National Admissions to Substance Abuse Treatment Services

ACKNOWLEDGMENTS

This publication was developed for the Substance Abuse and Mental Health Services Administration (SAMHSA), Office of Applied Studies (OAS), by Synectics for Management Decisions, Inc. Arlington, Virginia, under Contract No. 283-97-9001. Significant contributors at Synectics for Management Decisions, Inc., include Leigh Henderson, Christian Evans, and Peter Hurley (Project Director). The report benefitted greatly from reviews by OAS staff Patricia Royston, Sarah Duffy, Gerri Scott-Pinkney, Anna Marsh, and Deborah Trunzo (Project Officer), and by Synectics staff Elizabeth Walter.

PUBLIC DOMAIN NOTICE

All material appearing in this report is in the public domain and may be reproduced or copied without permission from the Substance Abuse and Mental Health Services Administration. Citation of the source is appreciated.

COPIES OF THE PUBLICATION

Copies may be obtained, free of charge, from the National Clearinghouse for Alcohol and Drug Information (NCADI). The NCADI is a service of the Substance Abuse and Mental Health Services Administration (SAMHSA). Write or call NCADI at:

HIGHLIGHTS

• Four substances accounted for over 90 percent of all TEDS admissions in 1997: alcohol (48 percent), opiates (primarily heroin; 16 percent), cocaine (15 percent), and marijuana/hashish (13 percent).

Alcohol

- Alcohol accounted for about half (48 percent) of all TEDS admissions in 1997. However, 44 percent of these admissions reported secondary drug use as well. The proportion of alcohol admissions declined from 1992 to 1997, driven by a decline in admissions for abuse of alcohol alone from 37 percent in 1992 to 27 percent in 1997.
- Alcohol admission rates were generally highest in the West, Midwest, and Northeast. However, a number of States have shown substantial declines in admission rates for primary alcohol use.

Heroin and Other Opiates

- The proportion of opiate admissions surpassed that for cocaine admissions in 1997 for the first time since TEDS data collection began in 1992. The proportion of admissions for primary opiate use increased from 12 percent in 1992 to 16 percent in 1997.
- Heroin admission rates were highest in the West and Northeast. Rate increases over 1992-1997 were evident in Delaware, Oregon, Washington, Michigan, and Utah, and no States showed a decline.
- Most admissions for primary heroin abuse have been injectors of heroin. However, this proportion declined from 77 percent in 1992 to 68 percent in 1997, while the proportion of heroin admissions for inhalation increased from 19 percent in 1992 to 28 percent in 1997.
- Among heroin users experiencing a first treatment episode, the average duration of use was considerably shorter for inhalers and smokers than for injectors (8-9 years, compared to 14 years).

Cocaine/Crack

- The proportion of cocaine admissions fell below that for heroin admissions in 1997. The proportion of admissions for primary cocaine use declined from 18 percent in 1992 to 15 percent in 1997.
- Cocaine admission rates were highest in the Northeast and some Southern States. Trends indicated stable or declining admission rates for primary cocaine use.

• Smoked cocaine (crack) represented 73 percent of all primary cocaine admissions in 1997, a proportion that remained stable over the period 1993-1997.

Marijuana

- The proportion of admissions for primary marijuana use more than doubled between 1992 and 1997, from 6 percent to 13 percent.
- Marijuana admission rates showed substantial increases across a large number of States.
- Marijuana admissions were generally male (77 percent), white (60 percent), and young (49 percent were under 20 years old).
- Marijuana use began at an early age among primary marijuana admissions—more than half (56 percent) had first used marijuana by the age of 14, and 91 percent by the age of 18.

Methamphetamine/Amphetamine and Other Stimulants

- The proportion of admissions for abuse of methamphetamine/amphetamine and other stimulants increased from 2 percent to 5 percent between 1992 and 1997.
- Methamphetamine/amphetamine admissions showed an increase in admission rates over 1992-1997, spreading east from the Pacific States into the Midwest.
- Methamphetamine/amphetamine admissions were predominantly white (81 percent). The next largest racial/ethnic group was persons of Mexican origin, at 7 percent. Females made up 47 percent of methamphetamine/amphetamine admissions.
- Methamphetamine/amphetamines were most frequently inhaled (36 percent), but were injected by 28 percent and smoked by 28 percent.

Inhalants

• Almost one-third (32 percent) of inhalant admissions had used inhalants by the age of 12, and another 30 percent by the age of 14.

CHAPTER 1

DESCRIPTION OF THE TREATMENT EPISODE DATA SET (TEDS)

Introduction

This report presents tabular information and highlights from the Treatment Episode Data Set (TEDS) for 1997, and trend data for 1992-1997. The report provides information on the demographic and substance use characteristics of the 1.5 million annual admissions to treatment for abuse of alcohol and drugs in facilities that report to individual State administrative data systems.

The TEDS system comprises data on treatment admissions that are routinely collected by States in monitoring their individual substance abuse treatment systems. Selected data items from the individual State data files are converted to a standardized format consistent across States. These standardized data constitute TEDS.

TEDS consists of a Minimum Data Set collected by nearly all States, and a Supplemental Data Set collected by some States. The Minimum Data Set consists of 19 items that include:

- Demographic information
- Primary, secondary, and tertiary substances and their route of administration, frequency of use, and age at first use
- Source of referral to treatment
- Number of prior treatment episodes
- Service type, including planned use of methadone.

The Supplemental Data Set consists of 15 items that include psychiatric, social, and economic measures.

Definitions and classifications used in the Minimum and Supplemental Data Sets are detailed in Appendix A.

Because the goal for TEDS is to collect information on entire treatment episodes, SAMHSA is expanding its data collection efforts to include discharge data. These data, when linked to admission data, will enable analyses of questions that cannot be answered with admissions data alone. This system has been field tested, and preliminary results are presented in this report. Definitions and classifications used in the Discharge Data Set are detailed in Appendix A.

History

National-level data collection on admissions to substance abuse treatment was first mandated in 1972 under the Drug Abuse Office and Treatment Act, P.L. 92-255. This act initiated Federal funding for drug treatment and rehabilitation, and required reporting on clients entering drug (but not alcohol) abuse treatment. The Client-Oriented Data Acquisition Process (CODAP) was developed to collect admission and discharge data directly from federally funded drug treatment programs. (Programs for treatment of alcohol abuse were not included.) Reporting was mandatory for all such programs, and data were collected using a standard form. CODAP included all clients in federally-funded programs regardless of individual funding source. Reports were issued from 1973-81 based on data from 1,800-2,000 programs, and including some 200,000 annual admissions.

In 1981, collection of national-level data on admissions to substance abuse treatment was discontinued because of the introduction of the Alcohol and Drug Abuse and Mental Health Services (ADMS) Block Grant. The Block Grant transferred Federal funding from individual programs to the States for distribution, and included no data reporting requirement. Participation in CODAP became voluntary, and although several States submitted data through 1984, the data were in no way nationally representative.

In 1988, the Comprehensive Alcohol Abuse, Drug Abuse, and Mental Health Amendments (P.L. 100-690) established a revised Substance Abuse Prevention and Treatment (SAPT) Block Grant, and mandated Federal data collection on clients receiving substance abuse treatment. The Treatment Episode Data Set (TEDS) data collection effort represents the Federal response to this mandate. TEDS began in 1989 with the issue of three-year development grants to States. State participation in TEDS is to some extent voluntary—contingent on acceptance of SAPT Block Grant funds.

TEDS in the Context of DASIS

TEDS is one of the three components of SAMHSA's Drug and Alcohol Services Information System (DASIS). DASIS was created in 1995 to facilitate the integration of SAMHSA's existing treatment services data sets and to reduce redundancy and reporting burdens. The core of DASIS is the National Master Facility Inventory (NMFI), a continuously-updated comprehensive listing of all known substance abuse treatment facilities, and State-identified prevention and education facilities. The third component of DASIS is the Uniform Facility Data Set (UFDS) survey, an annual survey of the location, characteristics, and use of alcoholism and drug abuse treatment facilities. A unique ID

number assigned to the NMFI facility is used in the collection of client-level data (TEDS) and facility-level data (UFDS) so that the three data sets can be linked. Together, they provide national- and State-level information on the numbers and characteristics of individuals admitted to alcohol and drug treatment and describe the facilities that deliver care to those individuals.

TEDS includes facilities that are licensed or certified by the State substance abuse agency to provide substance abuse treatment (or are administratively tracked for other reasons), and that are required by the States to provide TEDS client-level data.

Limitations of TEDS

TEDS, while comprising a significant proportion of all admissions to substance abuse treatment, does not include all such admissions. TEDS is a compilation of facilities in State administrative systems. The scope of facilities included in TEDS is affected by differences in State systems of licensure, certification, accreditation, and the disbursement of public funds. For example, some State substance abuse agencies regulate private facilities and individual practitioners, while others do not. In some States, hospital-based substance abuse treatment facilities are not licensed through the State substance abuse agency. Some State substance abuse agencies track correctional facilities (State prisons and local jails), while others do not.

In general, facilities reporting TEDS data are those that receive State alcohol and/or drug agency funds (including Federal Block Grant funds) for the provision of alcohol and/or drug treatment services (see Chapter 4). Thus TEDS, while it does not comprise all admissions to substance abuse treatment, does include those admissions that constitute a burden on public

funds. Most States are able to report all admissions to all eligible facilities, although some report only those admissions that were financed by public funds. States may report data from facilities that do not receive public funds, but generally do not because of the difficulty in obtaining data from these facilities. TEDS also does not include data on facilities operated by Federal agencies. These include the Bureau of Prisons, the Department of Defense, and the Veterans Administration. However, some facilities operated by the Indian Health Service are included.

The primary goal for TEDS is to monitor the characteristics of treatment episodes for substance abusers. Implicit in the concept of treatment is a planned, continuing treatment regimen. Thus TEDS does not attempt to include early intervention programs (considered as prevention programs). Crisis intervention facilities such as sobering-up stations and hospital emergency departments are generally not included in TEDS, although a State may opt to include such programs in its submissions to TEDS.

Interpretation of the Data

TEDS is an exceptionally large and powerful data set. Like all data sets, however, care must be taken that interpretation does not extend beyond the limitations of the data. Limitations fall into two broad categories: those related to the scope of the data collection system, and those related to the difficulties of aggregating data from the highly diverse State data collection systems. Limitations to be kept in mind while analyzing the TEDS data include:

 TEDS is an admission-based system, and TEDS admissions do not represent individuals. A given individual admitted to treatment twice within a given year would be counted as two admissions. Most States cannot, for reasons of confidentiality, identify clients with a unique ID assigned at the State level. Consequently TEDS is unable to follow individual clients through a sequence of treatment episodes.

