Body Fl	luid Spaces in Pregnar	nt and
	Nonpregnant Women	

	WEIGHT	PLASMA VOLUME	ECF SPACE	TBW
	(kg)	(mL/kg)	(L/kg)	(L/kg)
NONPREGNANT		49		
	< 70		0.189	0.516
	70 – 80		0.156	0.415
	> 80		0.151	0.389
PREGNANT		67		
	< 70		0.257	0.572
	70 – 80		0.255	0.514
	> 80		0.240	0.454

Frederiksen MC, et al. Clin Pharmacol Ther 1986;40:321-8.

Cardiovascular System Changes

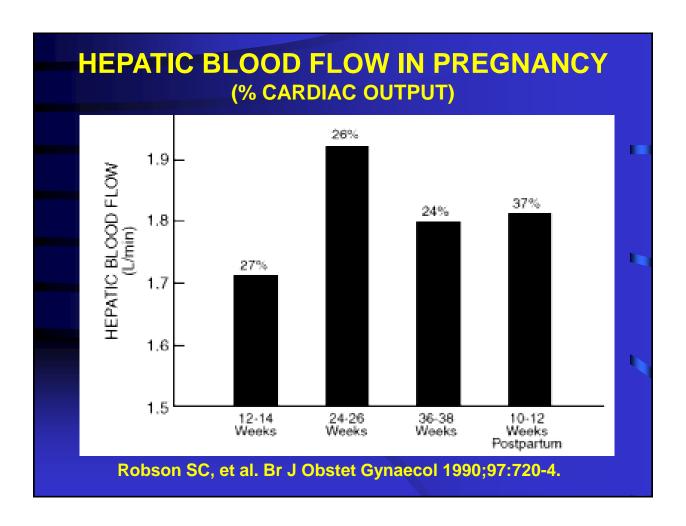

- Plasma volume expansion
 - Begins at 6 8 weeks gestation
 - Volume of 4700 5200 ml peaks at 32 weeks gestation
 - Increase of 1200 1600 ml above nonpregnant women

Cardiovascular System Changes

- Cardiac output increases 30 50%
 - 50% by 8 weeks gestation
- Increase in stroke volume and heart rate
 - Stroke volume in early pregnancy
 - Heart rate in later pregnancy

Regional Blood Flow Changes

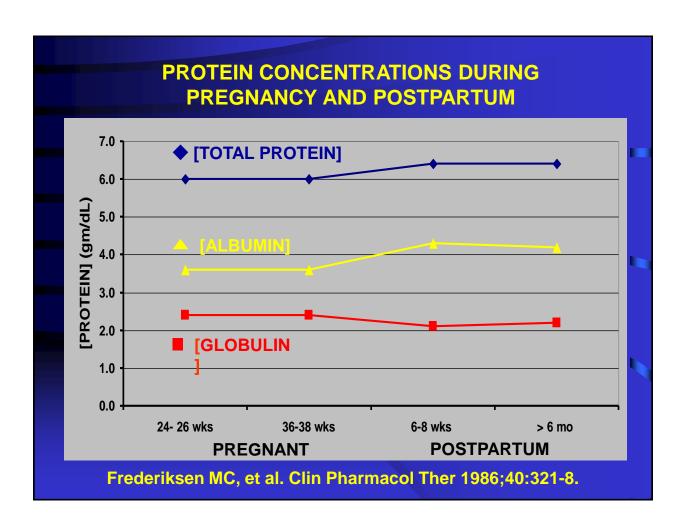

- Increased blood flow to uterus 20% of cardiac output at term
- Increased renal blood flow
- Increased skin blood flow
- Increased mammary blood flow
- Decreased skeletal muscle blood flow

- Cardiovascular system
 - Plasma volume expansion
 - Increase in cardiac output
 - Regional blood flow changes
- Respiratory Changes

Respiratory Changes • Compensated respiratory alkalosis • Lowered P_aCO₂ • pH 7.44

- Cardiovascular system
 - Plasma volume expansion
 - Increase in cardiac output
 - Regional blood flow changes
- Respiratory Changes
- Decrease in albumin concentration

Is The Hypoalbuminemia of Pregnancy Dilutional?

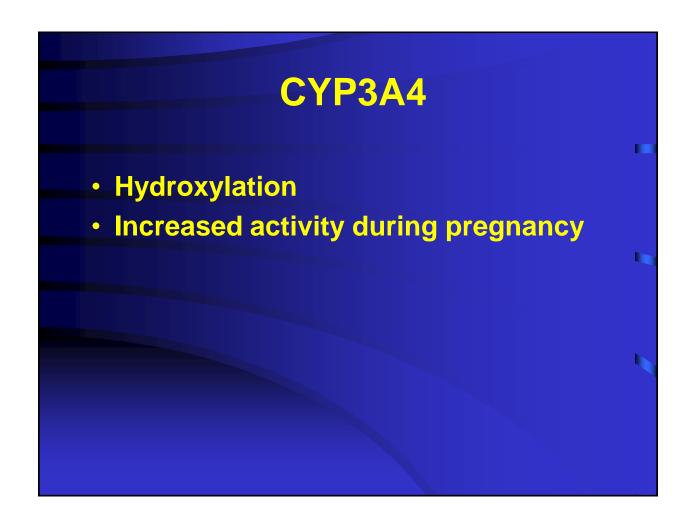

- [GLOBULIN] IS NOT REDUCED
- DISTRIBUTION VOLUME DOES NOT AFFECT C_{SS}

$$C_{SS} = \frac{SYNTHESIS RATE}{CL_E}$$

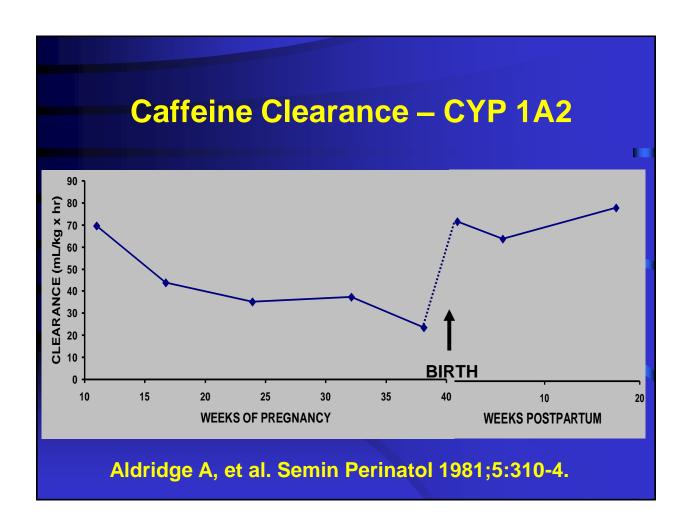

THEREFORE, ↓ [ALBUMIN] REFLECTS EITHER ↓
 SYNTHESIS RATE OR ↑ CL_E.

