

Incorporating Quality Measures in Tabular Data Protected by Perturbation Methods

[Ramesh A Dandekar](#)

U. S. Department of Energy, Washington DC 20585

Abstract. Statistical agencies routinely publish analysis reports by using survey data summarized in tabular format. The analysis reports often provide industry specific regional and sub-regional fluctuations in the reported tabular values by comparing them with the data collected in previous survey cycles. Based on the information presented in the tabular data, data users often make their own inferences about the changes in the market conditions for their own immediate geographical areas. To continue to meet these requirements, newly proposed cell perturbation-based tabular data protection methods such as controlled tabular adjustment ([Dandekar 2001](#)), and a [micro data level noise addition method](#) need to have a strategy in place to ensure that the data users do not confuse cell perturbation error with fluctuations in published cell values attributed to other sources. To achieve this objective, we propose a simple mechanism to continue to safeguard data quality and to provide the most accurate information to data users in the tabular format protected by cell perturbation methods. *Our proposed method with minor modifications could be used to convey the relative standard errors (RSE) associated with tabular format estimates derived from sampled survey data.*

Introduction

Statistical agencies routinely publish analysis reports by using survey data summarized in tabular format. The analysis reports often provide industry specific regional and sub-regional fluctuations in the reported tabular values by comparing them with the data collected in previous survey cycles. The comparative evaluation helps analysts to determine long and short term trends at local, regional and national levels. Similarly, such a comparison allows analysts to observe unusual fluctuations in reported tabular values over time resulting from either the policy changes or due to changes in the market conditions. Statements such as, “Coal consumption decreased in the electric power sector by 1.0 percent, the coking coal sector by 2.0 percent, and the other industrial sector by 1.4 percent.” or “Data show that total generation in the electric power sector (electric utilities and independent power producers) in the United States increased slightly in 2006.” are routinely used in statistical publications.

Based on the information presented in the tabular data, data users often make their own inferences about the changes in the market conditions for their own immediate geographical areas. To meet such a stringent requirement, newly proposed cell perturbation-based tabular data protection methods such as controlled tabular adjustment ([Dandekar 2001](#)), and a [micro data level noise addition method](#) need to have a unified strategy in place to ensure that the data users do not confuse cell perturbation error introduced by these methods to protect sensitive tabular cells with fluctuations in published cell values resulting from a variety of other sources, such as sampling and non-sampling errors . A practical mechanism is required to be in place to continue to safeguard data quality and to provide the most accurate information to data users in the tabular format using these methods.

A Practical Solution

To convey the accuracy and the quality of table cell specific information to the external data users, we propose using a table cell imbedded quality indicator for all tabular data protected by the cell perturbation methods. Our proposal advocates:

- To use a very small percentage change in the perturbed cell value (such as 0.01% or even smaller) as a threshold for quality acceptance criteria.
- To publicly disclose the threshold quality acceptance value for perturbed cells in a footnote to all the public use tables protected by cell perturbation methods.
- To suppress the selected number of right most digits from the perturbed tabular cells with perturbation error in excess of the threshold acceptance value. This is to inform data users the extent of error associated with the published perturbed cell value.

We propose the following equation to determine the number of right most digits to suppress:

$$\text{Right most digits to suppress} = \text{Integer Value} [\log_{10} (2.0 * \text{Abs} \{ \text{chng} \}) + 1.0]$$

It is important to note that attempts by the external data users to estimate the values for the suppressed digits will never result in the disclosure (exact or statistical) of sensitive cell values. At best, the estimate for the suppressed digits will result in external data users recovering the perturbed value for the sensitive cell. As a result, withholding the number of digits for only one cell in a given row or a column should not be considered as a potential disclosure problem arising from this procedure.

An Illustrative Example

Let us assume that the change made to a cell value within a plus or minus 0.5 percent of the true cell value is considered to be as good as the true cell value and therefore is published in its entirety.