- TEDS attempts to enumerate treatment episodes by distinguishing the initial admission of a client from his/her subsequent transfer to a different service type (for example, from residential treatment to outpatient) within a single continuous treatment episode. However, States differ greatly in their ability to identify transfers; some can distinguish transfers within providers but not across providers (see Chapter 4). Some admission records may in fact represent transfers, and therefore the number of admissions reported probably overestimates the number of treatment episodes.
- The number and client mix of TEDS admissions does not represent the total national demand for substance abuse treatment, nor the prevalence of substance use in the general population.
- In reporting TEDS data, SAMHSA must balance timeliness of reporting with completeness of the data set. States rely on individual facilities to report in a timely manner. States then bundle the data and report them to SAMHSA at regular intervals. Admissions from facilities that report late to the States may appear in a later data submission to SAMHSA. Thus the number of admissions reported here for 1997 may be expected to increase by as much as 10 percent as submissions of 1997 data continue. However, the additional submissions are unlikely to affect the percentage distributions that are the basis of this report.

 States continually review the quality of their data processing. When systematic errors are identified, States may revise or replace historical TEDS data files. While this process represents an improvement in the data system, the historical statistics in this report will differ slightly from those in earlier reports.

Considerations specific to this report include:

- The report includes initial client admissions records that were received and processed by SAMHSA through January 30, 1999.
- The report focuses on treatment admissions for substance abusers. Thus admissions for treatment as a codependent of a substance abuser are excluded. Records for identifiable transfers within a single treatment episode are also excluded.
- Records with partially complete data have been retained. Where records include missing or invalid data for a specific variable, that record is excluded from tabulations of that variable. The total number of admissions on which a percentage distribution is based is reported in each table.

- Primary alcohol admissions are characterized as Alcohol only or Alcohol with secondary drug. Alcohol with secondary drug indicates a primary alcohol admission with a specified secondary or tertiary drug. All other alcohol admissions are classified as Alcohol only.
- Cocaine admissions are classified according to route of administration as *Smoked* and *Other route*. Smoked cocaine primarily represents crack or rock cocaine, but can also include cocaine hydrochloride (powder cocaine) when it is free-based. Non-smoked cocaine includes cocaine admissions where the route of administration is not reported, and thus the TEDS estimate of the proportion of admissions for smoked cocaine is conservative.
- Methamphetamine/amphetamine admissions include admissions for both methamphetamine and amphetamine, but are primarily methamphetamine. Four States (Arkansas, Connecticut, Oregon, and Texas) do not distinguish methamphetamine and amphetamine admissions. However, for the States that make this distinction, methamphetamine makes up 93% of combined methamphetamine/amphetamine admissions.

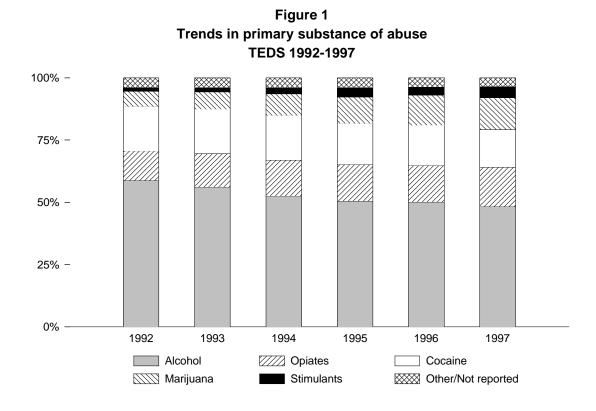

CHAPTER 2

OVERVIEW AND TRENDS: 1992-1997¹

Trend data are invaluable in monitoring changing patterns in substance abuse treatment admissions. These patterns reflect underlying changes in substance use in the population, and have important implications for resource allocation and program planning.

Trends in Primary Substance of Abuse

Table 2.1 and Figure 1. TEDS treatment admissions are dominated by four substances that together account for over 90 percent of all TEDS admissions. These are alcohol, opiates (primarily heroin), cocaine, and marijuana/hashish.

¹ TEDS trend data were compiled for 1992-1997 for the 47 States and jurisdictions that reported in 1997. Excluded were: Arizona, which collects encounter-based data that cannot currently be converted to admissions; Mississippi, which does not currently participate in the TEDS system; and Indiana, Puerto Rico, and West Virginia, which are implementing systems changes.

- *Alcohol* accounted for about half (48 percent) of all TEDS admissions in 1997. However, 44 percent of these admissions reported secondary drug use as well. The proportion of alcohol admissions declined from 1992-1997, driven by a decline in admissions for abuse of alcohol alone from 37 percent in 1992 to 27 percent in 1997.
- The proportion of *opiate* admissions surpassed that for *cocaine* admissions in 1997. This is the first year since TEDS data collection began in 1992 that this has occurred. Changes in both opiate and cocaine admissions were found:
 - The proportion of admissions for primary *opiate* use increased from 12 percent in 1992 to 16 percent in 1997.
 - The proportion of admissions for primary *cocaine* use declined from 18 percent in 1992 to 15 percent in 1997. Smoked cocaine (crack) represented 73 percent of all primary cocaine admissions in 1997, a proportion that remained stable over the period 1993-1997.
- The proportion of admissions for primary *marijuana* use more than doubled between 1992 and 1997, from 6 percent to 13 percent.
- The proportion of admissions for abuse of *methamphetamine/amphetamine* and other stimulants increased from 2 percent to 5 percent between 1992 and 1997.
- Admissions attributable to *sedatives and tranquilizers* represent a small and stable proportion of TEDS admissions (one-half of 1 percent).
- Abuse of *hallucinogens*, *PCP*, *inhalants*, *and over-the-counter medications* together accounted for only about one-half of 1 percent of TEDS admissions in 1997.

Trends in the Co-Abuse of Alcohol and Drugs

Table 2.2 and Figure 2. The concurrent abuse of alcohol and drugs is a significant problem. In 1997, 44 percent of all admissions reported problems with both alcohol and drugs. Twenty-three percent reported primary drug abuse with secondary alcohol use, and 21 percent reported primary alcohol abuse with secondary drug use.

Primary alcohol use declined from 59 percent of TEDS admissions in 1992 to 48 percent in 1997. Primary drug use increased from 39 percent in 1992 to 49 percent in 1997. This may reflect changing priorities in the treatment system rather than a change in substance use patterns. Limited resources and targeted programs may result in a shift of State funds from treatment of alcohol abusers to treatment of drug abusers.

Figure 2 Trends in the co-abuse of alcohol and drugs TEDS 1992-1997 100% -75% -50% -25% -0% 1994 1997 1992 1993 1995 1996 Alcohol only Alcohol w/secondary drug Drug w/secondary alcohol Drug only Not reported

9

Trends in Admission Rates by Primary Substance and State

Figures 3-7 are maps portraying changing patterns in State admission rates for selected substances from 1992-1997. Shading for each substance indicates change relative to the 1992 admission rate for the total United States. Light gray indicates States whose rates were below the 1992 U.S. rate. Dark gray indicates States whose rates were above the 1992 U.S. rate, and black indicates States with extremely high rates (the 1992 U.S. rate plus twice the change in the U.S. rate from 1992-1997). White indicates States for which no data were available.

 Alcohol admission rates were generally highest in the West, Midwest, and Northeast. However, a number of States showed substantial declines in admission rates for primary alcohol use.

- Heroin admission rates were highest in the West and Northeast. Rate increases over 1992-1997 were evident in Delaware, Oregon, Washington, Michigan, and Utah, and no States showed a decline.
- Cocaine admission rates were highest in the Northeast and some Southern States. Trends indicated stable or declining admission rates for primary cocaine use.
- Marijuana admission rates showed substantial increases across a large number of States.
- Methamphetamine/amphetamine admissions showed an increase in admission rates, spreading east from the Pacific States into the Midwest.

(per 100,000 population aged 12 and over)

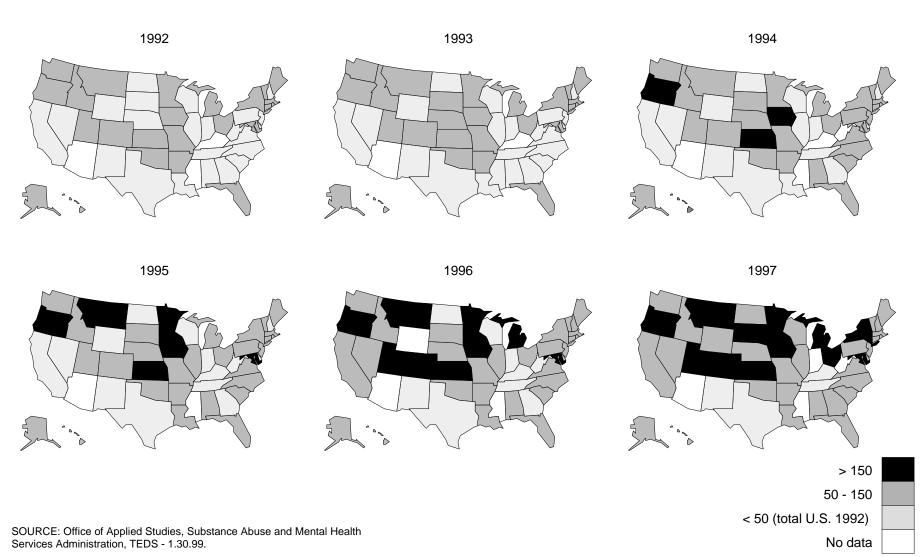

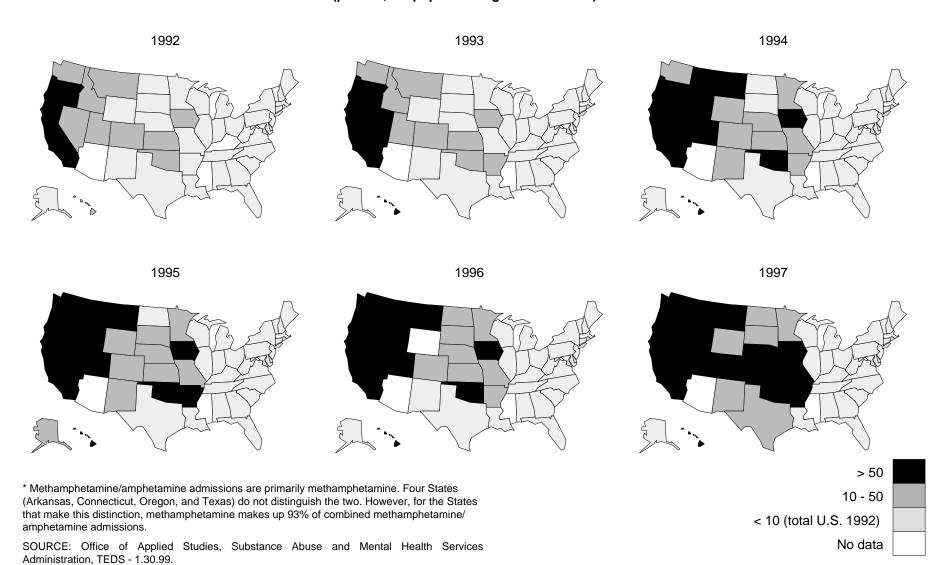

Figure 7

Primary methamphetamine/amphetamine* admission rates by State: 1992-1997

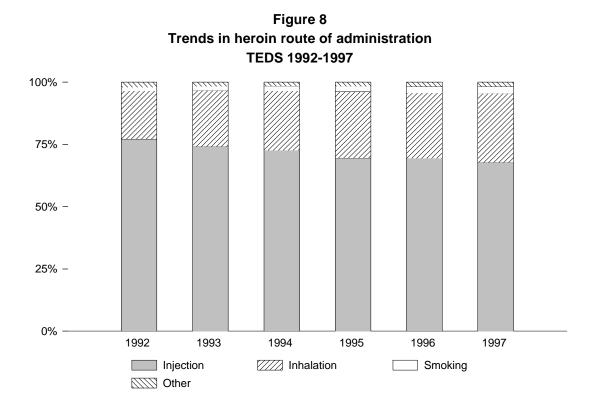

(per 100,000 population aged 12 and over)

