Births: Preliminary Data for 2011

Brady E. Hamilton, Ph.D.; Joyce A. Martin, M.P.H.; and Stephanie J. Ventura, M.A.;
Division of Vital Statistics

Abstract

Objectives—This report presents preliminary data for 2011 on births in the United States. U.S. data on births are shown by age, live-birth order, race, and Hispanic origin of mother. Data on marital status, cesarean delivery, preterm births, and low birthweight are also presented.

Methods—Data in this report are based on approximately 100 percent of 2011 births. Records for the few states with less than 100 percent of records received are weighted to independent control counts of all births received in state vital statistics offices in 2011. Comparisons are made with final 2010 data.

Results— The 2011 preliminary number of US births was 3,953,593, 1 percent less (or 45,793 fewer) births than in 2010; the general fertility rate (63.2 per 1,000 women age 15-44 years) declined to the lowest rate ever reported for the United States. The number of births declined for most race and Hispanic origin groups in 2011, whereas the rate declined only for Hispanic, non-Hispanic black and AIAN women. • The birth rate for teenagers 15-19 years fell 8 percent in 2011 (31.3 births per 1,000 teenagers 15-19 years), another record low, with rates declining for younger and older teenagers and for all race and Hispanic origin groups. • The birth rates for women in their twenties declined as well, to a historic low for women aged 20-24 (85.3 births per 1,000). • The birth rate for women in their early thirties was unchanged in 2011 but rose for women aged 35-39 and 40-44. • The birth rate for women in their late forties was unchanged in 2011. • The first birth rate in 2011 (25.4 births per 1,000) was the lowest ever recorded for the United States. • The birth rate, the number of births, and the percentage of births to unmarried women each declined for the third consecutive year. The birth rate was 46.1 birth per 1,000 unmarried women aged 15-44 and the percentage of births to unmarried women was 40.7. • The cesarean delivery rate was 32.8 percent unchanged from 2010. • The preterm birth rate fell for the 5th straight year in 2011 to 11.72; declines were reported for each of the largest race and Hispanic origin groups. • The 2011 low birthweight rate was 8.10 percent, down slightly from 8.15 percent in 2010.

Introduction

This report from the Centers for Disease Control and Prevention's National Center for Health Statistics (NCHS) presents preliminary data on births and birth rates [including births to teens (**Figure 1**)] and selected maternal and infant health characteristics for the United States in 2011. The findings are based on approximately 100 percent of registered vital records occurring in calendar year 2011, which were received and processed by NCHS as of June 28, 2012. Trends in the preliminary reports for 1995-2010 births were confirmed by the final vital statistics for each year [1,2]. Comparisons are based on the

final data for 2010 and earlier years [2]. Changes and differences presented in this report are statistically significant at the 0.05 level, unless noted otherwise.

State-specific detailed tables for 2011 births, based on preliminary data — showing the percentages of births to unmarried women, delivered by cesarean, born preterm, and of low birthweight — are available on the NCHS website (see **internet tables I-1-I-4** at http://www.cdc.gov/nchs/data/nvsr/nvsr61/nvsr61_05_tables.pdf).

Keywords: births • birth rates • maternal and infant health • vital statistics

Results

Births and birth rates

Key findings are listed below:

- The preliminary number of **births** for the United States in 2011 was 3,953,593, 1 percent less (or 45,793 fewer) than in 2010 (3,999,386) (**Tables 1-3** and **Figure 2**) [2]. Births declined for the three largest race and Hispanic origin groups (down 3 percent for Hispanic women, and 1 percent for non-Hispanic white and non-Hispanic black women), but rose (3 percent) for Asian or Pacific Islander (API) women. The number of births was essentially unchanged for American Indian or Alaska Native (AIAN) women.
- The preliminary **general fertility rate** (GFR) for 2011 was 63.2 births per 1,000 women age 15-44 years, the lowest rate ever reported for the United States (**Tables 1 and 2** and **Figure 2**) [2]. The 2011 rate was down 1 percent from the 2010 rate. Rates for two of the three largest race and Hispanic origin groups declined, down 6 percent for Hispanic women and 2 percent for non-Hispanic black, whereas the rate for non-Hispanic white women was essentially unchanged. The GFR for AIAN women was down 2 percent in 2011, whereas the rate for API women rose 1 percent. The 2011 rates for non-Hispanic black and Hispanic women in 2011 were the lowest ever reported for the United States.
- Birth rates declined for women for ages 15-29 from 2010 to 2011. The birth rates rose for women aged 35-39 and 40-44 and were unchanged for women aged 30-34 and 45-49.
- The **birth rate for teenagers 15-19** fell to another historic low in 2011, to 31.3 births per 1,000, down 8 percent from 2010 (34.2). The rate in 2011 is the lowest ever recorded in more than seven decades (see **Tables 2** and **5** and **Figure 1** for selected years) [2,3]. The teenage birth rate has declined more than 3 percent per year since the recent peak in 1991 (61.8), and the pace of decline has accelerated since 2007. The rate has dropped 25 percent from 2007 (41.5) and 49 percent in the two decades from 1991 to 2011.

