

Primer on Ensemble Modeling Systems

David R. Bright

*NOAA/NWS/Storm Prediction Center
Norman, OK*

National Severe Weather Workshop

March 5, 2009

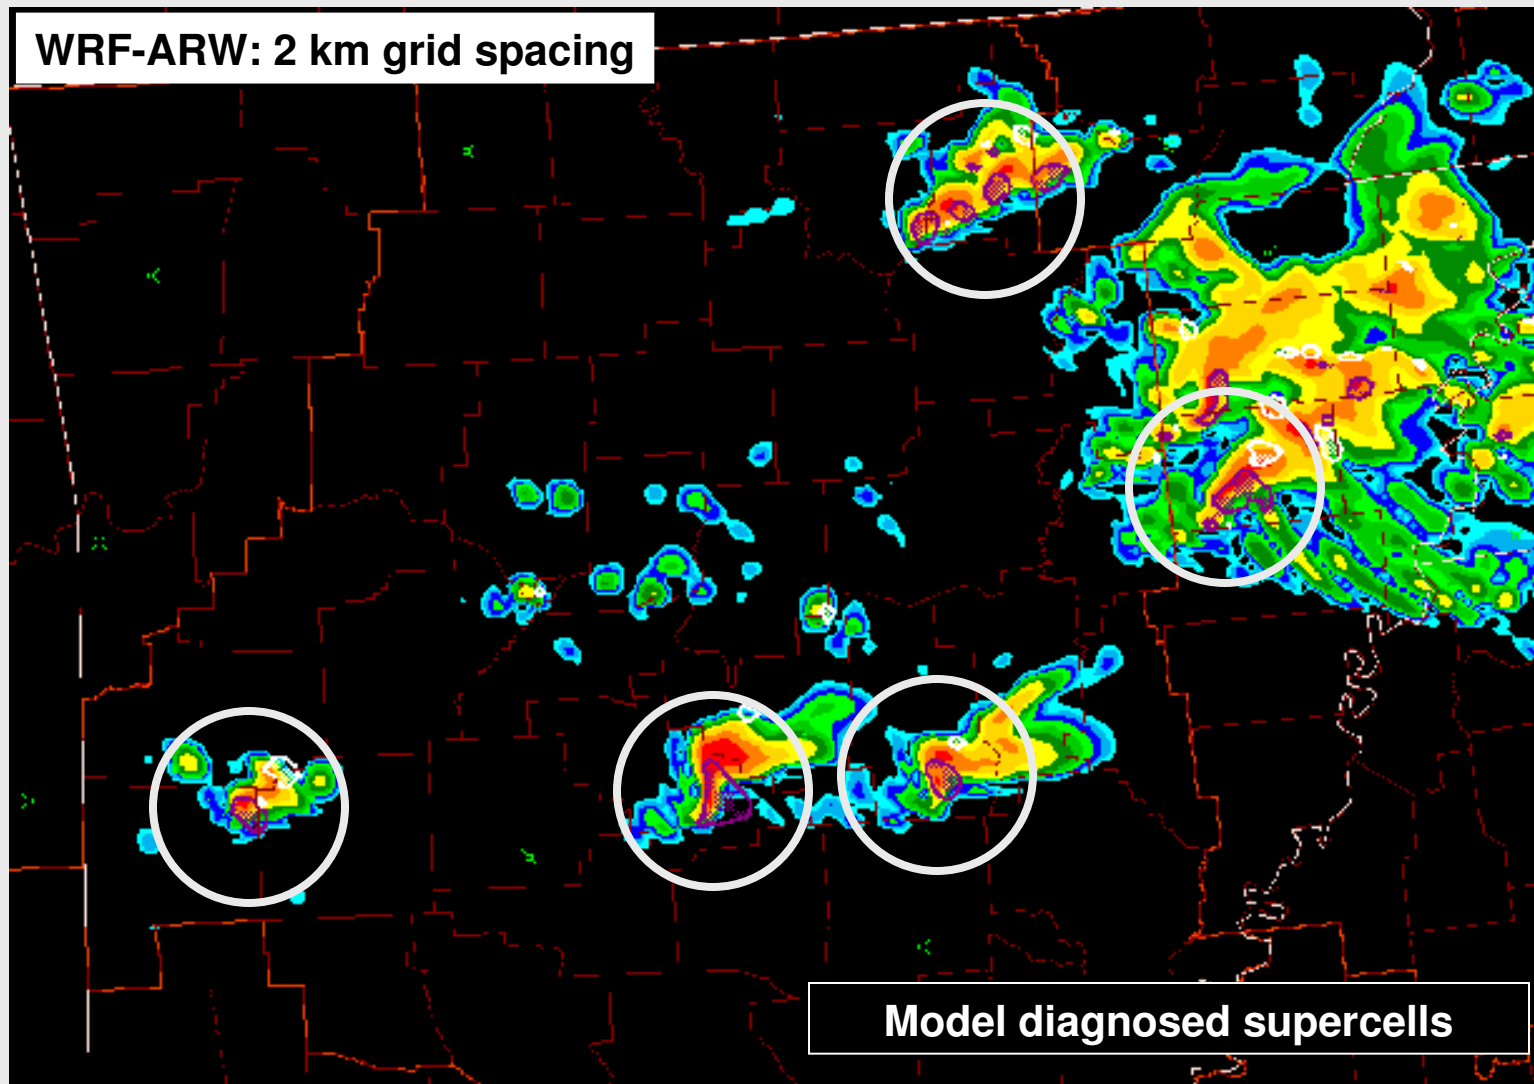

Norman, OK

Outline

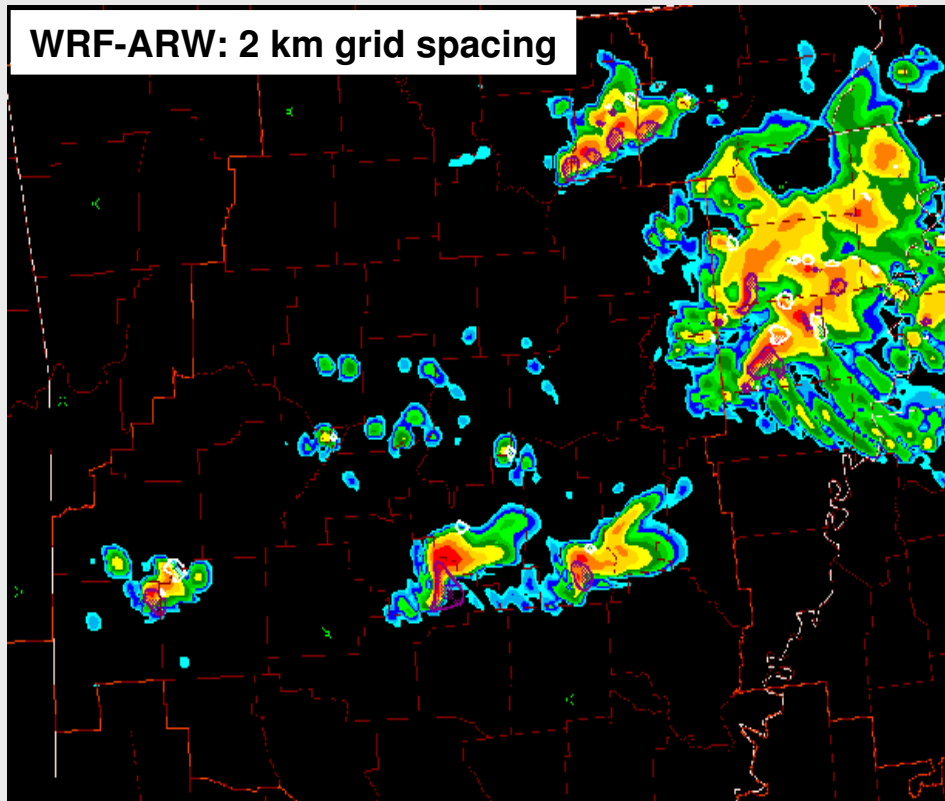

- Introduction to Ensemble Forecasting
- NOAA/NWS Short-Range Ensemble System (SREF)
- Case Study: Predicting a Severe Convective Outbreak using the SREF
- Using the SREF in Decision Support
- The Future of Ensembles and High-Impact Forecasting
- Summary

Example: One Model's Convective Forecast

0500 UTC 29 April 2005: 29 hr model reflectivity
(Zoomed in over central Arkansas)

Example: One Model's Convective Forecast

**0500 UTC 29 April 2005:
29 hr model reflectivity**

**0500 UTC 29 April 2005:
Base Reflectivity**

Example: One Model's Convective Forecast

Deterministic forecasts do not directly address questions of uncertainty

**0500 UTC 29 April 2005:
29 hr model reflectivity**

**0500 UTC 29 April 2005:
Base Reflectivity (Truth)**

- One forecast can be misleading and oversell forecast capability
- One forecast does not provide explicit information on uncertainty

What is an ensemble forecast?

- A collection of forecasts valid at the same time
- These forecasts may be produced by humans or models
- As guidance, an ensemble is comprised of NWP models that may have slightly different initial conditions, boundary conditions, model physics or parameters, or be entirely different models
- Theoretically rooted in the work of Lorenz and chaos (late 1950s and 1960s)

Ensemble Forecast Systems

- Contribute to **forecast confidence** by:
 - Providing a range of possible solutions
 - Minimize forecast error (e.g., mean) and quantify uncertainty (e.g., spread)
 - Provide probabilistic information
- Ensemble systems aid in **decision support**
 - Particularly if calibrated (i.e., reliable probabilities)
- Extend Predictability

NWP and Ensemble Systems

Weather forecasting: It's impossible to be certain all of the time!

- Numerical weather models...
 - All forecasts contain errors that increase with time
 - Doubling time of small initial errors ~1 to 2 days
 - Maximum large-scale (synoptic to planetary) predictability ~10 to 14 days
- Ensembles...
 - A collection of models that provide information on a range of plausible forecasts, statistical measures of confidence, and extend predictability
 - Scale to the problem of interest
 - Increasing in popularity
 - Requires “tools” to view a large number of models using a slightly different approach (statistical)

Short Range Ensemble Forecast (SREF)

- NWS SREF system (21 members)
 - 87 hr forecasts four times daily (03, 09, 15, 21 UTC)
 - North American domain
 - Model grid lengths 32-45 km
 - Multi-model: Eta, RSM, WRF-NMM, WRF-ARW
 - Multi-analysis: NAM, GFS initial and boundary conditions
 - IC perturbations and physics diversity
 - SPC adds one time-lagged NAM to the mix (22 members)
 - Recently added bias-correction to some fields (*not covered and not available on the SPC webpage*)

Upgrade soon: 32-35 km grid spacing; latest model code; etc.

