GROUNDWATER INFILTRATION STUDY

FOR

AS 4000 AREA

PREPARED BY

HOBBS, UPCHURCH & ASSOCIATES, P. A.

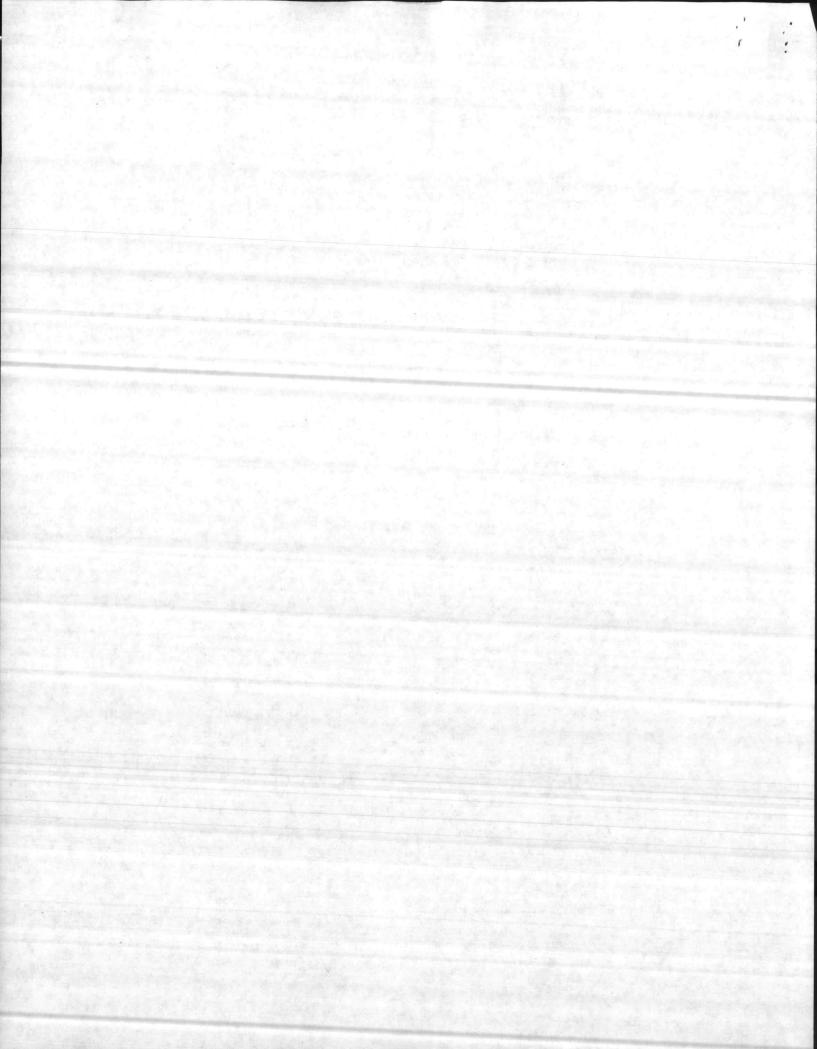

CONSULTING ENGINEERS

290 S. W. BROAD STREET

POST OFFICE BOX 1735

SOUTHERN PINES, NORTH CAROLINA

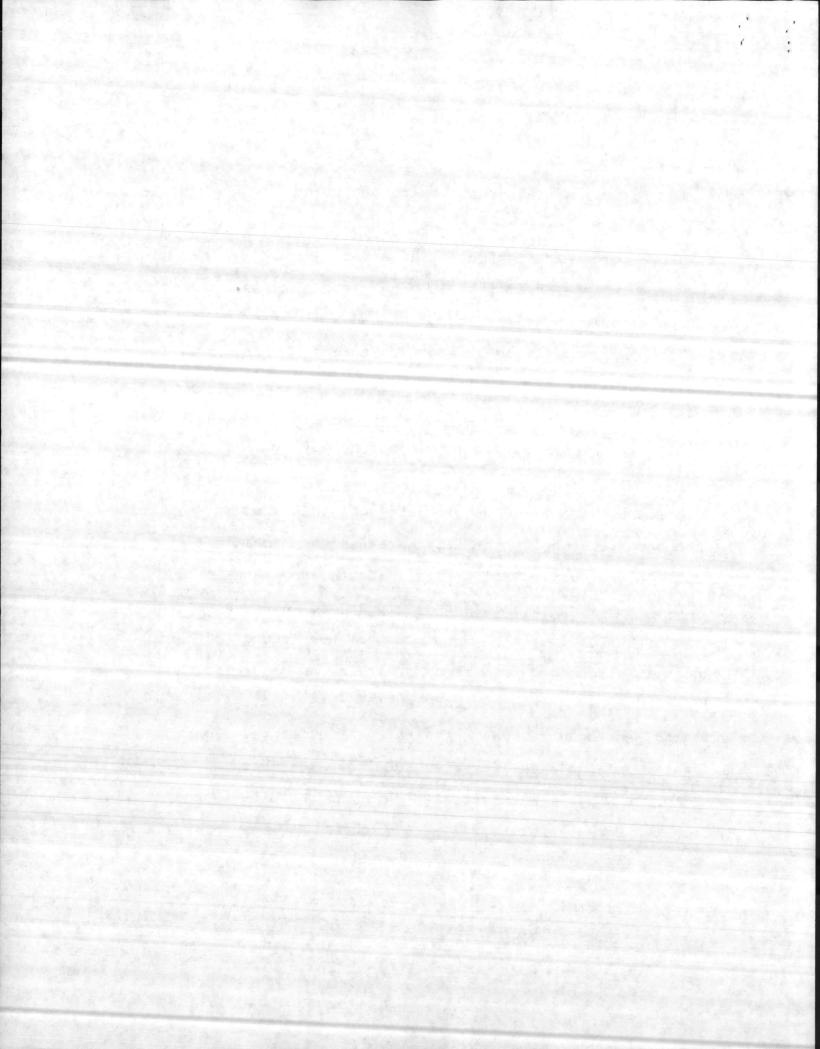

AUGUST 1, 1986

INTRODUCTION:

The purpose of this study is to determine the cause of groundwater infiltration into the structures in the AS-4000 area of the Marine Corps Air Station at New River, North Carolina. These structures include steam pits in mechanical rooms and a room in Building AS-4020. The results of groundwater level monitoring wells are presented in this report. Based on these results, visual observation of the sites, and conversations with the maintenance personnel, corrective measures are recommended. A cost estimate is included to project necessary funding for this project.

There are two major problem areas as indicated by Facilities Maintenance personnel. The first area is the Mechanical Room pit at Building AS-4035. This pit is 10 feet deep which includes a one foot sump. Water enters the sump around the construction joints in the concrete. A sump pump has been added and the seepage is discharged to a floor drain in the Mechanical Room. The second area is in and around Building AS-4020. A room in this building was thought to have a water leak under the floor. Excavation of the floor revealed running water which was determined to be groundwater. Water is also entering the pits in the Mechanical Room.