- Cardiovascular system
 - Plasma volume expansion
 - Increase in cardiac output
 - Regional blood flow changes
- Respiratory Changes
- Decrease in albumin concentration
- Enzymatic activity changes

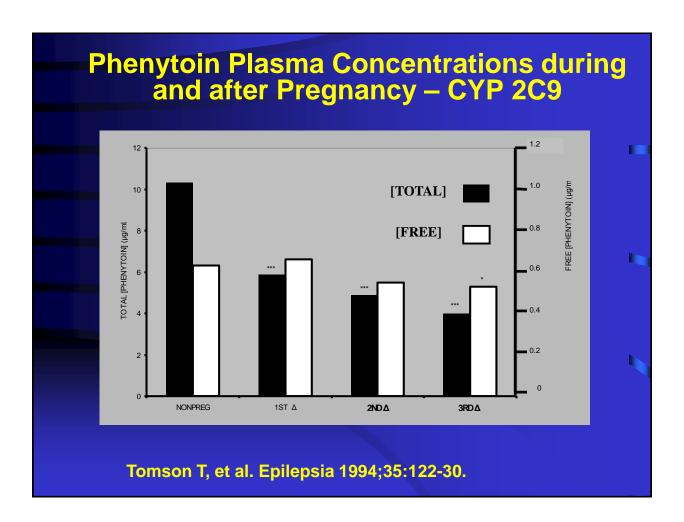

Enzymatic Activity Changes Thought to be related to pregnancy hormonal changes N-demethylation inhibited by progesterone, not by estrogen

CYP2C9 • Activity shown to increase during pregnancy • Lowered total concentration of phenytoin during pregnancy

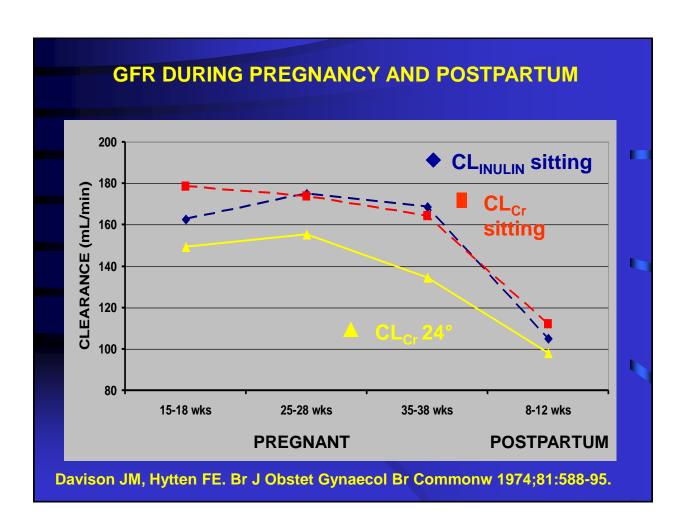

CYP2D6 Activity

- Genetic determined polymorphism
- Increased clearance of metoprolol observed during pregnancy
- Increased clearance in homozygous and heterozygous extensive metabolizers
- No change in homozygous poor metabolizers

Wadelius M, etal. Clin Pharmacol Ther 1997; 62: 400.

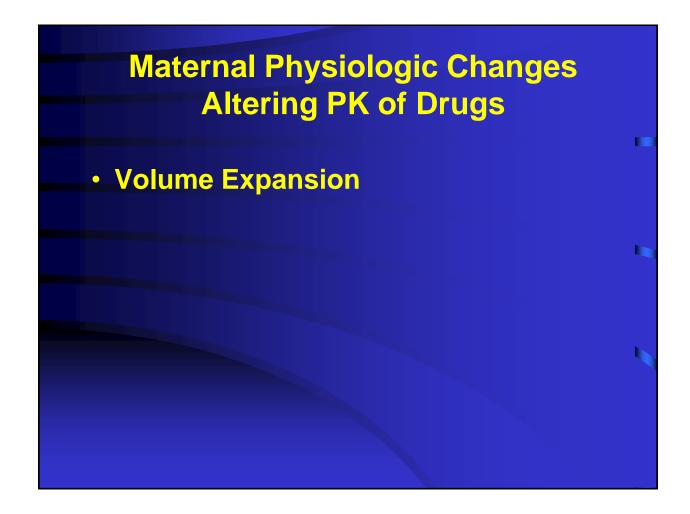

- Cardiovascular System
 - Plasma Volume Expansion
 - Increase in Cardiac Output
 - Regional Blood Flow Changes
- Respiratory Changes
- Decrease in Albumin Concentration
- Enzymatic Activity Changes
- Increase in GFR

