

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use ENGERIX-B safely and effectively. See full prescribing information for ENGERIX-B.

ENGERIX-B [Hepatitis B Vaccine (Recombinant)]

Suspension for Intramuscular Injection

Initial U.S. Approval: 1989

RECENT MAJOR CHANGES

Warnings and Precautions, Syncope (5.2) 03/2012
Warnings and Precautions, Multiple Sclerosis (5.8) 10/2011

INDICATIONS AND USAGE

ENGERIX-B is a vaccine indicated for immunization against infection caused by all known subtypes of hepatitis B virus. (1)

DOSAGE AND ADMINISTRATION

- ENGERIX-B is administered by intramuscular injection. (2.2)
- Persons from birth through 19 years of age: A series of 3 doses (0.5 mL each) given on a 0-, 1-, 6-month schedule. (2.3)
- Persons 20 years of age and older: A series of 3 doses (1 mL each) given on a 0-, 1-, 6-month schedule. (2.3)
- Adults on hemodialysis: A series of 4 doses (2 mL each) given as a single 2-mL dose or as two 1-mL doses on a 0-, 1-, 2-, 6-month schedule. (2.3)

DOSAGE FORMS AND STRENGTHS

- ENGERIX-B is a sterile suspension available in the following presentations:
 - 0.5-mL (10 mcg) single-dose vials and prefilled syringes (3)
 - 1-mL (20 mcg) single-dose vials and prefilled syringes (3)

CONTRAINDICATIONS

Severe allergic reaction (e.g., anaphylaxis) after a previous dose of any hepatitis B-containing vaccine, or to any component of ENGERIX-B, including yeast. (4)

WARNINGS AND PRECAUTIONS

- ENGERIX-B is available in vials and 2 types of prefilled syringes. One type of prefilled syringe has a tip cap which may contain natural rubber latex. The other type has a tip cap and a rubber plunger which contain dry

natural latex rubber. Use of these syringes may cause allergic reactions in latex-sensitive individuals. (5.1, 16)

- Syncope (fainting) can occur in association with administration of injectable vaccines, including ENGERIX-B. Procedures should be in place to avoid falling injury and to restore cerebral perfusion following syncope. (5.2)
- Apnea following intramuscular vaccination has been observed in some infants born prematurely. Decisions about when to administer an intramuscular vaccine, including ENGERIX-B, to infants born prematurely should be based on consideration of the infant's medical status, and the potential benefits and possible risks of vaccination. (5.4)

ADVERSE REACTIONS

The most common solicited adverse events were injection-site soreness (22%) and fatigue (14%). (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact GlaxoSmithKline at 1-888-825-5249 or VAERS at 1-800-822-7967 or www.vaers.hhs.gov.

DRUG INTERACTIONS

Do not mix ENGERIX-B with any other vaccine or product in the same syringe or vial. (7.1)

USE IN SPECIFIC POPULATIONS

- Safety and effectiveness of ENGERIX-B have not been established in pregnant women and nursing mothers. ENGERIX-B should only be given to a pregnant woman if clearly needed. (8.1, 8.3)
- Antibody responses are lower in persons older than 60 years of age than in younger adults. (8.5)

See 17 for PATIENT COUNSELING INFORMATION.

15 REFERENCES

16 HOW SUPPLIED/STORAGE AND HANDLING

17 PATIENT COUNSELING INFORMATION

*Sections or subsections omitted from the full prescribing information are not listed.

1 FULL PRESCRIBING INFORMATION

2 1 INDICATIONS AND USAGE

3 ENGERIX-B[®] is indicated for immunization against infection caused by all known
4 subtypes of hepatitis B virus.

5 2 DOSAGE AND ADMINISTRATION

6 2.1 Preparation for Administration

7 Shake well before use. With thorough agitation, ENGERIX-B is a homogeneous, turbid
8 white suspension. Do not administer if it appears otherwise. Parenteral drug products should be
9 inspected visually for particulate matter and discoloration prior to administration, whenever
10 solution and container permit. If either of these conditions exists, the vaccine should not be
11 administered.