Example 1:

Cell Value: 172 Change: -8

Percent Cell Value Change: $-8 / 172 * 100 = -4.65\%$

Number of cell value digits to suppress = Integer Value [$\log_{10} (2.0 * 8) + 1.0] = 2$

Adjusted cell value = $172 - 8 = 164$.

Published cell value = 1xx.

Example 2:

Cell Value: 3840 Change: -8

Percent Cell Value Change: $-8 / 3840 * 100 = -0.21\% \dots$ *Within threshold acceptance level*

Published cell value = Adjusted cell value = $3840 - 8 = 3832$

Example Using a Real Life Table Structure

To demonstrate the effectiveness of our proposed “quality preserving” solution, we use the same real life table structure of moderate hierarchical and linked complexity used in the technical paper, “[Comparative Evaluation of Four Different Sensitive Tabular Data Protection Methods Using a Real Life Table Structure of Complex Hierarchies and Links](#)”, (Dandekar 2007). The table consists of eight two-dimensional cross sections linked in the four-dimensional space. [Appendix A](#) shows a layout for one of the eight two-dimensional cross sections. We use the table layout from [Appendix A](#) to display the proposed published format output from our procedure. The rows in each of the eight cross sections provide geographical details consisting of hierarchical structure. The table is populated with the non-real synthetic micro data using the same procedure described in that paper. The p percent rule with p=10% is used to identify sensitive cells. To demonstrate the effectiveness of the micro data level noise addition method, the micro data used as an input to create the table is perturbed by an average of 10% and standard deviation of 0.005 by using a normal distribution.

To illustrate our approach, we use *0.01% cell perturbation error* as a threshold for quality acceptance criteria. **Table 1** shows a part of the table from [Appendix A](#) belonging to PAD District I. The table is protected by using a LP-based controlled tabular adjustment procedure targeted towards larger tabular cells (Dandekar2001). The first four columns in the table show the published format table cell values after our proposed right most digit suppression logic is applied to the cell values that are adjusted by using the CTA procedure. The last four columns in the table show the required cell specific adjustments from the CTA procedure. As a part of our proposal, the footnote to the table clearly identifies the threshold quality acceptance criteria used in the table. The withheld digits in the cell values are shown by symbol ‘x’.

*Lower Digits Withheld. Table Cell Perturbation Error Exceeds 0.01%

Based on the table content, the user knows that the PAD district total is within a range from 203,001 to 203,999 with an average value of 203,500. The uncertainty range of the PAD district total value can be estimated to be plus or minus 500. / 203,500 * 100 = 0.245%. Large numbers such as 203,xxx are used in practice in the thousands of measurement units and therefore are useful to most users with partial digits suppressed without uncertainty range computations. Similar computations could be performed for other tabular cells with withheld numbers of digits on an as-needed basis. When the table cell values are available in their entirety, users know for sure that the perturbation error is less than 0.01%. [Appendix B](#) shows the published table values based on our proposed method when the micro data level noise addition method is used as a statistical disclosure control strategy.

Comparative Assessment – Targeting Smaller vs Larger Cells

The current research related to the CTA method is mostly based on using larger non-sensitive cells to counter balance the adjustments required to protect sensitive tabular cells. However, the practitioners of the CTA method have a wide variety of options available through a selection of an appropriate objective function to select table cells for adjustments. As an option, the CTA procedure could be targeted toward smaller non-sensitive cells to counter balance the adjustments made to protect sensitive table cells. **Table 2** (a part of the table corresponding to PAD District I from [Appendix C](#)) shows the outcome from the CTA procedure when a cost function proportional to the cell value is used in the LP-based procedure. By using smaller cells for adjustments allows the larger cells to be published in their entirety, while for the small value cells the number of digits are withheld after these cells are adjusted to protect sensitive cells. This could be a preferred option for many applications.

