
Actuarial Status of the HI and SMI Trust Funds

by Barbara Klees and Carter Warfield*

This article is adapted from the 1986 annual reports of the Medicare Board of Trustees. It presents a summary of the current financial and actuarial status of the Hospital Insurance (HI) and Supplementary Medical Insurance (SMI) Trust Funds. The Board found that the present financing schedule for the HI program is barely sufficient to ensure the payment of benefits through the late 1990's if the intermediate (II-A and II-B) assumptions underlying the estimates are realized. Although steps have been undertaken to reduce the rate of growth in payments to hospitals, the Board urges Congress to take remedial measures to bring future HI program costs and financing into balance. The Board found the SMI program to be actuarially sound but recommends that Congress take action to curtail the rapid growth in that part of Medicare.

This summary presents an overview of the information contained in the Annual Reports of the Trustees¹ required under title XVIII of the Social Security Act, Health Insurance for the Aged and Disabled, commonly known as Medicare. There are two basic programs under Medicare:

- (1) Hospital insurance (HI), which pays for inpatient hospital care and other related care of those aged 65 or older and of the long-term disabled.
- (2) Supplementary medical insurance (SMI), which pays for physicians' services, outpatient hospital services, and other medical expenses of those aged 65 or older and of the long-term disabled.

The HI program is financed primarily by payroll taxes, with the taxes paid by current workers used primarily to pay benefits to current beneficiaries. However, the HI program maintains a trust fund to provide a small reserve against fluctuations and to

anticipate changes in the demographic makeup of the population. The SMI program is financed on an accrual basis with a contingency margin. This means that the SMI Trust Fund should always be somewhat greater than the claims that have been incurred by enrollees but not yet paid by the program. The trust funds hold all of the income not currently needed to pay benefits and related expenses. The assets of the funds may not be used for any other purpose; however, they may be invested in certain interest-bearing obligations of the U.S. Government.

The Secretaries of Treasury, Labor, Health and Human Services, and two public members serve as Trustees of the HI and SMI Trust Funds. The Secretary of Treasury is the Managing Trustee. The Administrator of the Health Care Financing Administration, the agency charged with administering the Medicare program, is the Secretary of the Board of Trustees.

Hospital Insurance Trust Fund

The hospital insurance program is financed primarily by payroll taxes. The HI contribution rates applicable to taxable earnings in each of the calendar years 1983 and later are shown in table 1. The maximum taxable amounts of annual earnings are shown for 1983 through 1986. After 1986, the automatic increase provisions in section 230 of the Social Security Act determine the maximum taxable amount.

Table 1.—Contribution rates and maximum taxable amount of annual earnings

Calendar year	Maximum taxable amount of annual earnings	Contribution rate (percent of taxable earnings)	
		Employee and employer, each	Self-employed
1983.....	\$35,700	1.30	1.30
1984.....	37,800	1.30	2.60
1985.....	39,600	1.35	2.70
1986.....	42,000	1.45	2.90
Changes scheduled in present law: 1987 and later ...	(1)	1.45	2.90

¹ Subject to automatic increase.

Operations of the HI Program

In calendar year 1985, over 27 million persons aged 65 or older and about 3 million disabled persons under age 65 were covered under HI, financed primarily by the contributions of 122 million workers through payroll taxes. Payroll taxes during 1985 amounted to \$47.6 billion, accounting for 92.6 percent of all HI income. Interest payments to the HI

fund amounted to 6.5 percent of all HI income for 1985. The remaining 0.9 percent consisted primarily of transfers from the Railroad Retirement Account and the general fund of the Treasury (in accordance with provisions for the collection of taxes from railroad workers, the collection of taxes on deemed military service wage credits, and reimbursement to the fund for benefits for certain uninsured persons) and premiums paid by voluntary enrollees. Of the \$48.4 billion in HI disbursements, \$47.6 billion was for benefit payments while the remaining \$0.8 billion was spent for administrative expenses. The HI administrative expenses were 1.7 percent of total disbursements. In calendar year 1985, the HI Trust Fund was credited with an additional \$1.8 billion, representing a partial repayment of the interfund loan made to the Federal Old-Age and Survivors Insurance Trust Fund in December 1982.

Actuarial Status of the HI Trust Fund

The Board of Trustees has adopted the general financing principle that annual income to the HI

¹ A loan of \$12.4 billion to the OASI Trust Fund was made in 1982. This loan was still an asset of the HI Trust Fund; however, since these assets were not immediately available for payment of HI benefits, they were subtracted from the HI fund balance. The positive amounts shown represent repayments of principal to the HI Trust Fund.

² Ratio of assets in the trust fund at the beginning of the year to disburse-

ments during the year.

³ Figures for 1985 represent actual experience.

⁴ Trust fund depleted in calendar year 1998.

⁵ Trust fund depleted in calendar year 1996.