GROUNDWATER LEVEL MONITORING WELLS:

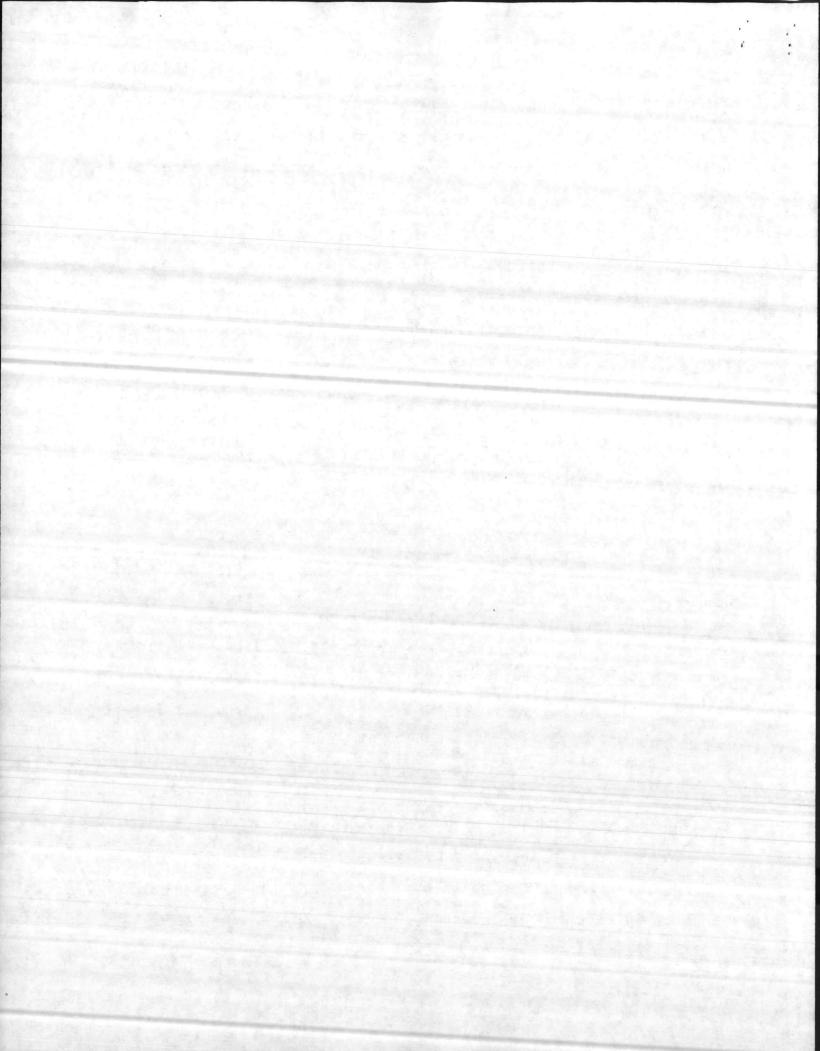

To determine the extent that ground water was contributing to this problem, six monitoring wells were installed at various locations around the site. These are shown on Drawing No. 1 which also indicates the general topography of the site and location of the structures, parking areas and roads. The data from the groundwater level monitoring wells is probably not indicative of average conditions because of the sustained drought occurring at this time. There has been only 8.5 inches of recorded rainfall for the entire year at this date. The normal rainfall for this time of year is 28 inches. The elevations for the ground water and wells is presented in Table 1.

		and the second second					
Well #	1	2	3	4	5	6	
Grade *	27	27	22	24	25.5	24	
Bottom of Well	18	23	15	17	19.5	18	
Groundwater Level	18	25	16	17.5	19.5+	18.5	
Depth of Water	1"	23"	10"	3"	2"	7"	

TABLE 1 GROUNDWATER LEVEL MONITORING WELL DATA

*Elevations taken from construction drawings. Elevations are given to the nearest 0.5 foot.

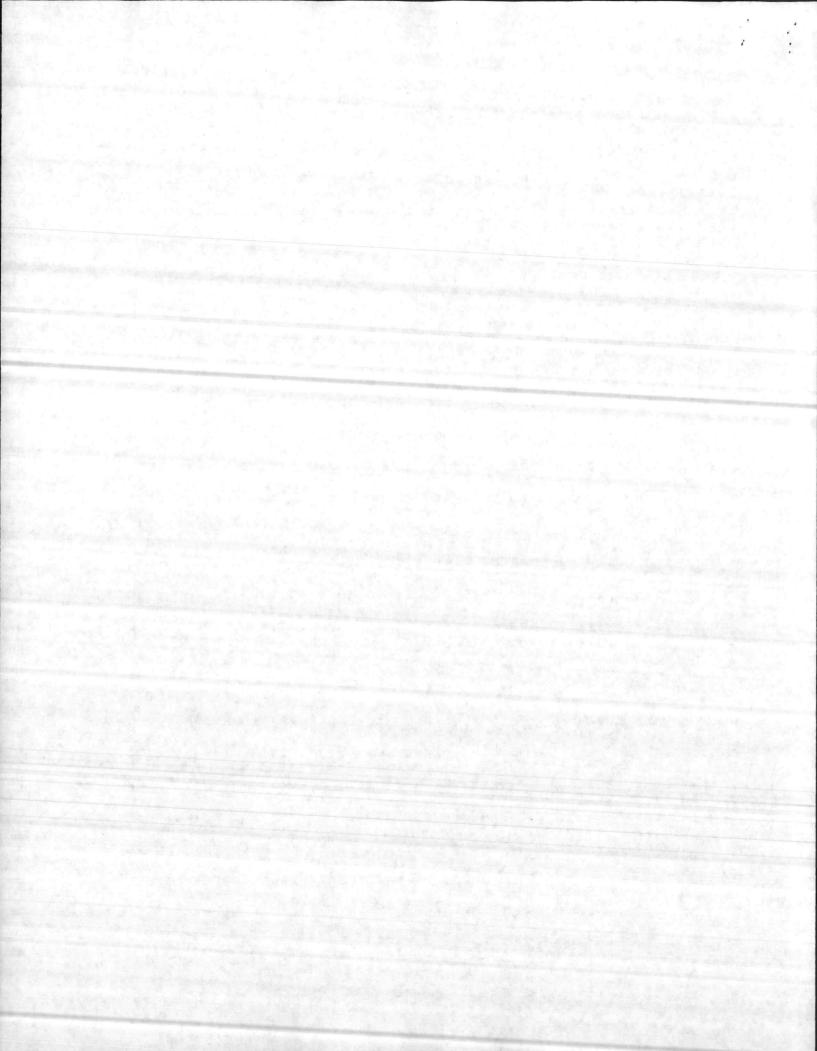

The wells were installed by boring a 6-inch hole and placing a length of 4-inch PVC pipe in it. The bottom 18-inches of pipe was slotted to allow groundwater to enter. Gravel was placed

between the pipe and the side of the hole to the height of the slots. The annular space was then filled with excavated material. The top of the pipe was extended 6 - 12 inches above grade and capped. Water levels were measured one week after installation. The depth of the well was determined by soil conditions at the time of the borings.