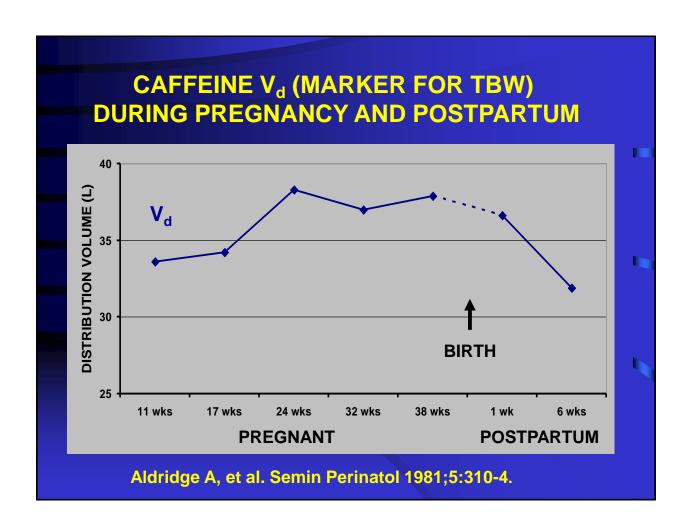

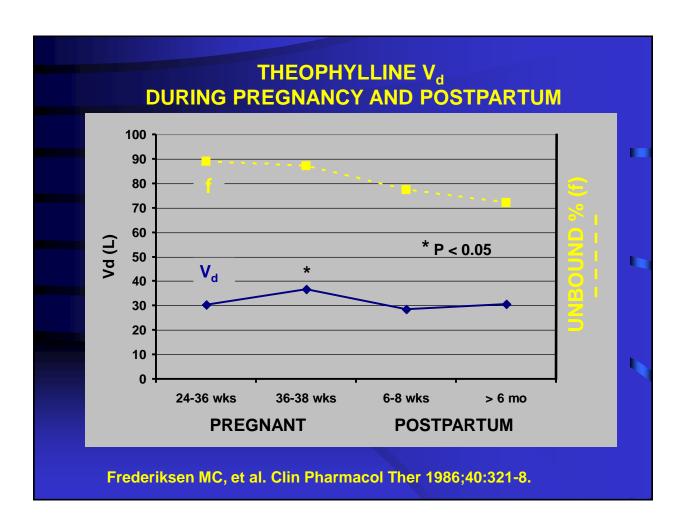

- Cardiovascular System
 - Plasma Volume Expansion
 - Increase in Cardiac Output
 - Regional Blood Flow Changes
- Respiratory Changes
- Decrease in Albumin Concentration
- Enzymatic Activity Changes
- Increase in GFR
- Gastrointestinal Changes

Gastrointestinal Changes

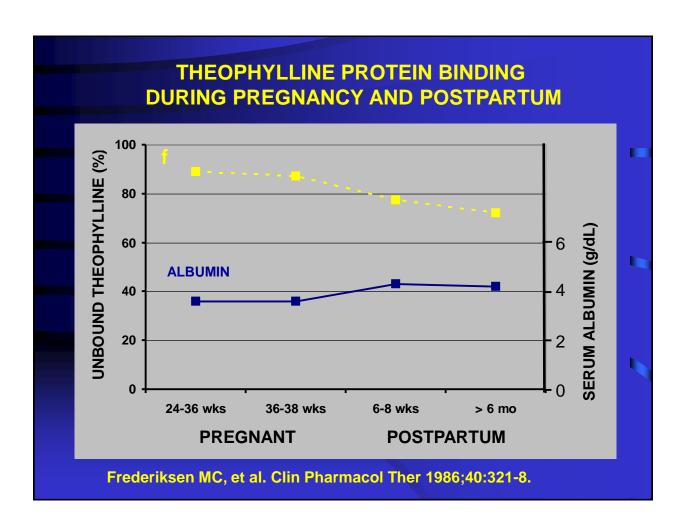

- Decreased gastric acidity
- Gastric emptying
 - Delayed in laboring women
 - No difference between 1st & 3rd ∆ in nonlaboring women
 - No difference from postpartum
- Increased orocecal transit time in 3rd Δ
 - Progesterone effect
 - Pancreatic polypeptide inverse correlation

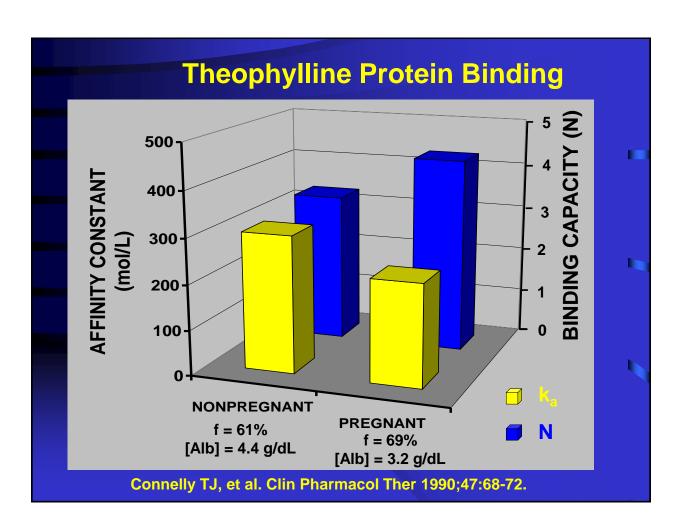

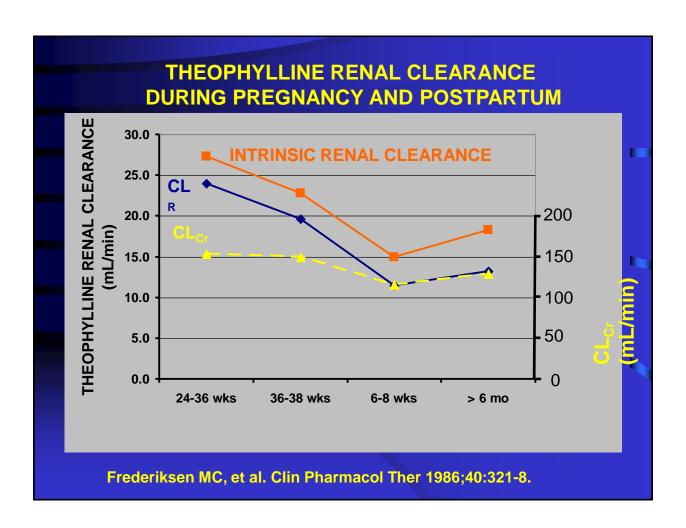

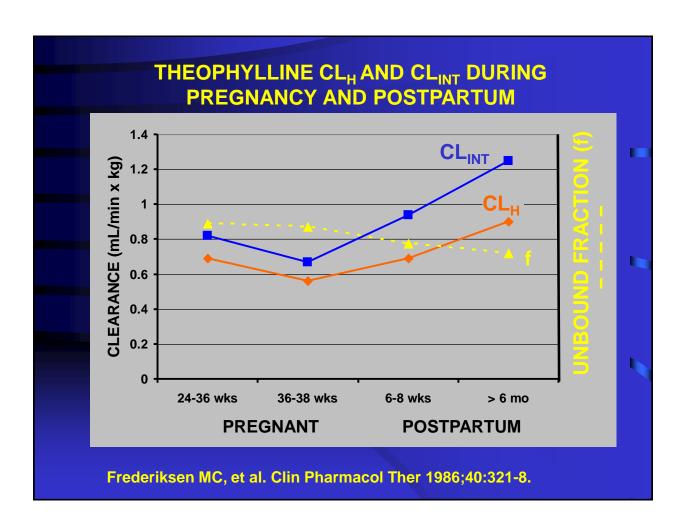

Maternal Physiologic Changes Altering PK of Drugs • Volume expansion • Protein binding-increase in free fraction of drugs bound to albumin

