PRODUCER PRICE INDEXES – JULY 2012

The Producer Price Index for finished goods rose 0.3 percent in July, seasonally adjusted, the U.S. Bureau of Labor Statistics reported today. This advance followed a 0.1-percent increase in June and a 1.0-percent decline in May. At the earlier stages of processing, prices received by manufacturers of intermediate goods moved down 0.9 percent in July, and the crude goods index advanced 1.8 percent. On an unadjusted basis, prices for finished goods rose 0.5 percent for the 12 months ended July 2012, continuing the trend of slowing year-over-year increases following a 7.0-percent rise for the 12 months ended September 2011. (See table A.)

Stage-of-Processing Analysis

Finished goods

In July, the increase in the finished goods index was led by prices for finished goods less foods and energy, which moved up 0.4 percent. Also contributing to higher finished goods prices, the index for finished consumer foods advanced 0.5 percent. By contrast, prices for finished energy goods decreased 0.4 percent.

Finished core: The index for finished goods less foods and energy moved up 0.4 percent in July, the largest rise since a 0.6-percent increase in January 2012. Over forty percent of the July advance can be attributed to prices for light motor trucks, which climbed 1.6 percent. The indexes for pharmaceutical preparations and cigarettes also were major factors in the rise in finished core prices. (See table 2.)

Finished foods: The index for finished consumer foods advanced 0.5 percent in July, the same rate as in June. Over half of the July increase can be traced to prices for beef and veal, which climbed 3.8 percent. Higher prices for pork also contributed significantly to the advance in the finished foods index.

Finished energy: The index for finished energy goods moved down 0.4 percent in July, the fifth straight decrease. Most of the July decline is attributable to prices for gasoline, which fell 3.1 percent.

Intermediate goods

The Producer Price Index for intermediate materials, supplies, and components fell 0.9 percent in July, the fourth consecutive decline. Prices for intermediate materials less foods and energy led the July decrease, moving down 0.9 percent. The index for intermediate energy goods dropped 1.6 percent. By contrast, prices for intermediate foods and feeds advanced 1.4 percent. For the 12 months ended in July, the intermediate goods index fell 2.6 percent, the largest decrease since a 7.7-percent decline for the 12 months ended October 2009. (See table B.)

Intermediate core: Prices for intermediate materials less foods and energy moved down 0.9 percent in July, the largest decrease since a 2.4-percent drop in December 2008. About half of the July decline can be attributed to the index for basic organic chemicals, which fell 6.3 percent. Lower prices for steel mill products and fabricated structural metal also were factors in the decrease in the intermediate core index. (See table 2.)

Intermediate energy: The index for intermediate energy goods fell 1.6 percent in July, the fourth straight decline. A 6.1-percent drop in prices for lubricating oil base stocks was a significant factor in the July decrease. A decline in the index for gasoline also contributed to the decrease in intermediate energy goods prices.

Intermediate foods: Prices for intermediate foods and feeds climbed 1.4 percent in July, the largest advance since a 1.4-percent increase in August 2011. More than half of the July rise can be traced to the index for prepared animal feeds, which moved up 3.1 percent.

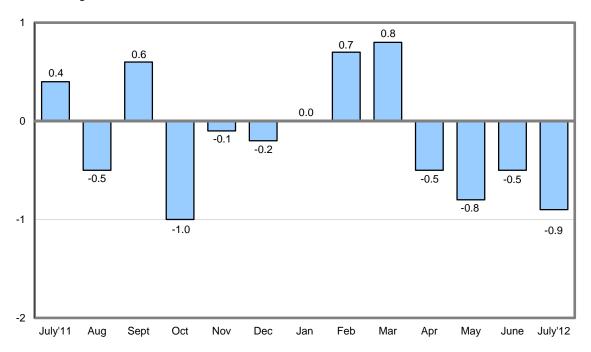

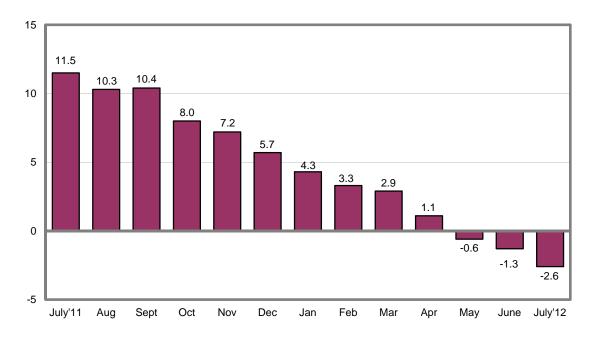

Chart 4. 12-month percent changes in the Producer Price Index for intermediate goods, not seasonally adjusted: July 2011 – July 2012