Trends in Heroin Admissions by Route of Administration

Table 2.3 and Figure 8. Most admissions for primary heroin abuse have been injectors of heroin. However, this proportion declined from 77 percent in 1992 to 68 percent in 1997. Most of the change is because of an increase in the proportion of admissions for heroin inhalation, from 19 percent in 1992 to 28 percent in 1997.

Admissions for heroin inhalation tend to be younger than for heroin injection (33 percent below age 30 in 1997, compared to 22 percent). They are more likely to be experiencing a first treatment episode than are injectors (28 percent compared to 18 percent). Inhalers who enter treatment for the first time have been using heroin for a shorter period of time than injectors entering treatment for the first time (an average of 9 years, compared to 14 years).

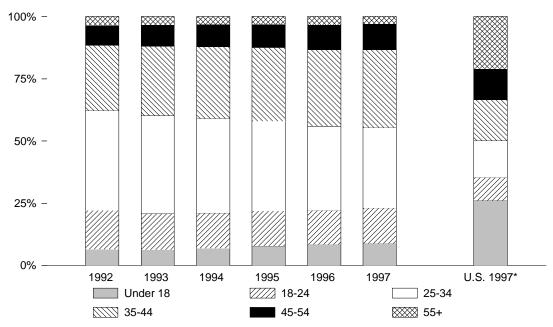

Trends in Demographic Characteristics

Table 2.4. The sex distribution of TEDS admissions is different from that of the U.S. population. In the United States, about half the population is male, while in TEDS, males represented 70 percent of admissions in 1997, a proportion that remained fairly stable from 1992-1997.

Table 2.4 and Figure 9. The age distribution of TEDS treatment admissions is different from that of the U.S. population. Some 88 percent of TEDS admissions in 1997 were between the ages of 18 and 54, compared to about 53 percent of the U.S. population.

Within TEDS treatment admissions, the proportion that is older has increased since 1992. Admissions for those aged 35-54 increased from 34 percent in 1992 to 42 percent in 1997. The proportion of treatment admissions aged 25-34 declined from 40 percent in 1992 to 32 percent in 1997. The proportion of those under 18 has increased slightly, from 7 percent in 1992 to 9 percent in 1997.

Figure 9
Trends in age at admission
TEDS 1992-1997 compared to U.S. population 1997

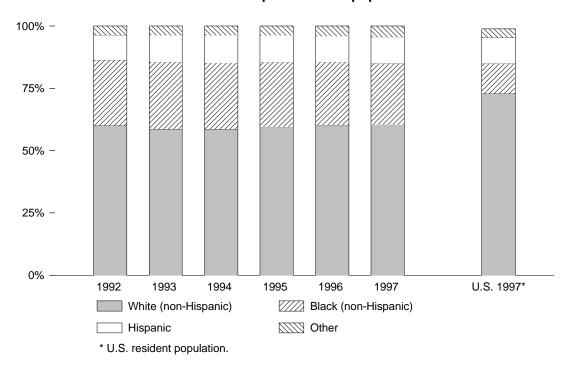

^{*} U.S. resident population.

Table 2.4 and Figure 10. The racial/ethnic composition of TEDS admissions is somewhat different from that of the U.S. population. Non-Hispanic whites are the majority in both groups, but represented 61 percent of TEDS admissions in 1997, compared to 73 percent of the U.S. population. Non-Hispanic blacks represented 25 percent of TEDS admissions in 1997, and 12 percent of the U.S. population.

The racial/ethnic composition of TEDS admissions has remained fairly constant since 1992, at about 60 percent non-Hispanic white, 25 percent non-Hispanic black, 11 percent Hispanic, and 4 percent other groups.

Figure 10
Trends in race/ethnicity
TEDS 1992-1997 compared to U.S. population 1997

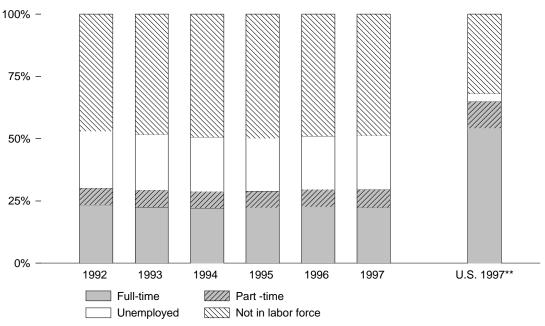

Trends in Socio-Economic Status

Table 2.5. TEDS admissions aged 18 and older are socio-economically disadvantaged compared to the U.S. population. This is evident in the unadjusted distributions of employment status and education. Because TEDS admissions are different demographically from the U.S. population, the distributions have been statistically adjusted to provide a more valid comparison to the U.S. population. The adjusted distributions indicate an even greater disparity than do the unadjusted.

Table 2.5 and Figure 11. TEDS admissions aged 18 and over were much less likely to be employed than was the U.S. population of that age. About half of TEDS admissions (49 percent) were not in the labor force in 1997, compared to 32 percent of the U.S. population. Only 22 percent were employed full-time, compared to 54 percent of the U.S. population. These proportions were relatively stable from 1992-1997.

Figure 11
Trends in employment status, aged 18 and older
TEDS* 1992-1997 compared to U.S. population 1997

^{*} Adjusted for age, sex, and race/ethnicity to the U.S. population.

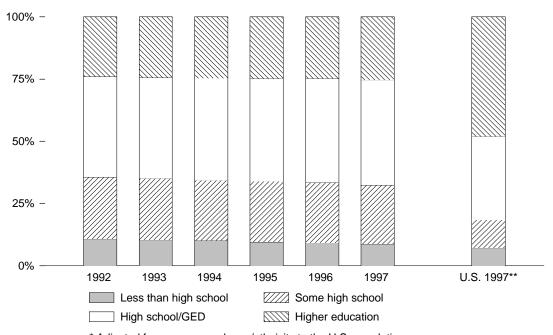

^{**} U.S. noninstitutional population.

¹ The distributions have been adjusted for age, sex, and race/ethnicity to the U.S. population. In essence, this technique compares the distributions under the assumption that the TEDS population and the U.S. population had the same age, sex, and racial/ethnic characteristics.

Table 2.4 and Figure 12. TEDS admissions aged 18 and over generally had less education than the U.S. population of that age. TEDS admissions were less likely to have completed high school (68 percent of those aged 18 and

over completed high school, compared to 81 percent for the U.S. population) and to have received higher education (25 percent vs. 48 percent). These proportions were relatively stable from 1992-1997.

CHAPTER 3

CHARACTERISTICS OF ADMISSIONS: 1997

This chapter highlights important findings in the 1997 data (see Tables 3.1a-3.10). These tables include all items in the TEDS Minimum and Supplemental Data Set for 1997, presented as percentage distributions according to primary substance of abuse. The stacked bar charts in this chapter emphasize the major users of each substance in terms of sex, age, and race/ethnicity. For detailed information on sub-groups, see the associated tables.

All Admissions

• White males made up 42 percent of all treatment admissions in 1997, followed by white females (18 percent), black males (17 percent), and black females (8 percent) (Table 3.2a). Admissions for females peaked at age 30-34, and admissions for males at 35-39 (Figure 13 and Table 3.2a).

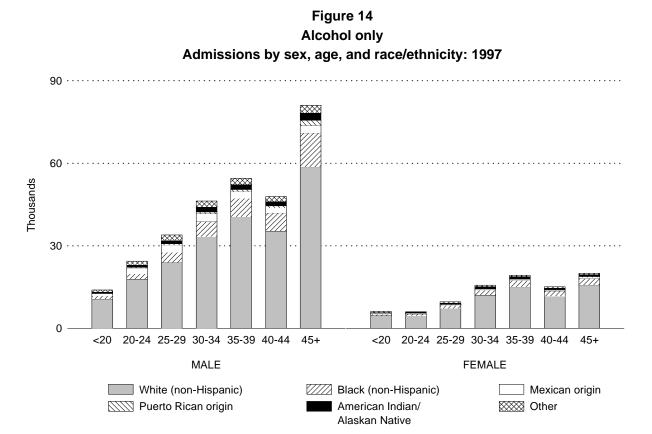

¹ See Chapter 4, Tables 4.3 and 4.4, for State-by-State and total item response rates. See Appendix A for details of the categories for the individual items in the data set.

² In the bar charts, admissions of Mexican and Puerto Rican origin made up 77 percent of Hispanic admissions. The category *Other* includes Hispanics not of Mexican or Puerto Rican origin, Asian/Pacific Islanders, and all others.

Alcohol Only

- Admissions for abuse of alcohol alone, with no secondary drug abuse, represented 27 percent of TEDS admissions in 1997 (Table 3.1b).
- Alcohol-only admissions tended to be male (77 percent) and white (74 percent), with white males making up 56 percent of all alcohol-only admissions (Tables 3.1a and 3.2a). Alcohol alone was the substance most likely to be reported by admissions aged 35 and older (Table 3.1b).
- Eighty percent of alcohol-only admissions reported that they first became intoxicated by the age of 18 (Table 3.3).
- Half of all alcohol-only admissions reported that they had not been in treatment before the current episode (Table 3.3).
- The criminal justice system was responsible for referring 45 percent of alcohol-only admissions to treatment (Table 3.4).