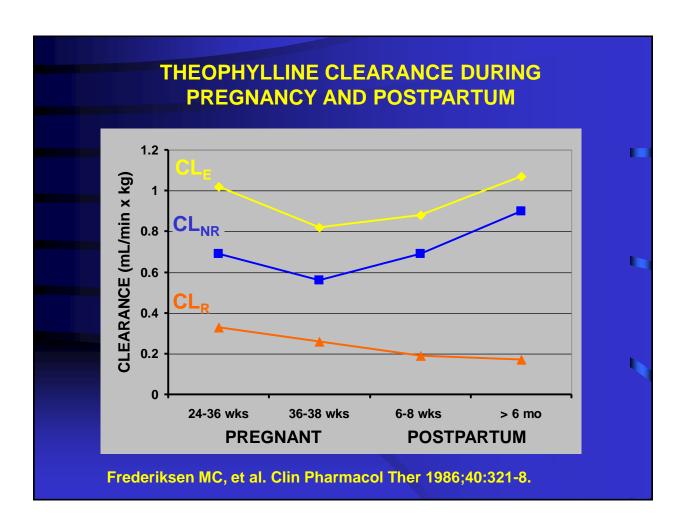

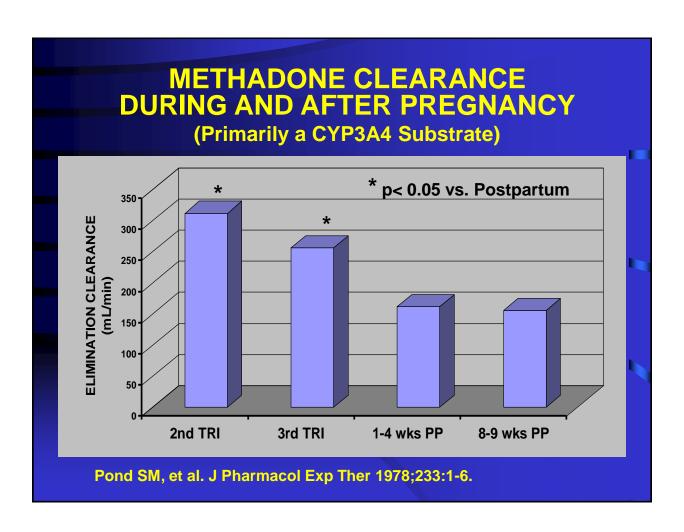

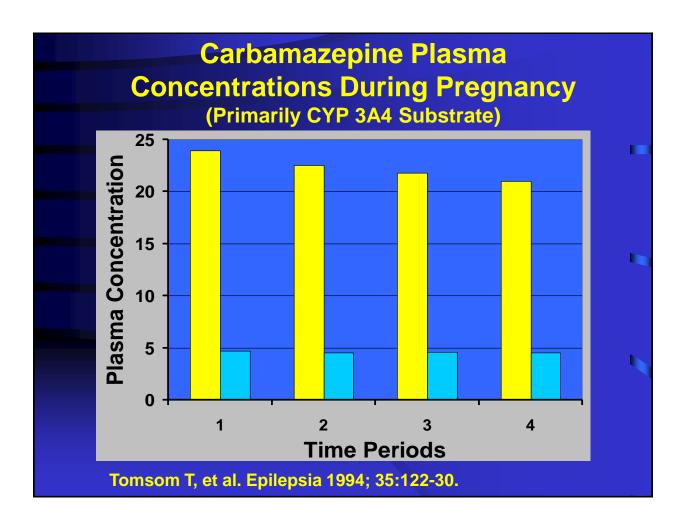

Maternal Physiologic Changes Altering PK of Drugs • Volume expansion • Protein binding • Clearance changes