Global Ensemble Forecast (GEFS)

<u>Model</u>	<u>Res</u>	<u>Levels</u>	<u>Mems</u>	<u>Cld Physics</u>	<u>Convection</u>
GFS	T126* (~ 105 km)	28	20**	GFS physics	Simple A-S

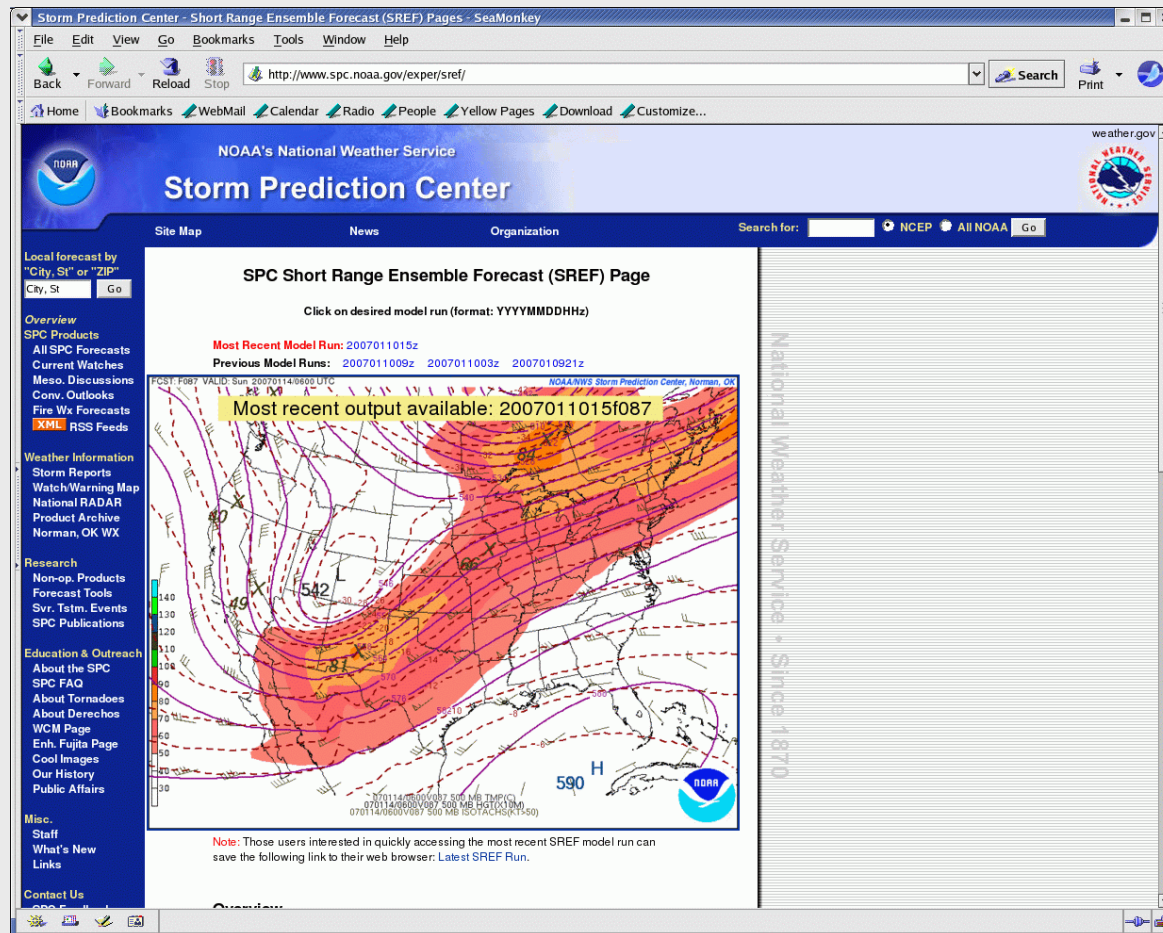

* Same resolution as the operational GFS in 1998

** 20 statistically independent perturbations (using Ensemble Kalman filter method)

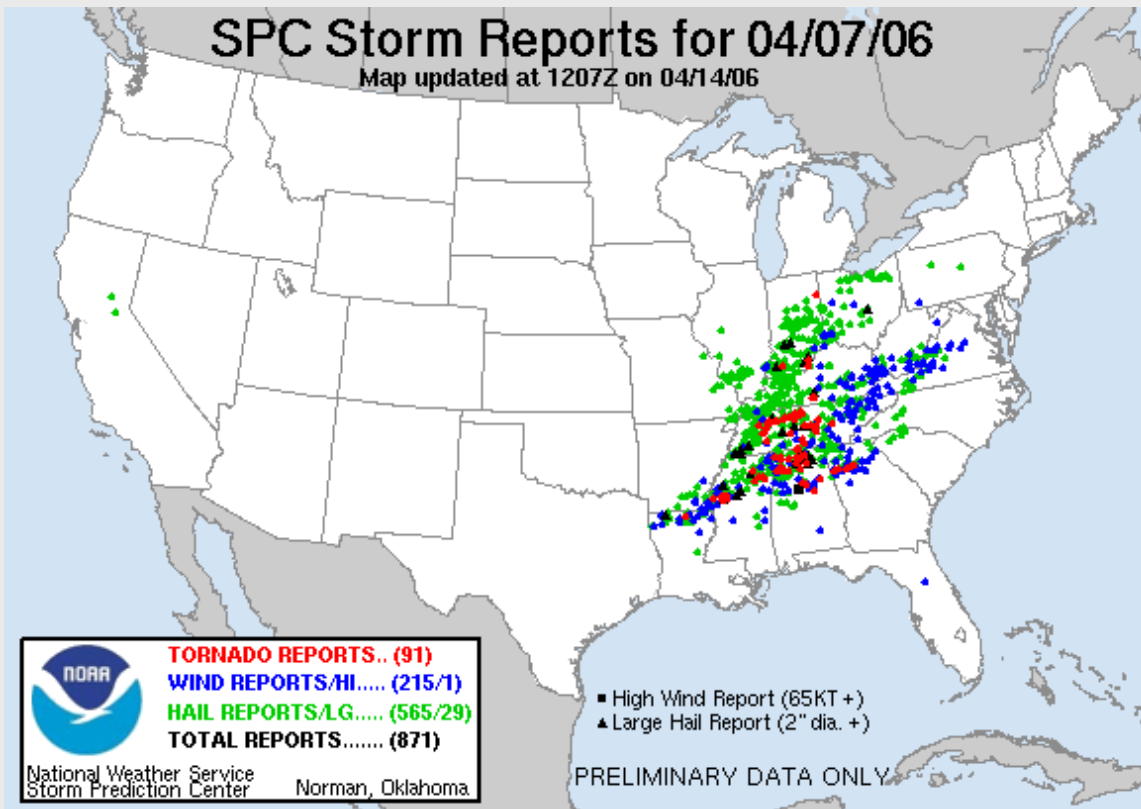

Case Study: The following SREF products are available in real-time at the SPC website