- The *number of births to teenagers 15-19* dropped 10 percent from 2010 to 2011, to 329,797, the fewest since 1946. The number of births to teenagers has fallen considerably from 2007 – by 26 percent (from 444,899), and by 38 percent since 1991.
- The *birth rate for the youngest teenagers, aged 10-14 years*, was unchanged at 0.4 births per 1,000 in 2011. Reflecting the declining female population in this age group, the *number of births to mothers under 15-year-olds* fell to 3,974, the fewest since 1946.
- Birth rates for teenagers 15-17 years declined more from 2010 to 2011 than for older teenagers (down 11 percent and 7 percent, respectively). The rate for ages 15-17 in 2011 was 15.4 per 1,000, 29 percent lower than in 2007, while the rate for ages 18-19 years fell to 54.1 per 1,000, 25 percent lower than in 2007.
- Among racial and ethnicity groups, declines from 2010 to 2011 for teenagers 15-19 years ranged from 6 to 8 percent for non-Hispanic white, non-Hispanic black, AIAN, and API teenagers. The birth rate for Hispanic teenagers fell 11% from 2010 to 2011 and dropped 34 percent from 2007 to 2011, the largest decline of any population group. Birth rates for teenagers 15-17 and 18-19 years fell significantly from 2010 to 2011 in all racial and ethnicity groups, except for API teenagers 18-19 years which was essentially unchanged.
- According to a recent analysis of state-specific teenage birth rates, the recent national declines through 2010 were reflected in all but three states [4].
- In 2011, the **birth rate for women aged 20–24 years** was 85.3 births per 1,000 women, the lowest rate ever recorded for the United States, 5 percent lower than in 2010 (**Tables 2-4** and **Figure 3**) [5]. The *number of births* to women in this group declined 3 percent between 2010 and 2011 (**Tables 2-4**). The **rate for women aged 25–29 years** was 107.2 births per 1,000 women, 1 percent below the rate in 2010 (108.3) and the lowest birth rate for women in this age group since 1976 [2]. The number of births to women aged 25–29 years declined less than 1 percent in 2011.
- The **birth rate for women aged 30–34 years** was unchanged in 2011 at 96.5 births per 1,000 women (**Tables 2** and **4** and **Figure 3**). The number of births to women in this age group increased 3 percent. Following three straight years of decline, the **rate for women aged 35-39 years** rose 3 percent in 2011, to 47.2 births per 1,000 women, from 45.9 in 2010 [2]. The number of births to women in this age group decreased slightly in 2011.
- The **birth rate for women aged 40–44 years** was 10.3 births per 1,000 women in 2011, 1 percent above the rate in 2010 (10.2) and the highest rate for women in this age group since 1967 (10.6) [2,5]. The number of births to women in this age group increased 2 percent in 2011. The **rate for women aged 45–49 years** (which includes

births to women aged 50 years and over) remained at 0.7 births per 1,000 women; the number of births to these women decreased by 1 percent (**Tables 2-4**).

