# 2007 Census of Government Finance: A Discussion of Response Rate Quality Issues, Data User Concerns, and Plans for Data Improvements --Updated 

## Introduction

In the release of the preliminary data for the 2007 Census of Governments: Finance in September 2009, we issued a report summarizing the limitations of the preliminary data. While most of the preliminary data for general purpose governments and schools was of good quality, we cautioned the data user when using the preliminary special district data. The impact of the known errors on the released aggregates was discussed in detail in the paper. We also issued a mitigation strategy designed to help address these known limitations. Both long- and short-term strategies were discussed. In this revision of the paper, we are updating the previous report with the results of the additional work done in October and November of 2009. This report will serve as documentation of the initial limitations and the results of our efforts to mitigate some of the errors prior to the release of the final 2007 data.

In the release of the preliminary data for the 2007 Census of Governments: Finance, we cautioned our data users of problems that were to be addressed in subsequent releases of revised data in 2009. Two states had unit response rates around 40 percent (Delaware and New Mexico). The impact of these low response rates was discussed in the initial report. We identified 27 states with other problems at the state by type-of-government level (predominately for special districts).

## Background

The U.S. Census Bureau has written quality standards that will ensure compliance with the 2006 Office of Management and Budget's statistical standards. The standard entitled Quality Requirements for Releasing Data Products addresses the response rates that must be achieved in order to release Census Bureau data products. If these response rates are not achieved, appropriate steps must be taken to inform the data users of the weaknesses in the data.

In this report we discuss three response rates. Because the data are from a census, weighted and unweighted response rates are the same. The first response rate that is discussed is a unit response rate. This is the count of the respondents divided by the count of all units in the universe of local or state and local governments. A unit is counted as a response if it has responded to at least one data item on the census form.

The second response rate that is discussed is the item response rate. This is the ratio of the number of respondents to an item divided by the number of units who could have responded to that item. For example, a ratio of the counties in the United States that reported revenues to the total number of counties in the United States who could have reported revenue would be an item response rate for county revenues.

The third response rate is the Total Quantity Response Rate (TQRR). This rate is similar to the item response rate, but the value of the item of interest is summed rather than the count. In the above example, the TQRR would be the ratio of the county revenues for county respondents in the United States to the total county revenue in the United States.

The Census Bureau standard on releasing data products stipulates that the unit response rate for its products must be above 60.0 percent. The TQRR for key variables must be above 70.0 percent. Otherwise, the data must be released with warnings to the data user. Key variables are those variables that have been determined to be the most important variables for the survey. For the Census of Government Finance, the key variables are Total Revenue, Total Expenditure, Total Debt, and Total Assets.

## Findings of Noncompliance with the Statistical Standards

In analyzing the preliminary data, we found that there were two states that had unit response rates that were under 60 percent, the Census Bureau's quality standard. Delaware with a 40.4 percent response rate and New Mexico with a 43.8 percent response rate did not meet the unit response rate statistical standards. On further examination, it was discovered that for the 2007 state by type-of-government tables, the following groups did not meet the 60 percent response rate standard: Arkansas cities ( 59.4 percent), South Dakota townships ( 46.1 percent), and special districts in Connecticut (55.5 percent), Delaware (28.6 percent), Idaho (59.9 percent), Illinois (55.7 percent), Louisiana (56.3 percent), Mississippi (53.8 percent), Nebraska (52.1 percent), New Mexico ( 28.5 percent), North Dakota ( 57.8 percent), South Dakota ( 58.0 percent), and Texas (56.1 percent).

The Census Bureau also has statistical standards on the Total Quantity Response Rates (TQRR). All key items should have TQRR that are above 70 percent. The four main aggregates are Total Revenue, Total Expenditure, Total Debt, and Total Assets. For Total Revenue, the following groups did not pass the 70 percent criterion: Oklahoma counties ( 67.8 percent); Tennessee municipalities ( 61.9 percent); townships in Missouri (61.3 percent), North Dakota (52.6 percent), Ohio (67.0 percent), South Dakota (42.3 percent), and Vermont ( 68.9 percent); and special districts in Arkansas ( 68.1 percent), Hawaii ( 0.5 percent), Iowa ( 68.4 percent), Mississippi ( 62.2 percent), Montana (61.3 percent), New Mexico ( 64.3 percent), and South Dakota ( 58.0 percent), and Vermont (69.2 percent). The list is similar for Total Expenditure with the exceptions of Iowa and New Mexico special districts and Missouri townships, which all have response rates in the acceptable range.

TQRR for Total Debt was identified as problematic for the following groups: Tennessee municipalities ( 60.0 percent); Missouri ( 0.6 percent), North Dakota (31.3 percent), Ohio (61.1 percent), South Dakota (32.9 percent), and Vermont townships (68.3 percent); and special districts in Arkansas ( 66.9 percent), Idaho ( 61.3 percent), Indiana ( 58.0 percent), Maine ( 65.9 percent), Mississippi ( 60.3 percent), Montana ( 7.3 percent), Nebraska ( 69.4 percent), Oklahoma (65.6 percent), Vermont (65.7 percent), West Virginia (61.8 percent) and Wyoming (33.2 percent).