<http://www.spc.noaa.gov/exper/sref/>

Severe Weather Event of April 7, 2006

- More than 800 total severe reports
 - 3 killer tornadoes and 10 deaths

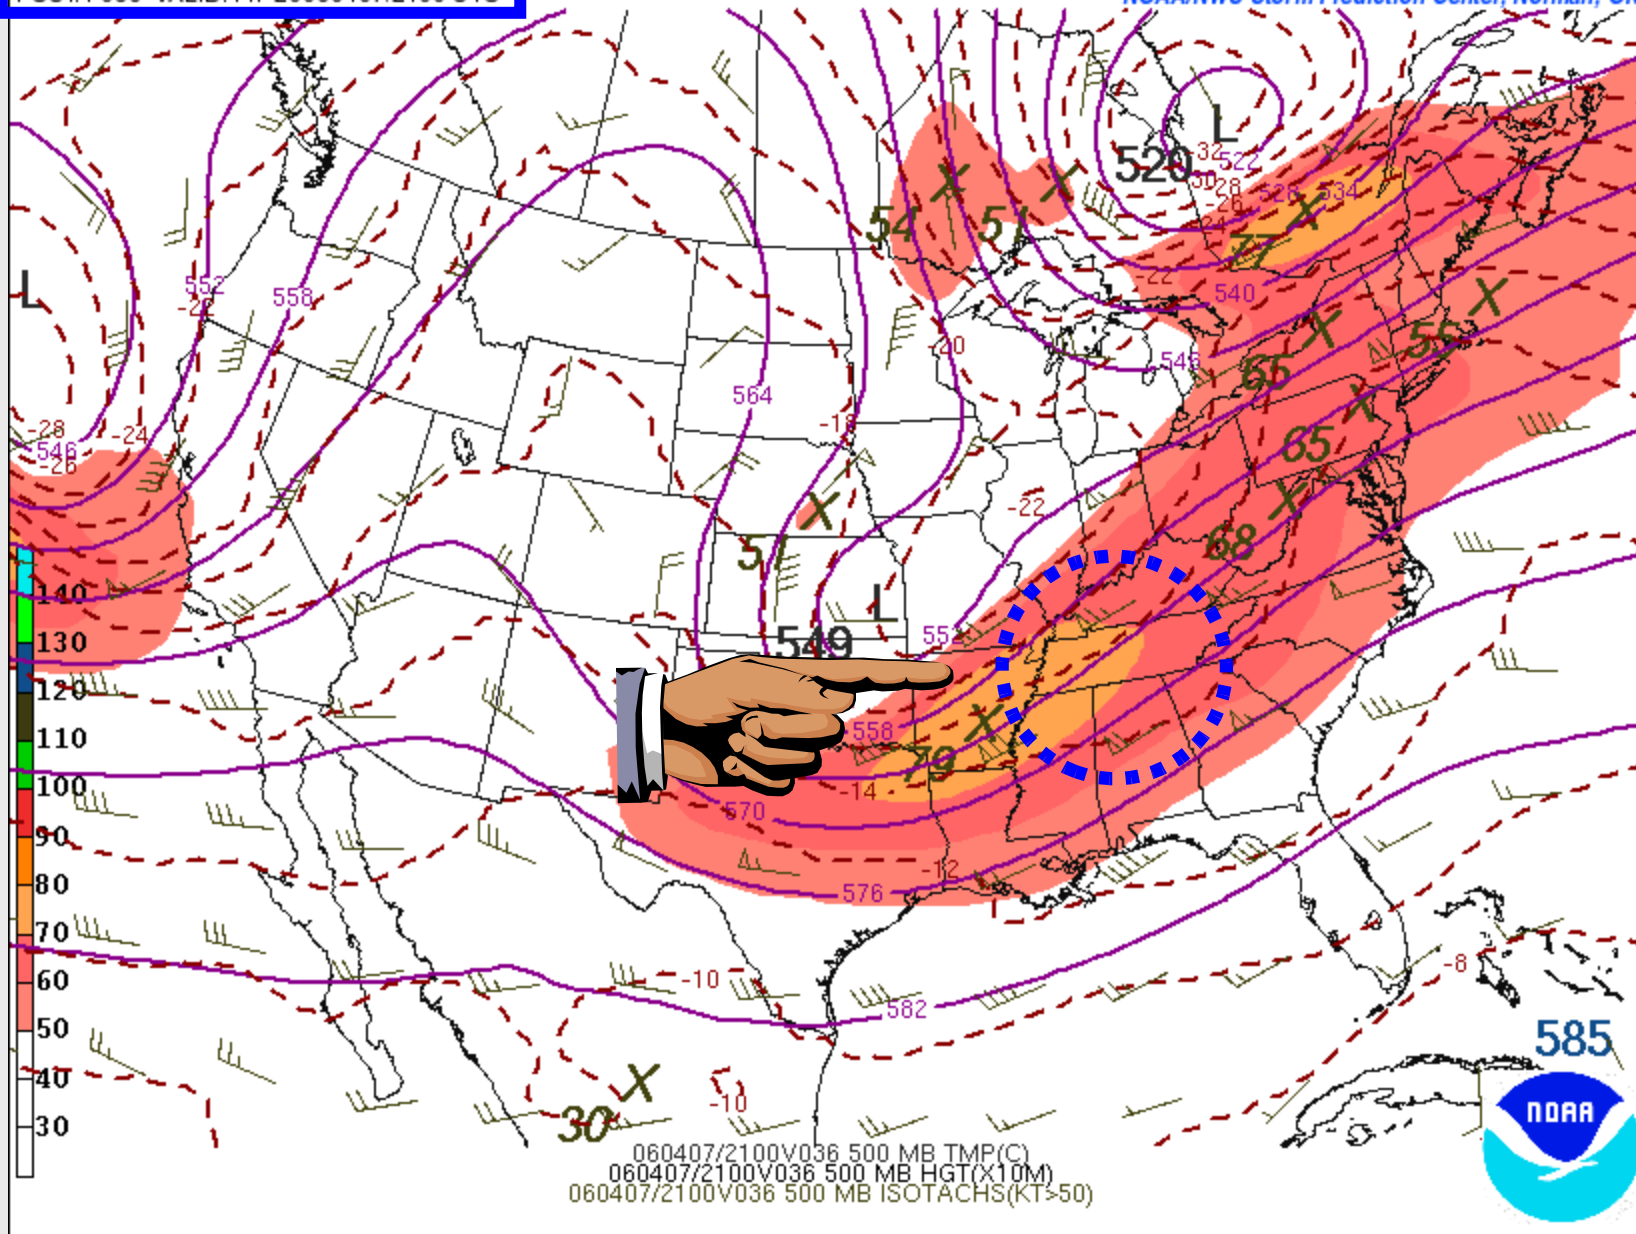

Poster from WFO Nashville, TN

SREF 500 mb Mean Height, Wind, Temp

FCST: F036 VALID: Fri 20060407/2100 UTC

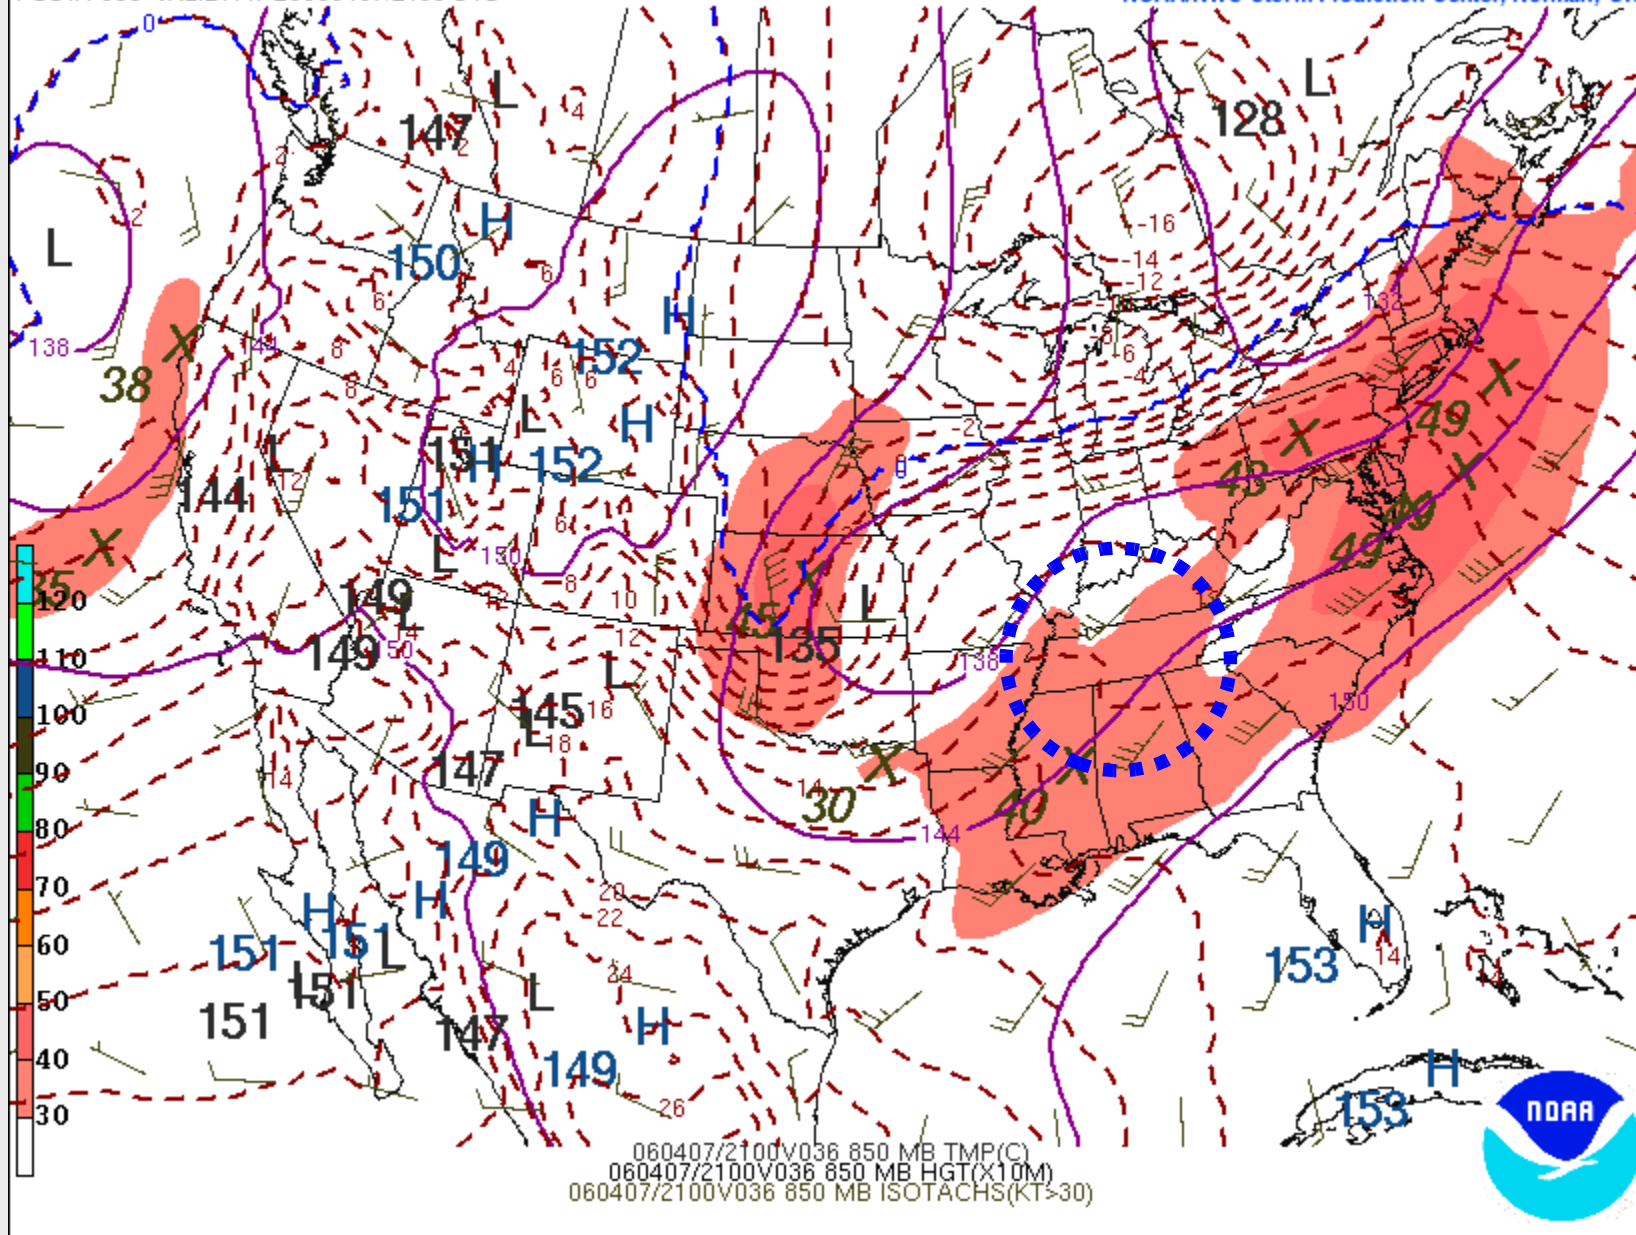

NOAA/NWS Storm Prediction Center, Norman, OK

SREF 850 mb Mean Height, Wind, Temp

FCST: F036 VALID: Fri 20060407/2100 UTC

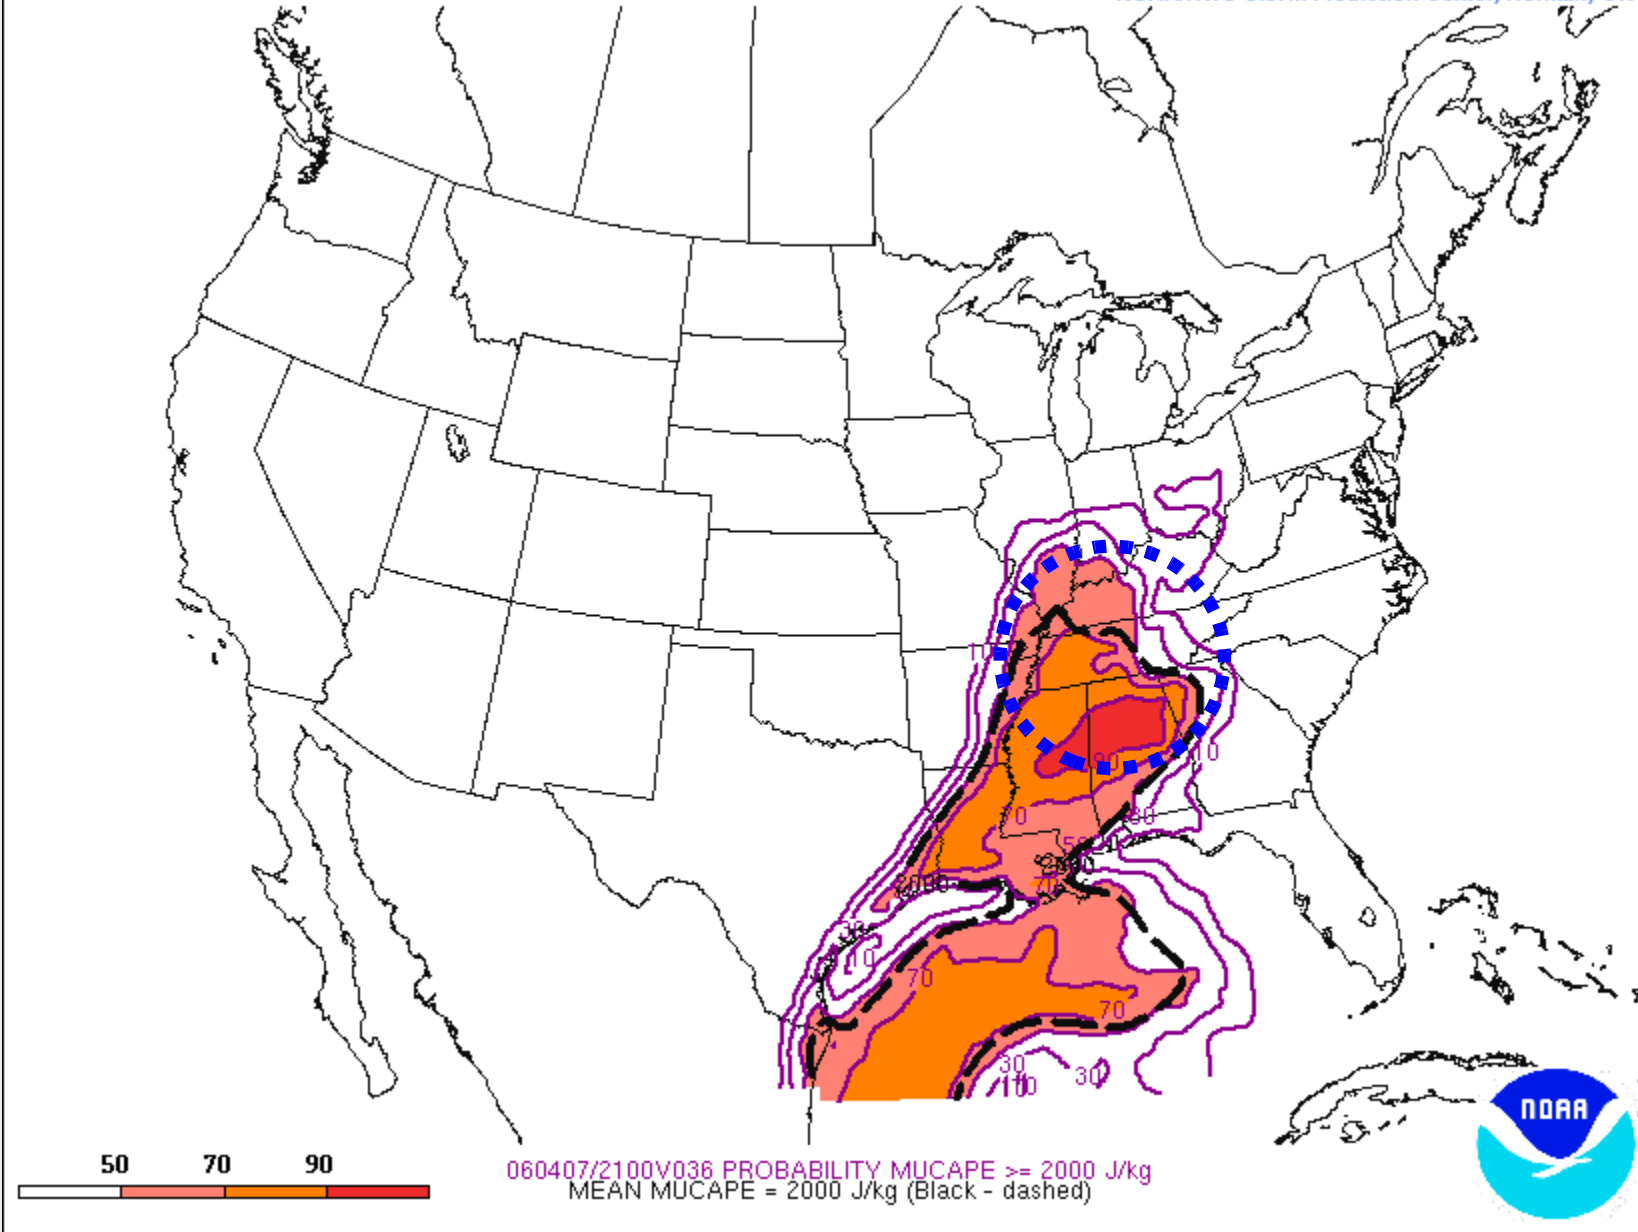

NOAA/NWS Storm Prediction Center, Norman, OK

SREF Pr[MUCAPE \geq 2000 J/kg] & Mean MUCAPE=2000 (dash)