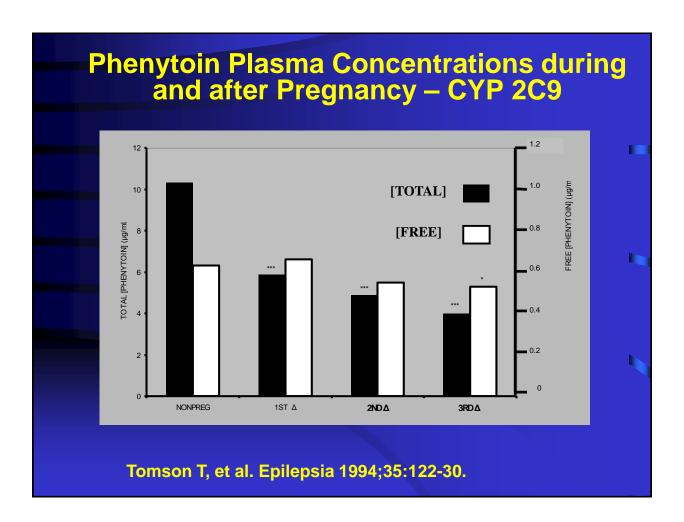

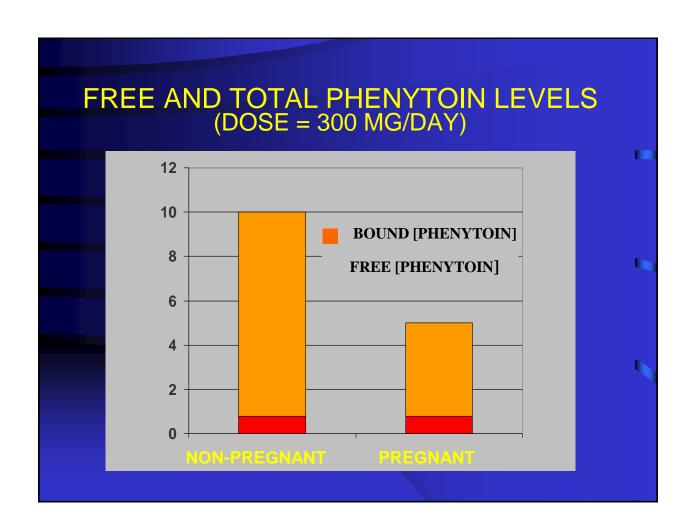

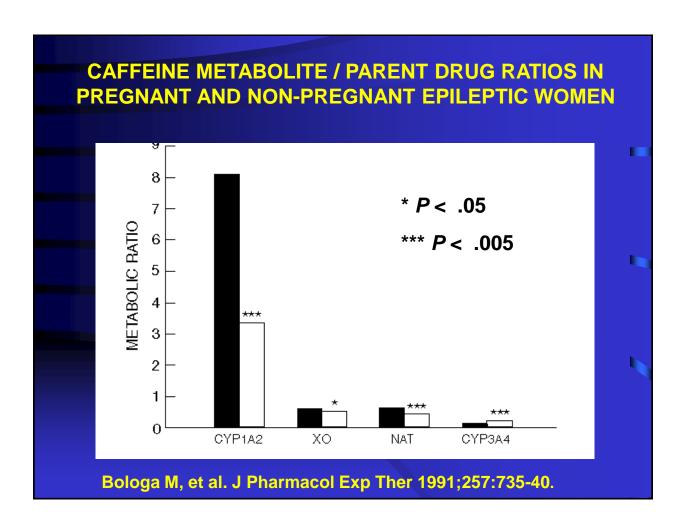

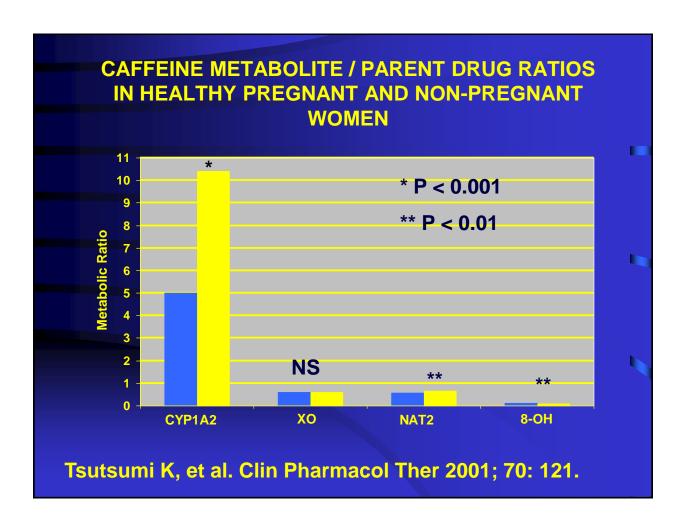

Betame	ethasone PK ir Twin Pregna	n Singleton and ancies	
Parameter	Singleton	Twin	
V _d (L)	67.5 ± 27.9	70.9 ± 28.4

T½ (h)	9.0 ± 2.7	7.2 ± 2.4 *	
	* P < .0°	17 ** P < .06	
Ballabh P, et	al. Clin Pharmacol	Ther 2002; 71, 39.	

Lamotrigine Clearance in Pregnancy

- Phase II biotransformation by glucuronidation
- Increased clearance in second and third trimesters (> 65%)
- May require dose adjustment
- Rapid decrease in clearance in the first two weeks postpartum

Tran TA, et al. Neurology 2002; 59: 251-55.

Pharmacokinetics of Cefuroxime in Pregnancy Pt Category V_D(L) CI(ml/min) T(1/2) 17.8<u>+</u> 1.9 **Pregnant** 282<u>+</u>34* 44<u>+</u>5* At Delivery 19.3<u>+</u>3.1 259<u>+</u>35* 52<u>+</u>10 **Postpartum** 16.3<u>+</u>2.1 198<u>+</u>27 58+8 *p<0.05 on comparison to PP Philipson A et al. Am J Obstet Gynecol 1982; 142: 823.

Pharmacokinetics of Amoxicillin in Pregnancy

Study Period	CI _R (L/hr)	CI _s (ml/min)
18 - 22 wks	24.8±6.7*	280 ± 105*
30 – 34 wks	24.0 ± 3.9*	259 ± 54*
Postpartum	15.3 ± 2.6	167 ± 47

P < 0.001 as compared to PP

Andrew MA et al. Clin Pharmacol Ther 2007; 81: 547.

Tobramycin Pharmacokinetics

- CI higher in mid-trimester with a corresponding shorter half-life
- CI lower in the third trimester with a corresponding longer half-life

Bourget P, et al. J Clin Pharm Ther 1991;16:167-76

Metformin PK in Pregnancy

- C_{max} in pregnancy 81% lower than postpartum values
- Mean metformin concentrations 69% of the postpartum values
- Mean AUC for metformin during pregnancy is 80% of the postpartum AUC

Hughes RCE et al. Diabetes Medicine 23:323-6, 2006.

	2 nd △	3 rd △	PP
I _R ml/min	723 ± 243*	625 ± 130*	447 ± 132
r CI ml/min	240 ± 70*	207 ± 56**	165 ± 44
ecretion CI ml/min	480 ± 190*	419 ± 78*	313 ± 98

Heparin PK during Pregnancy Shorter time to peak heparin concentration and effect Lower peak effect Brancazio et al. Am J Obstet Gynecol 1995; 173: 1240.

Enoxaprin PK during Pregnancy

- T_{max} shows no change
- C_{max} lower during pregnancy
- Cl decreases in late pregnancy
- Lower anti-factor Xa activity
- AUC lower during pregnancy

Casele, et al. Am J Obstet Gynecol 1999; 181: 1113.

Maternal Physiologic Changes Altering PK of Drugs Volume expansion Protein binding Clearance changes Gastrointestinal changes

Oral Ampiclin Pharmacokinetics in Pregnancy Parameter Pregnant Nonpregnant 8.2<u>+</u>4.1 12.6<u>+</u>4.3* AUC(cm²) 2.2<u>+</u>1.0 Peak Level (µg/ml) 3.7<u>+</u>1.5* **Bioavailability (%)** 45.6<u>+</u>20.2 48.1+19.3** * P < 0.001 ** NS Philipson A. J Inf Dis 1977;136:370-6.