12 For the prefilled syringes, attach a sterile needle and administer intramuscularly.

13 For the vials, use a sterile needle and sterile syringe to withdraw the vaccine dose and
14 administer intramuscularly. Changing needles between drawing vaccine from a vial and injecting
15 it into a recipient is not necessary unless the needle has been damaged or contaminated. Use a
16 separate sterile needle and syringe for each individual.

17 2.2 Administration

18 ENGERIX-B should be administered by intramuscular injection. The preferred
19 administration site is the anterolateral aspect of the thigh for infants younger than 1 year and the
20 deltoid muscle in older children (whose deltoid is large enough for an intramuscular injection)
21 and adults. ENGERIX-B should not be administered in the gluteal region; such injections may
22 result in suboptimal response.

23 ENGERIX-B may be administered subcutaneously to persons at risk of hemorrhage (e.g.,
24 hemophiliacs). However, hepatitis B vaccines administered subcutaneously are known to result
25 in a lower antibody response. Additionally, when other aluminum-adsorbed vaccines have been
26 administered subcutaneously, an increased incidence of local reactions including subcutaneous
27 nodules has been observed. Therefore, subcutaneous administration should be used only in
28 persons who are at risk of hemorrhage with intramuscular injections.

29 Do not administer this product intravenously or intradermally.

30 2.3 Recommended Dose and Schedule

31 Persons From Birth Through 19 Years of Age: Primary immunization for infants
32 (born of hepatitis B surface antigen [HBsAg]-negative or HBsAg-positive mothers), children
33 (birth through 10 years of age), and adolescents (11 through 19 years of age) consists of a series
34 of 3 doses (0.5 mL each) given on a 0-, 1-, and 6-month schedule.

35 Persons 20 Years of Age and Older: Primary immunization for persons 20 years of
36 age and older consists of a series of 3 doses (1 mL each) given on a 0-, 1-, and 6-month schedule.

37 Adults on Hemodialysis: Primary immunization consists of a series of 4 doses (2 mL
 38 each) given as a single 2-mL dose or two 1-mL doses on a 0-, 1-, 2-, and 6-month schedule. In
 39 hemodialysis patients, antibody response is lower than in healthy persons and protection may
 40 persist only as long as antibody levels remain above 10 mIU/mL. Therefore, the need for booster
 41 doses should be assessed by annual antibody testing. A 2-mL booster dose (as a single 2-mL
 42 dose or two 1-mL doses) should be given when antibody levels decline below 10 mIU/mL.¹ [See
 43 *Clinical Studies (14.2).*]
 44

45 **Table 1. Recommended Dosage and Administration Schedules**

Group	Dose ^a	Schedules
Infants born of:		
HBsAg-negative mothers	0.5 mL	0, 1, 6 months
HBsAg-positive mothers ^b	0.5 mL	0, 1, 6 months
Children:		
Birth through 10 years of age	0.5 mL	0, 1, 6 months
Adolescents:		
11 through 19 years of age	0.5 mL	0, 1, 6 months
Adults:		
20 years of age and older	1 mL	0, 1, 6 months
Adults on hemodialysis	2 mL ^c	0, 1, 2, 6 months

46 HBsAg = Hepatitis B surface antigen

47 ^a 0.5 mL (10 mcg); 1 mL (20 mcg).

48 ^b Infants born to HBsAg-positive mothers should also receive hepatitis B immune globulin
 49 (HBIG) [see *Dosage and Administration (2.5)*].

50 ^c Given as a single 2-mL dose or as two 1-mL doses.
 51

52 **2.4 Alternate Dosing Schedules**

53 There are alternate dosing and administration schedules which may be used for specific
 54 populations (e.g., neonates born of hepatitis B–infected mothers, persons who have or might
 55 have been recently exposed to the virus, and travelers to high-risk areas) (Table 2). For some of
 56 these alternate schedules, an additional dose at 12 months is recommended for prolonged
 57 maintenance of protective titers.
 58

59 **Table 2. Alternate Dosage and Administration Schedules**

Group	Dose ^a	Schedules
Infants born of: HBsAg-positive mothers ^b	0.5 mL	0, 1, 2, 12 months
Children: Birth through 10 years of age	0.5 mL	0, 1, 2, 12 months
5 through 10 years of age	0.5 mL	0, 12, 24 months ^c
Adolescents: 11 through 16 years of age	0.5 mL	0, 12, 24 months ^c
11 through 19 years of age	1 mL	0, 1, 6 months
11 through 19 years of age	1 mL	0, 1, 2, 12 months
Adults: 20 years of age and older	1 mL	0, 1, 2, 12 months

60 HBsAg = Hepatitis B surface antigen

61 ^a 0.5 mL (10 mcg); 1 mL (20 mcg).