Percent change

Crude goods

The Producer Price Index for crude materials for further processing advanced 1.8 percent in July. For the 3-month period ended in July, prices for crude materials fell 5.0 percent after declining 6.2 percent from January to April. In July, the monthly increase in the crude goods index was mostly attributable to prices for crude foodstuffs and feedstuffs, which jumped 5.2 percent. Also contributing to the July increase, prices for crude energy materials climbed 0.6 percent. By contrast, the index for crude nonfood materials less energy fell 1.1 percent. (See table B.)

Crude foods: Prices for crude foodstuffs and feedstuffs increased 5.2 percent in July. From April to July, the index for crude foods advanced 1.2 percent subsequent to a 0.5-percent decline for the 3 months ended in April. In July, the monthly rise was mostly the result of a 27.8-percent jump in the grains index. Higher prices for hay, hayseeds, and oilseeds and for raw milk also contributed to the advance in the crude foods index. (See table 2.)

Crude energy: The index for crude energy materials rose 0.6 percent in July. For the 3 months ended in July, prices for crude energy materials declined 9.3 percent compared with a 14.2-percent drop from January to April. The monthly increase in July was mostly attributable to a 12.3-percent advance in prices for natural gas. Additionally, the index for coal rose 0.8 percent.

Crude core: Prices for crude nonfood materials less energy declined 1.1 percent in July. From April to July, the crude core index fell 6.4 percent following a 1.6-percent decrease in the prior 3-month period. A 9.0-percent decline in prices for iron and steel scrap was a major contributor to the monthly decrease in July.

Services Analysis

Trade industries: The Producer Price Index for the net output of total trade industries edged down 0.1 percent in July, the first decline since a 0.3-percent decrease in December 2011. (Trade indexes measure changes in margins received by wholesalers and retailers.) Leading the July decline, margins received by clothing and clothing accessories stores fell 6.4 percent. Lower margins received by gasoline stations and grocery stores also were major factors in the decrease in the total trade industries index.

Transportation and warehousing industries: The Producer Price Index for the net output of transportation and warehousing industries moved down 0.4 percent in July following a 0.2-percent decline in June. About sixty percent of the July decrease can be traced to a 1.3-percent drop in prices received by the scheduled air transportation industry group. Lower prices received by the industry for couriers and express delivery services and by line-haul railroads also contributed to the decline in the index for transportation and warehousing industries.

Traditional service industries: The Producer Price Index for the net output of total traditional service industries was unchanged in July after inching up 0.1 percent in June. In July, higher prices received by the industry group for securities, commodity contracts, and related financial investment services and by the passenger car rental industry offset falling prices received by the industry group for depositary credit intermediation and the software publishing industry.

The Producer Price Index for August 2012 is scheduled to be released on Thursday, September 13, 2012 at 8:30 a.m. (EDT).

Resampling of Industries

Effective with the release of data for July 2012, the Producer Price Index (PPI) includes data for 34 resampled industries classified according to the North American Industry Classification System (NAICS). The Bureau of Labor Statistics periodically updates the sample of producers providing data for the PPI to reflect current conditions more accurately when the structure, membership, technology, or product mix of an industry shifts. The first results of this systematic process were published in July 1986. Subsequent efforts have been completed at 6-month intervals.

Industries selected for resampling in July 2012 are noted below. For information on specific index additions, deletions, and recodes that are effective with this semiannual update, see the July 2012 issue of the *PPI Detailed Report* online at **http://www.bls.gov/ppi/ppidr201207.pdf**, or contact the PPI Section of Index Analysis and Public Information at *ppi-info@bls.gov* or (202) 691-7705.

Technical Note

Brief Explanation of Producer Price Indexes

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measure the average change over time in the prices received by domestic producers of goods and services. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices can differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 9,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the construction, trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Stage-of-processing indexes, (2) commodity indexes, and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final-demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, as well as nondurable goods such as apparel and home heating oil. Capital equipment includes durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

Commodity Indexes

The commodity classification structure of the PPI organizes goods and services by similarity of material composition or end use, disregarding their industry of origin. Table 6 of the *PPI Detailed Report* includes data for commodity indexes, organized in a hierarchal structure, including major commodity groupings (two-digit commodity codes), subgroups (three-digit codes), product classes (four-digit codes), subproduct classes (five- and six-digit codes), item groupings (seven-digit codes) and individual items (eight-, nine-, and ten-digit codes).