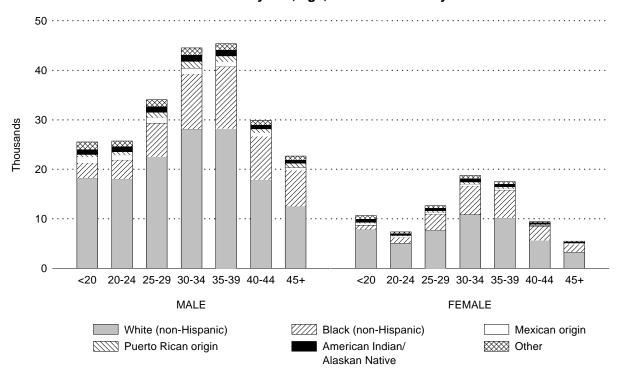

22

Alcohol with Secondary Drug Use

- Admissions for primary abuse of alcohol with secondary use of drugs represented 21 percent of TEDS admissions in 1997 (Table 3.1b).
- Admissions for abuse of alcohol with secondary drug use differed markedly from those for abuse of alcohol alone. These admissions were less likely to be white (63 percent vs. 74 percent). The average age at admission was lower, at 32 years vs. 38 years (Figure 15 and Table 3.1a).
- Marijuana was the substance most frequently reported as a secondary substance by alcohol admissions (62 percent). Smoked cocaine was reported as a secondary substance by 27 percent (Table 3.6).

Figure 15
Alcohol with secondary drug use
Admissions by sex, age, and race/ethnicity: 1997

Heroin

- Heroin and other opiates were the leading illicit drugs responsible for treatment admissions in 1997, accounting for 16 percent of TEDS admissions in 1997 (Table 3.1b). Ninety-four percent of these admissions were for heroin.
- Thirty-five percent of heroin admissions were at least 40 years old (Table 3.1a). Forty-eight percent of heroin admissions were white (Table 3.1a). However, half (48 percent) of all admissions of persons of Puerto Rican origin, and about one-third (32 percent) of persons of Mexican origin, were for primary heroin use (Table 3.1b).
- The most common route of administration for heroin was injection (68 percent). However, 28 percent of admissions reported

- inhalation (snorting) as their preferred route of administration (Table 3.3).
- Heroin admissions reported secondary use of non-smoked cocaine (27 percent), alcohol (26 percent), smoked cocaine (12 percent), and marijuana (12 percent) (Table 3.6).
- Daily heroin use was reported by 83 percent of heroin admissions (Table 3.3).
- Most heroin admissions (79 percent) had been in treatment before the current episode, and 27 percent had been in treatment 5 or more times (Table 3.3).
- Methadone use was planned as part of treatment for 42 percent of primary heroin admissions (Table 3.4).

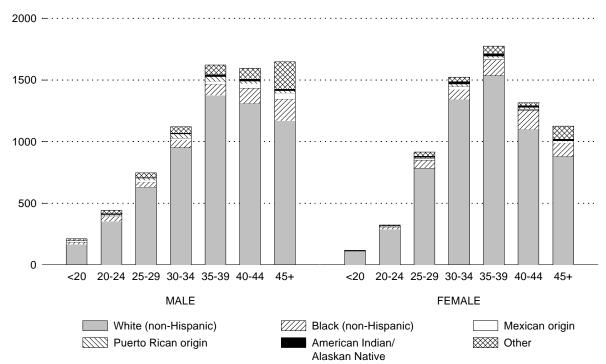

Figure 16
Heroin
x age and racele

Other Opiates

- Opiates other than heroin accounted for one percent of TEDS admissions in 1997 (Table 3.1b).
- Admissions for other opiates were 49 percent female and 83 percent white (Table 3.1a).
- The most frequent route of administration was oral (74 percent) (Table 3.3).

- Thirty percent first used opiates other than heroin after age 30 (Table 3.3).
- Methadone use as part of treatment was planned for 24 percent of other opiate admissions (Table 3.4).
- Forty-one percent of other opiate admissions reported no abuse of other substances (Table 3.6).

Figure 17
Other opiates
Admissions by sex, age, and race/ethnicity: 1997

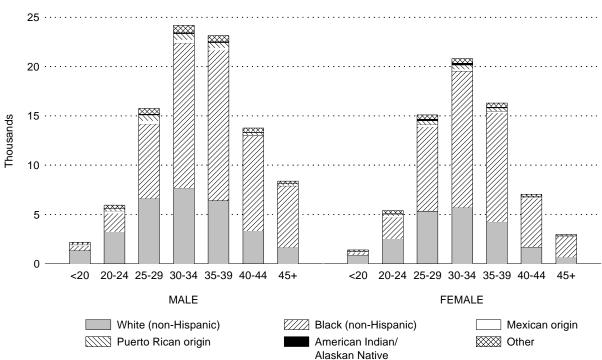

Smoked Cocaine (Crack)

- In 1997, cocaine fell behind opiates as the leading illicit drug responsible for TEDS admissions, accounting for 11 percent of admissions. About three-quarters (74 percent) of cocaine admissions were for smoked cocaine (crack) (Tables 3.1a and 3.1b).
- Smoked cocaine admissions, when compared to total TEDS admissions, were disproportionately black and female—61 percent of these admissions were black, and

- 43 percent were female, compared to 25 percent and 30 percent of all TEDS admissions (Table 3.1a).
- Smoked cocaine was the primary substance most frequently reported by black admissions (28 percent of black treatment admissions) (Table 3.1b).
- Daily use was reported by 40 percent of smoked cocaine admissions (Table 3.3).

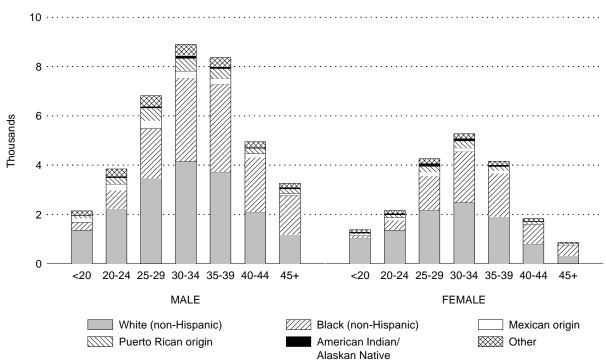

Figure 18
Smoked cocaine (crack)
Admissions by sex, age, and race/ethnicity: 1997

Non-Smoked Cocaine

- Non-smoked cocaine accounted for 4 percent of TEDS admissions in 1997 (Table 3.1b).
- About two-thirds (69 percent) of admissions for non-smoked cocaine reported inhalation as the route of administration (Table 3.3).
- Admissions for cocaine taken by routes other than smoking were more likely to be white and male than were smoked cocaine admissions—49 percent of these admissions were white, and 66 percent were male (Table 3.1a).

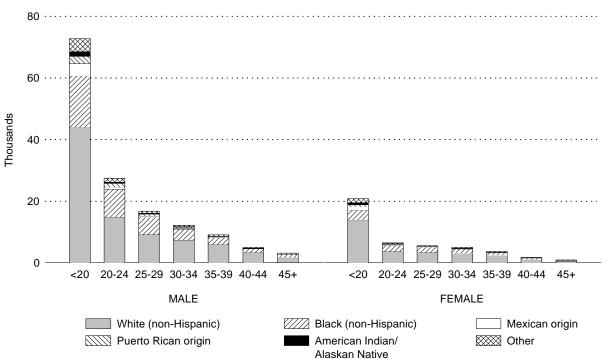

Figure 19
Non-smoked cocaine
Admissions by sex, age, and race/ethnicity: 1997

Marijuana/Hashish

- Primary marijuana abuse accounted for 13 percent of TEDS admissions in 1997 (Table 3.1b).
- Marijuana admissions were generally male, white, and young. More than three-quarters (77 percent) were male, 60 percent were white, and 49 percent were under 20 years old (Table 3.1a). Marijuana accounted for half of all admissions for persons under 20 (Table 3.1b).
- Marijuana use began at an early age among primary marijuana admissions—more than half (56 percent) had first used marijuana by the age of 14, and 91 percent by the age of 18 (Table 3.3).
- About half (52 percent) of marijuana treatment admissions were referred through the criminal justice system (Table 3.4).
- Secondary use of alcohol was reported by 59 percent of admissions for primary marijuana abuse (Table 3.6).

Figure 20 Marijuana/hashish Admissions by sex, age, and race/ethnicity: 1997

Methamphetamine/Amphetamine and Other Stimulants

- Methamphetamine/amphetamines and other stimulants were reported as the primary substance for 4.5 percent of 1997 TEDS admissions (Table 3.1b). Methamphetamine/amphetamine admissions include admissions for both methamphetamine and amphetamine, but are primarily methamphetamine. Four States do not distinguish methamphetamine from other amphetamine admissions. However, for the States that make this distinction, methamphetamine represents 93% of combined methamphetamine/amphetamine admissions.
- Methamphetamine/amphetamine admissions were predominantly white (81 percent). The next largest racial/ethnic group was persons of Mexican origin, at 7 percent (Table 3.1a).

- Females made up 47 percent of methamphetamine/amphetamine admissions (Table 3.1a). Methamphetamine/amphetamine admissions peaked at age 25-34 for both males and females (Figure 21 and Table 3.2a).
- Methamphetamine/amphetamines were most frequently inhaled (36 percent of amphetamine admissions), but were injected by 28 percent and smoked by 28 percent (Table 3.3).
- Seventy-five percent of methamphetamine/ amphetamine admissions reported use of other drugs as well. Use of marijuana/hashish was reported by 47 percent, and alcohol by 45 percent (Table 3.6).

Figure 21

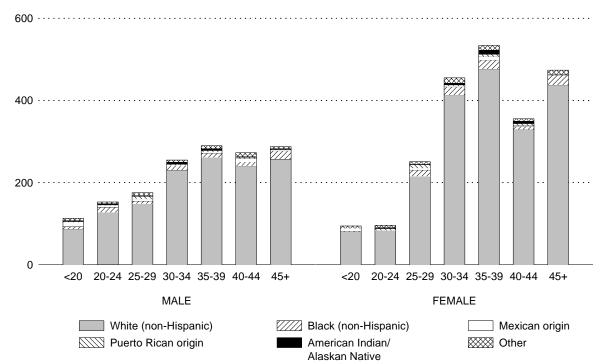

Methamphetamine/amphetamine and other stimulants

Admissions by sex, age, and race/ethnicity: 1997

Tranquilizers

- Tranquilizers were reported as the primary substance by 0.3 percent of TEDS admissions (Table 3.1b).
- Admissions for abuse of tranquilizers tended to be female (60 percent) and white (89 percent). Fifty-seven percent were aged 30 to 44 (Table 3.1a).
- Among primary tranquilizer admissions, 63 percent reported daily use of tranquilizers (Table 3.3).
- Forty-one percent of primary tranquilizer admissions reported use of alcohol as well as tranquilizers. Eighteen percent reported use of marijuana/hashish, and 13 percent reported use of opiates other than heroin (Table 3.6).
- Most entered treatment through individual referral (37 percent) or referral from another health care provider (19 percent) (Table 3.4).