⁶ Trust fund depleted in calendar year 1993.

Note: Totals do not necessarily equal the sum of rounded components.

program should be at least equal to annual outlays of the program plus an amount to maintain a balance in the trust fund equal to a minimum of one-half year's disbursements. At the beginning of 1986, the trust fund was below this desired level. However, on January 31, 1986, the outstanding balance of the loan made to the Federal Old-Age and Survivors Insurance Trust Fund in December 1982 was repaid, creating a balance in the HI Trust Fund estimated to be greater

than the 50 percent level.

Projections were made using four alternative sets of assumptions: optimistic (alternative I), two intermediate sets (alternatives II-A and II-B), and pessimistic (alternative III). Under both sets of intermediate assumptions, the trust fund ratio is projected to increase until about 1989 and then decline steadily until the fund is completely exhausted in the late 1990's. Under alternative I, the trust fund is projected to remain

solvent throughout the first 25-year projection period. Under alternative III, the trust fund is projected to increase to a level of about 76 percent in 1988 and then decrease rapidly until the fund is exhausted in 1993.

Table 2 in this report summarizes the estimated operations of the HI Trust Fund under the four alternative sets of assumptions. Chart 1 shows historic trust fund ratios for recent years and projected ratios under the four sets of assumptions.

The adequacy of the financing of the HI program on a long-range basis is measured by comparing on a year-by-year basis the actual tax rates specified by law with the corresponding total costs of the program, expressed as percentages of taxable payroll. The actuarial balance is defined to be the excess of the average tax rate for the valuation period over the average cost

of the program expressed as a percentage of taxable payroll. Table 3 compares the actuarial balance under each of the four sets of assumptions for the 75-year projection period 1986-2060. Chart 2 shows the year-by-year costs as a percentage of taxable payroll for each of the four sets of assumptions, as well as the scheduled tax rates. The cost figures include amounts for maintaining the trust fund at the level of a half-year's disbursements, as recommended by the Board of Trustees.

Chart 2 emphasizes the inadequacy of the financing of the HI program by illustrating the divergence of the program costs and scheduled tax rates under each set of assumptions.

Table 4 presents a comparison of the projected experience in the 1985 and 1986 Trustees' Reports. The following tabulation shows the major reasons for

Conclusion

The present financing schedule for the hospital insurance program is barely sufficient to ensure the payment of benefits and maintain the fund at a level of one-half year's disbursements over the next 7-9 years if the assumptions underlying the estimates are realized. The trust fund would be exhausted in the late 1990's under both alternatives II-A and II-B. Under the more pessimistic assumptions, the fund would be exhausted in 1993. Under the more optimistic alternative I assumption, the trust fund would remain solvent at least through the first 25-year projection period.

There are currently over four covered workers supporting each HI enrollee. This ratio will begin to decline rapidly early in the next century. By the middle of that century, there will be only slightly more than two covered workers supporting each enrollee. Not

III (pessimistic)	1992	1993	-7.97	-8.03

¹ The actuarial balance of the hospital insurance program is defined to be the excess of the average tax rate for the valuation period over the average cost of the program, expressed as a percent of taxable payroll, for the same period.

² The trust fund is solvent at least through the end of the first 25-year projection period.

only are the anticipated reserves and financing of the HI program inadequate to offset this demographic change but, under all but the most optimistic assumptions, the HI Trust Fund is projected to become exhausted even before the major demographic shift begins to occur. This depletion is projected to occur during the late 1990's under the intermediate assumptions, and could occur as early as 1993 if the pessimistic assumptions are realized.

The Board notes that promising steps have begun to reduce the rate of growth in payments to hospitals. Initial experience under the prospective payment system for hospitals suggests that this payment mechanism is an effective means of constraining the growth in hospital payments and improving the efficiency of the hospital industry. Efforts focused on improving the efficiency and reducing the costs of the health care delivery system need to be continued in close combination with mechanisms that will assure that the quality of health care is not adversely affected.

Because of the magnitude of the projected actuarial deficit in the HI program and the probability that the HI Trust Fund will be exhausted before the end of the century, the Board believes that early corrective action is essential to avoid the need for later, potentially precipitous changes. The Board, therefore, urges that Congress take early remedial measures to bring future HI program costs and financing into balance.

Supplementary Medical Insurance Trust Fund

Financing for the SMI program is established annually on the basis of standard monthly premium rates (paid by or on behalf of all participants) and monthly actuarial rates determined separately for aged and disabled beneficiaries (on which general revenue contributions are based). Before the 6-month transition period (July 1, 1983, through December 31, 1983), these rates were applicable in the 12-month pe-

riods ending June 30. Beginning January 1, 1984, the period for which rates were applicable was changed to calendar years. Monthly actuarial rates are equal to one-half the monthly amounts necessary to finance the SMI program. These rates determine the amount to be contributed from general revenues on behalf of each enrollee. Based on the formula in the law, the Government contribution effectively makes up the difference between twice the monthly actuarial rates and the standard monthly premium rate. Chart 3 presents these values for financing periods since 1975. The extent to which general revenue financing is becoming the major source of income for the program is clearly indicated in this chart.