Elevations are approximations from topographic maps developed during the design of the buildings. With the exception of Well No. 2, the water levels are approximately the same. Well No. 2 is notably different, with the water level only two feet below grade. The water line was checked and no leak was found. Steam lines are constantly monitored for pressure and no leak has been detected in the line running next to the site. The condensate drip leg from the steam pit discharges into a dry well located 10 feet from the monitoring well. The water elevation in the dry well is the same as the monitoring well. Because of the soil structure, the water cannot flow away as fast as it is being supplied, causing the high ground water level.

The soil borings indicated that there are predominantly two soil layers over this entire site. The top layer is a sand or clayey sand which is very permeable. The lower layer is a clay soil with little sand. There is usually a definite interface between these two layers. The groundwater levels appear to be well below the footings of the building and do not attribute much to the infiltration problem. The major source of water appears to be storm water. As the storm water percolates through the permeable upper soil layer,

it is soon stopped by the less permeable clay layer. The storm water then travels horizontally along the sand/clay interface where it runs under the buildings and into mechanical pits.

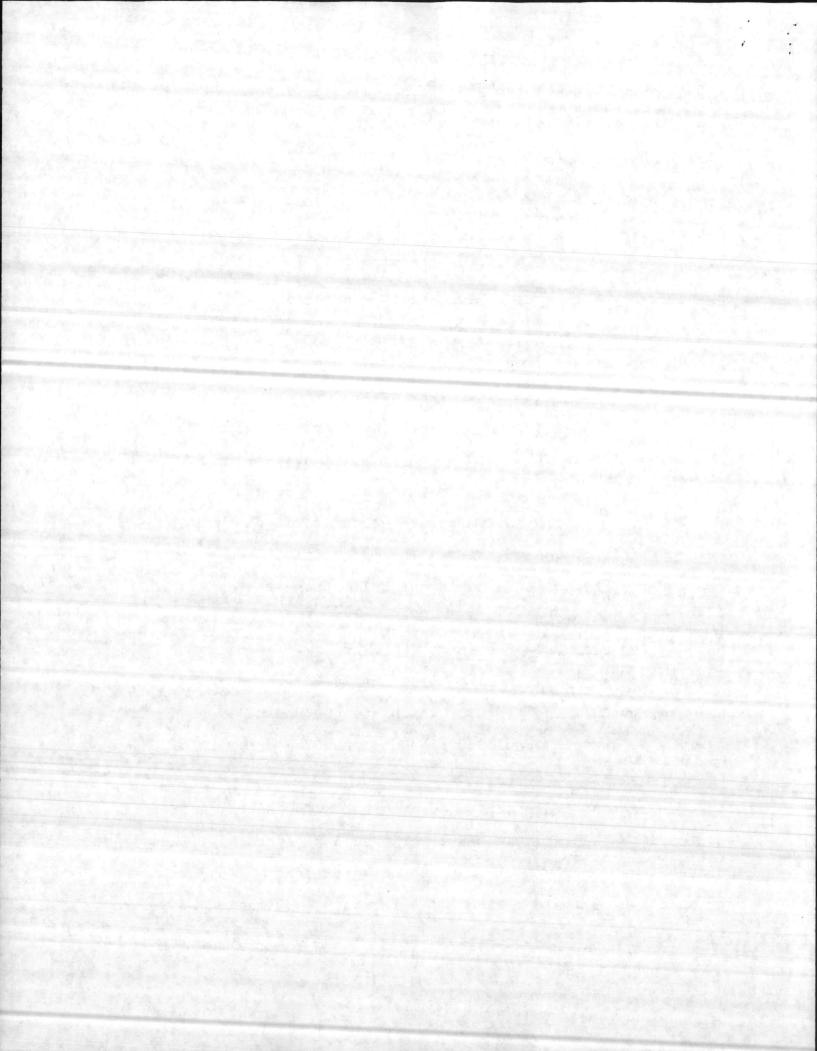

RECOMMENDATIONS:

The storm water should be intercepted and piped away from the buildings. Drawing No. 2 shows a network of pipes and catch basins to intercept this water. Perforated pipes located in gravel-filled ditches can be located just above the clay layer and intercept this water. Chronic wet areas in the grassed areas could also be drained with perforated pipe and catch basins. The drawing shows the piping around Buildings AS-4020 and AS-4025 and the Mechanical Buildings for AS-4030 and AS-4035. No problems were indicated for the other buildings, but similar drains may be used, if necessary.

The drain pipe is sized for 6-inches around the building and 12-inches in the grassed areas. The larger pipe is used in the grassed areas because of the larger collection area and shallow slopes. Preliminary calculations show the drains can be piped into the existing storm sewer system.

The drain pipe will also allow the water around the Mechanical Building for Building AS-4030, which has the unusually high water level. The drywell should be abandoned and the drip leg piped into the storm sewer or drain lines.

The leaking construction joints in the Mechanical Room pits should be caulked with an elastomeric sealant/adhesive. These joints have probably opened up due to settlement. The joints and any cracks need to be cleaned of all foreign materials and ground

to provide a suitable bonding surface. The joint should be primed with a pigmented high solids, epoxy resin to provide a suitable and waterproof coating for the joint filler. The use of a pigmented primer will provide an easy indication of good and complete coverage which is essential to provide a permanent waterproof bond. The joint should then be filled with an elastic sealant/adhesive. A moisture-cured polyurethane-based elastic sealant will allow the two sides of the crack or joint to move with expansion and contraction and still seal the water out of the structure.

The surface of the concrete should be free of surface water but can be saturated. This may require the dewatering of the area around the pits. The area immediately surrounding the pits was probably filled with a select material. A well point could be placed in this material and the pits dewatered.