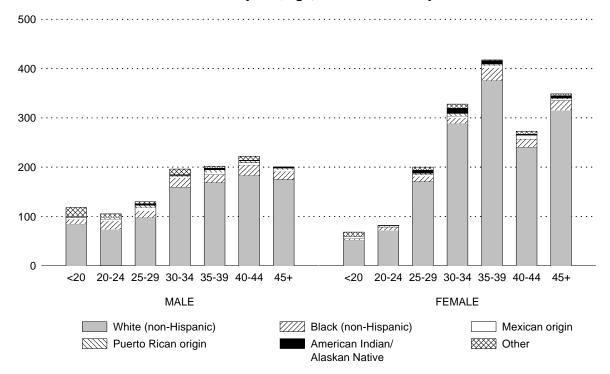

Figure 22
Tranquilizers
Admissions by sex, age, and race/ethnicity: 1997

Sedatives

- Admissions for primary sedative abuse were responsible for 0.2 percent of TEDS admissions in 1997 (Table 3.1b).
- Sedative admissions showed patterns similar to those for abuse of tranquilizers. They tended to be female (59 percent), white (85 percent), and from 30-44 years old (57 percent) (Table 3.1a).
- Fifty-three percent of sedative admissions reported daily use (Table 3.3).
- Thirty-three percent of sedative admissions reported use of alcohol as a secondary substance (Table 3.6).

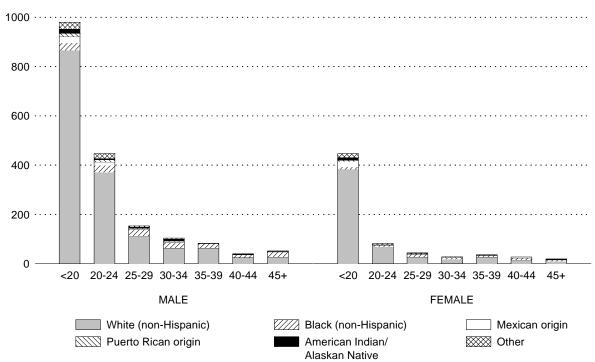

Figure 23
Sedatives
Admissions by sex, age, and race/ethnicity: 1997

Hallucinogens

- Hallucinogens were responsible for 0.2 percent of TEDS admissions in 1997 (Table 3.1b). Hallucinogens include LSD, DMT, STP, mescaline, psilocybin, peyote, etc.
- Admissions for hallucinogen abuse occurred primarily among white males of high school and college age. Admissions were 73 percent male and 82 percent white. Fifty percent were between 15 and 19, and 21 percent were between 20 and 24 (Table 3.1a).
- Hallucinogen admissions were likely to use a range of drugs—82 percent reported use of drugs other than hallucinogens. Marijuana/ hashish and alcohol were most common (used by 58 percent and 42 percent, respectively). Non-smoked cocaine and amphetamine use were reported by 11 percent each (Table 3.6).
- Thirty-six percent of hallucinogen admissions were referred through the criminal justice system (Table 3.4).

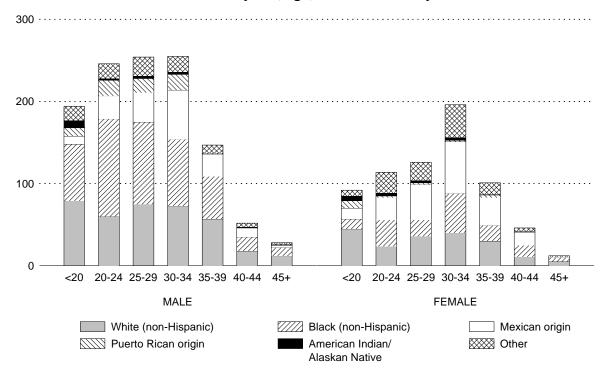

Figure 24
Hallucinogens
Admissions by sex, age, and race/ethnicity: 1997

Phencyclidine (PCP)

- Phencyclidine (PCP) was reported as a primary substance by 0.1 percent of TEDS admissions in 1997 (Table 3.1b).
- PCP admissions were approximately evenly split among non-Hispanic whites (30 percent), non-Hispanic blacks (32 percent), and Hispanics (32 percent) (Table 3.1a).
- PCP admissions for females peaked at age 30-34, but for males were at a fairly constant level for ages 20-34 (Figure 25 and Table 3.2a).
- Eighty percent of PCP admissions reported use of other drugs. Alcohol was reported by 44 percent, marijuana/hashish by 36 percent, smoked cocaine by 16 percent, and nonsmoked cocaine by 11 percent (Table 3.6).
- The usual route of administration for PCP was smoking, reported by 88 percent of admissions (Table 3.3).

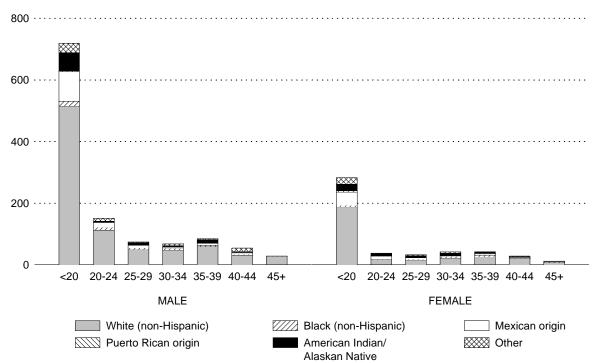

Figure 25
Phencyclidine (PCP)
Admissions by sex, age, and race/ethnicity: 1997

Inhalants

- Inhalants were reported as the primary substance of abuse by 0.1 percent of TEDS admissions (Table 3.1b). Inhalants include ether, glue, chloroform, nitrous oxide, gasoline, paint thinner, etc.
- Admissions for inhalant abuse were generally male (71 percent). While 69 percent of inhalant admissions were non-Hispanic white, the next most common racial/ethnic groups were persons of Mexican origin (12 percent) and American Indians (9 percent) (Table 3.1a).
- The predominant characteristic of inhalant admissions was youth—61 percent were under 20 (Table 3.1a).
- Almost one-third (32 percent) of inhalant admissions had used inhalants by the age of 12, and another 30 percent by the age of 14 (Table 3.3).
- About two-thirds of admissions for inhalant abuse reported use of other drugs as well, primarily alcohol (44 percent) and marijuana/hashish (41 percent) (Table 3.6).

Figure 26 Inhalants Admissions by sex, age, and race/ethnicity: 1997

CHAPTER 4

STATE DATA: 1992-1997

TEDS aggregates data collected through the disparate data collection systems of the Single State Agencies (SSAs) for substance prevention and treatment. States have cooperated with the Federal government in the data collection process, and substantial progress has been made toward developing a standardized data set. However, because each State system is unique, and each State has unique powers and mandates, significant differences exist among States. These differences are compounded by evolving health care payment systems. Table 4.1 presents key characteristics of State data collection systems.

State-to-State comparisons must be made with extreme caution. Some sources of apparent State-to-State variation in substance abuse patterns include:

 Completeness of reporting. Completeness of reporting at the cut-off date for preparation of this report varied from State to State. Future submissions of 1997 data are unlikely to affect the percentage distributions that are the basis of this report but may affect Statelevel counts and rates of admission. In addition, States review and improve their data collection and processing. Occasionally, States send revised data for earlier years to TEDS.

Figure 27 shows individual State admissions reporting patterns by month. Table B.3 (Appendix B) gives estimates by State of the number of 1997 admissions expected in late data submissions.

• Facilities included. Most States require facilities that receive State/public funding to report data to the State. 'State/public funding' generally refers to funding distributed by the SSA, but may also include funding distributed through another public agency. Some States require that additional categories (e.g., private facilities, methadone clinics, etc.) also report. In some States, other categories of facilities report voluntarily.

Table 4.1 contains additional details. Table B.3 (Appendix B) gives estimates by State of the number of 1997 admissions in facilities not eligible to report to TEDS.

- Clients included. Most States report data on all clients in a facility that is required to report to the State. However, some States report only those clients that receive State/public funds. See Table 4.1 for additional details.
- Admissions and transfers. Great variation is seen in the States' ability to identify and report client admissions and transfers. The goal for the TEDS system is to identify treatment episodes. Thus a change in service type or a change in provider, without an interruption in treatment, would ideally be categorized as a transfer. This requires, however, that clients be assigned unique IDs that can be linked across providers, and not all States are legally and/or technologically able to do this. A majority of States can identify transfers that occur when a client changes service type within the structure of

all States are legally and/or technologically able to do this. A majority of States can identify transfers that occur when a client changes service type within the structure of a given provider. However, far fewer can identify a transfer that occurs when a client changes providers. Several States do not themselves track transfers, but report as transfers to TEDS those clients who are discharged and readmitted within a specified time-period (which may vary from State to State). See Table 4.1 for additional details. Annual counts of admissions, transfers, and co-dependents are shown in Table 4.2.

 Data items. Not all States report all data items in the Minimum and Supplemental Data Sets. Most States report the Minimum Data Set for all or nearly all clients. However, the items reported from the Supplemental Data Set vary tremendously across States.

Tables 4.3 and 4.4 indicate, by State, the item response rates for the Minimum and Supplemental Data Sets.

• Treatment resources available. States differ widely in the amount of public funding available for substance abuse treatment, and in the constraints placed on the use of funds. States may be directed to target special populations such as pregnant women or adolescents. Where funds are limited, States may be compelled to exercise triage in admitting persons to treatment, admitting only those with the most 'severe' problems. In States with higher funding levels, a larger proportion of the population in need of treatment may be admitted, including the less severely impaired.

 Population subgroups. States may include or exclude certain sectors of the treatment population, and this relationship may change over time. For example, treatment programs based in the criminal justice system may or may not be administered through the State SSA. Detoxification facilities, which can generate large numbers of admissions, are not uniformly considered as treatment facilities.

The number of TEDS admissions reported in Texas declined significantly from 1995-1997. The most significant factor in this decline was that Texas stopped reporting its criminal justice system's substance abuse clients to TEDS in 1996. In addition, a reallocation of resources resulted in the closure of several detoxification units, facilities which typically generate large numbers of admissions.

Admissions in Iowa increased significantly in 1995 when Iowa began to include Medicaid clients in its data reporting system.