FCST: F036 VALID: Fri 20060407/2100 UTC

NOAA/NWS Storm Prediction Center, Norman, OK

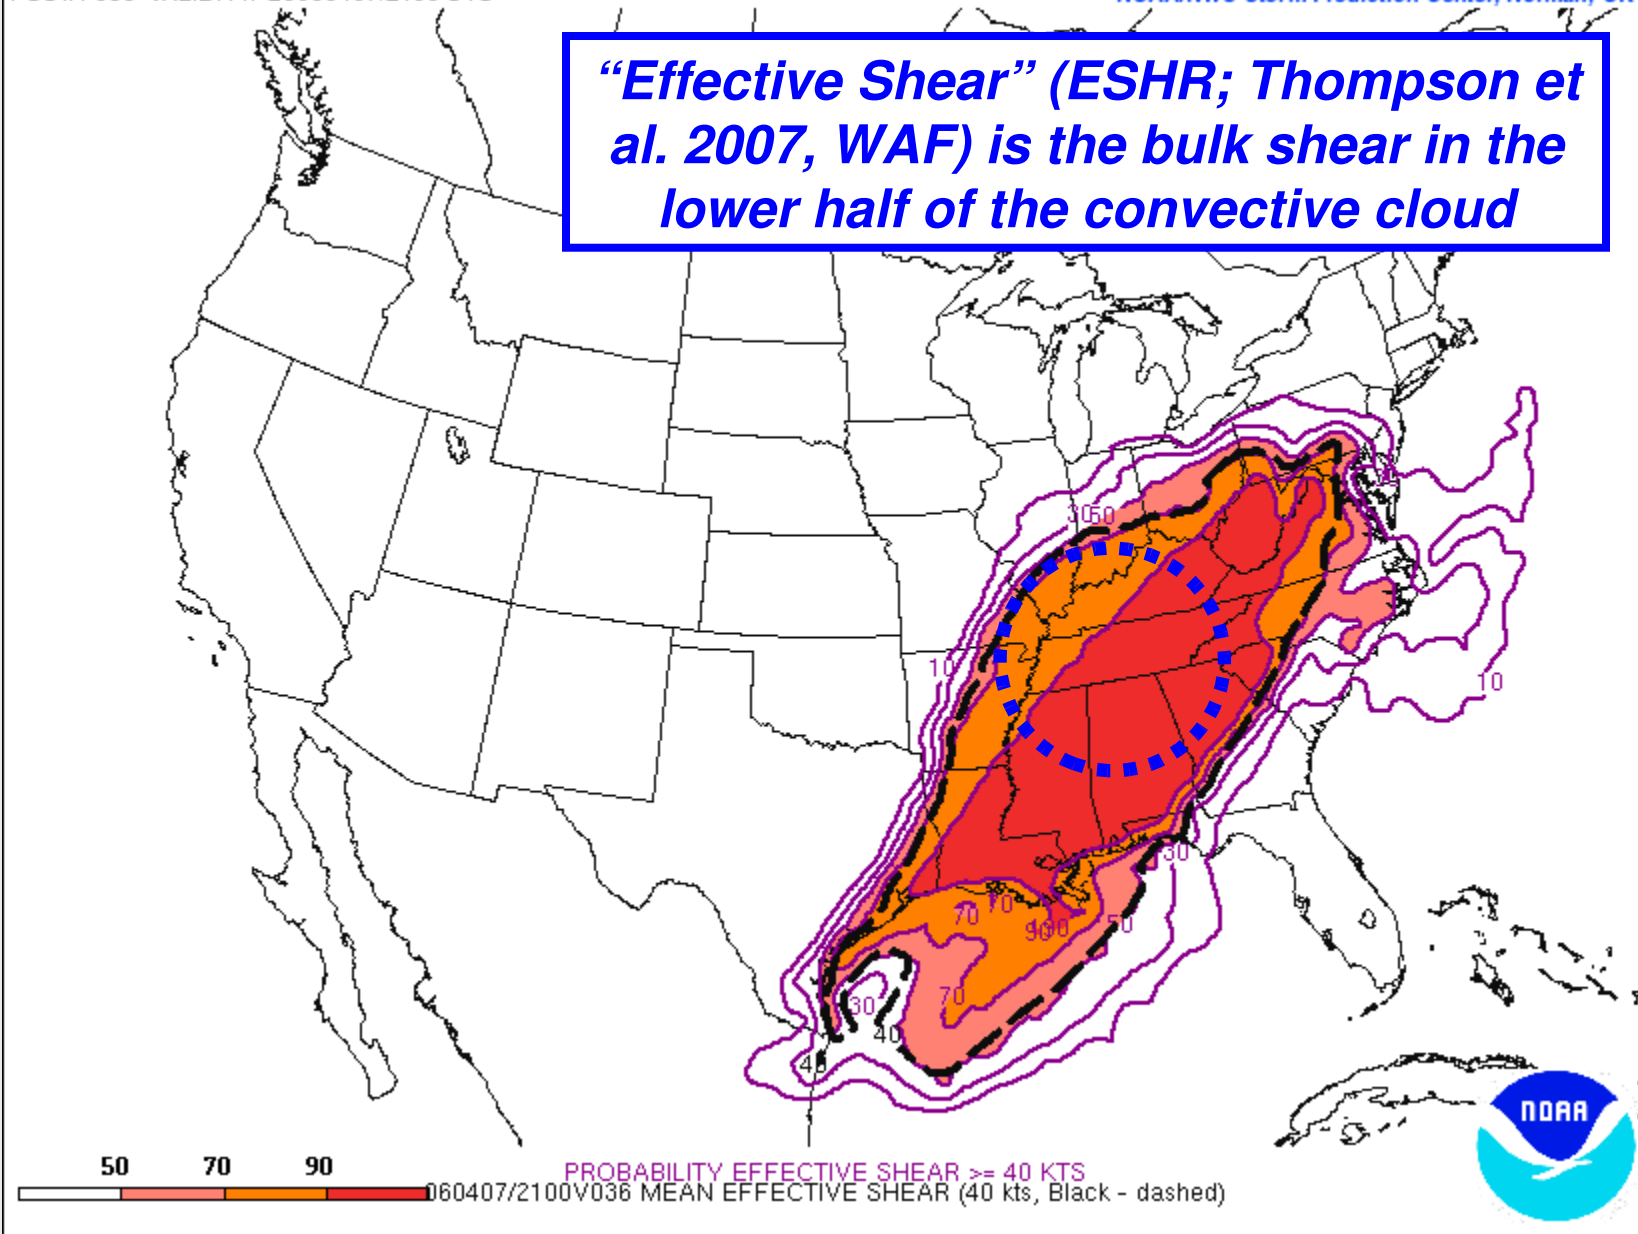

SREF Pr[ESHR \geq 40 kts] & Mean ESHR=40 kts (dash)

FCST: F036 VALID: Fri 20060407/2100 UTC

NOAA/NWS Storm Prediction Center, Norman, OK

“Effective Shear” (ESHR; Thompson et al. 2007, WAF) is the bulk shear in the lower half of the convective cloud

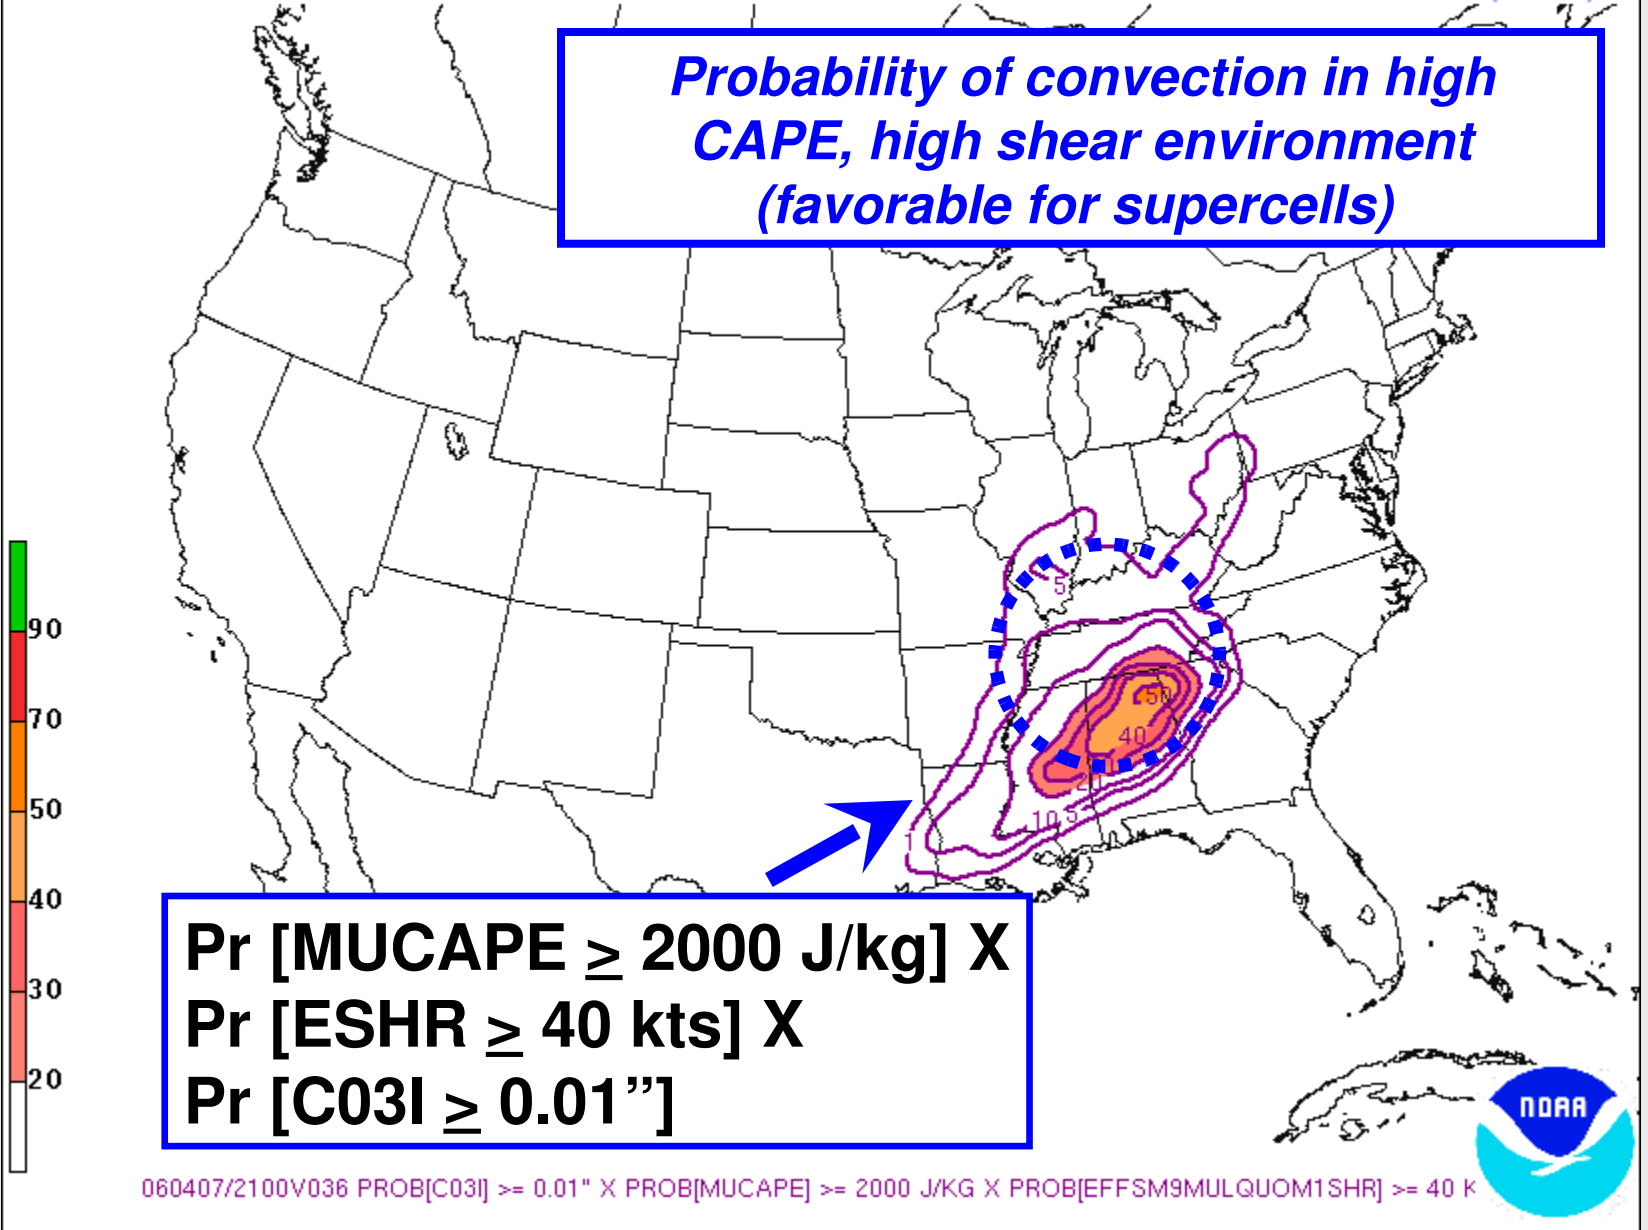

SREF Combined or Joint Probability

FCST: F036 VALID: Fri 20060407/2100 UTC

NOAA/NWS Storm Prediction Center, Norman, OK

*Probability of convection in high
CAPE, high shear environment
(favorable for supercells)*