62 ^b Infants born to HBsAg-positive mothers should also receive hepatitis B immune globulin
63 (HBIG) [see *Dosage and Administration (2.5)*].

64 ^c For children and adolescents for whom an extended administration schedule is acceptable
65 based on risk of exposure.

66

67 **2.5 Booster Vaccinations**

68 Whenever administration of a booster dose is appropriate, the dose of ENGERIX-B is
69 0.5 mL for children 10 years of age and younger and 1 mL for persons 11 years of age and older.
70 Studies have demonstrated a substantial increase in antibody titers after booster vaccination with
71 ENGERIX-B. See Section 2.2 for information on booster vaccination for adults on hemodialysis.

72 **2.6 Known or Presumed Exposure to Hepatitis B Virus**

73 Persons with known or presumed exposure to the hepatitis B virus (e.g., neonates born of
74 infected mothers, persons who experienced percutaneous or permucosal exposure to the virus)
75 should be given hepatitis B immune globulin (HBIG) in addition to ENGERIX-B in accordance
76 with Advisory Committee on Immunization Practices recommendations and with the package
77 insert for HBIG. ENGERIX-B can be given on either dosing schedule (0, 1, and 6 months or 0,
78 1, 2, and 12 months).

79 **3 DOSAGE FORMS AND STRENGTHS**

80 ENGERIX-B is a sterile suspension available in the following presentations:

- 81 • 0.5-mL (10 mcg) single-dose vials and prefilled TIP-LOK[®] syringes
- 82 • 1-mL (20 mcg) single-dose vials and prefilled TIP-LOK syringes

83 [See *Description (11)* and *How Supplied/Storage and Handling (16)*.]

84 **4 CONTRAINDICATIONS**

85 Severe allergic reaction (e.g., anaphylaxis) after a previous dose of any hepatitis
86 B-containing vaccine, or to any component of ENGERIX-B, including yeast, is a
87 contraindication to administration of ENGERIX-B [*see Description (11) and How*
88 *Supplied/Storage and Handling (16)*].

89 **5 WARNINGS AND PRECAUTIONS**

90 **5.1 Latex**

91 ENGERIX-B is available in vials and 2 types of prefilled syringes. One type of prefilled
92 syringe has a tip cap which may contain natural rubber latex. The other type has a tip cap and a
93 rubber plunger which contain dry natural latex rubber. Use of these syringes may cause allergic
94 reactions in latex-sensitive individuals. The vial stopper does not contain latex. [*See How*
95 *Supplied/Storage and Handling (16)*.]

96 **5.2 Syncope**

97 Syncope (fainting) can occur in association with administration of injectable vaccines,
98 including ENGERIX-B. Syncope can be accompanied by transient neurological signs such as
99 visual disturbance, paresthesia, and tonic-clonic limb movements. Procedures should be in place
100 to avoid falling injury and to restore cerebral perfusion following syncope.

101 **5.3 Infants Weighing Less Than 2,000 g**

102 Hepatitis B vaccine should be deferred for infants weighing <2,000 g if the mother is
103 documented to be HBsAg negative at the time of the infant's birth. Vaccination can commence at
104 chronological age 1 month or hospital discharge. Infants weighing <2,000 g born to HBsAg-
105 positive mothers or mothers of unknown HBsAg status should receive vaccine and hepatitis B
106 immune globulin (HBIG) within 12 hours if HBsAg status cannot be determined; the birth dose
107 should not be counted as the first dose in the vaccine series and it should be followed with a full
108 3-dose standard regimen (total of 4 doses).² [*See Dosage and Administration (2)*.]