SCOPE OF WORK:

100

- 4-10

I

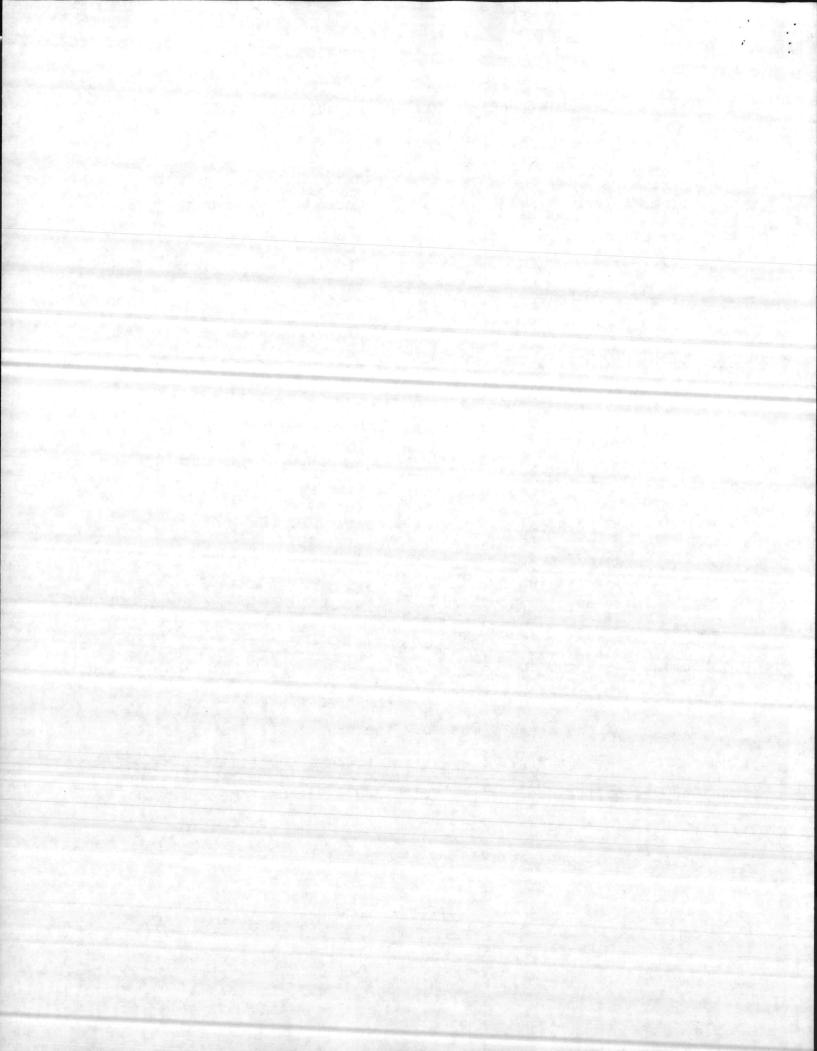

and and

distant.

1

10.00

The intent of the proposed work is to collect storm water which enters the ground in and around Buildings AS-4020 and AS-4025 and the Mechanical Buildings for AS-4030 and AS-4035 with 6-inch and 12-inch perforated pipe. The collected water shall be piped to existing storm water catch basins. The work includes installation of 2635 linear feet of 6-inch perforated drain pipe, 1900 linear feet of 12-inch perforated drain pipe, and 5-new catch basins with gratings. The work also includes repair and sealing of joints and cracks in steam pits totalling approximately 500 linear feet.

COST ESTIMATE:

T

F

T

I

I

ſ

ſ

and the

ſ

10.00

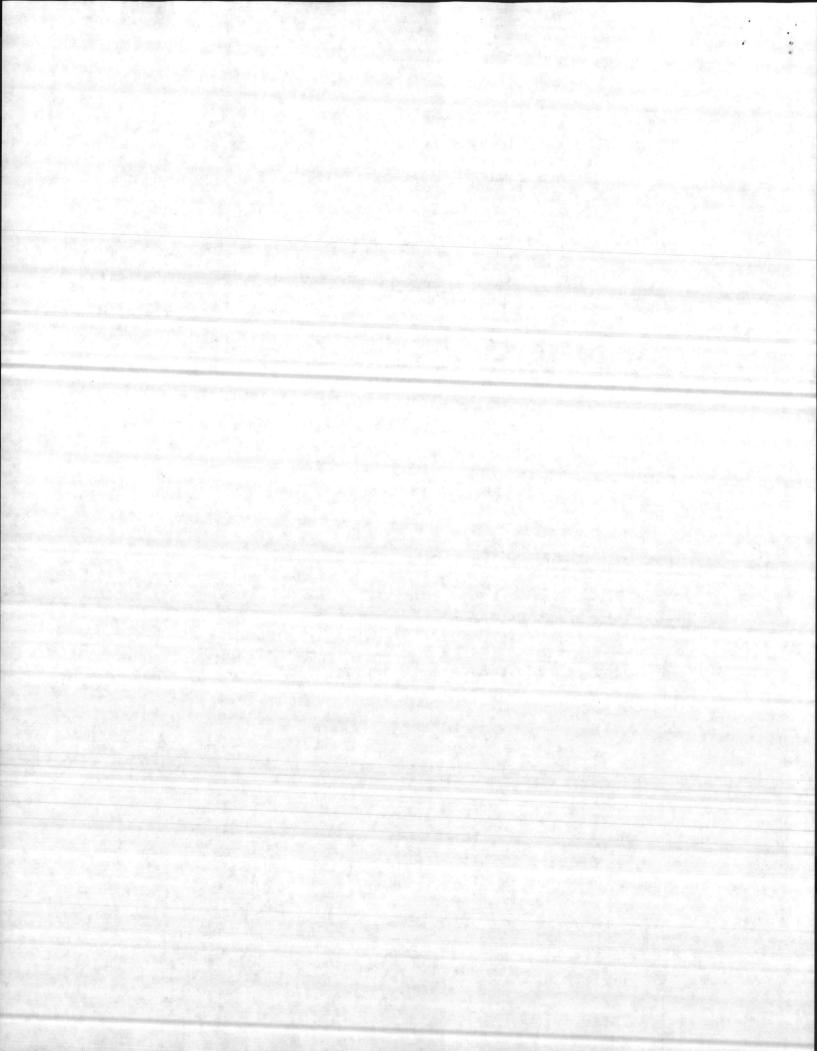

1

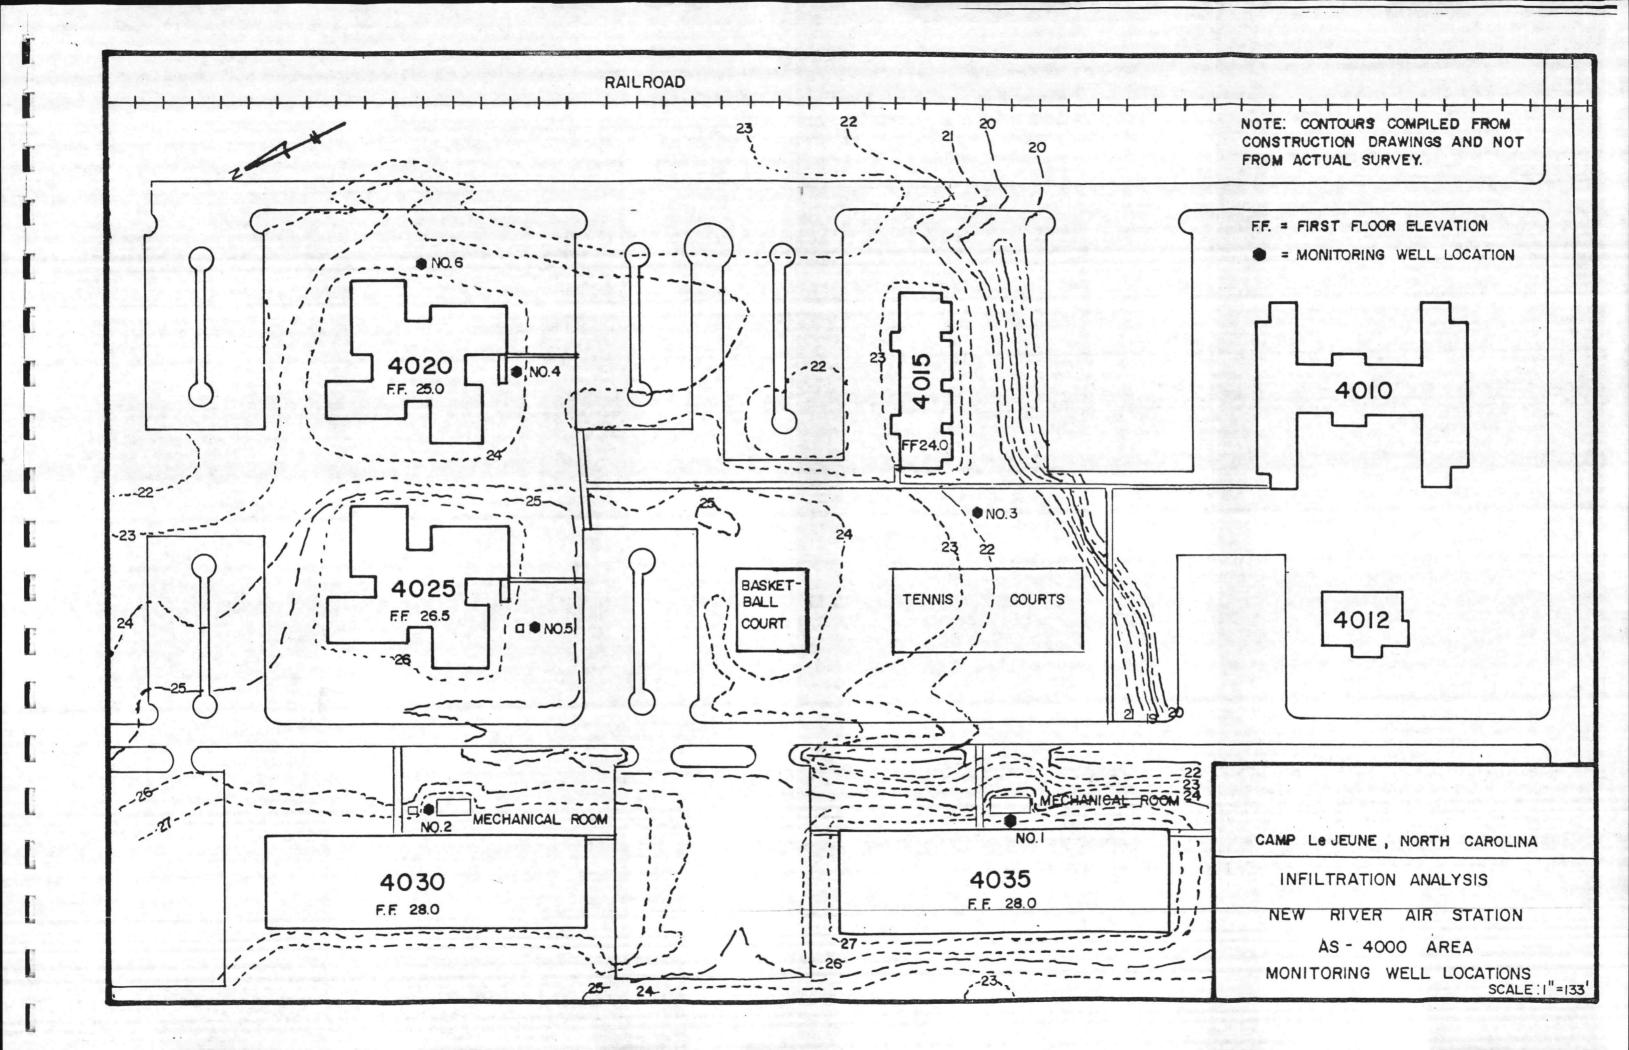

The proposed recommendations would cost aproximately \$65,000.00 to implement. This includes a cost of \$9,767.00 for repairing the cracks and joints in the mechanical room pits. This is based on an estimate of 100 L.F. per mechanical room pit with five pits to be serviced. The price per línear foot of repair is estimated to be \$10.18 and a cost of \$4,676.00 for well pointing, if necessary.

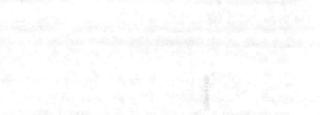

The estimated cost for the drainage system is broken down by building as shown below.

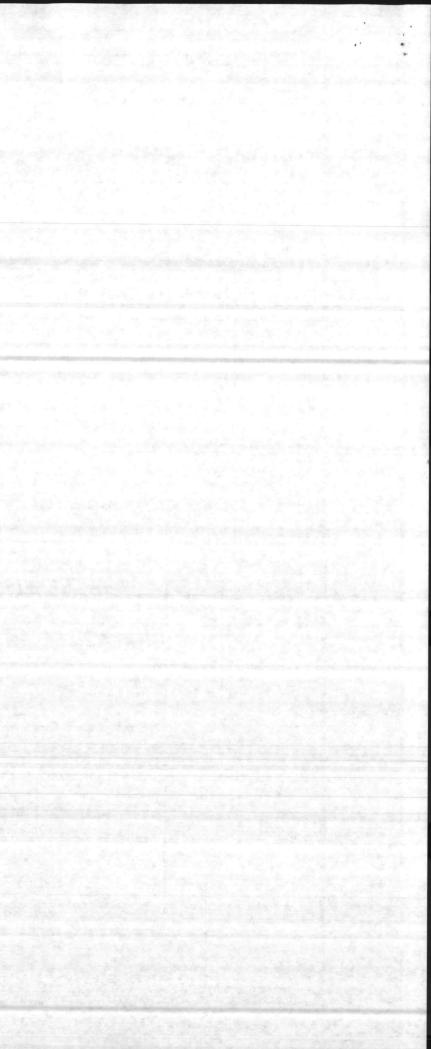

Bui	lding	Estimated	Construction	Cost
AS	4030	\$	3,759.00	
AS	4035		2,258.00	
AS	4020		23,109.00	
AS	4025		29,833.00	
TOT	CAL - Drainage System	n \$	58,959.00	
Cor	ntingency		6,041.00	t i
TOT	TAL	\$	65,000.00	

