on whether the individuals are living with family members or are living alone or with nonrelatives. For family members, the poverty threshold is determined by their family's total income; for individuals not living in families, their personal income is used as the determinant. Data were collected in the 2010 Annual Social and Economic Supplement to the Current Population Survey. (For a detailed description of the source of the data and an explanation of the concepts and definitions used in this report, see the technical note at the end of this report.)

## Demographic characteristics

Among those who were in the labor force for 27 weeks or more in 2009, about the same number of men and women were classified as working poor- 5.2 million. The working-poor rate, however, continued to be higher for women ( 7.5 percent) than for men ( 6.6 percent). (See table 2.)

Blacks and Hispanics continued to be about twice as likely as their White counterparts to be among the working poor. White working men and women who spent at least 27 weeks or more in the labor force were about equally likely to be poor ( 6.1 percent and 6.4 percent, respectively). Among Hispanics, the rates for men ( 14.2 percent) and women ( 13.6 percent) also were about the same. In contrast, the working-poor rate for Black women (14.2 percent) was higher than the rate for Black men (10.1 percent).

Young workers are more vulnerable to poverty than are other age groups, in part because their earnings are lower and

Percent

SOURCE: Annual Social and Economic Supplement, Current Population Survey (CPS), Bureau of Labor Statistics
their unemployment rate is higher, compared with their older counterparts. Among youths who were in the labor force for 27 weeks or more in 2009, 12.7 percent of 16 - to 19 -year-olds and 14.8 percent of 20 - to 24 -year-olds were in poverty, about double the rate for workers age 35 to 44 ( 7.0 percent). Workers age 45 to 54 ( 4.7 percent), 55 to 64 ( 3.6 percent), and 65 and older ( 2.3 percent) had lower working-poor rates than did other age groups in 2009. Except for the working-poor rate for 16- to 19-year-olds, which was unchanged in 2009, the working-poor rates for all major age groups increased over the year.

## Educational attainment

Achieving higher levels of education greatly reduces the incidence of living in poverty. Individuals who complete more years of education have greater access to higher paying jobs-such as managerial, professional, and related occupations-than those with fewer years of education. Of all the people in the labor force for 27 weeks or more in 2009, those with less than a high school diploma had a higher working-poor rate ( 20.3 percent) than did high school graduates with no college ( 8.8 percent). Workers with an associate's degree and those with a bachelor's degree or higher had the lowest working-poor rates: 4.7 percent and 2.1 percent, respectively. At nearly all levels of educational attainment, Blacks and Hispanics were more likely to be among the working poor than were Whites or Asians. (See table 3.)

Working-poor rates were fairly similar among White men and women at all educational levels. For example, 22.0 percent of White women with less than a high school diploma who spent at least half the year in the labor force were among the working poor, compared with 18.4 percent of their male counterparts. Among college graduates, the proportions classified as working poor were 2.0 percent and 1.8 percent for White women and White men, respectively. In contrast, Black women with less than a high school diploma were considerably more likely than their male counterparts to be among the working poor: 31.8 percent compared with 22.5 percent, respectively. Among Black men and women with a bachelor's degree or higher, the workingpoor rates were essentially the same ( 3.2 percent and 3.3 percent, respectively.) By comparison, women of Hispanic or Latino ethnicity with less than a high school diploma had slightly higher working-poor rates than their male counterparts ( 24.7 percent and 22.3 percent, respectively). The working-poor rates for Hispanic men and women with a bachelor's degree or higher were similar, at 3.9 percent and 3.3 percent, respectively.

## Occupation

The likelihood of being among the working poor varies widely by occupation. Workers in occupations requiring higher education and characterized by relatively high earnings-such as managerial, professional, and related occupations-were less
likely to be classified as working poor (2.3 percent) in 2009. In contrast, individuals employed in occupations that typically do not require high levels of education and that are characterized by relatively low earnings were more likely to be among the working poor. For example, 13.2 percent of service workers were classified as working poor in 2009. Indeed, service occupations, with 3.2 million working poor, accounted for nearly one-third of all those classified as working poor. Among those employed in natural resources, construction, and maintenance occupations, 9.7 percent of workers were classified as working poor. Within this occupation group, 16.8 percent of workers employed in farming, forestry, and fishing occupations and 11.6 percent of those in construction and extraction occupations were among the working poor. (See table 4.)

## Families

In 2009, 5.2 million families were living below the poverty level, despite having at least one member in the labor force for half the year or more. The 2009 figure was up from 4.5 million in 2008. Married-couple families had a lower likelihood of living below the poverty level ( 10.3 percent in 2009) than did families maintained by women ( 25.1 percent) or by men ( 17.6 percent), a pattern that held regardless of which member of the marriedcouple family was in the labor force. (See table 5.)