109 **5.4 Apnea in Premature Infants**

110 Apnea following intramuscular vaccination has been observed in some infants born
111 prematurely. Decisions about when to administer an intramuscular vaccine, including
112 ENGERIX-B, to infants born prematurely should be based on consideration of the infant's
113 medical status, and the potential benefits and possible risks of vaccination. For ENGERIX-B,
114 this assessment should include consideration of the mother's hepatitis B antigen status and the
115 high probability of maternal transmission of hepatitis B virus to infants born of mothers who are
116 HBsAg positive if vaccination is delayed.

117 **5.5 Preventing and Managing Allergic Vaccine Reactions**

118 Prior to immunization, the healthcare provider should review the immunization history
119 for possible vaccine sensitivity and previous vaccination-related adverse reactions to allow an
120 assessment of benefits and risks. Epinephrine and other appropriate agents used for the control of
121 immediate allergic reactions must be immediately available should an acute anaphylactic
122 reaction occur. [*See Contraindications (4)*.]

123 **5.6 Moderate or Severe Acute Illness**

124 To avoid diagnostic confusion between manifestations of an acute illness and possible
125 vaccine adverse effects, vaccination with ENGERIX-B should be postponed in persons with
126 moderate or severe acute febrile illness unless they are at immediate risk of hepatitis B infection
127 (e.g., infants born of HBsAg-positive mothers).

128 **5.7 Altered Immunocompetence**

129 Immunocompromised persons may have a diminished immune response to ENGERIX-B,
130 including individuals receiving immunosuppressant therapy.

131 **5.8 Multiple Sclerosis**

132 Results from 2 clinical studies indicate that there is no association between hepatitis B
133 vaccination and the development of multiple sclerosis,³ and that vaccination with hepatitis B
134 vaccine does not appear to increase the short-term risk of relapse in multiple sclerosis.⁴

135 **5.9 Limitations of Vaccine Effectiveness**

136 Hepatitis B has a long incubation period. ENGERIX-B may not prevent hepatitis B
137 infection in individuals who had an unrecognized hepatitis B infection at the time of vaccine
138 administration. Additionally, it may not prevent infection in individuals who do not achieve
139 protective antibody titers.

140 **6 ADVERSE REACTIONS**

141 **6.1 Clinical Trials Experience**

142 Because clinical trials are conducted under widely varying conditions, adverse reaction
143 rates observed in the clinical trials of a vaccine cannot be directly compared to rates in the
144 clinical trials of another vaccine and may not reflect the rates observed in practice.

145 The most common solicited adverse events were injection site soreness (22%) and fatigue
146 (14%).

147 In 36 clinical studies, a total of 13,495 doses of ENGERIX-B were administered to 5,071
148 healthy adults and children who were initially seronegative for hepatitis B markers, and healthy
149 neonates. All subjects were monitored for 4 days post-administration. Frequency of adverse
150 events tended to decrease with successive doses of ENGERIX-B.

151 Using a symptom checklist, the most frequently reported adverse events were injection
152 site soreness (22%) and fatigue (14%). Other events are listed below. Parent or guardian
153 completed forms for children and neonates. Neonatal checklist did not include headache, fatigue,
154 or dizziness.

155 Incidence 1% to 10% of Injections: *Nervous System Disorders:* Dizziness,
156 headache.

157 *General Disorders and Administration Site Conditions:* Fever (>37.5°C), injection
158 site erythema, injection site induration, injection site swelling.

159 Incidence <1% of Injections: *Infections and Infestations:* Upper respiratory tract
160 illnesses.

161 *Blood and Lymphatic System Disorders:* Lymphadenopathy.

162 *Metabolism and Nutrition Disorders:* Anorexia.
163 *Psychiatric Disorders:* Agitation, insomnia.
164 *Nervous System Disorders:* Somnolence, tingling.
165 *Vascular Disorders:* Flushing, hypotension.
166 *Gastrointestinal Disorders:* Abdominal pain/cramps, constipation, diarrhea, nausea,
167 vomiting.
168 *Skin and Subcutaneous Tissue Disorders:* Erythema, petechiae, pruritus, rash,
169 sweating, urticaria.
170 *Musculoskeletal and Connective Tissue Disorders:* Arthralgia, back pain,
171 myalgia, pain/stiffness in arm, shoulder, or neck.
172 *General Disorders and Administration Site Conditions:* Chills, influenza-like
173 symptoms, injection site ecchymosis, injection site pain, injection site pruritus, irritability,
174 malaise, weakness.