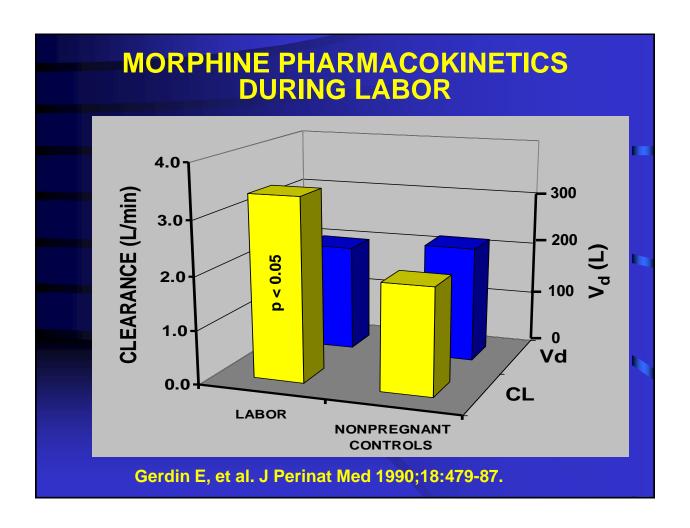

PK of Oral Valacyclovir & Acyclovir

- The pro-drug Valacyclovir converted by first pass metabolism to Acyclovir
- Non-pregnant Valacyclovir gives 3 5 times higher plasma level as Acyclovir
- Valacyclovir PK study in pregnancy gave plasma levels 3 times higher than Acylovir

Kimberlin DF, et al. Amer J Obstet Gynecol 1998; 179: 846

Peripartum Pharmacologic Considerations Increased cardiac output

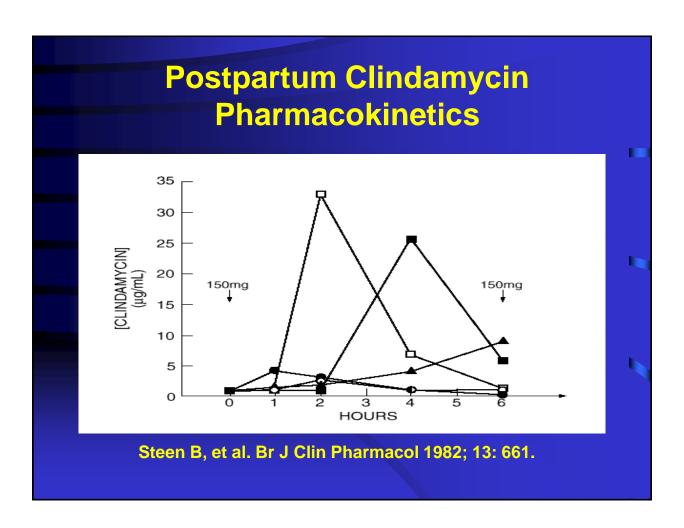

- Blood flow changes
- Uterine contractions
- ? Pharmacodynamic changes

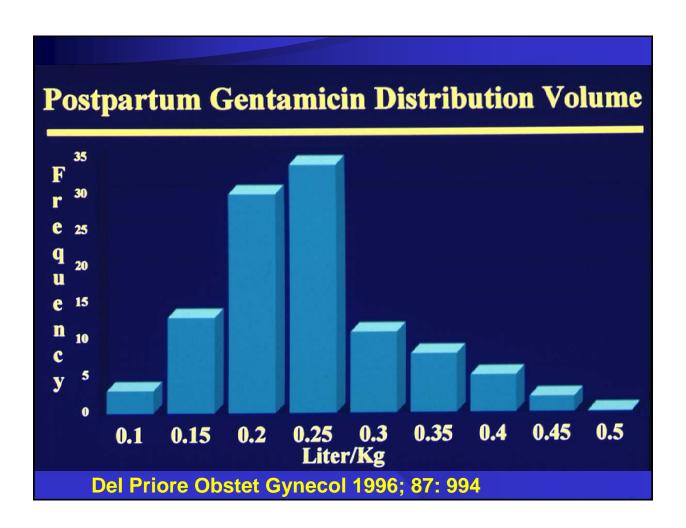

Pharmacokinetics of Cefuroxime in Pregnancy

Category	V _D (L)	CI (ml/min)	T(½)
Pregnant	17.8 <u>+</u> 1.9	282 <u>+</u> 34*	44 <u>+</u> 5*
At Delivery	19.3 <u>+</u> 3.1	259 <u>+</u> 35*	52 <u>+</u> 10

FillipsonA	et al. Alli 5 Ol	ostet Gynecol 1902,	142. 023.

Postpartum PK Considerations Increased cardiac output maintained GFR increased Diuresis Breastfeeding Great variability

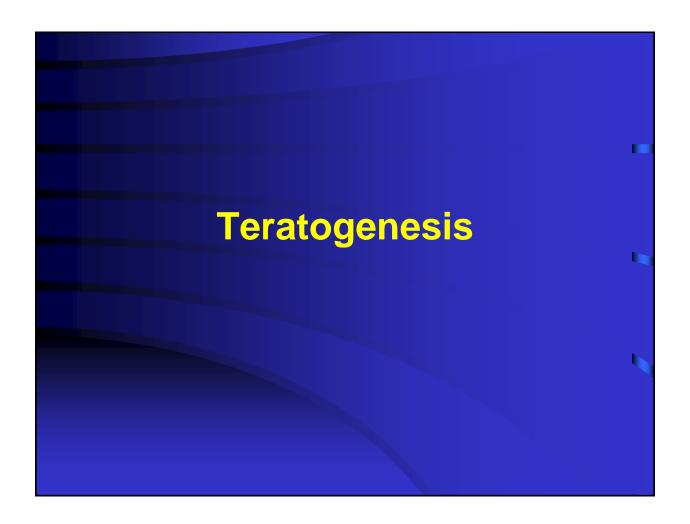

Drug Studies for Pregnancy

- Pregnancy Specific Drugs
 - Tocolytic agents
 - Oxytocic agents
 - Eclampsia agents
- Drugs commonly used by women of childbearing potential
 - Antidepressants
 - Asthma drugs

