# Property Value: 2007 and 2008 American Community Surveys 

American Community Survey Reports

## Introduction

This report is one of a series produced to highlight results from the 2008 American Community Survey (ACS), focusing on changes between the 2007 ACS and the 2008 ACS. The report series is designed to cover a variety of economic topics, such as poverty, occupation, home values, and labor force participation. This series provides information about the changing economic characteristics of the nation and states, the District of Columbia, and Puerto Rico. The ACS also provides detailed estimates of demographic, social, economic, and housing characteristics for congressional districts, counties, places, and other localities every year. A description of the ACS is provided in the text box "What Is the American Community Survey?"

This report presents data on property value at the national and state levels based on the 2007 ACS and 2008 ACS. On the ACS, the value of a home is the owner's estimate of what the house and lot would sell for if it were on the market. Median value estimates for 2007 were inflation-adjusted to 2008 dollars. ${ }^{1}$ Comparisons between the 2007 ACS and 2008 ACS should be interpreted with caution because of
${ }^{1}$ For additional information on value, visit <www.census.gov/acs/www/Downloads/2008 /usedata/Subject_Definitions.pdf>.

## What Is the American Community Survey?

The American Community Survey (ACS) is a nationwide survey designed to provide communities with reliable and timely demographic, social, economic, and housing data every year. It has an annual sample size of about 3 million addresses across the United States and Puerto Rico and includes both housing units and group quarters. The ACS is conducted in every county throughout the nation and every municipio in Puerto Rico, where it is called the Puerto Rico Community Survey.

Beginning in 2006, ACS data for 2005 were released for geographic areas with populations of 65,000 and greater. In 2008, the first set of multiyear estimates was released for data collected between January 2005 and December 2007. These 3-year estimates were published for geographic areas with populations of 20,000 and greater. The U.S. Census Bureau is planning to release the first 5 -year estimates in late 2010 for the smallest geographic areas based on data collected between January 2005 and December 2009.

The data contained in this report are based on the ACS sample interviewed in 2007 and 2008. For information on the ACS sample design and other topics, visit <www.census.gov/acs/www>.

[^0]
a change to the 2008 ACS value question. ${ }^{2}$

The data contained in this report are based on ACS samples that were selected for interview in 2007 and 2008 and are estimates of the actual figures that could have been obtained by interviewing the entire population using the same methodology. All comparisons presented in this report have taken sampling error into

[^1]account and are significant at the 90 percent confidence level unless noted otherwise. Due to rounding, some details may not sum to totals. For information on sampling and estimation methods, confidentiality protection, and sampling and nonsampling errors, please see the "2008 ACS Accuracy of the Data" document located at <www.census .gov/acs/www/Downloads/ACS /accuracy2008.pdf>.

## Property Value

In 2008, Hawaii recorded the highest median value of owneroccupied homes $(\$ 560,200)$ among states. Hawaii is followed by the District of Columbia $(\$ 474,100)$ and California ( $\$ 467,000$ ), which are not significantly different from each other. The next-highest values
are in New Jersey $(\$ 353,600)$, Massachusetts $(\$ 353,600)$, Maryland (\$341,200), and New York $(\$ 318,900)$.

Conversely, West Virginia $(\$ 95,900)$ and Mississippi $(\$ 99,700)$ recorded lower property values than those of the other 48 states and the District of Columbia.

The percentage change in median home values decreased in the United States ( -2.0 percent) and in 22 states between 2007 and 2008-five in the Northeast (Massachusetts, Rhode Island, New Jersey, Connecticut, and New Hampshire); four in the South (Florida, Maryland, West Virginia, and Georgia); eight in the Midwest (Michigan, Minnesota, Ohio, Indiana, Missouri, Iowa,

Wisconsin, and Illinois); and five in the West (Nevada, California, Arizona, Hawaii, and Washington). Although the rate of decline was not significantly different from each other, two states showed larger percentage declines than the
other 48 states and the District of Columbia-Nevada (16.0 percent) and California (15.5 percent). Florida (8.6 percent) ranked third.

States that experienced increases were Texas, Utah, Wyoming,

Oregon, Pennsylvania, Tennessee, and North Carolina. Of those states, no one state had a rate of increase that was significantly higher than the other six.

## Median Property Value by State and Puerto Rico: 2007 and 2008

(In 2008 inflation-adjusted dollars. Data are limited to owner-occupied housing units. For information on confidentiality protection, sampling error, nonsampling error, and definitions, see www.census.gov/acs/www)

| Area | 2007 median property value (dollars) |  | 2008 median property value (dollars) |  | Change in median property value (2008 less 2007) |  |  |  |

[^2]${ }^{1}$ Data are based on a sample and are subject to sampling variability. A margin of error is a measure of an estimate's variability. The larger the margin of error in relation to the size of the estimate, the less reliable the estimate. When added to and subtracted from the estimate, the margin of error forms the 90 percent confidence interval.

[^1]:    ${ }^{2}$ Changes made to the value question between the 2007 ACS and 2008 ACS may result in an inconsistency in the value distribution for some areas. In 2008, the response option for the value question was a write in. In 2007 and previous years, the value question included categorical response options with a write-in for values over $\$ 250,000$. The presentation of the data is consistent between 2007 and 2008. For more information about this questionnaire change, see <www.census.gov/acs/www/AdvMeth /content_test/H7_Property_Value.pdf>.

[^2]:    * Statistically different from zero at the 90 percent confidence level.