Diagnosics and Analysis

- Example: *Significant Tornado Parameter (STP)*
 - A parameter designed to help forecasters identify supercell environments capable of producing significant ($\geq F2$) tornadoes (Thompson et al. 2003)
- $STP = \mathbf{F}(\text{MLCAPE}, \text{MLLCL}, \text{Helicity}, \text{Deep shear})^*$
 - $STP \geq \sim 1$ indicative of environments that may support strong or violent tornadoes (given that right moving supercells occur)

* *An updated version (not shown) includes CIN and effective depth*

SREF Median STP, Union (red), Intersection (blue)

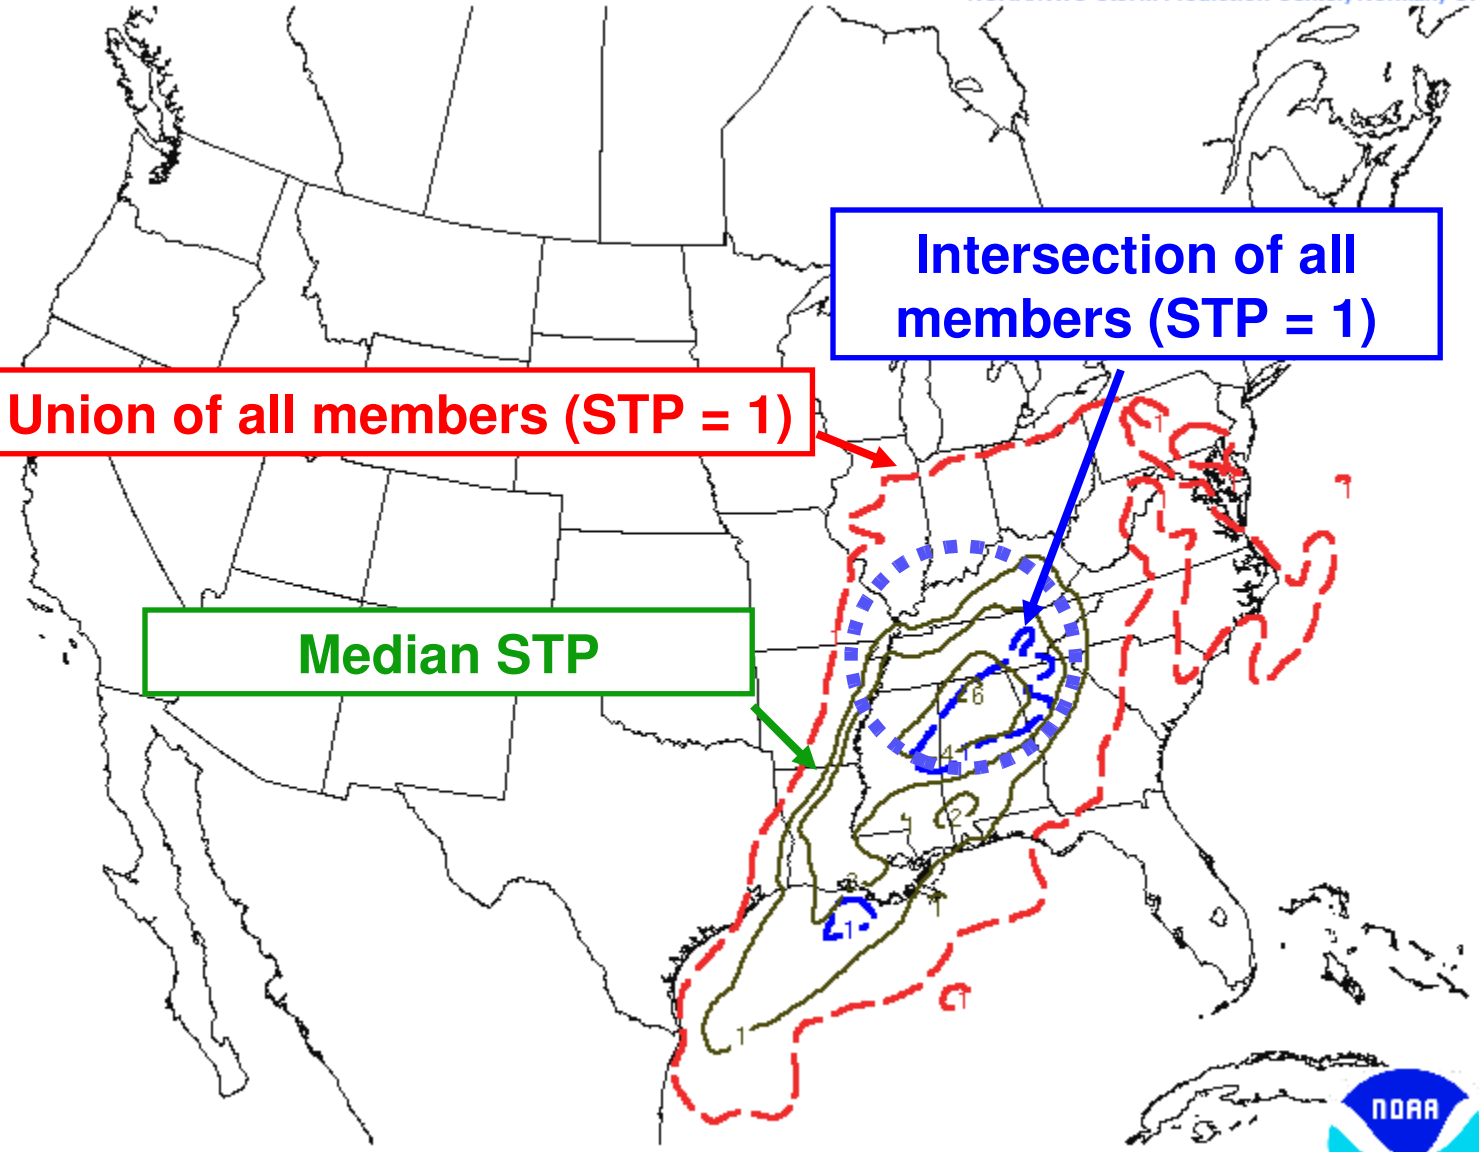

FCST: F036 VALID: Fri 20060407/2100 UTC

NOAA/NWS Storm Prediction Center, Norman, OK

Intersection of all members (STP = 1)

Union of all members (STP = 1)

Median STP

UNION (≥ 1 member: Red) and INTERSECTION (All members: Blue)

Severe Event of April 7, 2006

- **First ever** Day 2 outlook High Risk issued by SPC
- More than 800 total severe reports
 - 3 killer tornadoes and 10 deaths
- SREF severe weather fields aided forecaster confidence

Ensembles and Decision Support

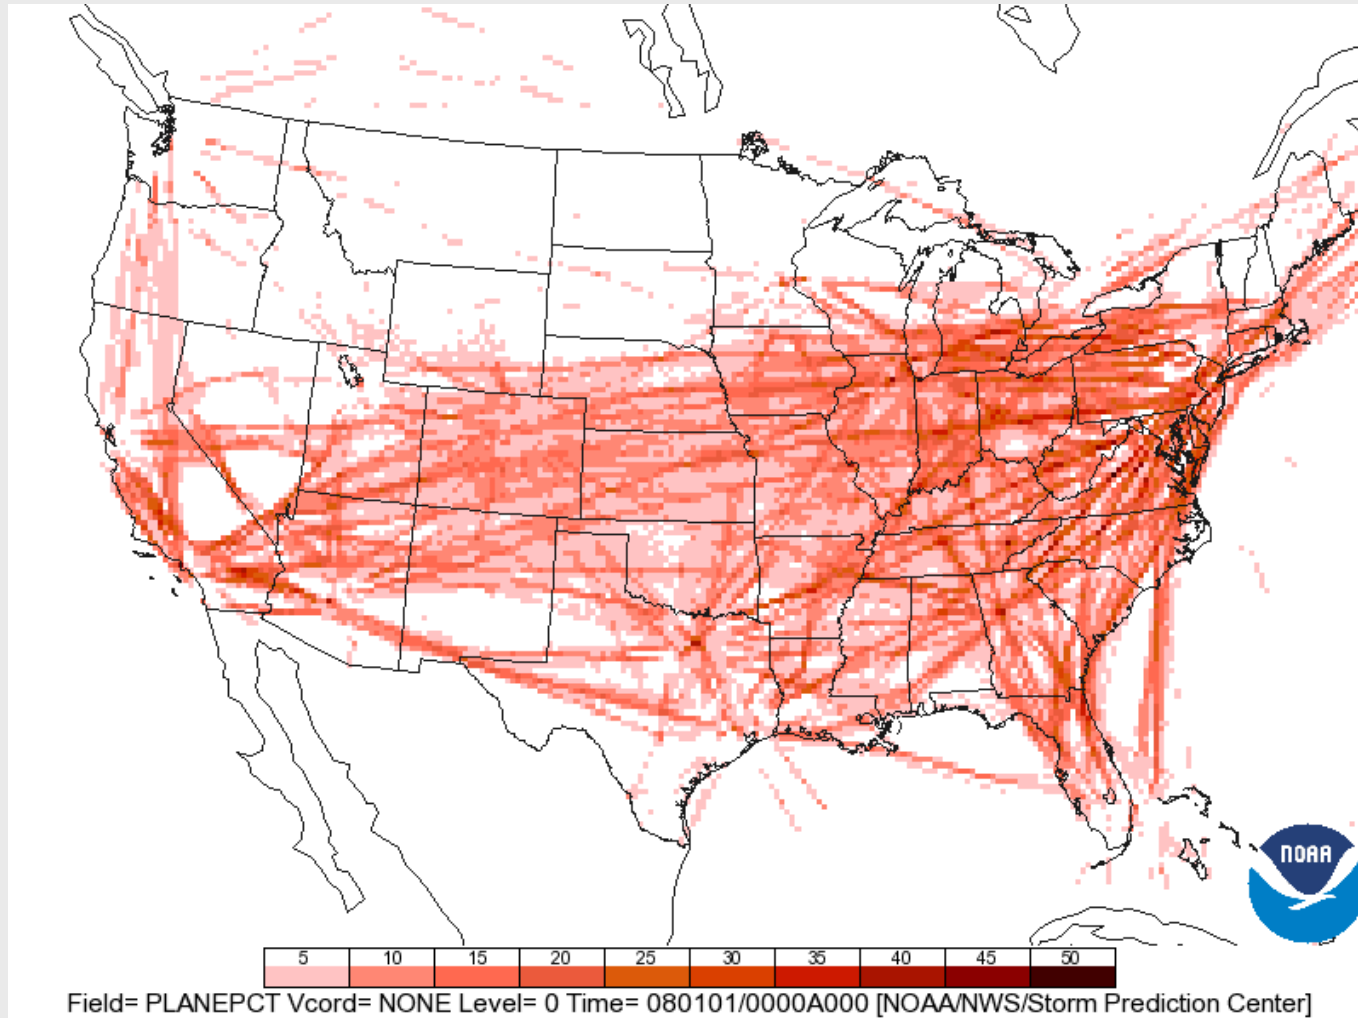

- **Example: En Route Aviation Impacts**
 - Convection cloud tops $\geq 37,000$ feet obstacles to aviation
 - Consider probability of cloud tops *and* probability of en route aircraft position