Among families with at least one member in the labor force for half the year, those with children had a greater likelihood of living below the poverty level than did those without children. The proportion of families with children aged 18 years and younger that lived in poverty was 12.0 percent, in contrast to 3.1 percent for families without children. About 26.6 percent of families maintained by a woman with children under the age of 18 were in poverty. For families maintained by men with children, the proportion in poverty also was relatively high: 18.2 percent. Among married-couple families with children, the proportion classified as working poor was 7.0 percent in 2009, up from 6.2 percent in 2008.

## Unrelated individuals

The "unrelated individuals" category includes individuals who live by themselves or with others not related to them. Of the 33.8 million unrelated individuals who were in the labor force for half the year or longer, 3.9 million lived below the poverty level in 2009. The working-poor rate for unrelated individuals was 11.7 percent, up from 10.0 percent in 2008. (See table 6.)

Within the group of unrelated individuals, teenagers were the most likely to be among the working poor. In 2009, nearly half of teens who were in the labor force for 27 weeks or more and who
lived on their own or with others not related to them lived below the poverty level. Overall, the working-poor rate for women living alone or with unrelated individuals was 12.0 percent, compared with 11.4 percent for their male counterparts. The working-poor rates for unrelated individuals were much higher for Blacks (15.1 percent) and Hispanics (18.2 percent) than for their White (11.1 percent) or Asian (11.3 percent) counterparts. (See table 7.)

Of the 3.9 million unrelated individuals considered to be among the working poor in 2009, about two-thirds lived with others. These individuals had a working-poor rate of about twice that of individuals who lived alone. Many unrelated individuals living below the poverty level may live with others out of necessity. Conversely, many of those who live alone do so because they have sufficient income to support themselves. Unrelated individuals' poverty status, however, is determined by each person's resources. The pooling of resources and sharing of living expenses may permit some individuals in this categorywho are technically classified as poor-to live at a higher standard than they would have if they lived alone.

## Labor market problems

As noted earlier, workers who usually work full time are less likely to live in poverty than are others, yet there remains a sizable group of full-time workers who live below the poverty threshold. Among those who participated in the labor force for 27 weeks or more and usually worked in full-time wage and salary jobs, 4.2 million, or 3.8 percent, were classified as working poor in 2009 , little different than the proportion in 2008 ( 3.6 percent). (See table 8.)

There are three major labor market problems that can hinder a worker's ability to earn an income above the poverty threshold: low earnings, periods of unemployment, and involuntary parttime employment. (See the technical note for detailed definitions.)

In 2009,86 percent of the working poor who usually worked full time experienced at least one of the major labor market problems. Low earnings continued to be the most common problem, with two-thirds (67 percent) subject to low earnings, either alone or in combination with other labor market problems. About 44 percent experienced unemployment alone or in conjunction with other problems, up from 38 percent in 2008. In 2009, 7 percent of the working poor experienced all three problems: low earnings, unemployment, and involuntary part-time employment.

Some 575,000 , or 14 percent, of the working poor who usually worked full time did not experience any of the three primary labor market problems in 2009. Their classification as working poor may be explained by other factors, including short-term employment, some weeks of voluntary part-time work, or a family structure that increases the risk of poverty.

## Source of data

The data presented in this report were collected in the Annual Social and Economic Supplement to the Current Population Survey (CPS). The CPS is a monthly sample survey of about 60,000 households conducted by the U.S. Census Bureau for the Bureau of Labor Statistics. Data from the CPS are used to obtain the monthly estimates of the Nation's employment and unemployment levels. The Annual Social and Economic Supplement, conducted in the months of February through April, includes questions about work activity and income during the previous calendar year. For instance, data collected in 2010 refer to the 2009 calendar year.

The estimates in this report are based on a sample and, consequently, may differ from figures that would have been obtained from a complete count using the same questionnaire and procedures. Sampling variability may be relatively large in cases where the numbers are small. Thus, both small estimates and small differences between estimates should be interpreted with caution. For a detailed explanation of the Annual Social and Economic Supplement to the CPS, its sampling variability, and more extensive definitions than those provided in this Technical Note, see Income, Poverty, and Health Insurance Coverage in the United States: 2009, Current Population Reports, P60-238 (U.S. Census Bureau, September 2010). This publication is available on the U.S. Census Bureau Web site at http://www.census.gov/ prod/2010pubs/p60-238.pdf, and additional information about income and poverty measures is online at http://www.census. gov/hhes/www/income/income.html.

Information in this report will be made available to sensoryimpaired individuals upon request. Voice phone: (202) 691-5200; Federal Relay Service: 1 (800) 877-8339. This material is in the public domain and, with appropriate credit, may be reproduced without permission.