- In 2011, the preliminary **total fertility rate** (TFR) was 1,894.5 births per 1,000 women, down 2 percent from 2010 (1,931.0), marking the fourth straight year of decline [2]. The TFR estimates the number of births that a hypothetical group of 1,000 women would have over their lifetimes, based on the age-specific birth rates in a given year.
 - The *TFR* for the United States in 2011 was below replacement, the level (2,100 births per 1,000 women) at which a given generation can exactly replace itself. The rate had been above replacement in 2006 and 2007, but has dropped below since, and was also below replacement from 1972 through 2005 [2].
 - The TFRs declined for nearly all race and Hispanic origin groups, down 5 percent for Hispanic women, 2 percent for non-Hispanic black and AIAN women, and 1 percent for non-Hispanic white women. The TFR rose 1 percent for API women.
- The preliminary **first birth rate** in 2011 was 25.4 births per 1,000 women age 15-44 years, a decline of 2 percent from 2010 (25.9) (**Table 4**) [2]. The first birth rate in 2011 is the lowest recorded for the United States [2,5]. First-birth rates declined for women aged 15-24, rose for women 30-39, and were essentially unchanged for women in all other age groups. Second- and third-order birth rates for women aged 15-44 years also declined as well (down 1-2 percent); the 2011 second-order birth rate is at the lowest level since 1940 (20.0) [2,5]. The rate for fourth and higher-order births was unchanged in 2011.
- The **general fertility rate** (**GFR**) decreased for 19 states in 2011 (Arizona, California, Colorado, Florida, Georgia, Idaho, Illinois, Iowa, Kansas, Louisiana, Nevada, New Mexico, New York, North Carolina, Oklahoma, Oregon, South Carolina, Texas, and Utah). Declines among states ranged from 1 percent (New York) to 4 percent (Idaho, Texas, and Utah) [2]. GFRs for the remaining 31 states, the District of Columbia, and all territories were essentially unchanged. Rates by state varied considerably, ranging from 51.5 births per 1,000 women age 15-44 years in Rhode Island to 83.6 in Utah (**Table 6**).
- The **nonmarital birth rate** declined 3 percent in 2011 to 46.1 births per 1,000 unmarried women aged 15-44. The drop from 2010 to 2011 was the third consecutive decline, totaling 11 percent since 2008 (51.8 per 1,000), according to preliminary data. The rate had risen steadily in recent years, increasing 19 percent from 2002 (43.6) to 2007 (51.8).
 - The total *number of births to unmarried women* declined about 2 percent in 2011 to 1,608,087, down from 1,633,471 in 2010. The number has now fallen for three consecutive years, down by 7 percent overall. Nonmarital births dropped for

teenagers and women in their early twenties, and increased for women in age groups 25 and older.

- The *proportion of all births to unmarried women* was 40.7 percent in 2011, slightly lower than in 2010 (40.8 percent). There was a decline for non-Hispanic black births and a small increase for non-Hispanic white births; changes for other race and Hispanic origin groups were not significant (**Tables 1 and 7**).
- Unmarried teenagers accounted for 18 percent of all nonmarital births in 2011, the lowest percentage ever reported. In 1970, teenagers accounted for 50 percent of births to unmarried women [6].
- The percentage of births to unmarried women increased in 4 states and declined in 10 states. Changes in the other 36 states and the District of Columbia were not significant (**Internet table I-1**).

Maternal and Infant Health Birth Characteristics

Key findings are listed below:

- The percentage of births in cesarean deliveries rose nearly 60 percent from 1996 through 2009 [2], but this upward trend may be at an end. Following a small decline in the rate from 2009 to 2010 (32.9 to 32.8 percent), the **cesarean delivery rate** was unchanged for 2010-2011 (**Table 8**).
- The rate of cesarean delivery declined from 2010 to 2011 among non-Hispanic white women; was not significantly changed for non-Hispanic black, AIAN and API mothers, but rose among Hispanic mothers.
- The **preterm birth rate** fell for the 5th straight year in 2011 to 11.72 percent, 2 percent lower than the 2010 rate (11.99 percent), and 8 percent lower than the 2006 peak. The preterm birth rate (the percentage of births delivered at less than 37 completed weeks of gestation) rose by more than 1/3 from 1981 to 2006 (see **Tables 8 and 9** and **Figure 4** for trends for 1990-2011) [2]. Although the lowest level in more than a decade, the 2011 rate of preterm birth is still higher than rates reported during the 1980s and most of the 1990s.
- Declines between 2010 and 2011 were observed among infants delivered early (<34 weeks) and late preterm (34-36 weeks). The early preterm percentage declined from 3.50 to 3.44 from 2010 to 2011, and is down from 3.66 percent in 2006. The late preterm birth rate declined from 8.49 to 8.28 percent from 2010 to 2011, and is down 10 percent from the 2006 high (**Table 9**).
- Preterm births declined among each of the largest race and Hispanic origin groups from 2010 to 2011; non-Hispanic white, non-Hispanic black and Hispanic infants (**Table 8**). Since 2006, the preterm rate has declined 8-9 percent for non-Hispanic

white and non-Hispanic black infants, and 5 percent for Hispanic infants [2]. Although still substantially higher than that of other groups, the 2010 and 2011 preterm rates for non-Hispanic black infants are the lowest reported in the 3 decades that comparable data have been available.

