

Section 33

Veterans Affairs Adjustment

Purpose: A Department of Veterans Affairs (VA) policy led to concerns about underreporting of cases to some SEER registries for diagnosis years 2005 through 2009, primarily among adult males. Assuming that proportions of cancer cases among males diagnosed by VA hospitals are similar over time, correction factors were estimated for age-adjusted incidence rates in SEER 9 and SEER 17 regions.

Data for Analysis: VA underreporting correction factors were estimated for SEER 9 and SEER 17 groupings. Data to estimate VA underreporting were provided by the following SEER 9 registries: San Francisco-Oakland, Iowa, New Mexico, Seattle, and Atlanta. Based on information provided by the Connecticut and Hawaii registries, the extent of VA underreporting was considered to be similar to registries with more complete information. In Utah, no VA only reports were received, and in Detroit approximately 75% of VA cases were estimated to have been reported by the VA to the registry.

The SEER 17 registries with VA case data included five SEER 9 registries as well as San Jose-Monterrey, Los Angeles, Rural Georgia, Louisiana, and Greater California. Adjustment factors based on VA underreporting in these registries were applied to Kentucky and the Alaskan Native Registry. All cases reported by the New Jersey registry were considered to be reported by sources other than the VA.

Analytic Approach: Correction factors for male cases diagnosed from 2005 through 2009 were estimated with baseline VA hospital data from 2000 through 2003: Correction factor = $(1 - \frac{\text{Reported VA only cases}}{\text{All reported cases}}) / (1 - \text{expected proportion VA only cases})$. The November 2011 submission file is the first to include diagnosis year (DY) 2009. The expected proportion of VA-only cases for DY 2009 in submission year (SY) 2011 is estimated from data on VA-only cases in DY 2000 to 2003, before VA reporting changed. DY 2004 was not considered a baseline or underreporting year:

$$[\text{VA only (DY 2000, SY 2002)} + (\text{DY 2001, SY 2003}) + (\text{DY 2002, SY 2004}) + (\text{DY 2003, SY 2005})] / [(\text{All cases (DY 2000, SY 2002)} + (\text{DY 2001, SY 2003}) + (\text{DY 2002, SY 2004}) + (\text{DY 2003, SY 2005})]$$
. Underreporting of VA cases from DYS 2005 to 2009 was estimated from VA-only case proportions reported in the baseline SYs (Figure 1).

Figure 1. Matrix of VA only case proportions by submission and diagnosis year

Submission Year	Diagnosis Year									
	2000	2001	2002	2003	2004*	2005	2006	2007	2008	2009

2010										
2011	2011 Submission File				5th	4th	3rd	2nd	1st	

Baseline reference years 2000-2003

Years since first submission

*No correlation factor for diagnosis year 2004 was deemed necessary

Age-adjusted and Age- and Race-Specific VA Correction Factors: VA-adjusted correction factors for males in SEER 9 and SEER 17 registries were estimated from available VA underreporting data. VA age-adjusted correction factors were calculated for all races, whites, and blacks of all ages and within four age-specific groups: 0-24, 25-49, 50-74, and 75+ years of age. Few veterans diagnosed with cancer are under 20 years of age, and adjustment factors for this age group were set at 1.0.

VA Reporting Backlog and Delay Adjustment: Typically, most cases diagnosed by a VA hospital are expected to be reported in the first possible data submission year, with a small proportion of delayed case reporting in subsequent submission years. Because some VA reporting has resumed since VA underreporting first occurred the resulting backlog of VA cases could create a surveillance artifact affecting delay-adjusted models. Therefore, VA cases from diagnosis years 2005 through 2008 were therefore redistributed in the 2011 submission file to reflect the expected delay distribution. VA delay-adjustments were integrated into SEER 9 and SEER 13 delay-adjusted models described in CSR technical notes at http://seer.cancer.gov/csr/1975_2009_pops09/technotes/reportingdelay.html and at <http://surveillance.cancer.gov/delay/vabacklog.html>

VA Underreporting Effect on Trends: Effects of correcting for VA underreporting on delay-adjusted cancer incidence trends were modest. After VA-adjustment, four of 15 delay-adjusted joinpoint model results in Table 1 were identical: melanoma, non-Hodgkin lymphoma, leukemia, and pancreas. In eight of 15 models the number of joinpoint segments, year intervals, directions and statistical significance of annual percent change were consistent before and after VA adjustment: all sites (whites), all sites (blacks), prostate, lung and bronchus, colon and rectum, kidney and renal pelvis, oral cavity and pharynx, and liver and intrahepatic bile duct. The last joinpoint segment for all sites (all races) included one more year; however, the direction and statistical significance of annual percent change were identical before and after VA adjustment. There was one less segment in VA-adjusted joinpoint incident trend models for urinary bladder and stomach cancer. After adjustment, a statistically significant annual percent change was seen for urinary bladder cancer (0.3%).

Estimation of Missing VA Cases: The VA correction factors for all cancers combined among males (all races, whites, blacks) in SEER 9 and SEER 17 registries during diagnosis years 2005 to 2009 are listed for all age groups and four age-specific groups (Table 2). Correction factors are often larger for more recent compared to earlier diagnosis years. Cancer site-specific correction factors for all races, whites and blacks are presented in Tables 3 to 14 in descending order of incidence rates. Within the context of variation in age of diagnosis and small numbers by site, correction factors were in a similar range to those for all cancer sites combined for prostate (Table 3), lung and bronchus (Table 4), colon and rectum (Table 5), urinary bladder (Table 6), melanoma of the skin (Table 7), and non-Hodgkin lymphoma (Table 8). Compared to all sites combined, the VA correction factors for black males 50-74 years of age were slightly elevated for cancers of the kidney and renal pelvis (Table 9). The VA correction factors were similar to those for all cancers combined for leukemia (Table 10) and oral cavity and pharynx cancer (Table 11). Underreporting of VA cases among black men 50-74 years of age and 75 years and more was observed for pancreas cancer (Table 12). While VA correction factors for stomach cancer were similar to overall VA correction factors (Table 13), those for liver and intrahepatic bile duct cancer were elevated among black males aged 50-74 years, particularly for DY 2009 (Table 14).

Based on modest and diminishing effects of VA underreporting in the November 2011 submission file compared to the November submission files of 2007 through 2010, a VA Underreporting section will not be included in future editions of the SEER Cancer Statistics Review unless there is an uptick in VA underreporting in future years. The National Cancer Institute will, however, continue to monitor and respond to VA underreporting as it affects registry data quality assessment and to account for surveillance artifacts related to the resumption of VA case reporting that could affect delay-adjusted incidence models.

VA Underreporting adjustment analyses are computed by age (0-24, 25-49, 50-74, 75+), race (all races, White, Black) and cancer site.

* SEER 9 Registries: Connecticut, Hawaii, Iowa, Utah, and New Mexico, metropolitan San Francisco, Detroit, Atlanta, and Seattle-Puget Sound.

Correction factors apply to the November 2011 SEER data submission.

†Joinpoint analyses with up to five joinpoints are based on rates per 100,000 persons and were age-adjusted to the 2000 US standard population (19 age groups – Census p25–1130).

Joinpoint (JP) Regression Program, v 3.5. April 2011, National Cancer Institute.

‡APC is based on delay-adjusted rates that were age-adjusted to the 2000 US standard population (19 age groups – Census p25–1130).

§The APC/AAPC is significantly different from zero ($p < .05$).

¶The AAPC is the Average Annual Percent Change and is based on the APCs calculated by Joinpoint.

||APCs are same as delay-adjusted.