Technical Considerations • Ethical and IRB concerns • Serial studies - Spanning pregnancy - Specific to peripartum period - Controls

Study Design

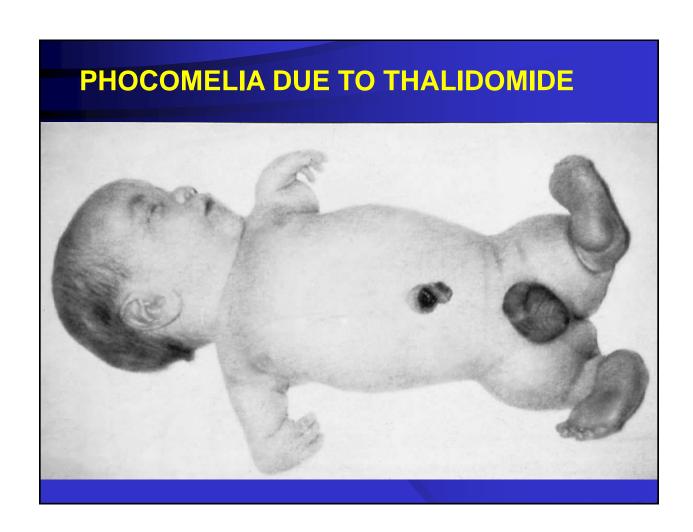

- Use population PK analysis
- Incorporate in vitro protein binding studies
- Use stable isotopes for bioavailability studies
- Use established tracer substances as reference markers

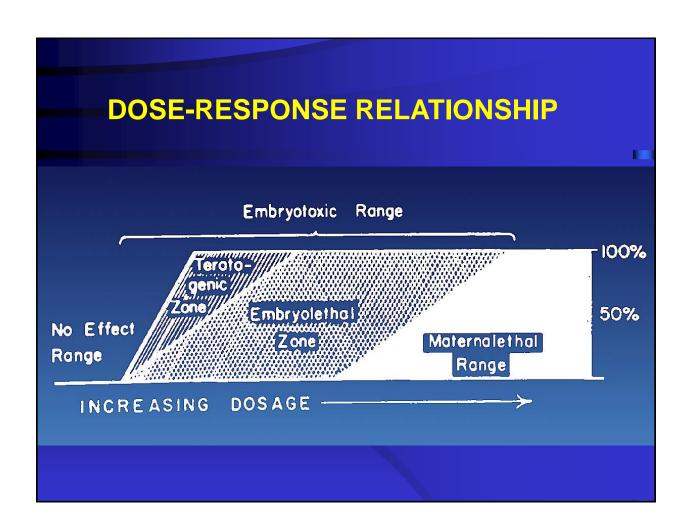

General Principles of Teratology

- Teratogens act with specificity
- Teratogens demonstrate a doseresponse relationship
- Teratogens must reach the conceptus
- Effects depend upon the development stage when exposed
- Genotype of mother and fetus effect susceptibility

General Principles of Teratology • Teratogens act with specificity • Teratogens demonstrate a doseresponse relationship

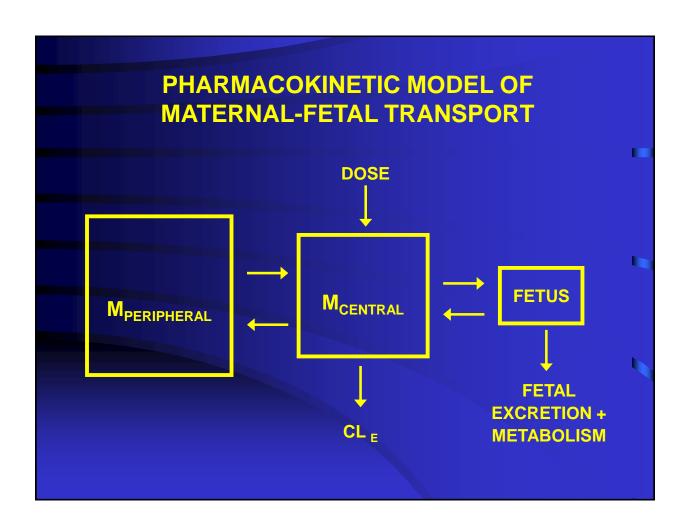

General Principles of Teratology

- Teratogens act with specificity
- Teratogens demonstrate a doseresponse relationship
- Teratogens must reach the conceptus

Placental Transport

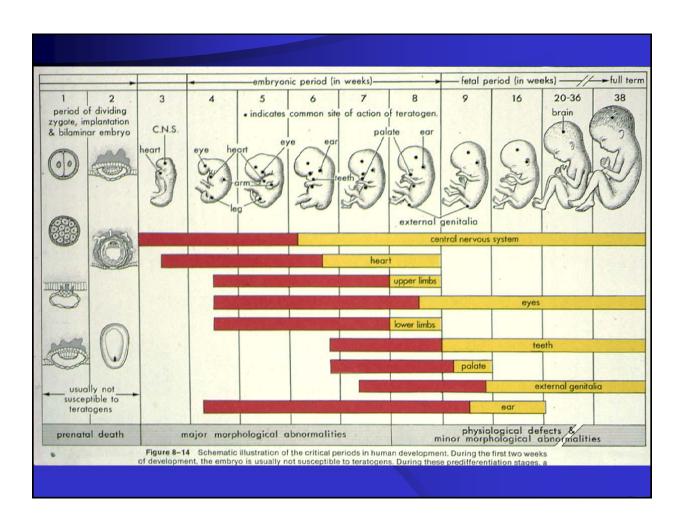

- Passive diffusion
- P-glycoprotein expressed on trophoblastic cells of placenta
- Active transport of P-glycoprotein substrates back to the mother
- Pore system
- Endocytosis