Gridded Flight Composites (20 km Grid) at 00 UTC

January 1, 2004 to December 31, 2008

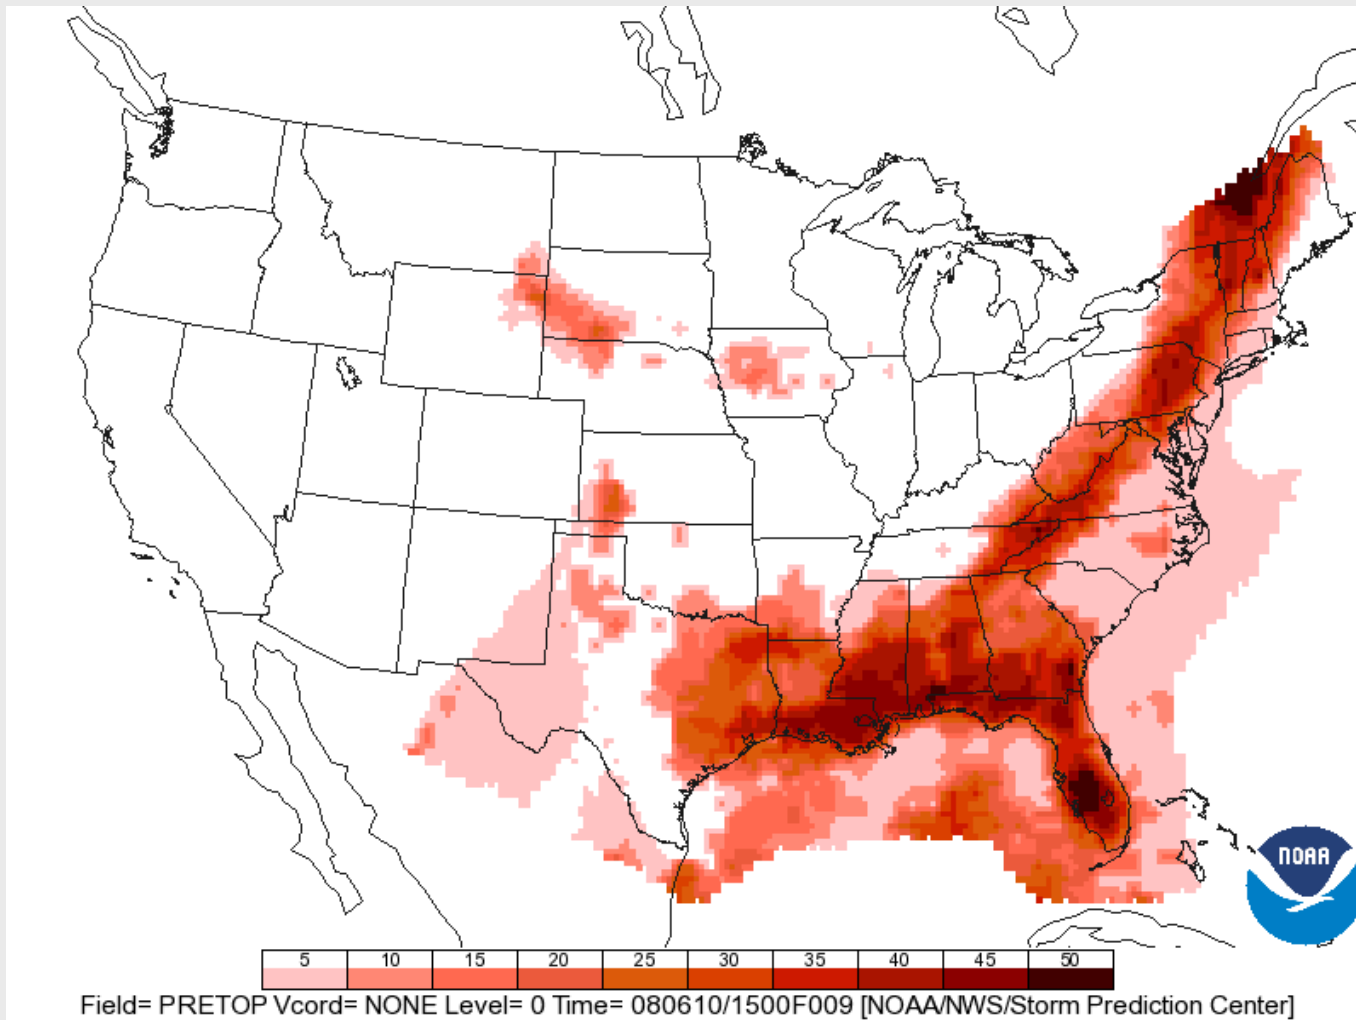

Snapshot probability of an aircraft inside the 20 km (AWIPS 215) grid box
All Flights $\geq 25,000$ Feet

SREF Guidance 15 UTC 10 June 2008

F009 valid at 00 UTC 11 June 2008

Probability of Convective Cloud Tops \geq 37,000 Feet

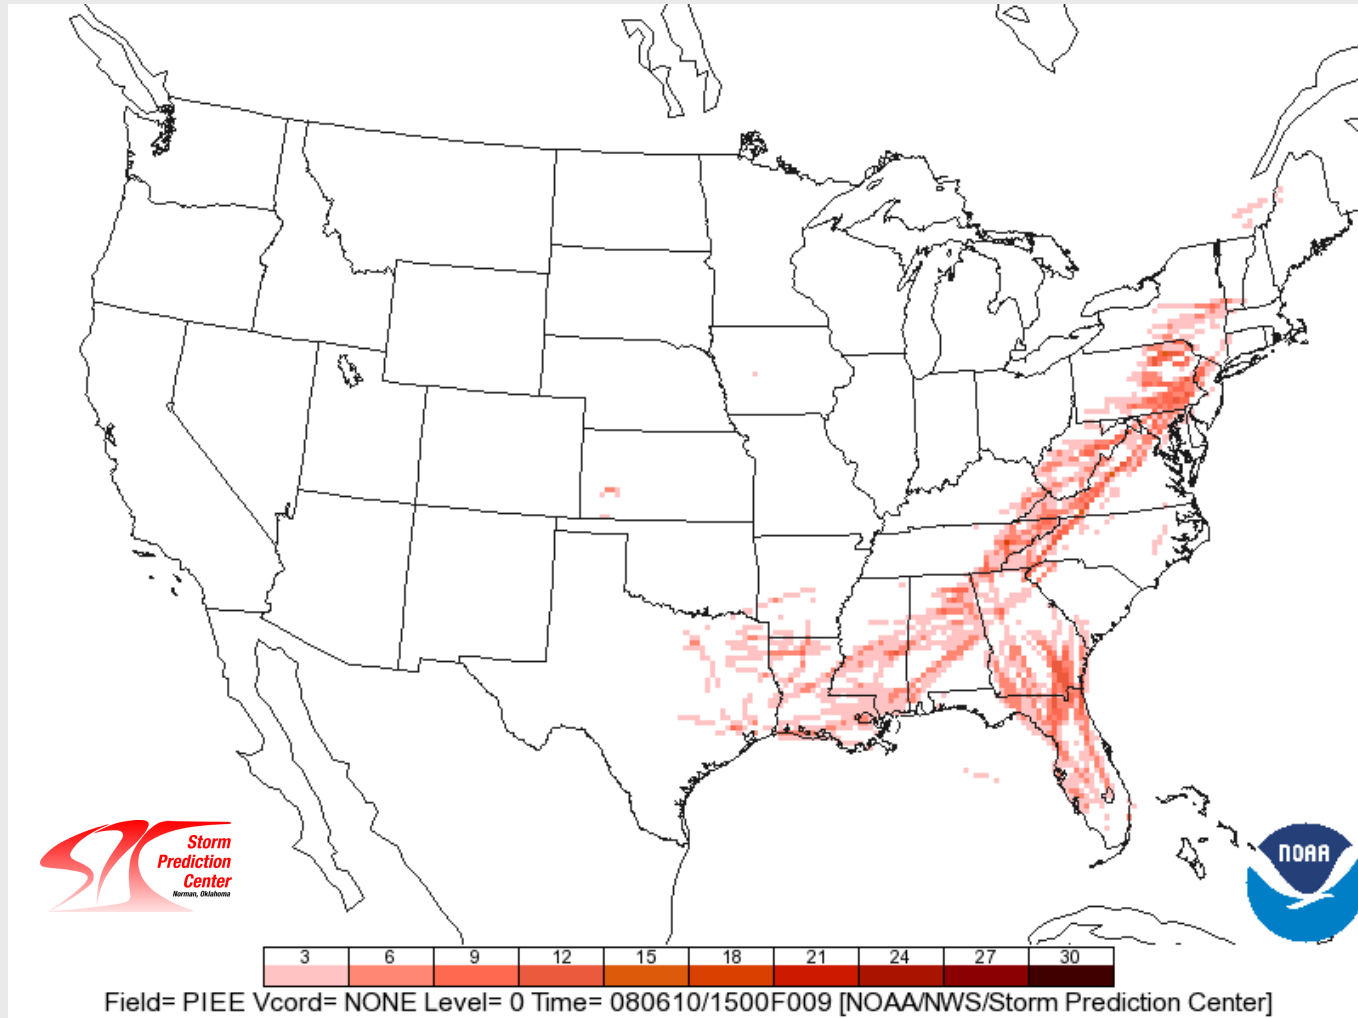

SREF Impact Guidance 15 UTC 10 June 2008

F009 valid at 00 UTC 11 June 2008

Probability cloud tops \geq 37,000 feet AGL *AND* aircraft > 25,000 feet AGL

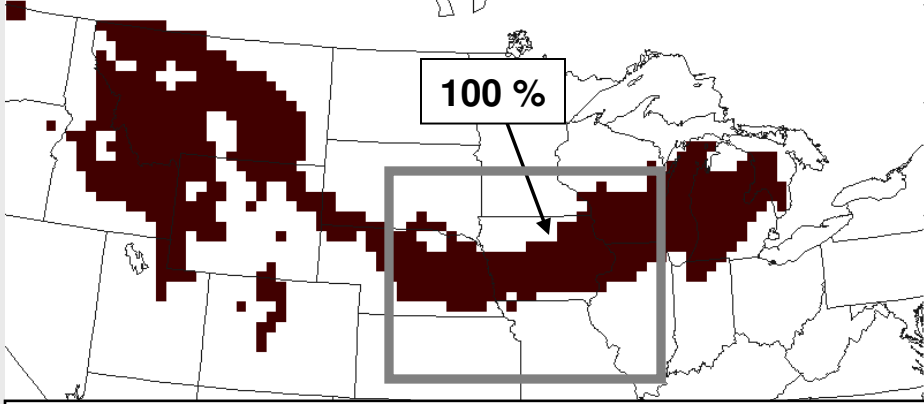

Potential En Route Impacts

Ensembles and Decision Support

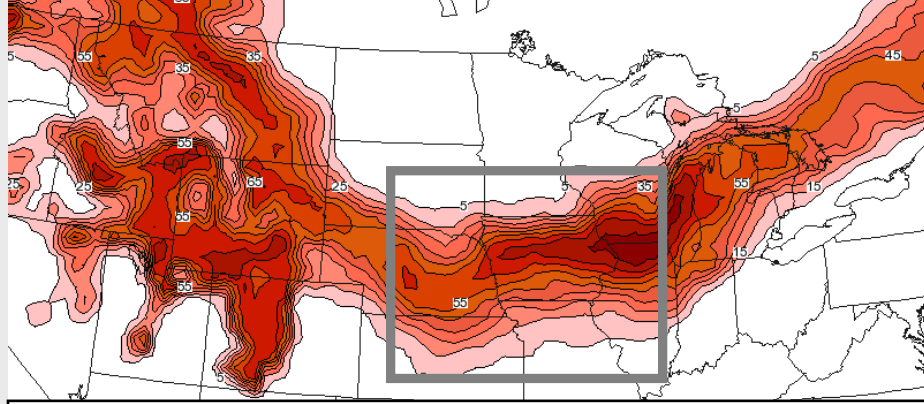

- **Example: Temperature forecasting**
 - Salt road treatment about 10% of cost of chemical road treatment
 - Salt most effective between 20F and 32F
 - Limited resources; therefore want to optimize decision making

100 %

**NDFD: Max Temp 27 Feb 2009 between 20-32F
Issued at 18 UTC 26 Feb 2009**

**SREF: Prob Max Temp 27 Feb 2009 between 20-32F
Issued at 09 UTC 26 Feb 2009**

Field= MAXTMPF Vcord= NONE Level= 0 Time= 090227/2100A000 [NOAA/NWS/Storm Prediction Center]