- The downward trend in preterm births for the recent 5-year period is observed across most of the United States; rates declined in 47 states and the District of Columbia from 2006 to 2011 (see **Tables 10** and **I-3**). Rates in the remaining three states were essentially unchanged.
- The 2011 **low birthweight** (LBW) rate was 8.10, down slightly from 8.15 percent in 2010. (**Table 8** and **Figure 4**). The LBW rate (the percentage of infants born at less than 2,500 grams or 5 lb, 8 oz) increased more than 20 percent from the mid 1980s through 2006, but has declined slowly, by 2 percent, from 2006 to 2011 [2]. The rate of **very low birthweight** (less than 1,500 grams or 3 lb, 4 oz) was essentially stable at 1.44 percent in 2011 (**Table 8**), but is down from the high of 1.49 percent for 2004 to 2007 [1]. The percentage of infants born moderately low birthweight (1,500-2,499 grams) declined to 6.66 percent in 2011, and is down from 6.77 percent in 2006.
- LBW declined slightly between 2010 and 2011 among non-Hispanic white, and non-Hispanic black infants, but was not significantly changed among Hispanic births. Since 2006, LBW rates are down 3 percent for non-Hispanic white and 5 percent for non-Hispanic black births; no consistent trend is observed for Hispanic births (**Table 8**) [1].

List of Detailed Tables

Report Tables

1. Selected demographic characteristics of births, by race and Hispanic origin of mother: United States, final 2010 and preliminary 2011
2. Births by age, race and Hispanic origin of mother: United States, final 2010 and preliminary 2011
3. Births by age of mother, live-birth order, and race and Hispanic origin of mother: United States, preliminary 2011
4. Birth rates by age of mother, live-birth order, and race and Hispanic origin of mother: United States, preliminary 2011

5. Births for women aged 10-19 years, by age and race and Hispanic origin of mother: United States, final 1991, 2005, 2007, and 2009-2010, and preliminary 2011
6. Births by race and Hispanic origin of mother: United States and each state and territory, preliminary 2011.
7. Births to unmarried women, by age: United States, final 2009 and preliminary 2010
8. Selected health characteristics of births, by race and Hispanic origin of mother: United States, final 2010 and preliminary 2011
9. Distribution of births born prior to 37 completed weeks of gestation: United States, final 1990, 2006, and 2010 and preliminary 2011
10. Total count of records and completeness of preliminary file of live births: United States, each State and territory, preliminary 2011

Technical Notes

Nature and sources of data

Preliminary data for 2011 are based on all births for that year (approximately 100 percent, see **Table 10**), with levels for 47 states and the District of Columbia at 100.0 percent and levels for the remaining 3 states just under 100 percent. Preliminary 2011 data are based on a continuous receipt and processing of statistical records through June 28, 2012, by the Centers for Disease Control and Prevention’s (CDC) National Center for Health Statistics (NCHS). NCHS receives the data from the states’ vital registration systems through the Vital Statistics Cooperative Program. In this report, U.S. totals include only events occurring within the 50 states and the District of Columbia. Data for Puerto Rico, Guam, and American Samoa are included in tables showing data by state, but are not included in U.S. totals (see **Tables 6 and 10**) and state-specific internet tables at http://www.cdc.gov/nchs/data/nvsr/nvsr60/nvsr61_05_tables.pdf). Data for Northern Marianas and the Virgin Islands were not available as of release of the 2011 preliminary file and are not included in this report. Detailed information on reporting completeness and imputation procedures may be found in the “User Guide to the 2010 Natality Public Use File” [7].

To produce the preliminary estimates shown in this report, records in the file were weighted using independent control counts of all 2011 births by state of occurrence. Detailed information on weighting and the reliability of estimates also may be found elsewhere [8].

The 1989 and 2003 U.S. Standard Certificates of Live Birth

This report includes selected 2011 data on items which are collected on both the 1989 Revision of the U.S. Standard Certificate of Live Birth (unrevised) and 2003 Revision of the U.S. Standard Certificate of Live Birth (revised). The 2003 revision is described in detail elsewhere [2,7,9,10]. Thirty-six states (California, Colorado, Delaware, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Michigan, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Washington, Wisconsin, and Wyoming), the District of Columbia, Puerto Rico, and Northern Marianas had implemented the revised birth certificate as of January 1, 2011. Two additional states, Massachusetts and Minnesota, and one territory, Guam, implemented the revised birth certificate in 2011, but after January 1. The thirty-six revised states and the District of Columbia that implemented as of January 1, 2011, represent 83 percent of all 2011 births.