*Lower Digits Withheld. Table Cell Perturbation Error Exceeds 0.01%

Comparative Assessment – Threshold Quality Acceptance Value

A variety of threshold values could be used depending on the quality requirements from the data users. Here we demonstrate the outcome when the threshold quality acceptance criterion is lowered to 1.0%. In **Table 3** (a part of the table corresponding to PAD District I from [Appendix D](#)), we target larger cells for the adjustments. In **Table 4** (a part of the table corresponding to PAD District I from [Appendix F](#)), we target smaller cells for the adjustments. As expected, fewer cells are flagged by using the lower quality acceptance criteria. [Appendix E](#) shows the published table values based on our proposed method when the micro data level noise addition method is used as a statistical disclosure control strategy.

*Lower Digits Withheld. Table Cell Perturbation Error Exceeds 0.0%

Basic Properties of Proposed Practical Solution

The proposed technical solution allows data users to estimate the accuracy and the uncertainty range associated with all tabular cells protected by the perturbation method. The uncertainty range estimated by the external data users is comparable (on the wider side) to the uncertainty range introduced by the cell perturbation method. *Withholding the number of digits for only one sensitive cell in a given row or a column does not cause the statistical disclosure of the perturbed cell.* This is apparent from Table 3. In that table, for the State of Massachusetts the number of digits are withheld for only one cell. The cell is sensitive with a true cell value of 172. However, for the external users the uncertainty range is estimated to be 125.52 (4012 - 1.01 * 3848) to 202.48 (4012 - 0.99 * 3848) with an expected value of 150. Unlike conventional cell suppression methods, estimates are available for all tabular cells. By using the appropriate

cost function among many available cost functions, the CTA outcome could be targeted to maximize the overall quality of the tabular data to meet the requirements of a majority of data users. *The method could be considered as a hybrid of various tabular data protection methods such as conventional cell suppression methods, partial cell suppression, selective rounding, and the interval estimation method.*

Future Work

In this paper we have established a basic framework to convey table cell specific information on the quality and the accuracy of tabular data protected by various perturbation methods. The concept of “threshold quality acceptance value” introduced in this paper is flexible enough to accommodate a wide variety of table structures requiring different quality expectations. The paper, however, does not address combined effects of intentional perturbation errors on other sources of survey errors attributed to sampling and non-sampling activities. To achieve that objective, a “joint threshold quality acceptance value” will required to be developed to combine various components of conventional survey errors with intentional perturbation error.

The “rightmost digit suppression method” from this paper makes indiscriminant use of the multiplier two to provide conservative uncertainty estimates to external data users. The multiplier is introduced to eliminate the possibility of indirect disclosure of sensitive cells by using external pattern auditing procedures. In an attempt to release more digits of information for the perturbed cells, a selective use of the multiplier of two on only sensitive table cells and for small value cells will need to be evaluated carefully to prevent indirect statistical disclosure by automated mathematical procedures.

The complete 72 pages of output from the test example used in this paper is available for all eight two-dimensional cross sections, three scenarios (CTA targeted at large cells, noise method and CTA targeted at small cells) and three threshold values from the [URL](http://mysite.verizon.net/vze7w8vk/t4344_All_per.pdf) http://mysite.verizon.net/vze7w8vk/t4344_All_per.pdf

* Lower Digits Withheld. Table Cell Perturbation Error Exceeds 1.000%

Supporting Examples: Preventing Cell Perturbation Procedures from Becoming Data Falsification Procedures (Incorporating Quality Measures in Tabular Data Protected by Cell Perturbation Methods) A Practical Solution

PSD2008

Table of Contents

<u>Method</u>	<u>Pages</u>
CTA Targeted at Large Cells 0.01% Threshold	1 to 8
Micro Data Level Noise 0.01 % Threshold	9 to 16
CTA Targeted at Small Cells 0.01% Threshold	17 to 24
CTA Targeted at Large Cells 1% Threshold	25 to 32
Micro Data Level Noise 1 % Threshold	33 to 40
CTA Targeted at Small Cells 1% Threshold	41 to 48
CTA Targeted at Large Cells 0.0% Threshold	49 to 56
Micro Data Level Noise 0.0 % Threshold	57 to 64
CTA Targeted at Small Cells 0.0% Threshold	65 to 72