175 **6.2 Postmarketing Experience**

176 In addition to reports in clinical trials, worldwide voluntary reports of adverse events
177 received for ENGERIX-B since market introduction (1990) are listed below. This list includes
178 serious adverse events or events which have a suspected causal connection to components of
179 ENGERIX-B.

180 The following adverse events have been identified during postapproval use of
181 ENGERIX-B. Because these events are reported voluntarily from a population of unknown size,
182 it is not always possible to reliably estimate their frequency or establish a causal relationship to
183 the vaccine.

184 Infections and Infestations: Herpes zoster, meningitis.

185 Blood and Lymphatic System Disorders: Thrombocytopenia.

186 Immune System Disorders: Allergic reaction, anaphylactoid reaction, anaphylaxis. An
187 apparent hypersensitivity syndrome (serum sickness-like) of delayed onset has been reported
188 days to weeks after vaccination, including: arthralgia/arthritis (usually transient), fever, and
189 dermatologic reactions such as urticaria, erythema multiforme, ecchymoses, and erythema
190 nodosum.

191 Nervous System Disorders: Encephalitis, encephalopathy, migraine, multiple sclerosis,
192 neuritis, neuropathy including hypoesthesia, paresthesia, Guillain-Barré syndrome and Bell's
193 palsy, optic neuritis, paralysis, paresis, seizures, syncope, transverse myelitis.

194 Eye Disorders: Conjunctivitis, keratitis, visual disturbances.

195 Ear and Labyrinth Disorders: Earache, tinnitus, vertigo.

196 Cardiac Disorders: Palpitations, tachycardia.

197 Vascular Disorders: Vasculitis.

198 Respiratory, Thoracic and Mediastinal Disorders: Apnea, bronchospasm including
199 asthma-like symptoms.

200 Gastrointestinal Disorders: Dyspepsia.

201 Skin and Subcutaneous Tissue Disorders: Alopecia, angioedema, eczema, erythema
202 multiforme including Stevens-Johnson syndrome, erythema nodosum, lichen planus, purpura.
203 Musculoskeletal and Connective Tissue Disorders: Arthritis, muscular weakness.
204 General Disorders and Administration Site Conditions: Injection site reaction.
205 Investigations: Abnormal liver function tests.

206 **7 DRUG INTERACTIONS**

207 **7.1 Concomitant Administration With Vaccines and Immune Globulin**

208 ENGERIX-B may be administered concomitantly with immune globulin.

209 When concomitant administration of other vaccines or immune globulin is required, they
210 should be given with different syringes and at different injection sites. Do not mix ENGERIX-B
211 with any other vaccine or product in the same syringe or vial.

212 **8 USE IN SPECIFIC POPULATIONS**

213 **8.1 Pregnancy**

214 Pregnancy Category C

215 Animal reproduction studies have not been conducted with ENGERIX-B. It is also not
216 known whether ENGERIX-B can cause fetal harm when administered to a pregnant woman or
217 can affect reproduction capacity. ENGERIX-B should be given to a pregnant woman only if
218 clearly needed.

219 **8.3 Nursing Mothers**

220 It is not known whether ENGERIX-B is excreted in human milk. Because many drugs
221 are excreted in human milk, caution should be exercised when ENGERIX-B is administered to a
222 nursing woman.