Data items exclusive to either the 1989 or the 2003 birth certificate revision are not shown in this report. A forthcoming report and/or data release based on 2011 final data will present selected data exclusive to the 2003 revised certificate.

Age of mother

For information and discussion of age of mother, see “User Guide to the 2010 Natality Public Use File” [7].

Hispanic origin and race

Hispanic origin

Hispanic origin and race are reported separately on the birth certificate. Data shown by race (i.e., AIAN and API) include persons of Hispanic or non-Hispanic origin, and data for Hispanic origin include all persons of Hispanic origin of any race. Data for non-Hispanic persons are shown separately according to the race of the mother because there are substantial differences in fertility and maternal and infant health characteristics between Hispanic and non-Hispanic white women. Items asking for the Hispanic origin of the mother have been included on the birth certificates of all states and the District of Columbia, the Virgin Islands, and Guam since 1993, on the birth certificate of Puerto Rico starting in 2005, and on the birth certificate of Northern Marianas starting in 2010 [7]. American Samoa does not collect this information.

Single, Multiple and “Bridged” race

The 2003 revision of the U.S. Standard Certificate of Live Birth allows the reporting of more than one race (multiple races) for each parent [9] in accordance with the revised standards issued by the Office of Management and Budget (OMB) in 1997 [11]. Information on this change is presented elsewhere [7,12-15].

In 2011, forty-one states and the District of Columbia reported multiple-race. Multiple-race reporting areas include: California, Colorado, Delaware, Florida, Georgia, Guam (in June), Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts (in February-March), Michigan, Minnesota (in March), Missouri, Montana, Nebraska, Nevada, New Hampshire, New Mexico, New York, North Carolina, North Dakota, Northern Marianas, Ohio, Oklahoma, Oregon, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Washington, Wisconsin, Wyoming, and the District of Columbia, which used the 2003 revision of the U.S. Standard Certificate of Live Birth, as well as Hawaii, Minnesota (through February), and Rhode Island, which used the 1989 revision of the U.S. Standard Certificate of Live Birth. Puerto Rico, which revised its birth certificate in 2005, continued to report race according to the 1989 revision of the U.S. Standard Certificate of Live Birth (that is, as an open-ended question in which only one response is accepted). The forty-one states and the District of Columbia accounted for 87 percent of U.S. births in 2011. Data from the vital records of the remaining nine states are based on the 1989 revision of the U.S. Standard Certificate of Live Birth that follows the 1977 Office of Management and Budget (OMB) standard, allowing only a single race to be reported [12,13].

To provide uniformity and comparability of the data during the transition period, before all or most of the data are available in the new multiple-race format, it was necessary to “bridge” the responses of those who reported more than one race (multiple race) to one, single race. The bridging procedure for multiple-race mothers and fathers is based on the procedure used to bridge the multiple-race population estimates (see “Population denominators”) [13-15]. Information detailing the processing and tabulation of data by race is presented elsewhere [7]. A previous report describes multiple race birth data for 2003 [16].

Marital status

For information and discussion of marital status, see “User Guide to the 2010 Natality Public Use File” [7].

Method of delivery, Gestation, and Birthweight

For information and discussion of method of delivery, gestational age, and birthweight, see “User Guide to the 2010 Natality Public Use File” [7].

Population denominators

U.S. national and state level birth and fertility rates for 2011 shown in this report are based on population estimates derived from the 2010 Census, as of July 1, 2011. These population estimates are available on the NCHS website [17]. The production of these population estimates is described in detail elsewhere [13].

Birth and fertility rates for the territories shown in this report are based on population estimates provided by U.S. Census Bureau [19,20].

Rates by state and territory shown in this report may differ from rates computed on the basis of other population estimates. Rates for states and territories with smaller populations, or groups with smaller populations, are more likely to be affected by differences in population base.

Information on the national estimates of births to unmarried women (i.e., methods of determining marital status) and the computation of the preliminary birth rates for unmarried women is presented elsewhere [2,7,21]. The birth rate for unmarried women for 2011 is estimated on the basis of the population distributions by marital status provided by the U.S. Census Bureau as of March 2011 and applied to the national population estimates as of July 1 of 2011, which is derived from the 2010 census [17,21,22].