Supporting Example By Using 1) CTA Targeted at Larger Cells, 2)Noise Addition Method and 3) CTA Targeted at Smaller Cells By Using Three Different Quality Acceptance Threshold Values of 0.01%, 1.0% and 0.0%

Synthetic Tabular Data - A Better Alternative to Complementary Data Suppression - Original Manuscript Dated December 2001

Ramesh A. Dandekar

Energy Information Administration, Department of Energy, Washington DC, USA
Ramesh.Dandekar@eia.doe.gov

Abstract. Complementary cell suppression is often used for statistical disclosure limitation in tabular data, and in particular for magnitude data such as aggregate economic statistics. Cell suppression results in missing data. This can complicate and sometimes thwart thorough analysis. Suppressed entries could be replaced by interval estimates of their hidden values, but this too presents analytical challenges. Expected values, often close to original values, threaten disclosure. These approaches are also limited in the ability to preserve additive structure. We demonstrate the use of synthetic tables to prevent disclosure of sensitive information. Synthetic tables are relatively easy to generate and provide significantly more information, compared to conventional tables protected by complementary data suppression techniques. Relatively low computational burden associated with synthetic tables make them much more attractive relative to other methods of tabular data protection. The accuracies of synthetic tabular cells are easy to control, making them a useful tool for dissemination of statistical information. The primary criterion for a valid synthetic table is that the value presented for a disclosure cell lie outside the cell's disclosure interval. The secondary objective is to hold a maximum number of synthetic cells to their true values. This is accomplished via iterative refinement of synthetic tabular cells using a variation of classical gradient search in a manner analogous to partial cell suppression.

1. Introduction

Procedures used to protect sensitive cells in tabular data have slowly evolved over the last four decades. From the very beginning federal statistical agencies realized that just withholding the value for sensitive cells was not a good enough strategy to protect sensitive information in tables containing marginal entries. The concept of complementary data suppression was, therefore, introduced and practiced ever since to protect sensitive cells from disclosure. At first it was thought that suppressing at least two cells in any given row or column offered adequate protection from disclosure for sensitive cells. Over the years statistical offices realized that the minimum of two suppressed cells in a row or column strategy did not work as well for sparse and multi-dimensional tables. Procedures based on network flow as well as linear programming techniques were introduced to increase the reliability and the efficiency of complementary data suppression procedures. In recent years, it has become increasingly

obvious that by using commonly practiced missing data analysis techniques, probabilistic estimates for the suppressed tabular cells can be derived with great accuracy, limiting the applicability of complementary cell suppression techniques for statistical disclosure prevention.

In this paper, we demonstrate an entirely different approach to the age-old objective of protecting sensitive data cells from disclosure in complex multi-dimensional link tables containing hierarchical structures. In our approach, we completely discard the notion of complementary data suppression and in its place advocate the use of synthetic tables to disseminate statistical information. Our proposed method completely eliminates the information loss associated with complementary data suppression procedures. Our proposed approach requires a fraction of the computational resources required by the complementary cell suppression methods, and offers multiple alternatives to produce synthetic data by appropriate selection of an objective function that satisfies a wide variety of requirements for different statistical offices.

2 Basic Concept

The basic concept of generating synthetic tabular data that closely mimics the overall characteristics of real tabular data is quite straightforward. In synthetic tables, values for all the sensitive cells are kept at a safe distance away from their true cell values. The remaining non-sensitive cell values in the table are then adjusted from their true values as little as possible by using some predetermined criteria to make the table contents additive in all the dimensions as in the original table. The optimal mathematical structure of a synthetic table is relatively easy to specify by using mixed integer linear programming formulation¹.