Field= MAXTMPF Vcord= NONE Level= 0 Time= 090227/2100A000 [NOAA/NWS/Storm Prediction Center]

**Truth: Max temperature verified between 20-32F
27 Feb 2009**

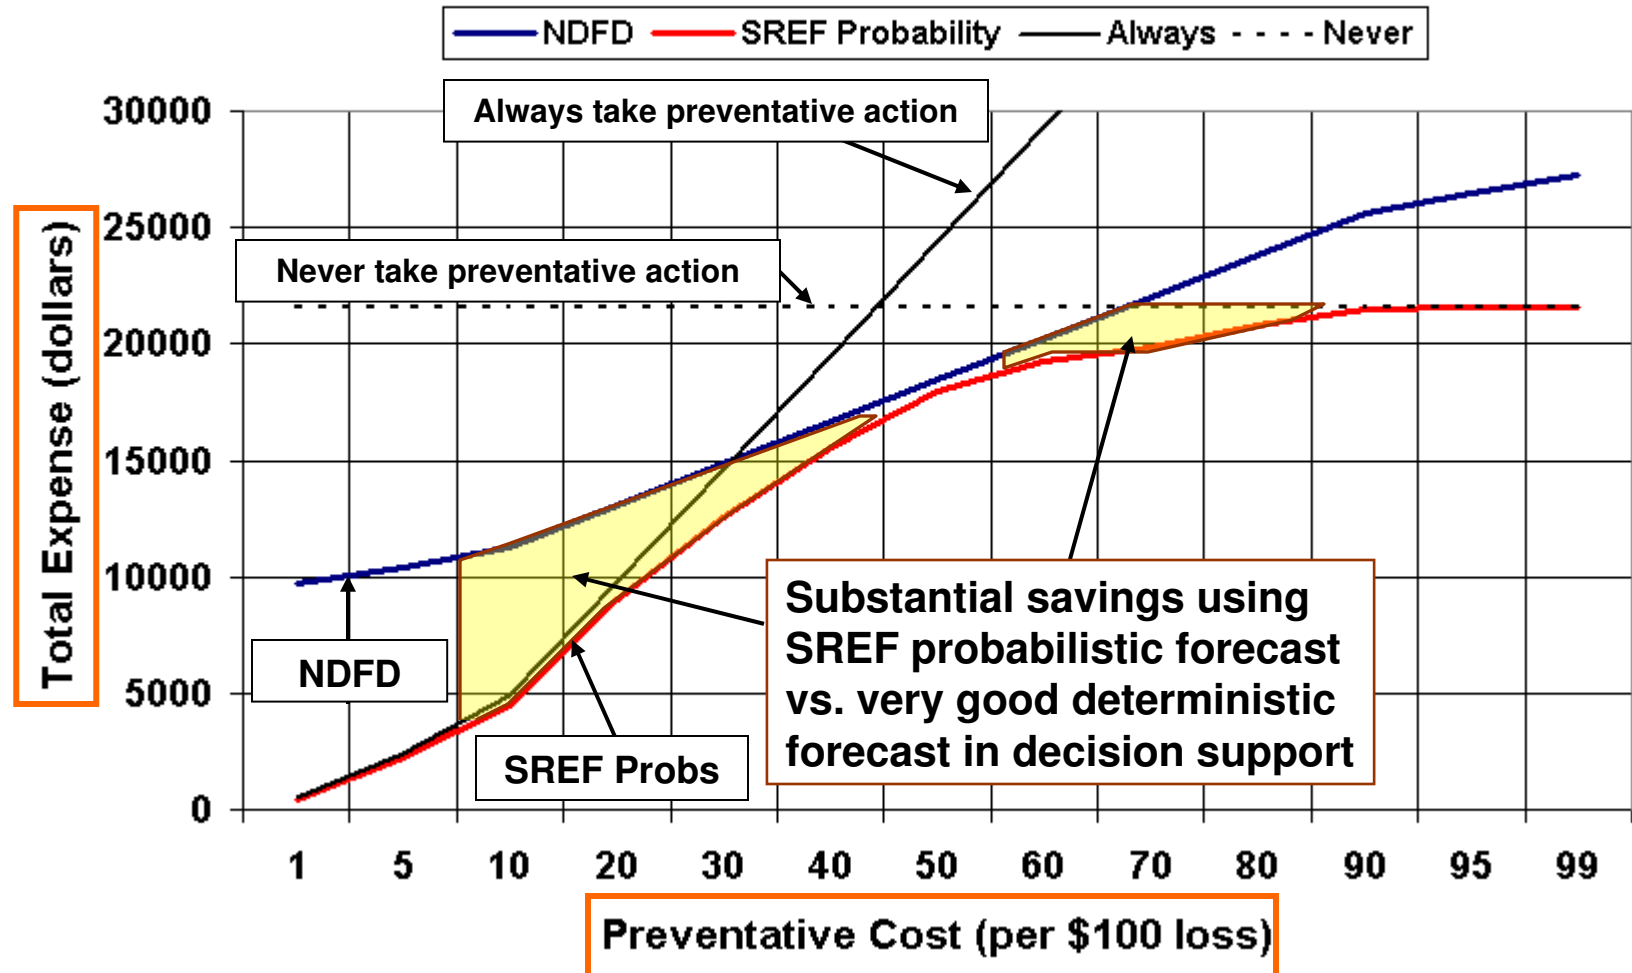

Verify the decision support guidance at every 40 kmx40 km grid point within the domain shown

Field= MUL100QUOS Vcord= NONE Level= 0 Time= 090227/2100 [NOAA/NWS/Storm Prediction Center]

Ensembles and Decision Support

Economic Value of Forecasts

Looking to the Future...

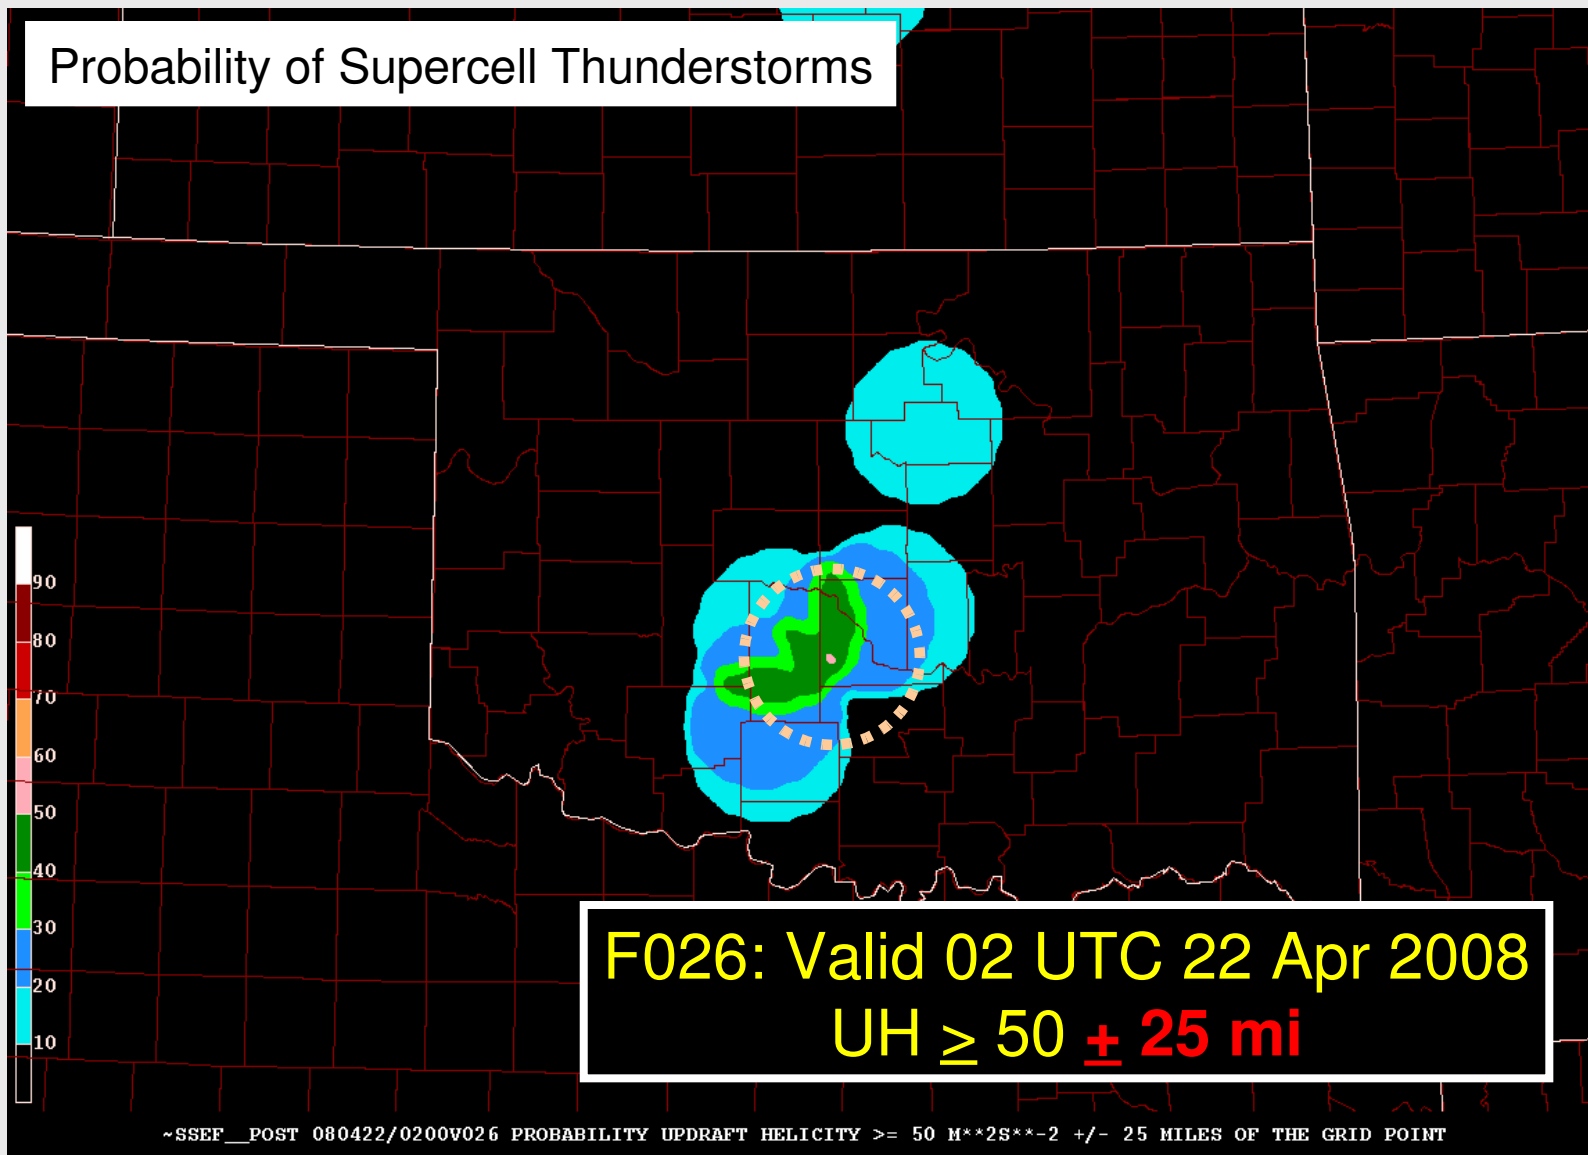

Future Applications: Convection and Severe Weather Resolving Ensembles

- NOAA Hazardous Weather Testbed (HWT)
- HWT Spring Experiment
- Convection allowing ensemble forecasts (2007-2009) to address uncertainty
 - 10 WRF members
 - 4 km grid length over 3/4 CONUS
 - Major contributions from: SPC, NSSL, OU/CAPS, EMC, NCAR
- Evaluate the ability of convection allowing ensembles to predict:
 - Convective mode (i.e., type of severe wx)
 - Magnitude of severe type (e.g., peak wind)
 - Aviation impacts (e.g., convective lines/tops)
 - QPF/Excessive precipitation