The populations for the U.S. used in this report were produced under a collaborative arrangement with the U.S. Census Bureau and are consistent with the 2010 census counts by age, race, and sex. Reflecting the guidelines issued in 1997 by the OMB, the 2010 census included an option for persons to report more than one race as appropriate for themselves and household members [11]. Beginning with births occurring in 2003, several states began reporting multiple race data. This number has increased to forty-one states and the District of Columbia in 2011 (see *Single, Multiple and “Bridged” race*). In order to produce birth and fertility rates by race during the transition period, the bridging of population data for multiple-race persons back to single-race categories was necessary. Once all states revise their birth certificates to be compliant with the 1997 OMB standards, the use of “bridged” populations can be discontinued. For detailed information on the revised OMB standards on race reporting and procedures used to produce the “bridged” populations, see “United States Census 2000 with Bridged Race Categories” [13].

Computing rates and percentages and Reliability of estimates

For information and further discussion on computing rates and percentages and the relative standard errors of the data, see Births: Preliminary Data for 2005 [8].

Acknowledgments

This report was prepared under the general direction of Charles J Rothwell, Director of the Division of Vital Statistics (DVS) and Stephanie J. Ventura, Chief of the

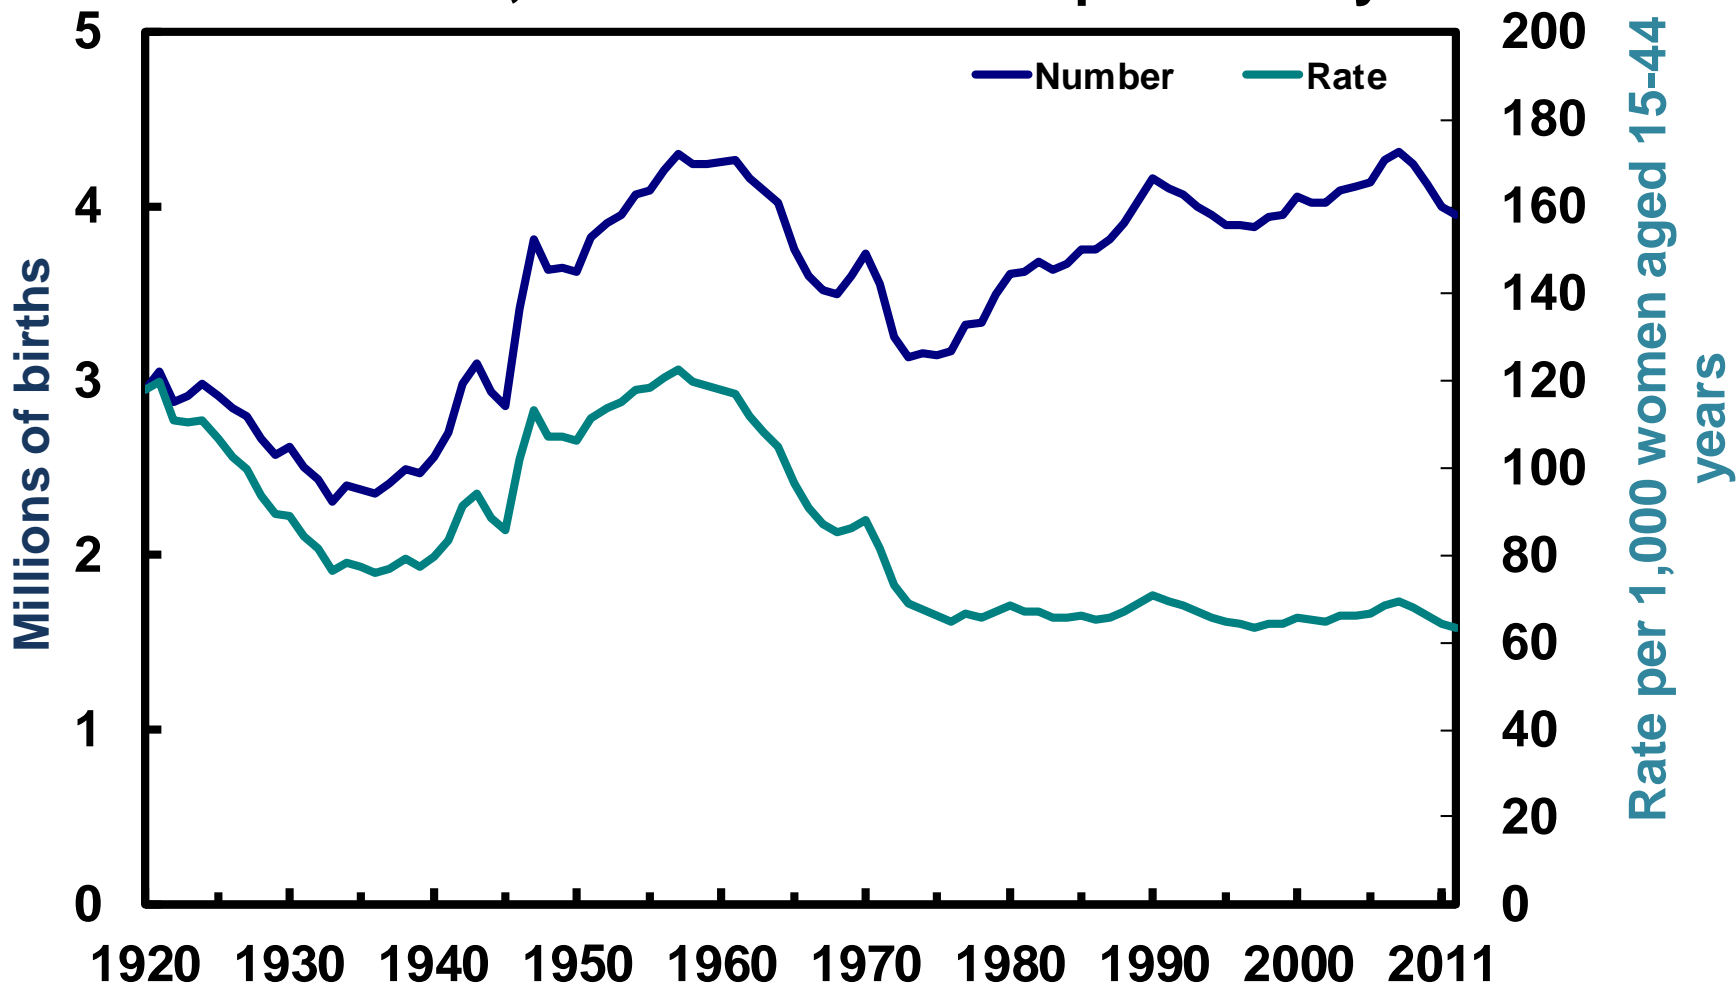