Minimize $SUM [c_i (y_i^+ + y_i^-)]$

Subject to

$$M (y_i^+ - y_i^-) = 0$$

$$0 \leq y_i^+ \leq UB_i$$

$$0 \leq y_i^- \leq LB_i$$

$$y_{ik}^+ \geq BOUND_{ik} * I_{ik}$$

$$y_{ik}^- \geq BOUND_{ik} * (1 - I_{ik})$$

where

I_{ik} is a binary zero/one variable

$BOUND_{ik}$ is confidentiality bound for sensitive cell ik

ik ($k = 1, \dots, p$) p sensitive cells

$i = 1, \dots, n$ n non-zero table cells

y_i^+ = positive adjustment to cell value

y_i^- = negative adjustment to cell value

UB_i and LB_i Upper and lower cell bounds

c_i = cost function.

¹ Fischetti, Salazar naming conventions are used

Five different cost functions are commonly used. They are: 1) constant, 2)log(value), 3) value, 4) 1/value, and 5) log(value)/value, where 'value' denotes the cell value.

It is generally known that the mixed integer linear programming formulations are suitable only to solve small problems. We, therefore, propose using a simplified linear programming formulation, which could be used in practice to generate large complex synthetic tables containing linked hierarchical structures. In our simplified linear programming formulation, the binary integer variable is replaced by a binary constant. We assign the binary constant the value of zero or one prior to finding a linear programming solution by using the following simple heuristic:

- Arrange all the sensitive cells in the table, in an increasing order of magnitude of the cell values.
- Using an alternate sequence, assign the value of zero and one to the binary constant associated with each sensitive cell, except when the values of the sensitive cells are identical.
- When the values of the sensitive cells are identical, assign the same binary constant value to them all.
- To ensure that our select direction of adjustment is followed, we assign relatively high value to the cost coefficient associated with sensitive cell adjustment component in the opposite direction.

3. Illustrative Example

We use a hypothetical 3 dimensional table, containing 10 columns, 6 rows and 4 levels to demonstrate generation of a synthetic table to disseminate statistical information. Our table contains 191 non-zero cells, of which 24 cells are sensitive cells. The location of the sensitive cells, their cell values and required cell protection values are as follows:

SENSITIVE CELLS AND PROTECTION REQUIREMENT

Col	Row	Lev	Val	Prot	Col	Row	Lev	Val	Prot	Col	Row	Lev	Val	Prot
2	1	1	714	39	2	1	2	539	59	2	4	3	644	35
4	1	2	70	7	4	1	3	614	34	4	2	2	786	87
4	2	3	928	51	4	4	2	382	42	4	6	2	1238	17
5	1	1	140	7	6	2	2	1074	59	6	3	2	544	30
7	1	3	549	61	7	3	2	631	70	7	5	2	726	40
7	5	3	134	7	8	1	3	92	10	8	4	2	1050	58
8	5	1	664	36	8	5	4	664	36	9	2	1	1042	57
9	3	3	820	91	9	5	2	1598	88	9	5	4	1598	88

By using the traditional complementary cell suppression technique, our test example requires 39 complementary cell suppressions to adequately protect 24 sensitive cells. The entire table contents are displayed below. In the table, the complementary suppression cells are marked by a symbol c next to the cell value. The sensitive cells are identified by a symbol w next to the cell value. In addition, to the symbols w and c, we use gray shades to identify suppressed cells. The gray shades are to emphasize that the numeric values for these cells are prevented from a display to data users. The

complementary cell suppression technique in this example results in a significant amount of information loss, rendering the table useless for many practical applications.

To generate a synthetic table that retains most of the statistical characteristics of the original unsuppressed table above, we use the linear programming heuristic formulation specified earlier. We make use of a cost function, which is proportional to the cell value, to identify the required controlled adjustments to select few non-sensitive cell values. The cell value adjustments are such that resulting table is additive in all the dimensions and at the same time the published estimates for the sensitive cells are kept outside of their disclosure range. The table below summarizes the cell locations and magnitude of required controlled adjustments to the true cell values. We have highlighted sensitive cells, in addition to marking them with symbol w, so that readers can easily verify that all adjustments to sensitive cells are beyond their respective confidentiality bounds.