Tables 4.5-4.7 present numbers of admissions and admission rates by State. Rates are presented as crude rates per 100,000 population. However, to facilitate comparisons, rates adjusted for age, sex, and race/ethnicity are also presented. This technique is used to take into account the demographic variation across States. Interpretation of these tables and comparison across States should be made cautiously, and should take into account the many sources of variation detailed above.

Figure 27. Monthly admissions by State or jurisdiction: 1992-1997 (page 1 of 4)

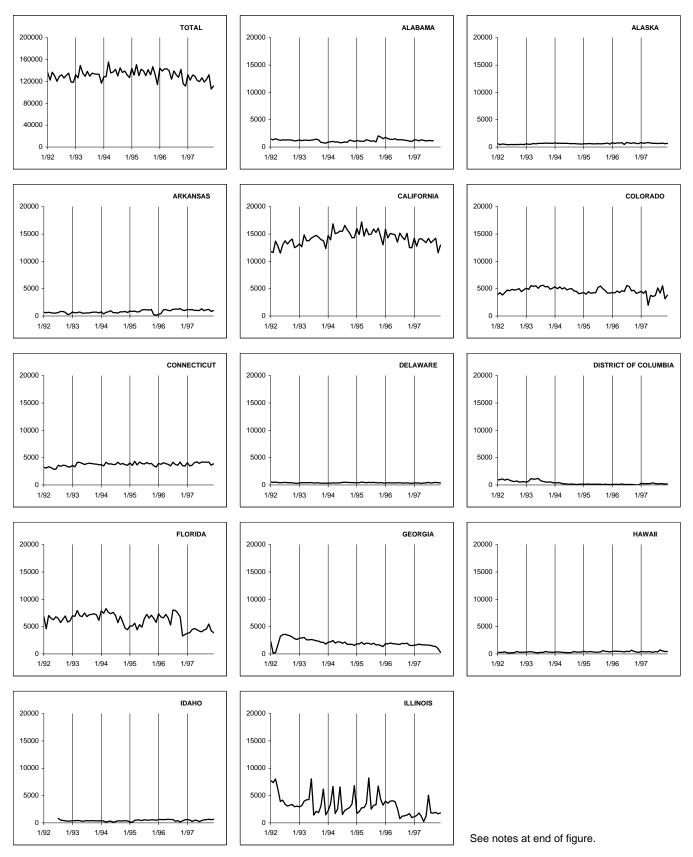

Figure 27. Monthly admissions by State or jurisdiction: 1992-1997 (page 2 of 4)

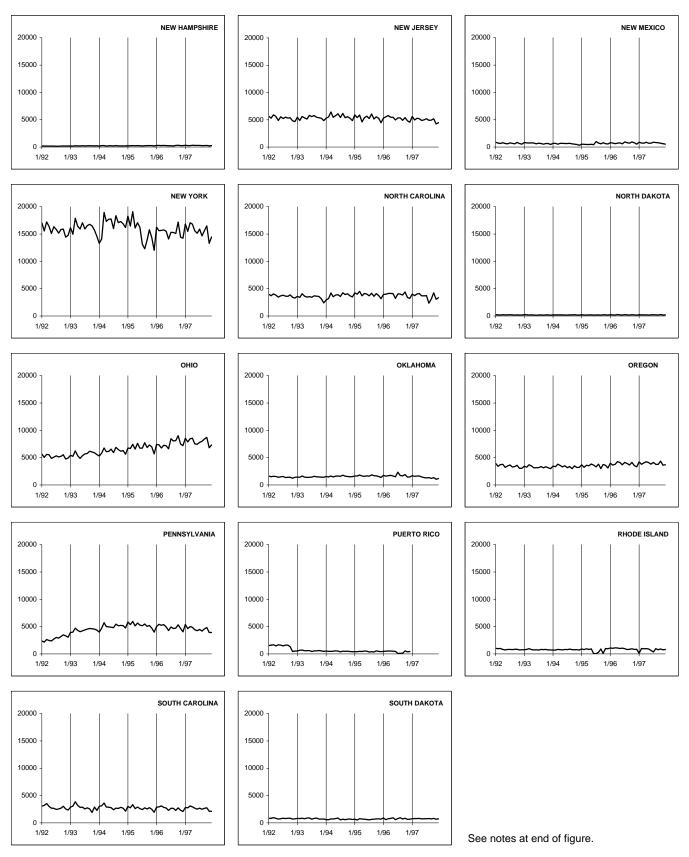

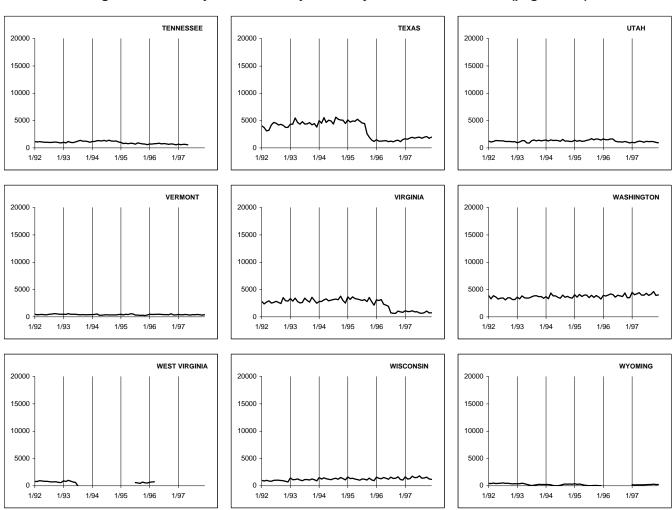

Figure 27. Monthly admissions by State or jurisdiction: 1992-1997 (page 4 of 4)

States not shown (Arizona and Mississippi) do not currently participate in the TEDS system.

CHAPTER 5

DISCHARGE DATA—PILOT TEST RESULTS

The goal of TEDS is to collect information on complete treatment episodes. Thus SAMHSA is expanding its data collection efforts to include discharge data. These data, when linked to admission data, will enable analyses of questions that cannot be answered with admissions data alone.

General Plan

As a first step, each State will be asked to submit data for all discharges from substance abuse treatment dating from January 1, 1995, through December 31, 1996, or the next earliest available calendar year. The State will link each discharge record to the corresponding admission record. Data to be submitted to SAMHSA will include items from both the admission and discharge records submitted as a single record. Items from the admission record include:

- Facility and client ID numbers
- Transaction type
- Date of admission
- Type of service at admission
- Date of birth, sex, age, and race/ethnicity

Items from the discharge record include:

- Facility and client ID numbers
- Type of service at discharge
- Date of discharge or date of last contact
- Reason for discharge or discontinuation of treatment.

Definitions and classifications used in the Discharge Data Set are detailed in Appendix A.

Pilot Test

This chapter presents results of a pilot test of discharge data submitted by Hawaii and Maryland. A total of 123,790 client discharge records (excluding co-dependents and transfers) were submitted for the years 1992-1998. Records were primarily for clients discharged in 1995-1996 (Maryland) and 1997-1998 (Hawaii). Records were linked to the original TEDS admission records by State, facility ID, client ID, type of service at admission, and date of admission; 89 percent of the discharge records could be linked. An additional two percent of the discharge records were not used in tabulations for this report because the discharge date given was earlier than the admission date and/or no reason for discharge was given.

The tabulations in this report are not representative of all admissions in all States. Neither State reported discharge data for hospital-based inpatient treatment programs.

Table 5.1 presents reason for discharge by type of service for all linked admission/discharge records. It also presents length of stay in treatment by reason for discharge and type of service. Tables 5.2-5.7 present this information separately by primary substance of abuse. Figures 28-31 summarize the information graphically.

 Overall, 47 percent of admissions completed treatment, and another 12 percent were transferred to another treatment program (Table 5.1 and Figure 28). Admissions to

- residential detox were most likely to complete treatment in that setting or to be transferred to further substance abuse treatment (89 percent). Seventy-nine percent of admissions to short-term residential rehabilitation completed treatment in that setting, or were transferred to further treatment, as were 60 percent of admissions to long-term residential rehabilitation. Admissions to ambulatory settings were less likely to complete treatment or to be transferred to other treatment settings (54 percent in all ambulatory settings combined).
- The completion rate was highest for alcoholonly admissions (62 percent completed treatment and 10 percent transferred to other treatment settings). It was lowest for primary heroin admissions (31 percent completed treatment and 15 percent transferred to other treatment settings) (Tables 5.2-5.7 and Figure 30).
- The average length of stay in treatment for persons completing treatment was 127 days (Table 5.1 and Figure 29). Length of stay for persons completing treatment averaged 6 days for residential detox, 25 days for shortterm residential treatment, 125 days for long-term residential treatment, and 163 days for ambulatory treatment (all settings combined).
- Length of stay for persons completing treatment was longest for alcohol-only admissions (160 days) and shortest for heroin, cocaine, and methamphetamine/amphetamine admissions (80-83 days) (Tables 5.2-5.7 and Figure 31).

APPENDIX A

TEDS DATA ELEMENTS

TEDS MINIMUM DATA SET

Missing values are coded as:

Unknown—The State collects this data item, but the record does not reflect an acceptable value. *Not collected*—The State does not collect this data item for submission to TEDS.

Client/codependent

A 'client' is a person who meets all of the following criteria:

- 1) Has an alcohol or drug related problem
- 2) Has completed the screening and intake process
- 3) Has been formally admitted for the treatment or recovery service in an alcohol or drug treatment unit operated or funded by a State alcohol or State drug authority
- 4) Has his or her own client record.

A person is not a client if he or she has completed only a screening or intake process or has been placed on a waiting list.

A 'codependent' is a person who has no alcohol or drug abuse problem, but:

- 1) Is seeking services because of problems arising from his or her relationship with an alcohol or drug user
- 2) Has been formally admitted for service to a State-operated or State-funded treatment unit
- 3) Has his or her own client record or has a record within a primary client record.

Transaction type

Identifies whether a record is for an initial admission or a transfer/change in service.

For purposes of reporting to TEDS, a treatment episode is defined as that period of service(s) between beginning of a treatment service for a drug or alcohol problem and the termination of services for the prescribed treatment plan.

When a client changes service, facility, program, or location during a treatment episode, the State will send a complete transfer record to TEDS.

Date of admission

The day when the client receives his or her first direct treatment or recovery service.

Type of service at admission

Describes the type of service the client received.