Reproductive Statistics Branch (RSB). Nicholas F. Pace, Chief of the Systems, Programming, and Statistical Resources Branch (SPSRB), and Steve J. Steimel, Annie S. Liu, and Candace M. Cosgrove provided computer programming support and statistical tables. Steve J. Steimel and Annie S. Liu of SPSRB prepared the natality file. Yashodhara Patel, Michelle J.K. Osterman, and Sally C. Curtin of RSB provided content review. Staff of the Data Acquisition and Evaluation Branch carried out quality evaluation and acceptance procedures for the state data files on which this report is based. The Registration Methods staff of DVS consulted with state vital statistics offices regarding the collection of birth certificate data. This report was edited and produced by CDC/OSELS/NCHS/OD/Office of Information Services, Information Design and Publishing Staff: _____ edited the report; typesetting was done by _____; and graphics were produced by _____.

Table 1. Selected demographic characteristics, by race and Hispanic origin of mother: United States, final 2010 and preliminary 2011

[Data for 2011 are based on a continuous file of records received from the states. Figures for 2011 are based on weighted data rounded to the nearest individual. Birth rates are the total number of births per 1,000 population in specified group. Fertility rates are the total number of births (regardless of the age of the mother) per 1,000 women aged 15-44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups in specified group multiplied by 5. Population estimated as of July 1 for 2011 and based on counts enumerated as of April 1 for 2010]

40-44 years	22,635	13.0	21,783	13.0
45-54 years ³	1,236	0.8	1,195	0.8

¹ Includes births to race and origin groups not shown separately, such as white Hispanic and black Hispanic women, and births with origin not stated.

² The total number includes births to women of all ages. The rate shown for all ages is the fertility rate, which is defined as the total number of births (regardless of the age of the mother) per 1,000 women aged 15-44 years.