After applying the linear programming-based control adjustments to the original table, our synthetic table will appear as shown below. Once again, in the following table we highlight all the sensitive cells for the ease of understanding of our readers. In a real application synthetic tables will be published in their entirety. Depending on the accuracy of the data a synthetic table represents, statistical offices as an option might decide to attach some kind of quality indicators to select a few cells where the published cell values are beyond some pre-determined tolerance level

In the synthetic table, true values are published for 103 cells. For the remaining 88 cells (including sensitive cells), the published cell values are altered slightly from their true values to protect the sensitive cell values from being disclosed within an allowable protection interval. Most of the cell values of the marginal cells are unaffected in the synthetic table. In addition, the table values are additive in all the dimensions.

4. Multi Dimensional Linked Tables

The linear programming heuristic identified above, to generate synthetic tabular data, is applicable to protect sensitive information in all the generic, multi-dimensional, linked tables containing hierarchical structure. We next provide the overall performance statistics for synthetic tables generated by using two different test examples of multi-dimensional linked tables. These two test cases were created by this author to enable testing of algorithm developed by Fischetti and Salazar, to generate optimum complementary cell suppression pattern.

The first test example consists of 2, five-dimensional linked sections of a six dimensional table (6x4x16x4x4x4). The table contains 1254 non-zero cells. Of this total, 1089 cells are non-sensitive and 165 cells are sensitive. Fischetti and Salazar determined that the

optimum complementary cell suppression results in 419 suppressed cells, which is 34% of total non-zero cells.

The second example consists of 4, five-dimensional linked sections of a nine dimensional table (4*29*3*4*5*6*5*4*5). The table contains 1141 non-zero cells, of which 831 cells are non-sensitive and 310 cells are sensitive. Fischetti & Salazar determined that the optimum complementary cell suppression results in 491 suppressed cells, which is 43% of total non-zero cells.

The synthetic tables generated by using these two test examples provide additive tables containing cell values for all the non-zero cells in the original test examples. In the following two tables we summarize the overall performance statistics of change from the true value of nonzero synthetic cells by ten different percent change from true value categories. We use five different cost functions that are commonly used in tabular cell protection to demonstrate five different possible formulations for synthetic tables.

15.00- 30.00	32{ 95.6%}	45{ 96.3%}	58{ 89.8%}	81{ 82.6%}	59{ 86.9%}
30.00-100.00	50{100.0%}	42{100.0%}	115{100.0%}	190{100.0%}	146{100.0%}
unchanged cells	353{ 31.2%}	329{ 29.1%}	453{ 40.3%}	287{ 26.3%}	302{ 27.1%}

² The numbers in the parentheses are cumulative percentages associated with the cell count.

From the summary statistics above it is clear that, by proper selection of the appropriate cost function, the controlled adjustments could be targeted to specific non-sensitive cell categories. Irrespective of the choice of the cost function, approximately 75% of the nonzero cell values in the first test case and 50% of the nonzero cell values in the second test case are altered within less than 1% of their true cell value. The synthetic cells undergoing changes in excess of 5% of true cell value are typically sensitive cells, which are otherwise blocked from publication using the complementary cell suppression method.

The quality of cell level information from the synthetic table could be conveyed to data users by using different strategies. As an option, a quality indicator, such as g (good), f (fair), and p (poor) could be assigned to each synthetic cell to inform the data user of the level of accuracy of information contained in each synthetic cell. Other options include: (1) providing overall percent accuracy of the published information, or (2) dividing the cells in multiple size categories and providing overall percent accuracy for each size category separately.

We have used only five basic cost functions to demonstrate the synthetic data generation technique in the linear programming environment. We, however, believe that a much wider spectrum of cost functions is readily available to the potential practitioner of synthetic tables to get a wide variety of desired results.

