

2011 Minerals Yearbook

ASBESTOS [ADVANCE RELEASE]

ASBESTOS

By Robert L. Virta

Domestic survey tables were prepared by Richard H. Kraft, statistical assistant, and the world production table was prepared by Lisa D. Miller, international data coordinator.

Asbestos has not been mined in the United States since 2002, and imports satisfied the needs of domestic consumers. U.S. apparent consumption was 1,180 metric tons (t) in 2011, an increase from 1,040 t in 2010. World production was 2.03 million metric tons (Mt) in 2011, almost unchanged from 2.04 Mt in 2010.

Legislation and Government Programs

The U.S. Geological Survey issued a map detailing reported historic asbestos mines, historic asbestos prospects, and natural asbestos occurrences in the southwestern United States. The map and dataset contain location, mineralogy, geology, and references to asbestos sites in California (Van Gosen and Clinkenbeard, 2011).

In April, the National Institute of Occupational Safety and Health (NIOSH) issued a revision to its strategic plan for asbestos research. The plan discussed the need for a better understanding of factors important to the toxicity of fibers, better data on occupational exposure to different types of fibers, and improved sampling and analytical methods (National Institute for Occupational Safety and Health, 2011, p. v–ix).

Consumption

U.S. apparent consumption of asbestos was calculated to be 1,180 t in 2011, a 13% increase from 1,040 t in 2010 (table 1). It is likely that much of the additional 140 t of chrysotile imported in 2011 went into stocks for future use rather than being used because it was unlikely that markets had expanded. Roofing products accounted for 41% of U.S. consumption; diaphragms for the chloralkali industry, 28%; coating and compounds, 2%; plastics, less than 1%; and other uses, 29%. Much of the chrysotile for which no end use was specified was likely to have been imported and (or) used by the chloralkali industry in 2011, based on trade data reported by United Business Media Global Trade (undated). Asbestos acts as a semipermeable diaphragm to separate the chlorine generated at the cell anode from the starting brine in the electrolytic cell. Chrysotile was the only type of asbestos used in the United States in 2011, 49% of which was grade 7, 16% was grade 5, 12% was grade 4, and 23% was unspecified (table 2).

Prices

The average free alongside ship (f.a.s.) unit value of unmanufactured asbestos fiber exports was \$1,230 per metric ton in 2011, an increase from \$708 per ton in 2010. The average U.S. customs unit value for all grades of imported asbestos increased to \$931 per ton in 2011 from \$786 per ton in 2010 because of higher valued chrysotile imports of unspecified grade from Canada and higher value grade 4 imports from Brazil. The

average value of imported crude chrysotile, all from Canada, was \$883 per ton in 2011, a slight increase from that of 2010. The average unit value for imports of milled, grade 4 chrysotile declined to \$1,620 per ton in 2011 from \$1,860 per ton in 2010 because of lower valued imports from Brazil and Canada.

Foreign Trade

The following section summarizes significant trade statistics on asbestos and products manufactured using asbestos. Detailed trade statistics, by country and individual U.S. port districts, are available from the International Trade Commission's Interactive Tariff and Trade Dataweb Web site (U.S. International Trade Commission, undated).

In 2011, U.S. exports of asbestos fiber were 169 t with an f.a.s. value of \$207,000, a decrease in tonnage from 171 t valued at \$121,000 in 2010 but a significant increase in value (tables 3, 4). Asbestos was exported to Mexico, Canada, Taiwan, the Dominican Republic, and Peru, in decreasing order by quantity. Asbestos has not been produced in the United States since 2002; thus, reported exports probably consisted of reexports of imported fiber or improperly classified products. The United States exported and reexported \$27 million of asbestos products in 2011, unchanged from that of 2010. The United Kingdom was the leading destination for asbestos products, followed by the Republic of Korea, Mexico, and Canada. These four countries accounted for 52% of the value of asbestos products exported and reexported from the United States in 2011 (table 3). The United Kingdom banned the use of asbestos in 1999, so imports from the United States probably were reexported from the United Kingdom or other products were misclassified as asbestos products. The same applies to several other countries listed in table 3 that have banned the use of asbestos or asbestos products.

Friction products, including brake linings, clutch linings, and disk pads, accounted for 44% of the value of manufactured products exported in 2011 (table 4). Because no asbestos brake components under Harmonized Tariff Schedule of the United States (HTS) code 6813.20 or asbestos-cement products under HTS code 6811.40 were manufactured in the United States, shipments under these two HTS code categories probably represented reexports of asbestos products and (or) exports of products incorrectly classified under these HTS codes.

In 2011, the United States imported 1,180 t of asbestos valued at \$1,100,000. Imports were from Canada (77% of the tonnage), Brazil (22%), and South Africa (1%) (table 5). The U.S. Census Bureau indicated that some amosite was imported in 2011. This was likely to have been chrysotile because the asbestos was imported from Canada and amosite mining ended in 1992 with the closure of the South African amosite mines. Based on the import source, asbestos listed under "other, unspecified asbestos type" in table 5 probably was chrysotile.

The United States also imported \$5.66 million of products with a basis of asbestos and products with a basis of asbestos and magnesium carbonate, a decrease from \$5.78 million in 2010. Some nonasbestos products probably are included under the asbestos HTS codes based on reported asbestos imports from countries that have banned asbestos use (table 6).

World Review

World production of asbestos was estimated to be 2.03 Mt in 2011, almost unchanged from 2.04 Mt in 2010. It was estimated that Russia was the leading producer of asbestos, followed by China, Brazil, Kazakhstan, and Canada. These five countries accounted for 99% of the world production (table 7).

Canada.—For the first time in more than 130 years, asbestos was not mined in Canada although production may resume if conditions change. LAB Chrysotile (through its subsidiary Lac d'amiante du Canada) indefinitely idled its chrysotile mine in Thetford Mines, Quebec. In addition to labor issues, a rock slide prevented access to some of its high-grade ore. In January 2012, LAB Chrysotile filed for bankruptcy. The Jeffrey Mine stopped production while waiting for funding to further develop its underground mine. The companies continued to sell chrysotile fiber from inventory (Canadian Broadcasting Corp., 2011; 2012; Canadian Mining Journal, 2011).

Zimbabwe.—Zimbabwe Mining Development Corp. (ZMDC) announced that it planned to reopen the Mashava and Shabanie chrysotile mines. The mines were closed in 2008 for financial reasons. ZMDC planned on reactivating the mine in stages (Zimbabwean, The, 2011).

Outlook

Although U.S. imports increased in 2011, U.S. consumption likely remained unchanged compared with that in 2010. Some imports probably were placed into stocks for future use based on industry trends that show no growth in markets. U.S. asbestos consumption is likely to decline over time as the few remaining consuming industries slowly replace older asbestos-based technology or phase out its use. World production remained nearly 2 Mt because of continued demand for asbestos products in many regions of the world.