³ The birth rate for women aged 45-49 years is computed by relating the number of births to women aged 45 years and over to women aged 45-49 years, because most of the births in this group are to women aged 45-49.

⁴ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2011, forty-one states and the District of Columbia reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes." Multiple-race reporting areas vary for 2010-2011; see "Technical Notes."

⁵ Includes persons of Hispanic origin according to the mother's reported race; see "Technical Notes."

⁶ Includes all persons of Hispanic origin of any race; see "Technical Notes."

NOTE: For information on the relative standard errors of the data and further discussion; see Reference 8.

Table 3. Births by age of mother, live-birth order, and race and Hispanic origin of mother: United States, preliminary 2011

4th child and over	11.8	*	0.1	6.0	18.7	23.6	17.2	5.3	0.3

0.0 Quantity more than zero but less than 0.05.

* Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.

¹ The rate shown is the fertility rate, which is defined as the total number of births, regardless of age of mother, per 1,000 women aged 15-44 years.

² The birth rate for ages 45-49 years is computed by relating births to women aged 45 years and over to women aged 45-49 years, because most of the births in this group are to women aged 45-49.

³ Includes births to race and origin groups not shown separately, such as white Hispanic and black Hispanic women, and births with origin not stated.

⁴ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2011, forty-one states and the District of Columbia reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."

⁵ Includes persons of Hispanic origin according to the mother's reported race; see "Technical Notes."

⁶ Includes all persons of Hispanic origin of any race; see "Technical Notes."

NOTE: For information on the relative standard errors of the data and further discussion, see Reference 8.

Table 5. Birth rates for women aged 10-19 years, by age and race and Hispanic origin of mother: United States, final 1991, 2005, 2007, and 2009-2010, and preliminary 2011

[Rates per 1,000 women in specified age and race and Hispanic origin group. Population based on counts enumerated as of April 1 for 2010 and estimated as of July 1 for all other year. Rates for 2005, 2007, and 2009 have been revised using population estimates based on the 2010 census, and may differ from rates previously published; see References 1 and 2]

--- Data not available.

- Quantity zero.

¹ Includes births to race and origin groups not shown separately, such as white Hispanic and black Hispanic women, and births with origin not stated.

² Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2011, forty-one states and the District of Columbia reported multiple race data. The multiple-race data for these states were bridged to the single race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes."

³ Includes persons of Hispanic origin according to the mother's reported race; see "Technical Notes."

⁴ Includes all persons of Hispanic origin of any race; see "Technical Notes."

⁵ Excludes data for the territories.

NOTE: For information on the relative standard errors of the data and further discussion; see Reference 8.

Table 7. Births to unmarried women, by age: United States, final 2010 and preliminary 2011

⁴ Birthweight of less than 2,500 grams (5 lb 8 oz).

⁵ Birthweight of less than 1,500 grams (3 lb 4 oz).

⁶ Includes births to race and origin groups not shown separately, such as white Hispanic and black Hispanic women, and births with origin not stated.

⁷ Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. Race categories are consistent with the 1977 Office of Management and Budget (OMB) standards. In 2011, forty-one states and the District of Columbia reported multiple-race data. The multiple-race data for these states were bridged to the single-race categories of the 1977 OMB standards for comparability with other states; see "Technical Notes." Multiple-race reporting areas vary for 2010-2011; see "Technical Notes."

⁸ Includes persons of Hispanic origin according to the mother's reported race; see "Technical Notes."

⁹ Includes all persons of Hispanic origin of any race; see "Technical Notes."

NOTE: For information on the relative standard errors of the data and further discussion, see reference 8.

Table 9. Distribution of births born preterm (prior to 37 completed weeks of gestation): United States, final 1990, 2006, and 2010 and preliminary 2011

of records received from the states]

	2011	2010	2006	1990
Gestational age ¹	Percent			
Under 32 weeks	1.92	1.96	2.04	1.92
32-33 weeks	1.51	1.53	1.62	1.40
Total under 34 weeks	3.44	3.50	3.66	3.32
34-36 weeks	8.28	8.49	9.15	7.30
Total under 37 weeks	11.72	11.99	12.80	10.62

NOTE: For information on the relative standard errors of the data and further discussion, see reference 8.

Table 10. Total count of records and completeness of preliminary file of live births: United States, each state and territory, preliminary 2011

[By place of occurrence]

Area	Live births	
	Counts of records	Percent completeness
United States ¹	3,960,982	100.000
Alabama	57,891	100.000
Alaska	11,338	100.000