Industry Net-Output Price Indexes

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 5 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes), Census product classes (7- and 8-digit codes), products (9-digit codes), and more detailed subproducts (11-digit codes), and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product categories. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products make up a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products—for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Data Collection

PPIs are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms also are chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. This survey is conducted via mail, fax, and the Internet.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of actual prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of industries introduced since the mid-1990s includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

Service sector industries introduced into the Producer Price Index, by SIC or NAICS code and the *PPI Detailed Report* that announces their introduction

Weights

Weights for most traditional commodity groupings of the PPI, as well as weights for commodity-based aggregate indexes calculated using traditional commodity groupings, such as stage-of-processing indexes, currently reflect 2007 values of shipments as reported in the *Census of Manufactures* and other sources. From January 2007 through December 2011, PPI weights were derived from 2002 shipment values. Industry indexes now are calculated under the 2012 NAICS structure utilizing 2007 value of shipment weights and 2002 net output ratios. The periodic update of the value weights

used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity price indexes are based on gross shipment values, including values of shipments between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities (which is comprised of major commodity groupings 01 through 15), are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct for this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982 = 100. From 1971 through 1987, the standard reference base for most PPI series was 1967 = 100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in the *BLS Handbook of Methods* (July 2010). This chapter can be downloaded from the BLS Web site at www.bls.gov/opub/hom/homch14.htm.

Calculating Index Changes

Each PPI measures price changes from a reference period that equals 100.0. An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: prices received by domestic producers of a sample of finished goods have risen from \$100 in 1982 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

Index point change

Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
Index percent change	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100 0.0	034 x 100
Equals percent change	3.4

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. unadjusted data that are generally cited when escalating longterm contracts such as purchasing agreements or real estate leases. For more information, see Escalation and Producer Price Indexes: A Guide for Contracting Parties, BLS Report 807. September 1991. on the Web www.bls.gov/ppi/ppiescalation.htm.

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year, the PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is reevaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or an aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than does the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-

processing indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (six-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if the pattern keeps shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products, but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of almost 300 seasonally adjusted series, only 27 were subject to intervention in 2009.

For more information relating to seasonal adjustment methods, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (July 2010) and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

Producer Price Index Data on the Internet

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, use of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 2.1 million instances of PPI series being downloaded from the Internet during the 12 months ended December 31, 2008.

Retrieving PPI data from the PPI Web site

PPI data can be obtained from the WWW address (www.bls.gov/ppi). Clicking on the "PPI Databases" link reveals the following methods of data retrieval:

• *Top Picks* is a form-based application for both Industry Data and Commodity Data that allows the user to quickly obtain PPI time series data by selecting the most commonly requested time series, including the All Commodities Index and the stage-of-processing indexes (for example, Finished Goods). Within each list, any one—or all—of the time series shown can be selected. A user can modify the

date range and output options after executing the query, using the reformat button above the data output table.

- One-Screen Data Search and Multi-Screen Data Search are form-based query applications for both Industry Data and Commodity Data designed for users unfamiliar with the PPI coding structure. These applications guide a user through the PPI classification system by listing index titles and do not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user's browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiplescreen, non-Java-based application. Both methods allow a user to browse the PPI coding structure and select multiple series codes. Users can modify the date range and output options after executing the query using the reformat button above the data output table.
- Series Report is a form-based application that uses formatted PPI time series identifiers (commodity or industry codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at a time.

There are five alphabetic prefixes used to create unique PPI time series identifiers: WP, WD, PC, PD, and ND. Each provides the user access to a different PPI database. Adding either a "u" (not seasonally adjusted) or an "s" (seasonally adjusted) to the end of these prefixes further specifies the type of data needed.

EXAMPLES

For commodity and stage-of-processing indexes, series identifiers combine a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted) with a commodity code.

Commodity code	Provides data for:
wps141101	Passenger cars, seasonally
	adjusted
wpu141101	Passenger cars, not
	seasonally adjusted
wpusop3000	Finished goods, not
	seasonally adjusted

For discontinued commodity indexes, series identifiers combine a "wdu" prefix (not seasonally adjusted) or a "wds" prefix (seasonally adjusted) with a commodity code.