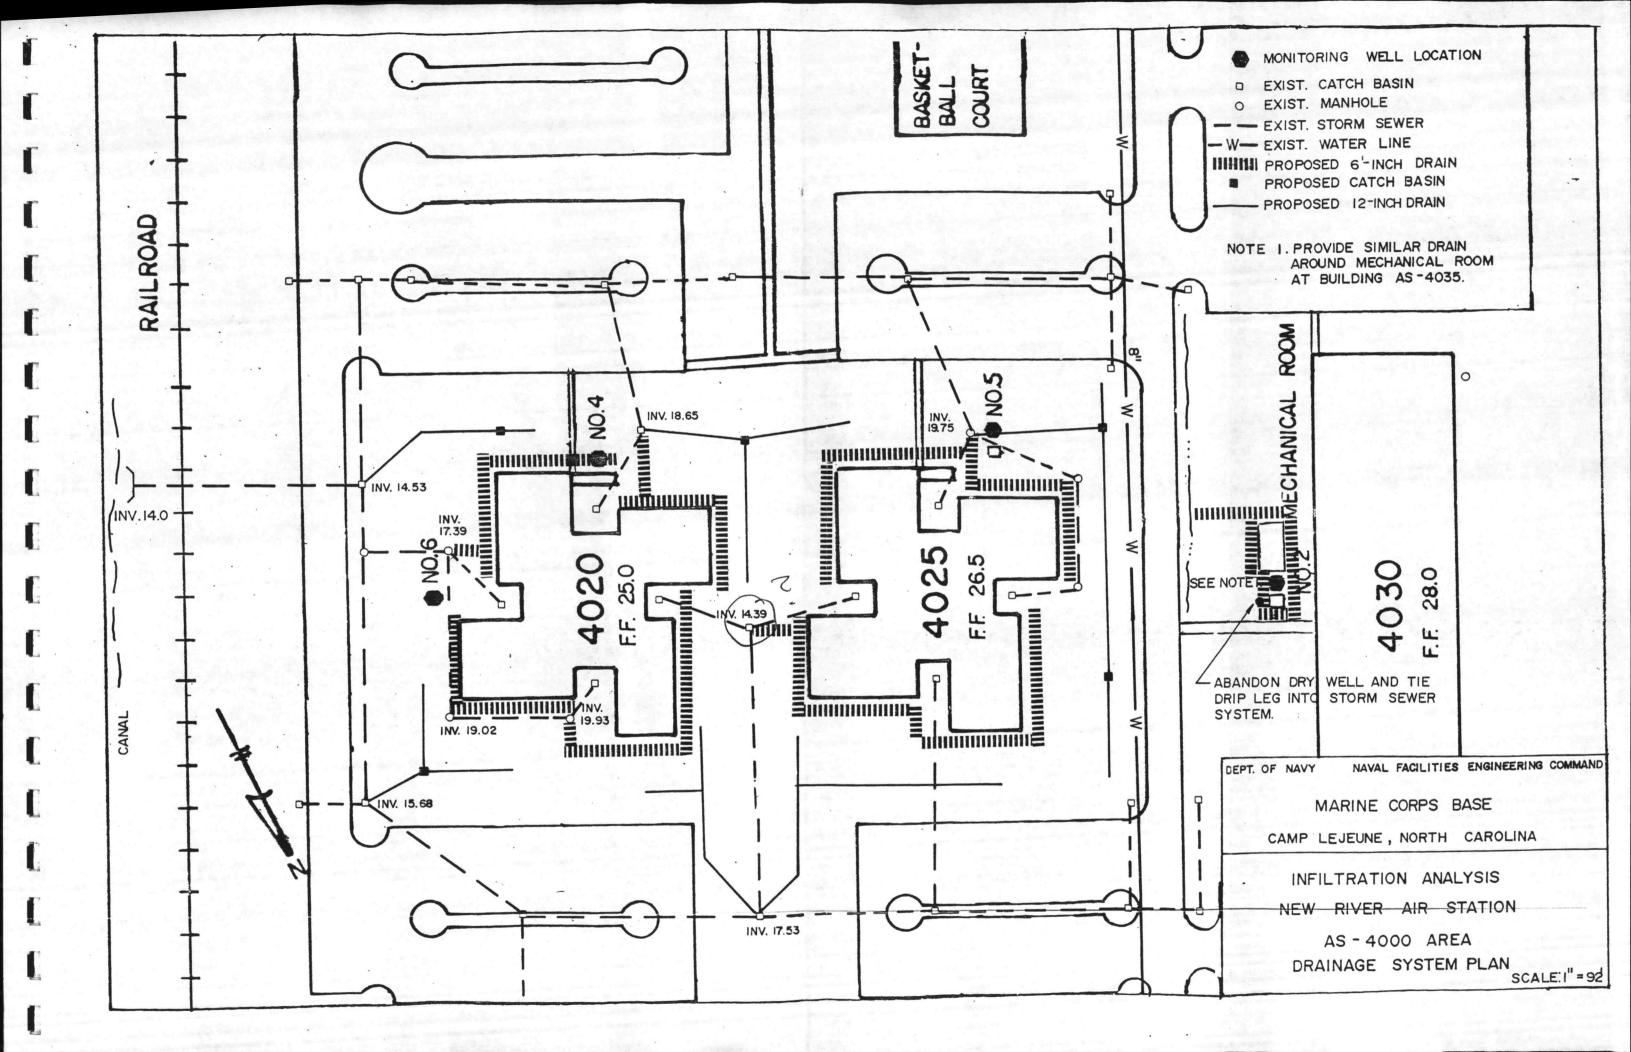

A detailed breakdown of costs is presented at the end of this report.