223 **8.4 Pediatric Use**

224 Safety and effectiveness of ENGERIX-B have been established in all pediatric age
225 groups. Maternally transferred antibodies do not interfere with the active immune response to the
226 vaccine. [*See Adverse Reactions (6) and Clinical Studies (14.1, 14.3, 14.4).*]

227 **8.5 Geriatric Use**

228 Clinical studies of ENGERIX-B used for licensure did not include sufficient numbers of
229 subjects 65 years of age and older to determine whether they respond differently from younger
230 subjects. However, in later studies it has been shown that a diminished antibody response and
231 seroprotective levels can be expected in persons older than 60 years of age.⁵

232 **11 DESCRIPTION**

233 ENGERIX-B [Hepatitis B Vaccine (Recombinant)] is a sterile suspension of
234 noninfectious hepatitis B virus surface antigen (HBsAg) for intramuscular administration. It
235 contains purified surface antigen of the virus obtained by culturing genetically engineered
236 *Saccharomyces cerevisiae* cells, which carry the surface antigen gene of the hepatitis B virus.
237 The HBsAg expressed in the cells is purified by several physicochemical steps and formulated as

238 a suspension of the antigen adsorbed on aluminum hydroxide. The procedures used to
239 manufacture ENGERIX-B result in a product that contains no more than 5% yeast protein.
240 Each 0.5-mL pediatric/adolescent dose contains 10 mcg of HBsAg adsorbed on 0.25 mg
241 aluminum as aluminum hydroxide.
242 Each 1-mL adult dose contains 20 mcg of HBsAg adsorbed on 0.5 mg aluminum as
243 aluminum hydroxide.
244 ENGERIX-B contains the following excipients: Sodium chloride (9 mg/mL) and
245 phosphate buffers (disodium phosphate dihydrate, 0.98 mg/mL; sodium dihydrogen phosphate
246 dihydrate, 0.71 mg/mL).
247 ENGERIX-B is available in vials and 2 types of prefilled syringes. One type of prefilled
248 syringe has a tip cap which may contain natural rubber latex. The other type has a tip cap and a
249 rubber plunger which contain dry natural latex rubber. The vial stopper does not contain latex.
250 *[See How Supplied/Storage and Handling (16).]*
251 ENGERIX-B is formulated without preservatives.

252 **12 CLINICAL PHARMACOLOGY**

253 **12.1 Mechanism of Action**

254 Infection with hepatitis B virus can have serious consequences including acute massive
255 hepatic necrosis and chronic active hepatitis. Chronically infected persons are at increased risk
256 for cirrhosis and hepatocellular carcinoma.

257 Antibody concentrations ≥ 10 mIU/mL against HBsAg are recognized as conferring
258 protection against hepatitis B virus infection.¹ Seroconversion is defined as antibody titers
259 ≥ 1 mIU/mL.

260 **13 NONCLINICAL TOXICOLOGY**

261 **13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility**

262 ENGERIX-B has not been evaluated for carcinogenic or mutagenic potential, or for
263 impairment of fertility.

264 **14 CLINICAL STUDIES**

265 **14.1 Efficacy in Neonates**

266 Protective efficacy with ENGERIX-B has been demonstrated in a clinical trial in
267 neonates at high risk of hepatitis B infection.^{6,7} Fifty-eight neonates born of mothers who were
268 both HBsAg-positive and hepatitis B “e” antigen (HBeAg)-positive were given ENGERIX-B
269 (10 mcg/0.5 mL) at 0, 1, and 2 months, without concomitant hepatitis B immune globulin
270 (HBIG). Two infants became chronic carriers in the 12-month follow-up period after initial
271 inoculation. Assuming an expected carrier rate of 70%, the protective efficacy rate against the
272 chronic carrier state during the first 12 months of life was 95%.

273 **14.2 Efficacy and Immunogenicity in Specific Populations**

274 Homosexual Men: ENGERIX-B (20 mcg/1 mL) given at 0, 1, and 6 months was
275 evaluated in homosexual men 16 to 59 years of age. Four of 244 subjects became infected with

276 hepatitis B during the period prior to completion of the 3-dose immunization schedule. No
277 additional subjects became infected during the 18-month follow-up period after completion of
278 the immunization course.

279 Adults with Chronic Hepatitis C: In a clinical trial of 67 adults 25 to 67 years of age
280 with chronic hepatitis C, ENGERIX-B (20 mcg/1 mL) was given at 0, 1, and 6 months. Of the
281 subjects assessed at month 7 (N = 31), 100% responded with seroprotective titers. The geometric
282 mean antibody titer (GMT) was 1,260 mIU/mL (95% Confidence Interval [CI]: 709, 2,237).