General Principles of Teratology

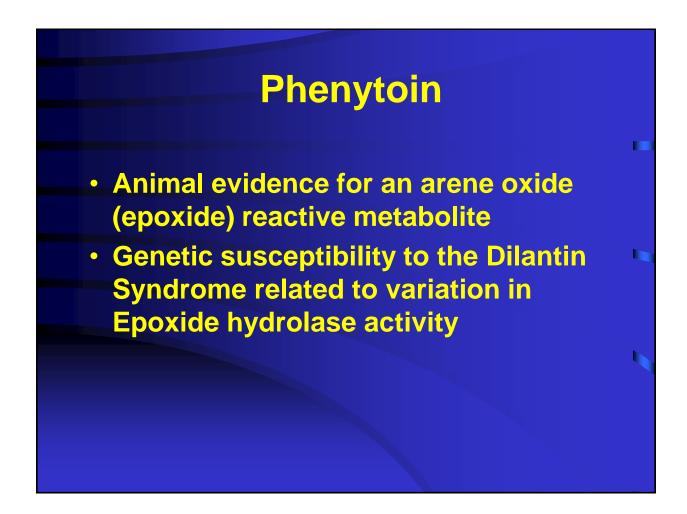

- Teratogens act with specificity
- Teratogens demonstrate a doseresponse relationship
- Teratogens must reach the conceptus
- Effects depend upon the development stage when exposed

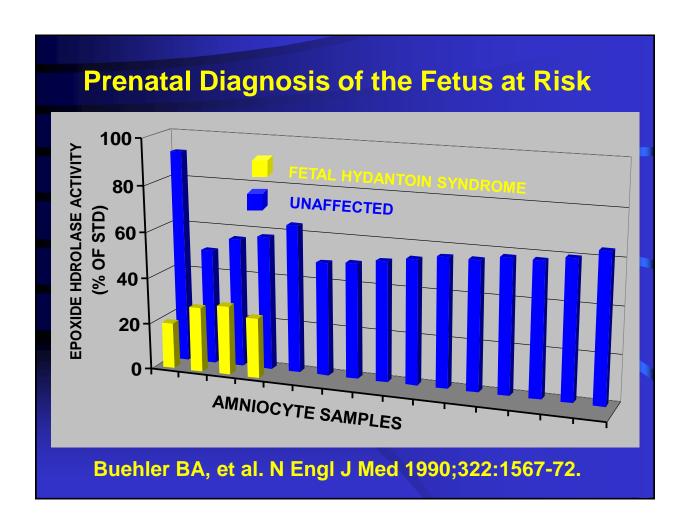

General Principles of Teratology

- Teratogens act with specificity
- Teratogens demonstrate a doseresponse relationship
- Teratogens must reach the conceptus
- Effects depend upon the development stage when exposed
- Genotype of mother and fetus effect susceptibility

Genetic Polymorphisms

- Decreased risk for fetal alcohol syndrome in African American women carrying alcohol dehydrogenase isoform 2

Mechanisms of Teratogenesis All theoretical Most not understood well Implications of a genetic component

Thalidomide

- Thalidomide causes DNA oxidation in animals susceptible to teratogenesis
- Pre-treatment with PBN (free radical trapping agent) reduced thalidomide embryopathy
- Suggesting that the mechansim is free radical-mediated oxidative DNA damage

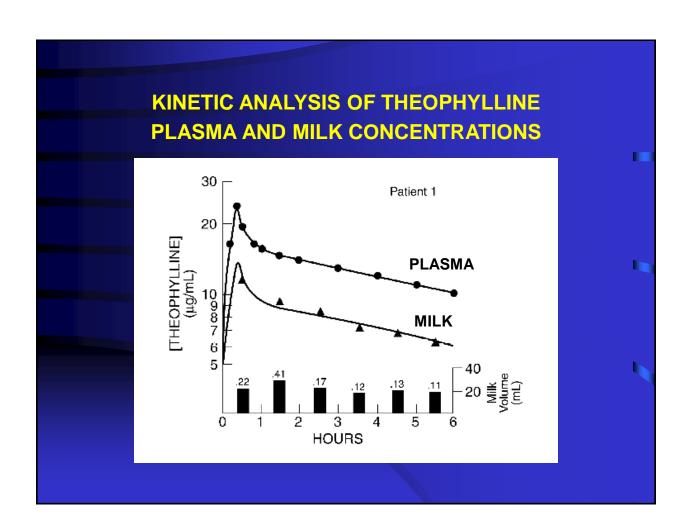

Parman T,et al. Nature Medicine 1999; 5: 582

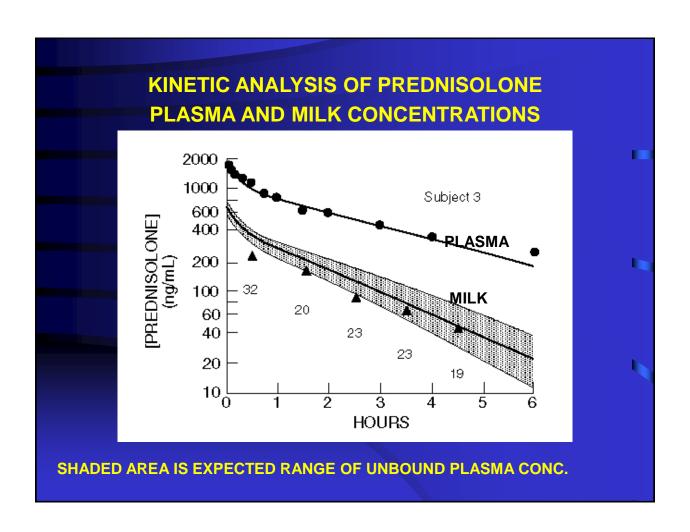

Teratogen?

- Is there a specific pattern of abnormalities?
- Was the agent present during development of that organ system?
- Is there a dose-response curve?
- Could there be a genetic component?

Evaluation of Drugs in Breast Milk Measure the M / P radio Estimate breast milk dose Estimate infant dose Measure blood level in the infant

Drugs in Breast Milk Free drug transferred into milk Milk concentrations usually less than serum concentrations Exchange is bi-directional

Factors Effecting the Milk / Plasma Concentration Ratio

- Maternal protein binding
- Protein binding in milk
- Lipid solubility of drug
- Physiochemical factors of drug effecting diffusion

Drugs Generally Contraindicated during Lactation

- Antineoplastics
- Immune suppressants
- Ergot Alkaloids
- Gold
- lodine
- Lithium carbonate
- Radiopharmaceuticals
- Social drugs & drugs of abuse
- Certain antibiotics

General Recommendations

- Drugs considered safe for pregnancy are usually safe during lactation
- Decrease the drug dose to the infant by feeding just prior to a dose
- Infant blood levels can be monitored and should be less than therapeutic