Sikagard 62 Figh-Build Protective Contine

Technical Data ----

I

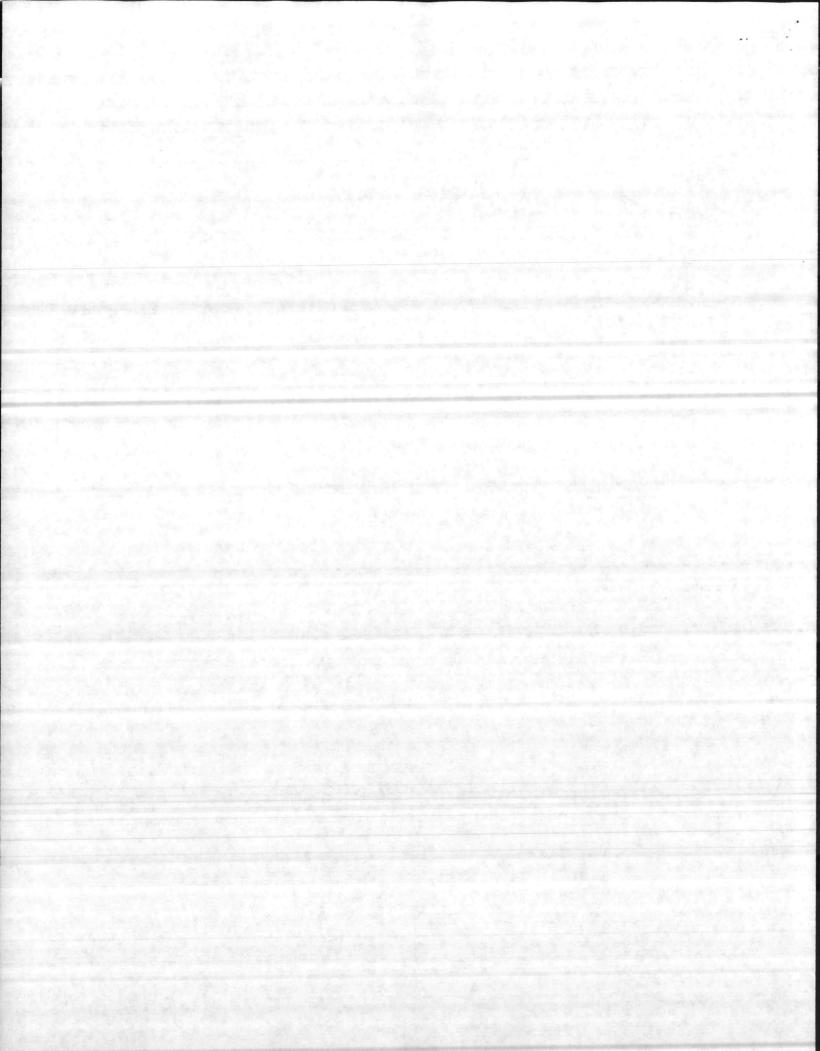

Description:	Sikagard 62 is a 2-component, solvent free, high-solids, epoxy resin, high-build protective and waterproofing coating.
Where To Use:	Wherever a high-build, corrosion-resistant, tile-like, protective coating is required on dry or damp structural substrates.
Advantages:	 Protects dry and damp surfaces. Exceptional tensile strength. Chemical resistant — for long-term protection. Convenient 1:1 mixing ratio. Easily paintable viscosity with high-build finish. Durable, tile-like finish permits wipe-off graffiti-removal. Five attractive colors for color-coding Outstanding bond to all common structural substrates for stay-in-place performance. High abrasion resistance for years of wear. After Sikagard 62, gray, is cured, it is in conformity with federal regulations and may be used in areas where it is in contact with potable water. All colors have USDA approval for use in food plants.
Packaging:	10-gallon, 4-gallon, 1-quart units.
Coverage:	For brush or roller application at approximately 4-7 mils: 400 to 225 sq ft/gal. Coverage will vary with temperatures, substrate, substrate condition, environment, and application technique.

GUARANTEED SUPPLY COMPANY P.O. BOX 36030 1211 ROTHERWOOD ROAD GREENSBORO, N.C 27416-6030 Filone (919) 273-3491 N.C. Wats 1-800-822-8854

TYPICAL DATA* (Material @ 73F 50% RH)

Storage Conditions:	Store in cool, dry area. Material should be approx 70F during mixing and application for best results.		
Colors:	Gray, red, yellow, green, tan.		
Mixing Ratio:	1:1 for all colors.		
Shelf Life:	1 year in original packaging.		
Pot Life:	30-40 minutes @ 73F.		
Tack-Free to Touch:	5-mil film 40F 73F 90F	7-16 hours 3 to 4 hours 1.5 hours	
Open Time (73F, 50% RH)	Foot traffic: 4 to 6 hours Rubber-wheel traffic: 8 to 10 hours Chemical exposure: 3 days		
Viscosity (cps):	A+B approx 2,800 (varies with color)		
Water Pick-Up:	Total water absorption 0.90% ASTM D-570 Procedure 6.5		
Tensile Properties:	ASTM D-638 14 days @ 73F Strength — 6,400 psi Elongation — 2.7%		

Chemical Resistance: (Typical Data)

Sample: Two coats approximately: 10 mils Cured 10 days at 73F \pm 2F, 50% RH Substrate: asbestos cement

HOW TO USE

Surface Preparation:	Clean substrate, remove laitance, curing compounds, other coatings, oil, grease, rust, waxes, or other bond-inhibiting substances by mechanical means. All surfaces must be clean, sound, and free of surface water. Concrete may be damp or in a saturated surface dry condition. For best results, precondition each component to between 65 and 85F before using.
Mixing:	Stir each component before proportioning. Measure out equal volumes of 'A' and 'B' component into clean container. Mix with
	a Sika mixing paddle attached to a slow-speed (400- to 600-rpm) electric drill for 3 minutes. Mix only that quantity which can be used within the pot life of the material.
	For spray application only, thin, if necessary, with up to 5% by volume of Sika Epoxy Thinner.