- Detoxification, 24-hour service, hospital inpatient—24 hour per day medical acute care services for detoxification for persons with severe medical complications associated with withdrawal
- Detoxification, 24-hour service, free-standing residential—24 hour per day services in non-hospital setting providing for safe withdrawal and transition to ongoing treatment
- Rehabilitation/residential, hospital (other than detoxification)—24 hour per day medical care in a hospital facility in conjunction with treatment services for alcohol and other drug abuse and dependency
- Rehabilitation/residential, short-term (30 days or fewer)—Typically 30 days or less of non-acute care in a setting with treatment services for alcohol and other drug abuse and dependency
- Rehabilitation/residential, long-term (more than 30 days)—Typically more than 30 days of non-acute care in a setting with treatment services for alcohol and other drug abuse and dependency; this may include transitional living arrangements such as halfway houses
- Ambulatory, intensive outpatient—At a minimum, the client must receive treatment lasting two or more hours per day three or more days per week
- Ambulatory, non-intensive outpatient—Ambulatory treatment services including individual, family, and/or group services; these may include pharmacological therapies
- Ambulatory, detoxification—Outpatient treatment services providing for safe withdrawal in an ambulatory setting (pharmacological or non-pharmacological)

Number of prior treatment episodes

Indicates the number of previous treatments the client has received in any drug or alcohol program. Changes in service for the same episode should *not* be counted as separate prior episodes.

Principal source of referral

Describes the person or agency referring the client to the alcohol or drug abuse treatment program.

Individual (includes self-referral)—Includes the client, a family member, friend, or any other individual that would not be included in any of the following categories; includes self-referral due to pending DWI/DUI

Alcohol/drug abuse care provider—Any program, clinic, or other health care provider whose principal objective is treating clients with substance abuse problems, or a program whose activities are related to alcohol or other drug abuse prevention, education, or treatment

Other health care provider—A physician, psychiatrist, or other licensed health care professional; or general hospitals, psychiatric hospitals, mental health programs, or nursing homes

School (educational)—A school principal, counselor, or teacher; or student assistance program (SAP), the school system, or an educational agency

Employer/EAP—A supervisor or an employee counselor

Other community referral—Community and religious organizations or any Federal, State, or local agency that provides aid in the areas of poverty relief, unemployment, shelter, or social welfare. Self help groups such as Alcoholics Anonymous (AA), Al-Anon, and Narcotics Anonymous (NA) are also included in this category. Defense attorneys are included in this category.

Court/criminal justice referral/DUI/DWI—Any police official, judge, prosecutor, probation officer, or other person affiliated with a Federal, State, or county judicial system. A referral by a court for DWI/DUI. Includes clients referred in lieu of or for deferred prosecution, or during pretrial release, or before or after official adjudication. Includes clients on pre-parole, pre-release, work or home furlough, or TASC. Client need not be officially designated as 'on parole'. Includes clients referred through civil commitment. Client referrals in this category are further defined in the Supplemental Data Set item Detailed criminal justice referral.

Date of birth

Client's date of birth.

Sex

Identifies client's sex.

Male Female

Race

Specifies the client's race.

Alaskan Native (Aleut, Eskimo, Indian)—Origins in any of the original people of Alaska

American Indian (other than Alaskan Native)—Origins in any of the original people of North America and who maintain cultural identification through tribal affiliation or community recognition

Asian or Pacific Islander—Origins in any of the original people of the Far East, the Indian subcontinent, Southeast Asia, or the Pacific Islands

Black—Origins in any of the black racial groups of Africa

White—Caucasian with origins in any of the people of Europe (including Portugal), North Africa, or the Middle East Other—A default category for use in instances in which the client is not classified above or whose origin group, because of area custom, is regarded as a racial class distinct from the above categories.

Ethnicity

Identifies client's specific Hispanic origin, if any.

Puerto Rican—Of Puerto Rican origin regardless of race

Mexican—Of Mexican origin regardless of race

Cuban—Of Cuban origin regardless of race

Other Hispanic—Of Central or South America or any other Spanish culture origin (including Spain), regardless of race Not of Hispanic origin

Education

Specifies the highest school grade the client has completed.

Employment status

Identifies the client's current employment status.

Full-time—Working 35 hours or more each week; includes members of the uniformed services

Part-time—Working fewer than 35 hours each week

Unemployed—Looking for work during the past 30 days, or on layoff from a job

Not in labor force—Not looking for work during the past 30 days or a homemaker, student, disabled, retired, or an inmate of an institution. Clients in this category are further defined in the Supplemental Data Set item *Detailed Not in Labor Force*.

Substance problem (primary, secondary, and tertiary)

These fields identify the client's primary, secondary, and tertiary substance problems.

None

Alcohol

Cocaine/crack

Marijuana/hashish—Includes THC and other cannabis sativa preparations

Heroin

Non-prescription methadone

Other opiates and synthetics—Includes codeine, Dilaudid, morphine, Demerol, opium, and any other drug with morphine-like effects

PCP—Phencyclidine

Hallucinogens—Includes hallucinogens, LSD, DMT, STP, mescaline, psilocybin, peyote, etc.

Methamphetamine

Other amphetamines—Includes Benzedrine, Dexedrine, Preludin, Ritalin, and any other amines and related drugs Other stimulants—Includes non-amphetamine stimulants

Benzodiazepines—Includes diazepam, flurazepam, chlordiazepoxide, clorazepate, lorazepam, alprazolam, oxazepam, temazepam, prazepam, triazolam, clonazepam, halazepam, and other unspecified benzodiazepines

Other tranquilizers—Includes non-benzodiazepine tranquilizers

Barbiturates—Includes phenobarbital, Seconal, Nembutal, etc.

Other sedatives or hypnotics—Includes non-barbiturate sedative/hypnotics, chloral hydrate, Placidyl, Doriden, etc. *Inhalants*—Includes ether, glue, chloroform, nitrous oxide, gasoline, paint thinner, etc.

Over-the-counter medications—Includes aspirin, cough syrup, Sominex, and any other legally-obtained nonprescription medication

Other

Usual route of administration (of primary, secondary, and tertiary substances)

These fields identify the usual route of administration of the respective substances.

Oral Smoking Inhalation Injection (intravenous or intramuscular) Other

Frequency of use (of primary, secondary, and tertiary substances)

These fields identify the frequency of use of the respective substances.

No use in the past month 1-3 times in the past month 1-2 times in the past week 3-6 times in the past week Daily

Age at first use (of primary, secondary, and tertiary substances)

These fields identify the age of first use of the respective substances. If the substance is alcohol, the field identifies the age of first intoxication.

Use of methadone planned

Identifies whether methadone will be used as part of the treatment.

Yes No

TEDS SUPPLEMENTAL DATA SET

Pregnant at time of admission

Specifies whether the client was pregnant at the time of admission

Yes

No

Veteran status

Identifies whether the client has served in the uniform services. This category also includes veterans of the Coast Guard and Public Health Service.

Yes

No

Psychiatric problem in addition to alcohol or drug problem

Identifies whether the client has a psychiatric problem in addition to his or her alcohol or drug use problem.

Yes

No

DSM criteria diagnosis

The diagnosis of the substance abuse problem from the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders*.

Marital status

Describes the client's marital status. The following categories are compatible with the U.S. Census.

Never married—Includes those whose only marriage was annulled

Now married—Includes those living together as married

Separated—Includes those separated legally or otherwise absent from spouse because of marital discord

Divorced

Widowed

Living arrangement

Specifies whether the client is homeless, living with parents or in a supervised setting, or living on his or her own.

Homeless—No fixed address; includes shelters

Dependent living—Dependent children and adults living in a supervised setting such as a halfway house or group home Independent living

Source of income/support

Identifies the client's principal source of financial support. For children under 18, this field indicates the parents' primary source of income/support.

Wages/salary
Public assistance
Retirement/pension
Disability
Other
None

Health insurance

Specifies the client's health insurance (if any). The insurance may or may not cover alcohol or drug treatment.

Private insurance
Blue Cross/Blue Shield
Medicare
Medicaid
Health maintenance organization (HMO)
Other (e.g., CHAMPUS)
None

Expected/actual source of payment

Identifies the primary source of payment for this treatment episode.

Self-pay
Blue Cross/Blue Shield
Medicare
Medicaid
Workman's Compensation
Other government payments
Other health insurance companies
No charge (free, charity, special research, or teaching)
Other

Detailed 'Not in labor force'

Gives more detailed information about those clients who are not in the labor force.

Homemaker Student Retired

Disabled

Inmate of institution (prison or institution that restrains a person, otherwise able, from the labor force)

Other

Not applicable

Detailed criminal justice referral

Gives more detailed information about those clients who are referred to treatment through contact with the criminal justice system.

State/Federal court

Formal adjudication process (other than State/Federal court)

Probation/parole

Other recognized legal entity Diversionary program (e.g., TASC)

Prison DUI/DWI Other

Not applicable

Days waiting to enter treatment

Indicates the number of days from the first contact or request for service until the client was admitted and the first clinical service was provided.

Detailed drug code (primary, secondary, and tertiary)

These fields identify the client's specific drug problems, and have a direct relationship to the TEDS Minimum Data Set item Substance problem.

Alcohol Diazepam (Valium) Crack Flurazepam (Dalmane) Lorazepam (Ativan) Other cocaine Triazolam (Halcion) Marijuana/hashish Heroin/morphine Other benzodiazepines Methadone Meprobamate (Miltown) Codeine Other tranquilizers D-propoxyphene Phenobarbital

Oxycodone Secobarbital/amobarbital Meperidine Secobarbital (Seconal) Hydromorphone Ethchlorvynol (Placidyl) Pentazocine Glutethimide (Doriden) Methaqualone

Other narcotic analgesics

PCP or PCP combinations Other non-barbiturate sedatives

LSD Other sedatives Other hallucinogens Aerosols Methamphetamine/speed Nitrites **Amphetamine** Solvents Methylphenidate (Ritalin) Anesthetics Other stimulants Other inhalants Alprazolam (Xanax) *Diphenhydramine*

Chlordiazepoxide (Librium) Diphenylhydantoin sodium

Clorazepate (Tranxene) Other drugs

TEDS DISCHARGE DATA SET

Items that refer to the admission event

These items must match or come from the admission record (see TEDS Minimum Data Set for definitions).

Client/codependent

Transaction type

Date of admission

Type of service at admission

Date of birth

Sex

Race

Ethnicity

Items that refer to the discharge event

Type of service at discharge—See TEDS Minimum Data Set item *Type of service at admission* for definitions.

Date of last contact

Specifies the month, day, and year when the client was last seen for a treatment. The date may be the same as the date of discharge. In the event of a change of service or provider within a treatment episode, it is the date the client transferred to another service or provider.

Date of discharge

Specifies the month, day, and year when the client was formally discharged from the treatment facility or service. The date may be the same as the date of last contact. In the event of a change of service or provider within a treatment episode, it is the date the service terminated or the date the treatment ended at a particular provider.

Reason for discharge, transfer, or discontinuance of treatment

Indicates the outcome of treatment or the reason for transfer or discontinuance of treatment.