283 Adults on Hemodialysis: Hemodialysis patients given hepatitis B vaccines respond with
284 lower titers, which remain at protective levels for shorter durations than in normal subjects. In a
285 clinical trial of 56 adults who had been on hemodialysis for a mean period of 56 months,
286 ENGERIX-B (40 mcg/2 mL given as two 1-mL doses) was given at 0, 1, 2, and 6 months. Two
287 months after the fourth dose, 67% (29/43) of patients had seroprotective antibody levels
288 (≥ 10 mIU/mL) and the GMT among seroconverters was 93 mIU/mL.

289 **14.3 Immunogenicity in Neonates**

290 In clinical studies, neonates were given ENGERIX-B (10 mcg/0.5 mL) at 0, 1, and
291 6 months or at 0, 1, and 2 months of age. The immune response to vaccination was evaluated in
292 sera obtained one month after the third dose of ENGERIX-B.

293 Among infants administered ENGERIX-B at 0, 1, and 6 months, 100% of evaluable
294 subjects (N = 52) seroconverted by month 7. The GMT was 713 mIU/mL. Of these, 97% had
295 seroprotective levels (≥ 10 mIU/mL).

296 Among infants enrolled (N = 381) to receive ENGERIX-B at 0, 1, and 2 months of age,
297 96% had seroprotective levels (≥ 10 mIU/mL) by month 4. The GMT among seroconverters
298 (N = 311) (antibody titer ≥ 1 mIU/mL) was 210 mIU/mL. A subset of these children received a
299 fourth dose of ENGERIX-B at 12 months of age. One month following this dose, seroconverters
300 (N = 126) had a GMT of 2,941 mIU/mL.

301 **14.4 Immunogenicity in Children and Adults**

302 Persons 6 Months Through 10 Years of Age: In clinical trials, children (N = 242)
303 6 months through 10 years of age were given ENGERIX-B (10 mcg/0.5 mL) at 0, 1, and
304 6 months. One to 2 months after the third dose, the seroprotection rate was 98% and the GMT of
305 seroconverters was 4,023 mIU/mL.

306 Persons 5 Through 16 Years of Age: In a separate clinical trial including both
307 children and adolescents 5 through 16 years of age, ENGERIX-B (10 mcg/0.5 mL) was
308 administered at 0, 1, and 6 months (N = 181) or 0, 12, and 24 months (N = 161). Immediately
309 before the third dose of vaccine, seroprotection was achieved in 92.3% of subjects vaccinated on
310 the 0-, 1-, and 6-month schedule and 88.8% of subjects on the 0-, 12-, and 24-month schedule
311 (GMT: 117.9 mIU/mL versus 162.1 mIU/mL, respectively, $P = 0.18$). One month following the
312 third dose, seroprotection was achieved in 99.5% of children vaccinated on the 0-, 1-, and
313 6-month schedule compared to 98.1% of those on the 0-, 12-, and 24-month schedule. GMTs
314 were higher ($P = 0.02$) for children receiving vaccine on the 0-, 1-, and 6-month schedule

315 compared to those on the 0-, 12-, and 24-month schedule (5,687.4 mIU/mL versus
316 3,158.7 mIU/mL, respectively).

317 Persons 11 Through 19 Years of Age: In clinical trials with healthy adolescent
318 subjects 11 through 19 years of age, ENGERIX-B (10 mcg/0.5 mL) given at 0, 1, and 6 months
319 produced a seroprotection rate of 97% at month 8 (N = 119) with a GMT of 1,989 mIU/mL
320 (N = 118, 95% CI: 1,318, 3,020). Immunization with ENGERIX-B (20 mcg/1 mL) at 0, 1, and
321 6 months produced a seroprotection rate of 99% at month 8 (N = 122) with a GMT of
322 7,672 mIU/mL (N = 122, 95% CI: 5,248, 10,965).

323 Persons 16 Through 65 Years of Age: Clinical trials in healthy adult and adolescent
324 subjects (16 through 65 years of age) have shown that following a course of 3 doses of
325 ENGERIX-B (20 mcg/1 mL) given at 0, 1, and 6 months, the seroprotection (antibody titers
326 ≥ 10 mIU/mL) rate for all individuals was 79% at month 6 (5 months after second dose) and 96%
327 at month 7 (1 month after third dose); the GMT for seroconverters was 2,204 mIU/mL at
328 month 7 (N = 110).

