

MedImmune, Inc

To Whom It May Concern:

MedImmune received your request for a Material Safety Data Sheet (MSDS) for:

**MEDI-522**

In accordance with 29 CFR 1910.1200, the OSHA Hazard Communication Standard, this product is not deemed to be hazardous. Based on a hazard determination as required by the Standard, MEDI-522 does not meet the definition of a hazardous chemical. Therefore, there is no MSDS for this product.

MedImmune, Inc. recognizes that you want to provide as much safety information as possible to your employees regarding the materials they handle and we are happy to assist you in your efforts.

MEDI-522 is a monoclonal antibody produced in cell culture that has been tested and found to be negative for adventitious viruses. There is no toxicity expected from incidental occupational exposure to this product. However, due to the mechanism of action of MEDI-522, it is possible that parenteral exposure to the product could cause effects on fetal and placental tissue, wound healing, or menses. In addition, because the material is a protein compound, sensitizing reactions may be possible.

As is the case with any substance where its potential hazards have not been fully evaluated, precautions should be taken to prevent exposures.

If you have any further questions regarding a MSDS, please call our Health, Safety & Environmental Affairs Department at (800)949-3789 or (301)228-5210.

Sincerely,

Mark S. Tartaglia, CIH  
Associate Director,  
Health, Safety, and Environmental Affairs