Finally, the TQRR for Total Assets fell below the standard for Tennessee cities (61.0 percent); townships in Missouri (38.6 percent), North Dakota (56.4 percent), Ohio (67.7 percent), South Dakota (46.6 percent), and Vermont (68.3 percent); and special districts in Arkansas (65.3 percent), Hawaii ( 0.0 percent), Idaho ( 65.4 percent), Iowa (56.3 percent), Kansas ( 64.8 percent), Kentucky ( 63.7 percent), Maine (49.2 percent), Mississippi (42.8 percent), Montana (14.0 percent), Nebraska (47.3 percent), New Mexico (64.1 percent), Pennsylvania ( 69.2 percent), South Dakota ( 59.1 percent), Vermont (46.2 percent), and West Virginia (38.0 percent).

These findings are summarized in Table A, which gives the list of all states with statistical compliance issues (for unit response rates and for Total Quantity Response Rates for the key variables) at the state by type-of-government level.

## Findings of Noncompliance after Initial Mitigation Efforts

After the implementation of the mitigation strategy in the fall of 2009, a few areas continue to fall below acceptable statistical standards. Those areas that are still noncompliant with the statistical standards after mitigation are highlighted in Table A. Of particular note, we increased the response rate in the South Dakota townships to 96.0 percent after finding a new resource for the townships data. Historically, these townships have been chronic nonrespondents. For noncompliant units, the TQRRs are supplied in parentheses.

It should be noted that although the unit response rates for Delaware and New Mexico remain low, the TQRRs for revenue, expenditure, debt and assets are all above 97 percent for Total Local estimates. It should also be noted that although Missouri townships have a low TQRR for debt, the TQRRs for Missouri's Total Local key variables are all above 93 percent, and the State and Local TQRRs are all above 97 percent. Likewise, the low TQRR for debt for North Dakota townships has little effect on the North Dakota Total Local key variables, which are above 85 percent while the State and Local TQRRs are all above 94 percent. The data user should be cautious of using the Missouri and North Dakota townships' debt data, but the response rates for the state area estimates comply with Census Bureau standards.

Tables A1 and A2 in the Appendix show the Total State and Local and Total Local TQRRs respectively. The other tables in the Appendix show updates to Tables 1 through 4 in the original document.

## Effects of Nonresponse on the Data

The unit response rates for Delaware and New Mexico are very low due to the high nonresponse among the numerous drainage ditch districts in the two states. Both states have a relatively small number of governments, so the drainage ditch districts have an effect on the unit response rate. Table 2 verifies that the unit response rate problem is in the special districts. Table 3 shows that for Delaware the TQRRs are acceptable for all types of government for the key variables of interest. New Mexico, on the other hand does not have an acceptable level for the TQRR for the special districts. Further examination of the TQRR by state shows that in New Mexico, poor response by drainage districts, housing and community development districts, solid waste management districts, and water utility districts combined to give a poor TQRR for New Mexico special districts.

An examination of the special district TQRRs by function in Table 4 reveals low TQRRs at a U.S. Total Special District level for Drainage for all key variables. The user should use caution when using these numbers. The user should also use caution when using data from the following special district functions with low TQRRs: education, industrial development, and mortgage credit. Although these functions are questionable for special district estimates, they are often a small part of the local governments total or state and local governments total and usually have little effect on the state area estimates.

An examination of the special districts by state reveals several problematic function codes in the detail variables that led to the special district problems in the key item totals. Table B summarizes these problems. Function codes that had TQRRs under 50 percent were deemed as poor quality in these preliminary data.

| Tennessee | Miscellaneous commercial activities, water transport |
| Texas | Mortgage credit, drainage, solid waste management |
| Utah | Highways, parks \& recreation, solid waste management, soil \& water conservation, other multi-function districts |
| Vermont | Fire protection, housing and community development, parks \& recreation, other multi-function districts |
| Virginia | Parks \& recreation |

| State | Functions |
| :--- | :--- |
| Washington | Cemeteries, water supply utilities, natural resources \& water multi- <br> function district |
| West Virginia | Water supply utility |
| Wisconsin | Drainage, housing \& community development, reclamation |

A review of the response rates by imputation cell reveals that the data from the general purpose governments with smaller population sizes have lower response rates than those imputation cells for larger governments. This is a common finding in the economic data because of the impact of these large units on the estimates of major aggregates and on the TQRR.

## Further Research

Further research is needed to explain some of the anomalies found in the response rates (i.e., the extremely low TQRR for Missouri townships and Montana special districts and the low TQRR for assets in the Montana special districts). This will be a near-term project. Some anomalies have already been researched and explained, like Hawaii special districts. For Hawaii, one sizeable special district that responded in 2006 did not respond in 2007. Because we were able to find a Comprehensive Annual Financial Report (CAFR) for this district, analysts will compile the data from this district, and it will be released in the revision. Similar targeted research must take place.