For more information on the data provided in this report, write to the U.S. Bureau of Labor Statistics, Division of Labor Force Statistics, Room 4675, 2 Massachusetts Avenue NE, Washington, DC 20212; email: cpsinfo@bls.gov; or telephone (202) 691-6378.

## Comparability of estimates

The 2009 estimates in this report, which were collected in the 2010 Annual Social and Economic Supplement to the CPS, are not strictly comparable with data for 2008 and earlier years because of the introduction in January 2010 of revised population controls used in the CPS. Additional information is on the Internet at http://www.bls.gov/cps/documentation.htm\#pop.

## Concepts and definitions

Poverty classification. Poverty statistics presented in this report are based on definitions developed by the Social Security Administration in 1964 and revised by Federal interagency committees in 1969 and 1981. These definitions originally were based on the Department of Agriculture's Economy Food Plan
and reflected the different consumption requirements of families predicated on the basis of factors such as family size and the number of children under 18 years of age.

The actual poverty thresholds vary in accordance with the makeup of the family. In 2009, the average poverty threshold for a family of four was $\$ 21,954$; for a family of nine or more persons, the threshold was $\$ 44,366$; and for an unrelated individual aged 65 years or older, it was $\$ 10,289$. Poverty thresholds are updated each year to reflect changes in the Consumer Price Index for All Urban Consumers (CPI-U). The thresholds do not vary geographically. (For more information, see Income, Poverty, and Health Insurance Coverage in the United States: 2009, online at http://www.census.gov/prod/2010pubs/p60-238.pdf.)

Low earnings. The low-earnings level, as first developed in 1987, represented the average of the real value of the minimum wage between 1967 and 1987 for a 40-hour workweek. The year 1967 was chosen as the base year because that was the first year in which minimum-wage legislation covered essentially the same broad group of workers that currently is covered. The low-earnings level has been adjusted each year since then in accordance with the CPI-U so that the measure maintains the same real value that it held in 1987. In 2009, the low-earnings threshold was $\$ 315.76$ per week. For a more complete definition, see Bruce W. Klein and Philip L. Rones, "A profile of the working poor," Monthly Labor Review, October 1989, pp. 3-13, on the Internet at http://www. bls.gov/opub/mlr/1989/10/art1full.pdf.

Income. Data on income are limited to money income-before personal income taxes and payroll deductions-received in the calendar year preceding the supplement. Data on income do not include the value of noncash benefits such as food stamps, Medicare, Medicaid, public housing, and employer-provided benefits. For a complete definition of income, see Income, Poverty, and Health Insurance Coverage in the United States: 2009, online at http://www.census.gov/prod/2010pubs/p60-238.pdf.

Labor force. Persons in the labor force are those who worked or looked for work sometime during the calendar year. The number of weeks in the labor force is accumulated over the entire year. The focus in this report is on persons who were in the labor force for 27 weeks or more.

Involuntary part-time workers. These are persons who, during at least 1 week of the year, worked fewer than 35 hours because of slack work or business conditions or because they could not find full-time work. The number of weeks of involuntary part-time work is accumulated over the year.

Occupation. This term refers to the occupation in which a person worked the most weeks during the calendar year.

Unemployed. Unemployed persons are those who looked for
work while not employed or those who were on layoff from a job and were expecting to be recalled to that job. The number of weeks unemployed is accumulated over the entire year.

Family. A family is defined as a group of two or more persons residing together who are related by birth, marriage, or adoption. The count of families used in this report includes only primary families. A primary family consists of the reference person (householder) and all people living in the household who are related to the reference person. Families are classified either as married-couple families or as those maintained by men or women without spouses present. Family status is determined at the time of the interview and thus may be different from that of the previous year.

Unrelated individuals. These are persons who are not living with any relatives. Such individuals may live alone, reside in a nonrelated family household, or live in group quarters with other unrelated individuals.

Related children. Related children are children (including sons,
daughters, and step- or adopted children) of the husband, wife, or person maintaining the family, as well as other children related to the householder by birth, marriage, or adoption.

Race. White, Black or African American, and Asian are categories used to describe the race of people. People in these categories are those who selected that race group only. Data for the two remaining race categories-American Indian or Alaska Native and Native Hawaiian or Other Pacific Islander-and for people who selected more than one race category are included in totals, but are not shown separately because the number of survey respondents is too small to develop estimates of sufficient quality for publication. In the enumeration process, race is determined by the household respondent.

Hispanic or Latino ethnicity. Hispanic or Latino ethnicity is assigned to persons who identified themselves in the CPS enumeration process as being Spanish, Hispanic, or Latino. People whose ethnicity is identified as Hispanic or Latino may be of any race.