5. Iterative Refinement of LP Solution

The primary objective of the synthetic table is to provide estimates for sensitive cells, which are outside the disclosure limits. The secondary objective is to hold a maximum number of synthetic cells to their true cell values. This could be accomplished via an iterative refinement of the linear programming solution as follows:

- Exclude all the synthetic cells that are at the true cell value from future LP formulation.
- For the remaining non-sensitive synthetic cells, replace the original cost function with the new cost function, which is an inverse proportion of change in the cell value in the previous LP solution.
- Find the revised linear programming solution to generate a new subset of synthetic cell values.

In theory, multiple iterations could be performed to successively increase the number of synthetic cells that are at their true cell values. However in practice, by increasing the number of iterations estimates for more and more sensitive cells fall within their respective disclosure limits.

The table below summarizes the overall statistics for the second test example, after single iterative refinement of the LP heuristic.

Second Test Example After Single Iterative Refinement

Percent change from true value	c o s t f u n c t i o n u s e d f o r o p t i m i z a t i o n				
	const	log(value)	value	1/value	log(value)/value
.00- .10	669{ 58.6%}	649{ 57.0%}	625{ 55.1%}	603{ 53.4%}	567{ 50.0%}
.10- .50	89{ 66.4%}	94{ 65.3%}	73{ 61.6%}	100{ 62.3%}	83{ 57.4%}
.50- 1.00	38{ 69.8%}	44{ 69.2%}	45{ 65.5%}	32{ 65.1%}	46{ 61.4%}
1.00- 1.50	31{ 72.5%}	22{ 71.1%}	26{ 67.8%}	18{ 66.7%}	28{ 63.9%}
1.50- 2.00	29{ 75.0%}	15{ 72.4%}	10{ 68.7%}	15{ 68.0%}	24{ 66.0%}
2.00- 5.00	60{ 80.3%}	84{ 79.8%}	81{ 75.8%}	69{ 74.1%}	95{ 74.4%}
5.00- 10.00	103{ 89.3%}	100{ 88.6%}	156{ 89.6%}	139{ 86.4%}	166{ 89.1%}
10.00- 15.00	33{ 92.2%}	57{ 93.6%}	40{ 93.1%}	43{ 90.3%}	29{ 91.6%}
15.00- 30.00	61{ 97.5%}	27{ 96.0%}	38{ 96.5%}	38{ 93.6%}	35{ 94.7%}
30.00-100.00	28{100.0%}	46{100.0%}	40{100.0%}	72{100.0%}	60{100.0%}
unchanged cells	543{ 47.6%}	556{ 48.9%}	565{ 49.8%}	498{ 44.1%}	513{ 45.3%}

From the table above, it is clear that the number of synthetic cells at their true cell value increases dramatically

6. Conclusion

Synthetic tabular data offers a significantly more attractive option for dissemination of statistical data containing sensitive information than conventional complementary cell suppression. Conventional complementary cell suppression methods result in too significant an amount of information loss, irrespective of how close one attempts to get to the optimum cell suppression choice. The overall information generated by using the complementary cell suppression method fails to compare favorably in regard to the practical utility of information provided by synthetic tables. The computational resources required to generate a synthetic table is a very small fraction of the resources required to generate a table protected by the complementary cell suppression method.

In this paper we have demonstrated a simple heuristic to generate synthetic tabular data. The heuristic is based on the linear programming formulation. However, we believe that computational techniques, such as iterative proportional fitting and the EM algorithm, could also be used effectively to generate synthetic tabular data.

**TO CONVEY THE ACCURACY AND THE
QUALITY OF TABLE CELL SPECIFIC
INFORMATION TO THE EXTERNAL DATA
USERS:**

**THE PAPER PROPOSE USING A TABLE CELL
IMBEDDED QUALITY INDICATOR FOR ALL
TABULAR DATA PROTECTED BY THE
PERTURBATION METHODS.**

THE PROPOSAL ADVOCATES:

1) TO USE RELATIVELY SMALL PERCENTAGE CHANGE IN THE PERTURBED CELL VALUE AS A THRESHOLD FOR QUALITY ACCEPTANCE CRITERIA.