The problems found in these preliminary data should also be used to assist in the questionnaire redesign for the next Census of Government Finance and the Annual Finance Survey. Item response rates for each variable will be completed in the future and will be used to give insight into the detailed items that are problematic. This should help guide the work of the Government Finance Questionnaire Redesign effort.

Further analyses of the data should be undertaken for a more thorough nonresponse bias study.

## Mitigation Strategy

While it appears that there are major problems with the data, many of the states are relatively close to meeting the statistical standards. The data that are being released are preliminary and revised data will be released in November 2009. We will be creating two teams to focus on 1) bringing states that are close to compliance into compliance and 2) examining anomalies like the Hawaii discovery discussed in the Further Research section. Prior to the release of the revised data, the first team of analysts will compile further information from Comprehensive Annual Financial Reports (CAFR) for the following state by type of government groups: Arkansas and Tennessee municipalities, Oklahoma counties, Ohio and Vermont townships, and special districts in Arkansas, Hawaii, Iowa, Nebraska, South Dakota, and Vermont. As time permits, further work will be done.

The second team, which will include mathematical statisticians and analysts, will be working concurrently to investigate the low TQRR for debt for Missouri townships and Montana special districts as well as the low TQRR for assets in Montana special districts. They will determine if there are imputation or reported data problems or if a large unit
was missing, as in Hawaii. The team will suggest a strategy for addressing each problem and, upon approval, implement the strategy to correct each problem.

In processing the 2008 survey, the response rates will be monitored more closely. There will be new training to educate the analysts and supervisors about nonresponse follow-up of the weighted units, like the smaller townships and special districts. The current processing system gives unweighted response rates which gives a false reading when trying to monitor response rates. Each analyst will be taught to monitor the weights of the nonrespondents also. Work will begin with a new team to build a dashboard that will give a more accurate picture of the final response rates by using weighted response rates in the monitoring tool. The dashboard tool will also monitor imputation cell unit response rates as well as simple TQRR estimates for each of the major variables of interest.

In early fiscal year 2010, a series of workshops will be held with data users and data providers. The content of the new finance questionnaires will be determined from work that will start with these workshops. A study of the item response rates that are available from this Census will be used to determine where data providers are having difficulty with the questions. For example, in Table B, it is apparent that several special districts that should be reporting sewer and water are not reporting. This corroborates internal anecdotes from analysts who have said that respondents cannot report sewer and water totals separately. It is apparent from the response rates that natural resources reporting is problematic in several states. There is some evidence that health and hospitals reporting is also challenging.

It is apparent from these preliminary data that drainage ditch districts and other small special districts are not reporting directly. The sample that will be used to estimate the 2009 Annual Finance Survey has been designed to take far fewer small special districts and townships. Extra efforts will be taken to reach those small governments that have been selected for the new sample since their weights will be large. Analysts will try to identify central sources of data that may be able to supply drainage ditch district data.

For the 2012 Census of Governments, we may also examine the possibility of sampling the nonresponse and adjusting estimates using the results of the nonresponse sample.

## Update on Mitigation Strategies

As discussed previously, to implement the mitigation strategy, two teams of analysts and mathematical statisticians were formed in the fall of 2009. The results of their efforts are evident in the reduction of the number of noncompliant cells in Table A. Further research is still needed after the initial mitigation. The results of initial studies of the Total Quantity Response Rates point to a need to research ways to improve the imputation methodology, particularly for debt. With an investment in another resource for obtaining actual debt issued and debt retired data, the quality of the debt data should improve.

Tracking of response rates will be improved through the use of a dashboard for nonresponse follow-up efforts. A team is developing a dashboard for tracking the 2010 process. We are making efforts to improve the follow-up for 2009, but the dashboard tool will not be available to the analysts for 2009.

As noted in the initial mitigation strategy, we will be addressing content and forms changes. As a part of this effort, data user exchanges were held in the Fall of 2009, and these discussions will continue through 2010. We are now starting interagency working groups with the Bureau of Economic Analysis and the Federal Reserve Board to address content and forms design issues that will hopefully alleviate some of the problems with nonresponse. We will also be working with the Census Bureau's Office of Economic Planning and Innovation to guide us in our contacts with data providers in an effort to understand their records and their processes for filling out the Finance Survey’s forms.

## Conclusion

Better methods of flagging the data have allowed for a nonresponse study. The adoption of the full range of edit and imputation flags will allow us to do an extensive edit evaluation and nonresponse bias study in the future. The findings are not surprising as they corroborate much of the anecdotal data from analysts in the past. These data can be used though to pinpoint the source of many of the anecdotal problems that we have historically heard. This information will be valuable in retraining analysts and in redesigning the questionnaire. Efforts will be taken to provide more data where possible prior to the November release of the revised data.