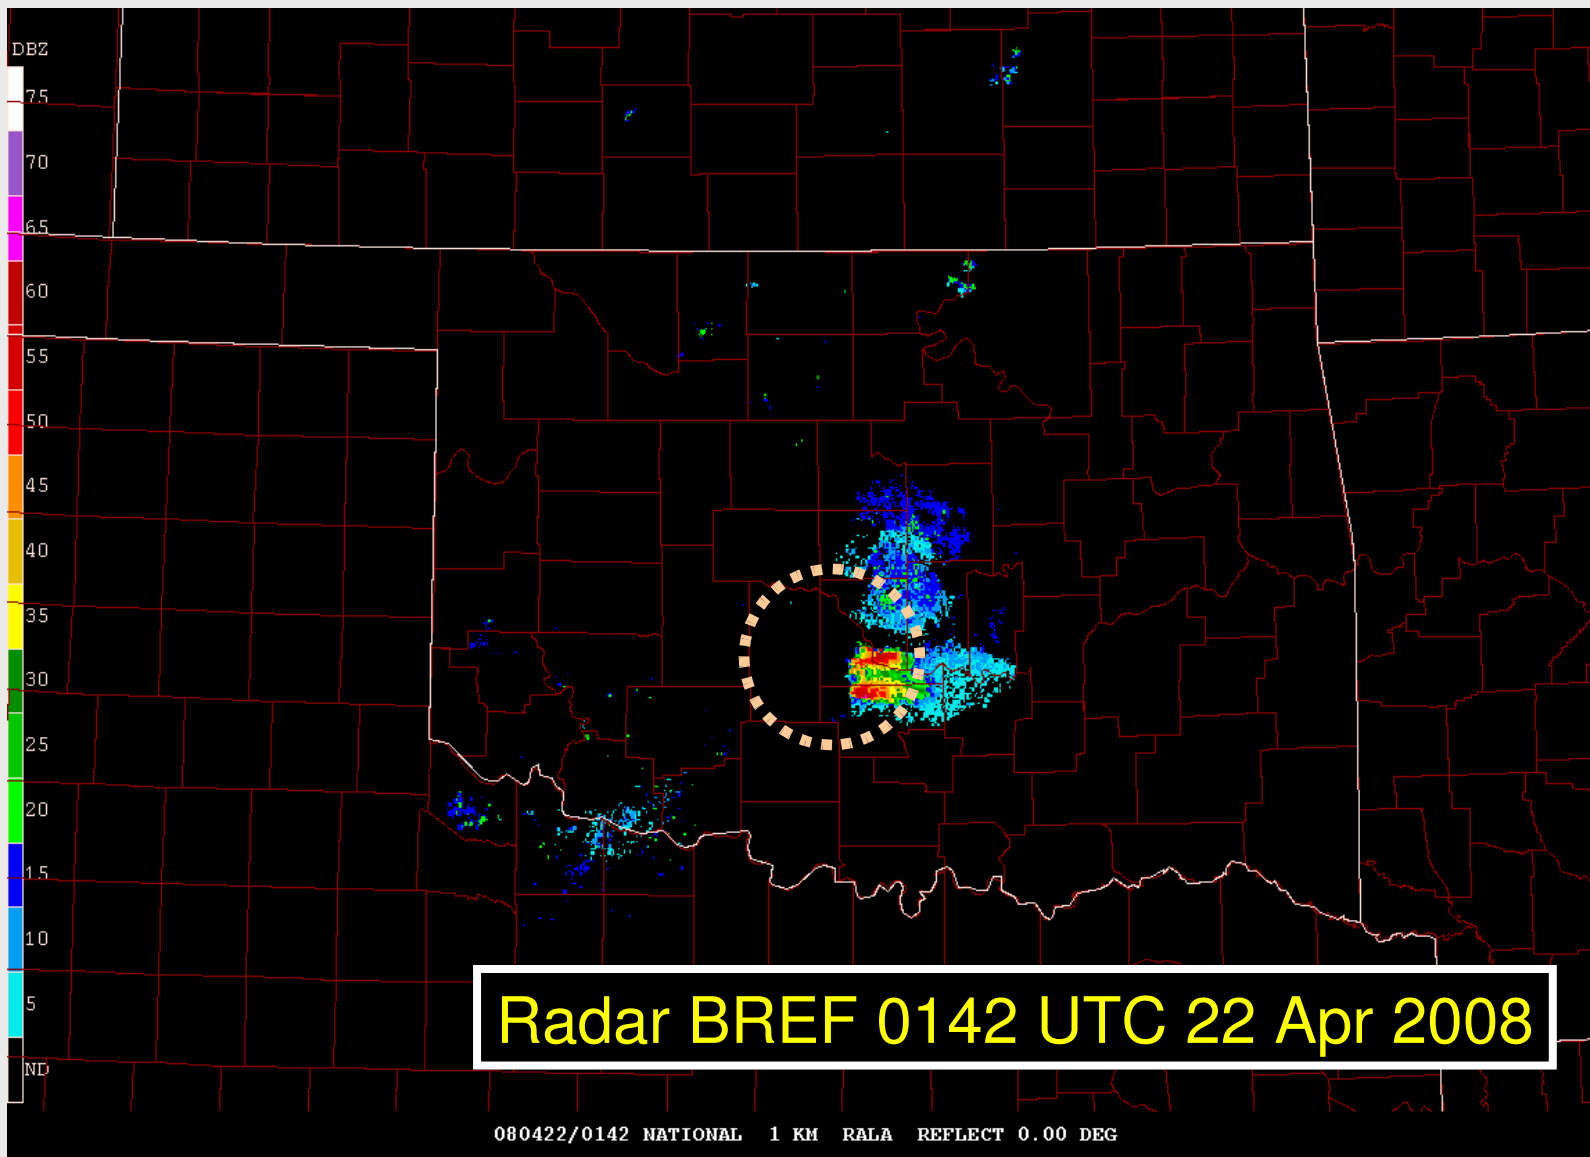

2003 Spring Experiment

Probability Updraft Helicity $\geq 50 \text{ m}^2/\text{s}^2$

Observed Radar

Probability Updraft Helicity $\geq 50 \text{ m}^2/\text{s}^2$

Jack Hales

View of the left split looking south from Norman, OK (0145 UTC 22 Apr 2008)
(Numerous large hail reports up to 2.25")

Convective Mode: Linear Detection

- Determine contiguous areas exceeding 35 dbZ
- Estimate mean length-to-width ratio of the contiguous area; search for ratios $\geq 5:1$
- Flag grid point if the length exceeds:
 - 200 miles

Probability Linear Mode Exceeding 200 miles

Squall Line Detection

F024: Valid 00 UTC 18 Apr 2008
Linear mode \pm 25 miles

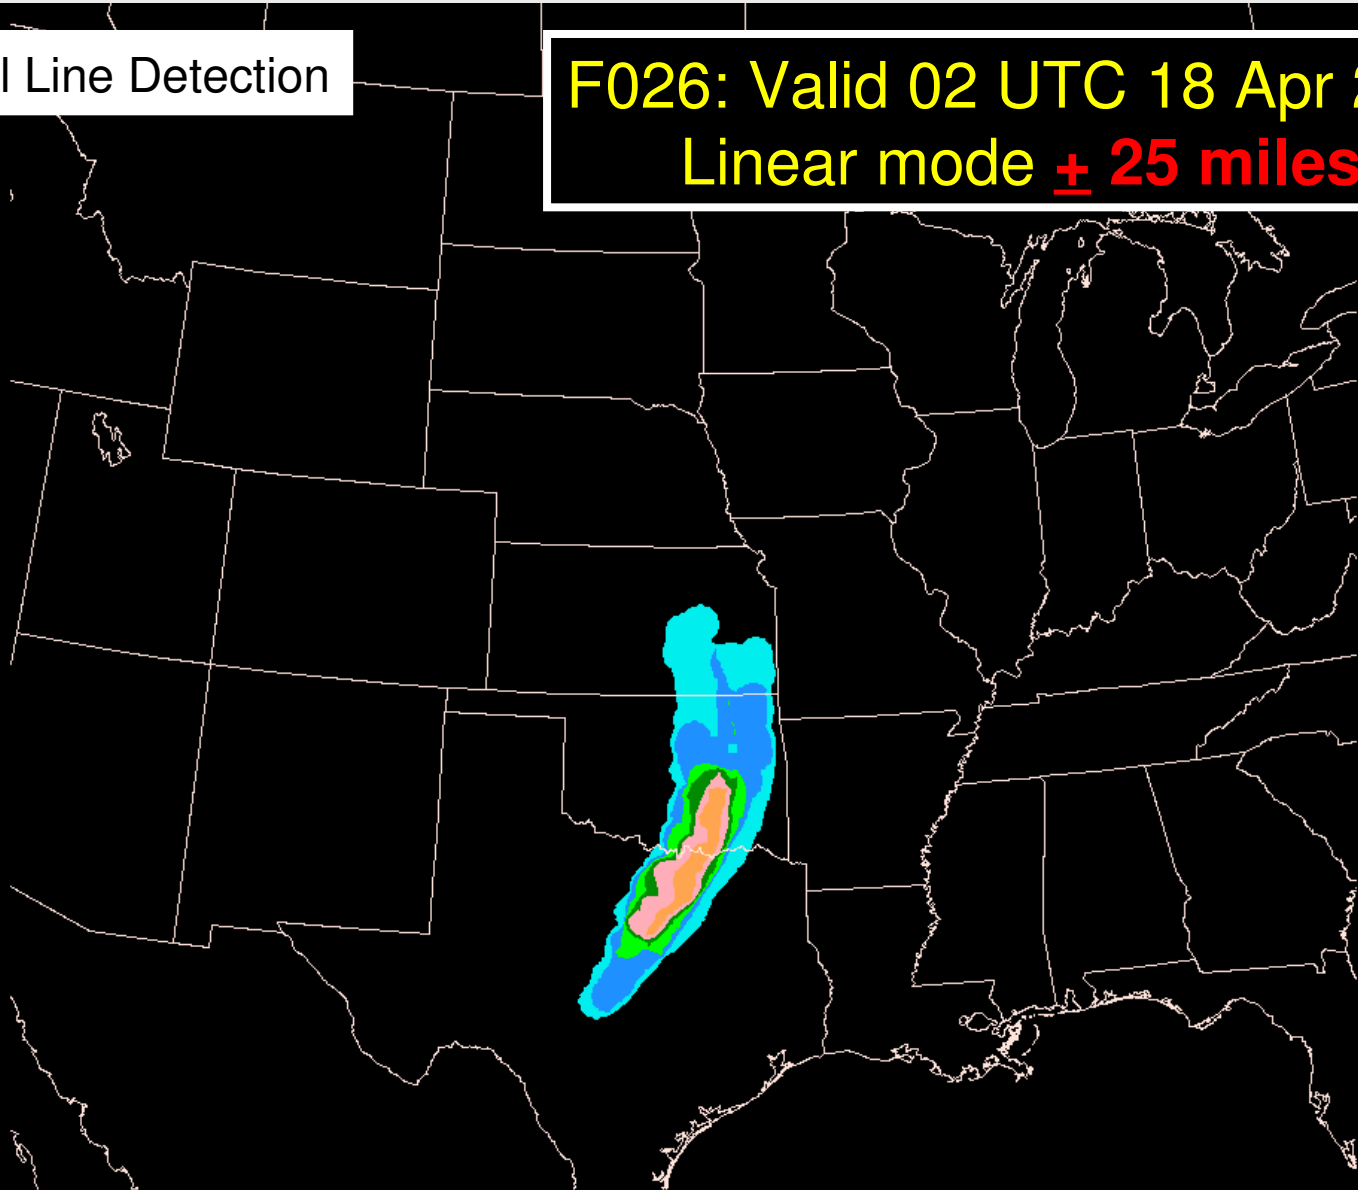

~SSEF_POST 080418/0000V024 PROBABILITY LINEAR MODE WITHIN 25 MILES OF THE GRID POINT (dbZ>=35;Aspect>=5;Length>=200 mi)

Probability Linear Mode Exceeding 200 miles

Linear mode \pm 25 miles

~SSEF_POST 080418/0200V026 PROBABILITY LINEAR MODE WITHIN 25 MILES OF THE GRID POINT (dbZ>=35;Aspect>=5;Length>=200 mi)

Linear Convective Mode: Impacts

Image provided by Jon Racy

Summary

- Ensembles are a collection of models valid at the same time
 - Contribute confidence to the forecast process
 - Provide a range of possible scenarios
 - Lend themselves to probabilistic forecasting and decision support
- Output can be tailored to many specialty applications or forecast problems
- High-resolution ensembles show tremendous promise for severe convective storm forecasting and decision support