2) TO PUBLICLY DISCLOSE THE THRESHOLD QUALITY ACCEPTANCE VALUE FOR PERTURBED CELLS IN A FOOTNOTE TO ALL THE PUBLIC USE TABLES PROTECTED BY PERTURBATION METHODS.

PROPOSAL ALSO ADVOCATES:

TO SUPPRESS THE SELECTED NUMBER OF RIGHT MOST DIGITS FROM THE PERTURBED TABULAR CELLS WITH PERTURBATION ERROR IN EXCESS OF THE THRESHOLD ACCEPTANCE VALUE.

THIS IS TO INFORM DATA USERS THE EXTENT OF ERROR ASSOCIATED WITH THE PUBLISHED PERTURBED CELL VALUE.

**THE PAPER PROPOSES THE FOLLOWING
EQUATION TO DETERMINE THE
NUMBER OF RIGHT MOST DIGITS TO
SUPPRESS:**

$$\text{DIGITS TO SUPPRESS} = \text{INT} [\text{LOG}_{10} (2.0 * \text{ABS} \{ \text{CHNG} \}) + 1.0]$$

THE PROPOSED FORMULA

---- PREVENTS EXTERNAL AUTOMATED AUDIT PROCEDURES TO DETERMINE EXACT VALUES OF SUPPRESSED DIGITS

----- CONVEYS TABULAR DATA QUALITY AT THE TABLE CELL LEVEL

TO DEMONSTRATE THE EFFECTIVENESS OF THE PROPOSED “QUALITY PRESERVING” SOLUTION, THE PAPER USES THE SAME REAL LIFE TABLE USED IN THE TECHNICAL PAPER PRESENTED AT FCSM2007 CONFERENCE:

“COMPARATIVE EVALUATION OF FOUR DIFFERENT SENSITIVE TABULAR DATA PROTECTION METHODS USING A REAL LIFE TABLE STRUCTURE OF COMPLEX HIERARCHIES AND LINKS”

* Lower Digits Withheld. Table Cell Perturbation Error Exceeds 1.000%

THE COMPLETE 72 PAGES OF OUTPUT FROM THE TEST EXAMPLE USED IN THIS PAPER IS AVAILABLE FOR ALL EIGHT TWO-DIMENSIONAL CROSS SECTIONS, THREE SCENARIOS (CTA TARGETED AT LARGE CELLS, NOISE METHOD AND CTA TARGETED AT SMALL CELLS) AND THREE THRESHOLD VALUES FROM THE URL [HTTP://MYSITE.VERIZON.NET/VZE7W8VK/T4344_ALL_PER.PDF](http://mysite.verizon.net/vze7w8vk/t4344_all_per.pdf)

THANK YOU!

**AFTER INTRODUCTION TO
STATISTICAL COMMUNITY IN MID
90's ...**

**PERTURBATION METHODS TO
PROTECT TABULAR DATA
HAVE BEEN OVERSOLD
ON EITHER SIDE OF ATLANTIC
OCEAN (CTA AND NOISE)**

**TREMENDOUS POTENTIAL FOR
ABUSE AND MISUSE EXISTS
PREVENTATIVE MEASURES ARE
REQUIRED TO ENSURE DATA
QUALITY OF TABLES PROTECTED
BY PERTURBATION METHODS
(CTA AND NOISE)**

**STATISTICS NETHERLANDS DESCRIBES
PERTURBATION METHODS AS
“DATA FALSIFICATION PROCEDURE”**

**ONS DESCRIBES PERTURBATION
METHODS AS
“DATA DAMAGING PROCEDURE”**

THIS PERCEPTION NEEDS TO BE CHANGED

MY PAPER OFFERS A “TRIVIAL”
SOLUTION TO FIX GIGANTIC DATA
QUALITY PROBLEM ARISING FROM
POTENTIAL MIS-USE OF
PERTURBATION METHODS