329 An alternate 3-dose schedule (20 mcg/1 mL given at 0, 1, and 2 months) designed for
330 certain populations (e.g., individuals who have or might have been recently exposed to the virus
331 and travelers to high-risk areas) was also evaluated. At month 3 (1 month after third dose), 99%
332 of all individuals were seroprotected and remained protected through month 12. On the alternate
333 schedule, a fourth dose of ENGERIX-B (20 mcg/1 mL) at 12 months produced a GMT of
334 9,163 mIU/mL at month 13 (1 month after fourth dose) (N = 373).

335 Persons 40 Years of Age and Older: Among subjects 40 years of age and older given
336 ENGERIX-B (20 mcg/1 mL) at 0, 1, and 6 months, the seroprotection rate 1 month after the third
337 dose was 88% and the GMT for seroconverters was 610 mIU/mL (N = 50). In adults older than
338 40 years of age, ENGERIX-B produced anti-HBsAg antibody titers that were lower than those in
339 younger adults.

340 **14.5 Interchangeability With Other Hepatitis B Vaccines**

341 A controlled study (N = 48) demonstrated that completion of a course of immunization
342 with 1 dose of ENGERIX-B (20 mcg/1 mL) at month 6 following 2 doses of
343 RECOMBIVAX HB[®] (10 mcg) at months 0 and 1 produced a similar GMT (4,077 mIU/mL) to
344 immunization with 3 doses of RECOMBIVAX HB (10 mcg) at months 0, 1, and 6 (GMT:
345 2,654 mIU/mL). Thus, ENGERIX-B can be used to complete a vaccination course initiated with
346 RECOMBIVAX HB.⁸

371 **16 HOW SUPPLIED/STORAGE AND HANDLING**

372 ENGERIX-B is available in single-dose vials and prefilled disposable TIP-LOK syringes
373 (packaged without needles) (Preservative Free Formulation):

374 10 mcg/0.5 mL Pediatric/Adolescent Dose

375 NDC 58160-820-01 Vial (contains no latex) in Package of 10: NDC 58160-820-11

376 NDC 58160-820-43 Syringe (tip cap may contain latex) in Package of 10: NDC 58160-820-52

377 NDC 58160-820-32 Syringe (tip cap and plunger contain latex) in Package of 10: NDC 58160-
378 820-51

379 20 mcg/mL Adult Dose

380 NDC 58160-821-01 Vial (contains no latex) in Package of 10: NDC 58160-821-11

381 NDC 58160-821-05 Syringe (tip cap may contain latex) in Package of 1: NDC 58160-821-34

382 NDC 58160-821-43 Syringe (tip cap may contain latex) in Package of 5: NDC 58160-821-48

383 NDC 58160-821-43 Syringe (tip cap may contain latex) in Package of 10: NDC 58160-821-52

384 NDC 58160-821-32 Syringe (tip cap and plunger contain latex) in Package of 1: NDC 58160-
385 821-32

386 NDC 58160-821-31 Syringe (tip cap and plunger contain latex) in Package of 5: NDC 58160-
387 821-46

388 Store refrigerated between 2° and 8°C (36° and 46°F). Do not freeze; discard if product
389 has been frozen. Do not dilute to administer.

390 **17 PATIENT COUNSELING INFORMATION**

- 391 • Inform vaccine recipients and parents or guardians of the potential benefits and risks of
392 immunization with ENGERIX-B.
- 393 • Emphasize, when educating vaccine recipients and parents or guardians regarding potential
394 side effects, that ENGERIX-B contains non-infectious purified HBsAg and cannot cause
395 hepatitis B infection.
- 396 • Instruct vaccine recipients and parents or guardians to report any adverse events to their
397 healthcare provider.
- 398 • Give vaccine recipients and parents or guardians the Vaccine Information Statements, which
399 are required by the National Childhood Vaccine Injury Act of 1986 to be given prior to
400 immunization. These materials are available free of charge at the Centers for Disease Control
401 and Prevention (CDC) website (www.cdc.gov/vaccines).