Treatment completed

Left against professional advice (dropped out)

Terminated by facility

Transferred to another substance abuse treatment program or facility—This code is to be used for all clients who have a change of service or provider within an episode of treatment

Incarcerated—This code is to be used for all clients whose course of treatment is terminated because the client has been incarcerated

Death

Other

Unknown

APPENDIX B

TEDS COVERAGE OF THE TREATMENT UNIVERSE

TEDS comprises a significant proportion of all admissions to substance abuse treatment in the United States, but does not include all such admissions. An estimate of the total number of admissions to substance abuse treatment requires knowledge or estimation of several components: 1) the number of admissions reported to TEDS, 2) the number of admissions in facilities that should have reported to TEDS but did not; 3) the number of admissions in facilities that were not part of the TEDS system.

The TEDS system comprises data that is routinely collected by States in monitoring their individual substance abuse treatment systems. Facilities¹ that report to TEDS are those that are accountable to the State substance abuse agency (SSA)—generally, facilities that receive State alcohol and/or drug agency funds (including Federal block grant funds) for the provision of substance abuse treatment services. Thus TEDS, while it does not include all admissions to substance abuse treatment, does include those admissions that constitute a burden on public funds. The scope of facilities included in TEDS is affected by differences in State systems of licensure, certification, accreditation, and the disbursement of public funds (see Table 4.1). Facilities that may not be accountable to the States, and thus not included in the TEDS data system are: 1) facilities that operate entirely with private funds; 2) individual practitioners; 3) hospital-based substance abuse treatment facilities not licensed through the State SSA; 4) correctional facilities (State prisons and local jails); and 5) Federal facilities operated by the Veterans Administration, the Department of Defense, and the Bureau of Prisons.

Universe of Substance Abuse Treatment Facilities

Facilities that were not part of the TEDS system or that failed to report to TEDS can be identified because TEDS is part of SAMHSA's integrated Drug and Alcohol Services Information System (DASIS). The core of DASIS is the National Master Facility Inventory (NMFI), a continuously-updated comprehensive listing of all known substance abuse treatment facilities (public, private, and Federal). Another component of DASIS is the Uniform Facility Data Set (UFDS) survey, an annual survey of the location, characteristics, and use of alcoholism and drug abuse treatment facilities. A unique ID number assigned to the NMFI facility is used in the collection of client-level data (TEDS) and facility-level data (UFDS) so that the three data sets can be linked.

Treatment facilities in the NMFI fall into three general categories. These are distinguished by the services provided, the components of DASIS of which they are part, and the relationship of the facility to its State SSA.

Treatment facilities accountable to State SSAs and eligible to report to TEDS

This group includes facilities that are licensed or certified by the State SSA to provide substance abuse treatment (or are accountable to the SSA

¹ In this report, entities in DASIS are referred to as "facilities". However, a "facility" may be a program-level, clinic-level, or multi-site respondent.

for other reasons), and are required by the SSA to provide TEDS client-level data. State DASIS representatives maintain this segment of the NMFI by reporting new facilities, closures, and address changes to SAMHSA.

Treatment facilities administratively tracked by State SSAs but not eligible to report to TEDS

This group includes treatment facilities that are licensed, certified, or otherwise approved by the State SSA (or are administratively tracked by it for other reasons), but that are not required by the SSA to provide TEDS client-level data. Some private for-profit facilities fall into this category. This group also includes programs operated by Federal agencies (the Bureau of Prisons, the Department of Veterans Affairs, the Department of Defense, and the Indian Health Service). NMFI records for federally-operated facilities are updated annually through lists provided by these agencies.

Treatment facilities not accountable to State SSAs and not eligible to report to TEDS

This group of facilities represents the ongoing SAMHSA effort to make the NMFI as comprehensive as possible by including treatment facilities that are not accountable, for a variety of reasons, to State SSAs. Many of these facilities are private for-profit, small group practices, or hospital-based programs. They are identified through screening of alternative source databases such as the commercial American Business Index, the annual American Hospital Association survey, and SAMHSA's biennial Inventory of Mental Health Organizations.

In addition to the continuous updating of the NMFI by State DASIS representatives, the annual UFDS survey is a major source of information on active substance abuse treatment facilities. The 1997 UFDS survey was sent to all

facilities on the NMFI as of about 6 weeks before the survey reference date (October 1, 1997). Extensive efforts were made to contact all facilities. The overall survey response rate for 1997 (including treatment and non-treatment facilities) was 86 percent. Non-respondents may have included facilities that were closed but could not be so identified.

Table B.1 presents information on how the 14,856 active treatment facilities on the NMFI on October 1, 1997 (the UFDS survey reference date) are represented in the TEDS and UFDS data. All of these facilities were included in the 1997 UFDS survey.

Of the total 14,856 facilities, 5,711 both reported to TEDS during calendar year 1997 and responded to the 1997 UFDS. These facilities accounted for 1,232,190 (83 percent) of the 1,477,881 TEDS admissions reported for 1997. The remaining 17 percent of TEDS admissions were reported by facilities that did not respond to the 1997 UFDS survey.

Of the 5,442 facilities that did not report TEDS admissions in 1997, but did respond to the 1997 UFDS, 24 percent were eligible to report to TEDS. Some of these facilities may have submitted 1997 TEDS data after the cut-off date for this report.

There were 1,904 facilities that did not report TEDS admissions for 1997 and did not respond to the 1997 UFDS survey. The UFDS contractor was unable to locate 1,653 of these facilities, or to confirm that they were in operation and

¹ Office of Applied Studies, Substance Abuse and Mental Health Services Administration (1999). *Uniform Facility Data Set (UFDS): 1997. Data on Substance Abuse Treatment Facilities.* Drug and Alcohol Services Information System Series: S-6. DHHS Pub. No. (SMA) 99-3314. Table 1.1.

providing services on October 1, 1997. Clients served in these facilities, if any, were not counted in either TEDS or UFDS data, and are not included in the universe of known substance abuse treatment facilities.

Table B.2 summarizes TEDS coverage of known treatment facilities. Of the 12,952 facilities in the known universe, 8,801 (68 percent) were eligible to report to TEDS. Of those that were eligible, 85 percent did report and 15 percent failed to report.

Estimation of Annual Admissions to Facilities in the Known Universe

Estimates of the number of admissions to facilities not reporting to TEDS were made using the relationship of TEDS data to UFDS survey data. In 1997, 5,711 facilities reported both annual admissions to TEDS and, for UFDS, a count of active clients on the survey reference date. For these facilities, a regression model was used to delineate the relationship of annual admissions to active clients. Annual admissions to facilities not reporting to TEDS were estimated by applying this model to the number of active clients reported in UFDS.

To normalize the distributions, both annual admissions and the number of active clients were subjected to a \log_{10} transformation. To eliminate the influence of extreme values on the relationship between annual admissions and active clients, a turnover rate (the number of annual admissions divided by the number of active clients) was calculated. For the regression model, the upper and lower 5 percent of the distribution of the turnover rate were excluded.

The regression of $\log_{10}(\text{annual admissions})$ on $\log_{10}(\text{active clients})$ was highly significant (F = 4593, p < .0001). The R² indicated that this model accounted for 49 percent of the variance

in annual admissions. Additional variables were added to the model to attempt to improve its explanatory ability. These included funding source (public, all other), service type (inpatient, outpatient, mixed), provision of methadone services (yes/no), and State or jurisdiction. While all of these were highly significant as predictors, none made a substantial increase to the R², either alone or in combination. To maintain a parsimonious model that relied on as few predictors as possible, minimizing the problem of missing values, the original model was retained:

$$\log_{10}A = 0.76632 + 0.72217 \log_{10}N$$

where:

A = Annual admissions

N = Number of active clients

Figure B.1 shows the relationship of census size to annual admissions.

To estimate the annual admissions in facilities not reporting to TEDS, the regression model was applied to the number of active clients reported in UFDS. The admissions were summed by State. The number of 1997 admissions in non-reporting TEDS-eligible facilities was estimated at 146,189 (*Table B.2*). The number of admissions in facilities that were not TEDS-eligible was estimated at 430,563.

Adjustment for Late Data Submission

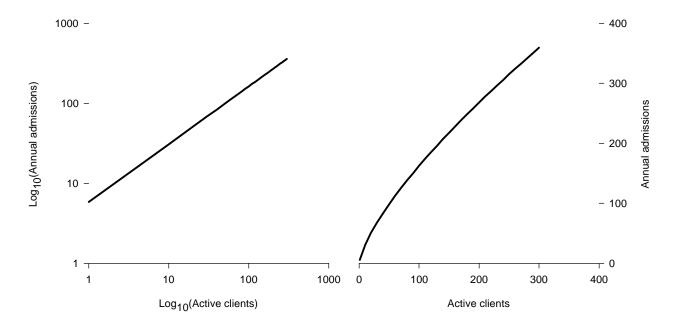

Completeness of reporting at the cut-off date for preparation of this report varied from State to State. Past patterns of TEDS data submission indicate that the number of admissions reported in this report is likely to increase by about 10 percent. To account for this under-counting in

the estimate of total annual admissions, the reporting history of each State was examined (see *Figure 27*). Autoregressive analysis was performed for each State for 1992-1996. Based on a comparison of this analysis with actual admissions reported for 1997, it was determined that 19 States could be expected to submit significant numbers of admissions in the future. Autoregression was used to estimate this number, and also to estimate the number of admissions in the three States that have submitted no data for 1997 (Indiana, Puerto Rico, and West Virginia). Late submissions of data are expected to add 152,742 admissions for 1997 (*Table B.2*).

Estimate of Total 1997 Substance Abuse Treatment Admissions

Based on the above calculations, there were estimated to be a total of 2,207,375 admissions to the known universe of treatment facilities in 1997 (*Table B.2*). Admissions reported by the TEDS-eligible facilities totaled 1,477,881 (83 percent) of the TEDS-eligible admissions universe and 67 percent of the known admissions treatment universe. State detail is presented in *Table B.3*.

Figure B.1 Relationship of annual admissions to active clients: 1997

Limitations of TEDS Coverage Estimates

Several problems regarding the above assessment of TEDS coverage should be recognized. First, the coverage estimates for TEDS reflect percentages of known treatment facilities. These are the facilities that have been identified and included in the NMFI, and that have responded to either TEDS or UFDS. Despite SAMHSA's extensive efforts to identify and contact all treatment facilities, some treatment facilities are not included. While this number is believed to be small, it does constitute an "unknown" universe of treatment facilities, with an unknown number of annual admissions. Secondly, although SAMHSA requests TEDS data on all admissions to any publicly-funded treatment facility, some State SSAs are structured so that they can report only clients treated with public funds (see Table 4.1). The number of clients in these facilities who are not receiving public funds is unknown.

Table B.1
TEDS and UFDS coverage of known universe of substance abuse treatment facilities: 1997