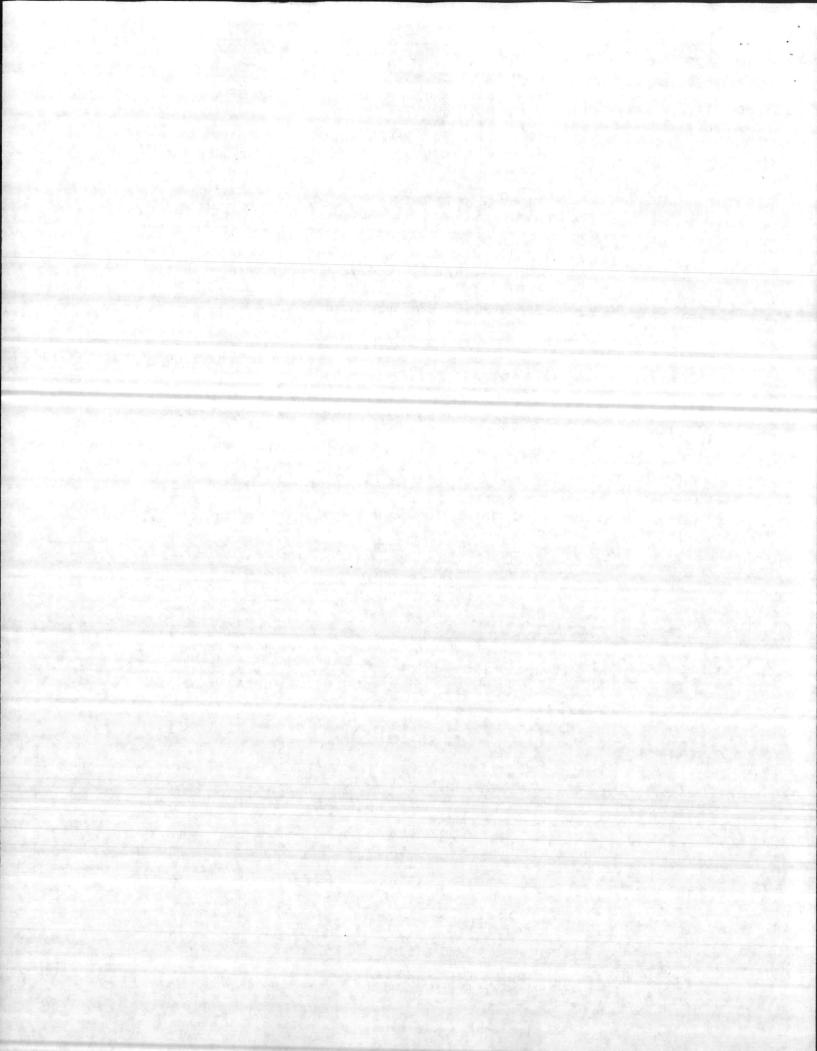

Application:	Apply to clean substrate. Use 3/8- or 7/16-innap roller, brush, or spray. Two coats are recommended. Second coat must be applied within 48 hr. If interval will be longer, contact SikaService for specific information. Recommended thickness per coat is 4-7 mils.
1	When spraying, use the following or similar equipment: Binks Model #18 Air-Atomized Spray Gun (#68 fluid nozzle, #68PB air nozzle, #68 fluid needle; #83 — 5661 2-gal pressure fluid tank).
Limitations:	Sikagard 62 forms a vapor barrier. Do not apply to surfaces where vapor condenses and freezes under coatings. Do not encap- sulate saturated concrete or mortar where freezing will occur. Apply only when substrate temperature is 50F or above and
	relative humidity is 95% or lower. Do not apply over wet
	(glistening) substrate.
alling had to get a plant fill provide any sale of the set of the	Minimum age of new concrete before coating is 3 to 6 weeks depending on climate.
Caution:	A COMPONENT — For Industrial Use Only! May cause injury to skin following prolonged or repeated contact.
	B COMPONENT - DANGER! CAUSES (SEVERE) BURNS.
	Contains alkaline amines: strong sensitizer. Do not get in eyes, on
	skin, or clothing. Avoid breathing vapor. Keep container closed. Use
a the second	with adequate ventilation. Wash thoroughly after use.
FIRST AID:	In case of contact, immediately flush eyes or skin with plenty of water for at least 15 min. Remove contaminated clothing and shoes. Call a physician. Wash clothing before re-use. Discard contaminated shoes, gloves.
	Wear protective clothing, goggles, gloves, and/or barrier creams.
	For industrial use only. Keep out of reach of children.

Sikallex-la Elastic Sealant/Adhesive Technical Data

Sikaflex-1a is a premium-grade, high-performance, moisture-cured, 1-component, Description: polyurethane-base, non-sag elastomeric sealant. Where To Use: Designed for all types of joints with maximum depth of 1/2 in. Excellent for small joints and fillets...windows, door frames, reglets, flashing, and many construction adhesive applications Suitable for vertical and horizontal joints; readily placeable at 40F Has many applications as an elastic adhesive between materials with dissimilar coefficients of expansion. Advantages: Easy, low-cost, ready-to-use Eliminates time, effort, and equipment for mixing, filling cartridges, pre-heating or thawing, and cleaning of equipment High elasticity Cures to a tough, durable, flexible consistency with exceptional cut- and tear-resistance Excellent adhesion Bonds to most construction materials...without primer in most cases Long life · Excellent resistance to aging, weathering Proven in tough climates around the world USDA- and FDA-approved† Approved for use in contact with potable water · Resists fuel, mineral oils, and dilute minerals, plant and animal juts Odorless, non-staining. Can be painted over with water-, oil-, and rubber-base paints. Since some paints dry slowly and the surface may remain slightly tacky, a preliminary test is essential. Meets Fed Spec TT-S-00230C, Type II Class A. Meets EPA regulations on water extractability Meets Canadian Standard 19-GP-16A, Type II. 11-fl-oz cartridge seals 26 lin ft of 1/4-in. × 1/4-in. joint or 23 lin ft of 3/6-in. fillet. Coverage: Packaging: Disposable 11-fl-oz, moisture-proof aluminum cartridges, 24/case, 1.8- and 4.5-gal pails, and 20-fl-oz sausages, 20/carton. †Chemically acceptable to the U.S. Department of Agriculture for use in meat and poultry processing area under federal inspection. Meets FDA Regulation Title 21 on Indirect Food Additives, as found in Part 174; Part 175, Paragraph 175, 105; Part 177, Paragraph 177, 1680. and Paragraph 177.2600, being composed of ingredients acceptable for packaging and transporting food. GYSGT BOOTS, POLICE SERGE	ANT AS 4020 FXT 6246	YES XNO

LOCATION: AS 4020, 1ST DECK, ROOM 151, HOLE IN FLOOR

REQUEST FOR REPAIR OF THE HOLE IN THE FLOOR WHICH IS TWENTY-TWO (22') DESCRIPTION: LONG AND FORTY (40") INCHES WIDE AT ITS WIDEST POINT. THIS HOLE IS TWO (2) TO THREE (3) FEET DEEP AND CREATES A HAZARD TO OCCUPANCY. THIS ROOM CANNOT BE OCCUPIED BY PERSONNEL FOR SANITATION AND MOISTURE PROBLEMS PRESENTED BY THIS HOLE IN THE FLOOR. THE BASE MAINTENANCE PERSONNEL HAD TRACED A WATER LEAK TO THIS ROOM IN EARLY 1986 AND DUG UP THE FLOOR IN ORDER TO REPAIR THE LEAK. WHEN THE BASE MAINTENANCE PERSONNEL FINISHED, THE FLOOR WAS LEFT IN DISREPAIR. THE FLOOR NEEDS TO BE FILLED IN WHERE WATER WAS FOUND UNDER IT AND A NEW FLOOR PUT IN.

HEALTH AND COMFORT OF PERSONNEL DUE TO UNCOVERED SURFACE WHERE JUSTIFICATION: UNWANTED MOISTURE AND INSECTS CAN ENTER/UPKEEP OF GOVERNMENT PROPERTY. THERE IS A NEED TO RE-OCCUPY THIS ROOM.