In calendar year 1985, 29.9 million persons were covered under SMI. General revenue contributions during 1985 amounted to \$18.3 billion, accounting for 72.7 percent of all SMI income. About 22.4 percent of all income resulted from the premiums paid by the participants, with interest payments to the SMI fund accounting for the remaining 4.9 percent. Of the \$23.9 billion in SMI disbursements, \$22.9 billion was

for benefit payments while the remaining \$0.9 billion was spent for administrative expenses. SMI administrative expenses were 3.9 percent of total disbursements.

Operations of the SMI Program

Projected operations of the fund through 1988 are shown in tables 5 and 6. As shown, income has exceeded disbursements for most of the historical years. However, at the time that financing was being established for calendar year 1986, assets appeared to be more than sufficient to cover the incurred costs and an appropriate contingency. Therefore, the financing was established to reduce the assets to a more desirable level. As a result, in calendar year 1986, disbursements are projected to exceed income, and the trust fund balance is projected to decrease through calendar year 1986. By the end of calendar year 1987, though, the trust fund balance is projected to increase. The financial status of the program depends on both the total net assets and liabilities. It is, therefore, necessary

Chart 3. — SMI monthly per capita income

*For periods 1983 and earlier, the financing period is July 1 through July 30. For the transitional semester (TS), the financing period is July 1, 1983, through December 31, 1983. For 1984 through 1986, the financing period is January 1 through December 31.

to examine the incurred experience of the program, since it is this experience that is used to determine the actuarial rates discussed and that forms the basis of the concept of actuarial soundness as it relates to the SMI program.

Actuarial Soundness of the SMI Program

The concept of actuarial soundness, as it applies to the SMI program, is closely related to the concept as it applies to private group insurance. The SMI program is essentially yearly renewable term insurance financed from premium income paid by the enrollees and from income contributed from general revenue in proportion to premium payments.

In testing the actuarial soundness of the SMI program, it is not appropriate to look beyond the period for which the enrollee premium rate and level of general revenue financing have been established. The primary tests of actuarial soundness, then, are that (1) assets for years for which financing has been established be sufficient to meet the projected benefits and associated administrative expenses incurred for that

period, and (2) assets be sufficient to cover projected liabilities that will have been incurred by the end of that time but will not have been paid yet. Even if these tests of actuarial soundness are not met, the program can continue to operate if the trust fund remains at a level adequate to permit the payment of claims as presented. However, to protect against the possibility that cost increases under the program will be higher than assumed, assets should be sufficient to cover the impact of a moderate degree of projection error.

The primary tests for actuarial soundness and trust fund adequacy can be viewed by direct examination of absolute dollar levels. In providing an appropriate contingency or margin for error, however, there must be some relative measure. The relative measure or ratio used for this purpose is the ratio of net surplus or deficit to the following year's incurred expenditures. Chart 4 shows this ratio for historical years and for projected years under the intermediate assumptions (alternative II-B), as well as high- and low-cost sensitivity scenarios.

Financing for calendar year 1986 was established to

¹ The payments shown as being from the general fund of the Treasury include certain interest-adjustment items.

² Other income includes recoveries of amounts reimbursed from the trust fund that are not obligations of the trust fund and other miscellaneous income.

³ The financial status of the program depends on both the total net assets and the liabilities of the program.

⁴ Section 708 of title VII of the Social Security Act modified the provisions

for the delivery of social security benefit checks when the regularly designated delivery day falls on a Saturday, Sunday, or legal public holiday. Delivery of benefit checks normally due January 1982 occurred on December 31, 1981. Consequently, the SMI premiums withheld from the checks (\$264 million) and the general revenue matching contributions (\$883 million) were added to the SMI Trust Fund on December 31, 1981. These amounts are excluded from the premium income and general revenue income for calendar year 1982.

reduce the excess of assets over liabilities to a more appropriate level. As a result, the excess of assets over liabilities is expected to decrease by December 31, 1986, to a level that more appropriately accommodates a contingency for projection errors.

Conclusion

The financing established through December 1986 is sufficient to cover projected benefit and administra-

tive costs incurred through that time period, and to maintain a level of trust fund assets that is adequate to cover the impact of a moderate degree of projection error. The SMI program can thus be said to be actuarially sound.

Although the SMI program is financially sound, the Board notes with concern the rapid growth in the cost of the program. The Board recommends that Congress take action to curtail the rapid growth in the SMI program.

Chart 4. — Actuarial status of the SMI Trust Fund

Note: The actuarial status of the SMI Trust Fund is measured by the ratio of the end-of-year surplus or deficit to the incurred expenditures for the following year.