Commodity code	Provides data for:
wds019	Other farm products,
	seasonally adjusted
wdu0635	Preparations, ethical
	(prescription), not
	seasonally adjusted
wdusi138011	Stainless steel mill
	products, not seasonally
	adjusted

Current price indexes grouped by industry according to NAICS have series identifiers that begin with the prefix "pcu." After the prefix, there are 12 digits (the 6-digit industry code is listed twice) followed by up to 7 alphanumeric characters identifying product detail. Dashes are used as placeholders for higher-level industry group codes.

Industry-product code,	
current NAICS series	Provides data for:
pcu325325	Chemical manufacturing,
	not seasonally adjusted
pcu336110336110	Automobile and light duty
	motor vehicle
	manufacturing
pcu621111621111411	Offices of physicians, one-
	and two-physician
	practices and single-
	specialty group practices,
	general/family practice
pcu325412325412A	Pharmaceutical
	preparation
	manufacturing,
	pharmaceuticals acting on
	the respiratory system

Discontinued industry-product codes based on SIC combine a "pdu" prefix and "#" between the fourth and fifth characters of the product code. Series identifiers for the discontinued dataset use underscores as placeholders to complete a reference to an SIC industry group code of fewer than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of NAICS.)

Industry-product code,	
discontinued SIC series	Provides data for:
pdu28#	Chemicals and allied
	products, not seasonally
	adjusted
pdu331_#	Blast furnaces, steel
	works, and rolling and
	finishing mills, not
	seasonally adjusted
pdu3711#111	Passenger cars

Price indexes for discontinued series grouped by industry according to NAICS have identifiers that begin with the prefix "ndu." After the prefix, there are 12 numeric digits (the 6-digit industry code is listed twice), and up to 7 additional alphanumeric characters that identify product detail. Dashes are used as placeholders for higher-level industry group codes.

Industry-product code,	
discontinued NAICS series	Provides data for
ndu212231212231	Lead ore and zinc
	ore mining
ndu2122312122312	Lead and zinc
	concentrates
ndu212231212231214	Lead
	concentrates

• Text Files (FTP) and the FTP server are best suited for users requiring access to either a large volume of time series data or other PPI-related documentation (such as seasonal factor and relative importance tables). The FTP sites can be accessed at ftp://ftp.bls.gov or directly from the links on the "PPI Databases" page or the PPI homepage. Data and documentation available for download include the following:

	<u>Directory:</u>
Industry Data	/pub/time.series/pc
Industry Data - Discontinued	
(NAICS basis)	/pub/time.series/nd
(SIC basis)	/pub/time.series/pd
Commodity Data	/pub/time.series/wp
Commodity Data - Discontinued	d
Series	/pub/time.series/wd
Special requests	/pub/special.requests/ppi

The FTP site maintains files to help with searches and downloads. These files are centrally located in the /pub/doc directory. Within this directory, the overview.txt file contains an overview relating to all BLS data available through the FTP site. For current commodity-based PPI data, the program help file is wp.txt; for discontinued commodity series, wd.txt; for current industry-based PPI data based on NAICS, pc.txt; for industry-based SIC time series that have been discontinued, pd.txt; and for industry-based NAICS series that have been discontinued, nd.txt.

Users who prefer downloading PPI datasets as individual ZIP files should go to the directory labeled /pub/time.series/compressed/tape.format/ on the FTP site. This directory includes six PPI-specific ZIP files, one for each of the PPI databases—WP, WD, PC, ND, and PD—and a ZIP file for the annual 5-year revision to historical seasonal PPIs.

Other Sources of PPI Data

PPI data can also be accessed via the BLS homepage (www.bls.gov). Clicking on the "Databases & Tools" tab at the top of the homepage calls up a listing all available BLS programs.

Additional information

The PPI homepage (www.bls.gov/ppi) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The "Tables Created by BLS" section found beneath the

statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.

For questions or comments regarding PPI data classification, methodology, or data availability on the Internet, call or e-mail the Section of Index Analysis and Public Information at (202) 691-7705 or *ppi-info@bls.gov*.

¹ Comprehensive relative importance figures are initially computed after the publication of December indexes and are recalculated after final December indexes are available. Individual items and subtotals may not add exactly to totals because of rounding differences.

² The indexes for March 2012 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

³ Includes crude petroleum.

⁴ Excludes crude petroleum.

⁵ Percent of total finished goods.

⁶ Percent of total intermediate materials.

⁷ Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco."

⁸ Percent of total crude materials.
